PL01 Roundtable Keynote Day 1

Shifting Grounds: Paths, Connections, and Futures

Sandra Banjac (Netherlands), Emilija Gagrcin (Germany), Michael Bossetta (Sweden)

Communication research stands on shifting grounds. As the systems we study continue to transform, so do the conceptual models, methods, and priorities that define our field.

This opening plenary takes the ECC26 theme—Paths, Connections, and Futures—as an invitation to reflect on communication as a discipline. Rather than offering three separate speeches, the session unfolds cumulatively across three thematic rounds.

In the first round, Paths, we ask: What choices are shaping our field right now? Which theoretical approaches, methodological directions, and institutional pressures are defining communication research today? What do these choices enable, and what do they constrain?

In the second round, Connections, we turn to the relational question: What connects across technologies, disciplines, and societies? How does communication research build bridges across intellectual, political, and social fragmentation? What forms of explanation, critique, and collaboration endure across periods of transformation?

In the final round, Futures, we ask: What should we take into the future? What forms of research, responsibility, and imagination are necessary for communication scholarship to remain relevant, rigorous, and societally meaningful in uncertain times?

Each round begins with short provocations from the panelists, each framed by a single keyword capturing a central claim. As the session progresses, these keywords build a conceptual map that makes visible the paths we are taking, the connections we are building, and the futures we are collectively shaping. Audience interaction extends this mapping exercise, inviting participants to reflect on the commitments and connections they believe should guide communication in the years ahead.

By structuring the plenary around cumulative reflection rather than isolated commentary, the session seeks to embody what the conference theme calls for: clarity in our intellectual choices, openness in our perspectives, and shared responsibility in shaping the futures we design.

PL02 Keynote Lecture Day 2

KL 01 Exemplary Journalistic Actors: What Can the Core Learn from the Exemplary

Lenka Waschková Císařová[1]

[1] Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Journalism is changing, the grounds are shifting, but one thing remains the same: the power – the lust for power among various journalistic actors; and power struggles, not only at the margins of the journalistic field, but also within it. Similarly, power is present in journalism studies research, too – we also have our core and periphery – but we don't discuss it loudly. However, this power curtain in both practice and research should not make us blind or keep us quiet. On the contrary, we should actively observe who holds the power, identify it, challenge it: by paying attention not only to those in the core of the field(s), but also (and above all) to those on the periphery. Although power may seem to limit our options as researchers, we should not view the periphery of both the journalistic field and journalism studies research as marginal. On the contrary, we should recognise its potential to enrich the knowledge – through inclusive approach and diverse perspectives. In this context, we can consider peripheral actors to include not only those on the geographical margins, but also those on the margins of the field, such as local journalists, editors, camera reporters, journalists from less prominent beats, or x-journalists. While these journalistic actors are considered peripheral, we can regard them as exemplary. Exemplary is a suitable term that reflects a shift in perspective, allowing peripheral actors and their practices to be brought to the forefront – not only to acknowledge their importance in the journalistic field, but also to emancipate both the best practices and the pitfalls it entails. Conveniently, exemplary, according to the Oxford English Dictionary, means both setting a good example as well as serving as a warning to others, thus can cover the entire spectrum of (non)transferable experiences. In order to learn from those on the margins and being able to expand our knowledge to the core, we can follow the conference's paths–connections–futures framework. Not only are there paths leading to more inclusive research: considering structural conditions, we can ask, how journalistic and academic ecologies shape what knowledge becomes visible and even influential. There is also the path-dependency – when it comes to peripheral journalistic actors, we must look both ways – to the future and to the past, building on the existing body of knowledge in the field. We don't need to "reinvent the wheel", the exemplary actors have always been in the field. Considering connections, we should finally replace a ford with a bridge, moving beyond mere declarations about inclusive research and topic equality – first acknowledging the underrepresented voices in journalism and journalism studies; and second contribute to their amplification. Peripherality is an analytic resource, not a disadvantage. This approach can shift the grounds in journalism research, with futures based on emancipating marginalised actors and topics, thereby contributing to the resilience of the journalistic profession and scholarship. Therefore, we can consider

what the future of academia might look like if the peripheral actors also meaningfully shape knowledge. An interactive and entertaining keynote lecture will present data from research into exemplary actors in journalism, which will support and illustrate the above arguments. For example, it will showcase the exemplary entrepreneurial practices of local journalists, whose decades of experience can teach us about resilience under constraints.

PL02 Keynote Lecture Day 2

KL 02 The price of democracy: How digital platforms make illiberalism cheap

Frank Esser[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Democratic erosion represents one of the most pressing challenges facing liberal democracies, yet the role of political communication in facilitating this process remains undertheorized. This presentation will develop a conceptual framework of communicative democratic erosion explaining how transformations in political information environments (PIEs) have fundamentally altered the 'price' of pursuing illiberal strategies—making what was once prohibitively costly increasingly cheap and accessible. Our framework conceptualizes PIE changes—digitalization, platform dominance, fragmentation, and algorithmic curation—as opportunity structures that reduce three types of costs. First, digital platforms lower entry costs by enabling illiberal actors to bypass traditional gatekeepers and reach mass audiences directly. Second, algorithmic amplification and elite norm-violation signaling reduce social costs of expressing previously stigmatized illiberal views. Third, media capture weakens institutional costs by diminishing independent journalism's capacity to impose reputational sanctions. These cost-reduction mechanisms operate through four interconnected elements: (1) structural PIE transformations create new opportunity structures; (2) elites strategically exploit reduced entry costs; (3) citizens respond through pathways that activate intolerance or deactivate democratic engagement; (4) mainstream media normalize illiberal discourse, creating conditions for institutional capture. Captured media feed back into PIE fragmentation, creating cost spirals that accelerate erosion. Cross-national variation reflects three scope conditions—media system structure, regulatory capacity, and elite restraint—that determine whether platforms' cost-reducing effects translate into democratic decline. Our framework, developed through collaborative analysis by the Network of European Political Communication Scholars (Nepocs), bridges political communication and democracy studies while identifying actionable intervention points for restoring the costs that protect democracy.

SP01 The Impact of Technologies on Well-Being

SP 01 Measuring the benefits and drawbacks of ubiquitous connectivity: The digital well-being scale

Mariek M. P. Vanden Abeele[1], Michaela Šaradín Lebedíková[2], S.L. Murphy, Kyle Van Gaeveren[3], David de Segovia Vicente[4]

[1] University of Ghent, Ghent, Belgium
[2] Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic
[3] University of Ghent, Research Group for Media, Innovation and Communication, Ghent, Belgium
[4] University of Ghent, imec-mict, Ghent, Belgium

Digital well-being is an emerging concept that refers to the balance that individuals experience between the benefits and the drawbacks of ubiquitous connectivity. Definitions of Digital Well-being vary, leading to a variety of operationalizations, yet none match closely with the definition of digital well-being as a subjective experience of the benefits and drawbacks of ubiquitous connectivity. Hence, we performed a preregistered study (N = 1438) testing a Digital Well-being Scale to measure this subjective experience. The psychometric analysis of the scale revealed a second-order two-factor structure, with perceived benefits (hedonic and eudaimonic) and perceived drawbacks from smartphone use (loss of control and functional impairment) as separate dimensions. These dimensions formed internally consistent subscales. The findings of this study thus point towards the Digital Well-being scale as useful measurement tool for assessing the benefits and drawbacks that individuals experience from using digital technologies, that can be integrated in future research examining the antecedents, correlates, and outcomes of digital well-being.

SP01 The Impact of Technologies on Well-Being

SP 02 Does smartphone application use impact adolescents' affect? Or vice versa? An experience sampling study

Michaela Šaradín Lebedíková[1], David Lacko[1], Michal Tkaczyk[2], Jana Blahošová[1], S. Elavsky, David Smahel[1]

[1] Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic
[2] Masaryk University, Faculty of Informatics, Brno, Czech Republic

Adolescents spend substantial time on smartphones, often engaging with social and entertainment applications. While mood management theories suggest that media use can be linked to the regulation of affect, empirical findings remain mixed, and often rely on self-reports and unidirectional assumptions. This study advances theory and methodology by examining the short-term associations between social networking and entertainment application use and affective states, and vice versa, using experience sampling and trace data. A sample of 197 Czech adolescents participated in four two-week bursts of data collection, during which smartphone use was logged and affective states were assessed multiple times daily. While we found that application use was related to affective states at the between-person level, these findings did not consistently translate to individual-level dynamics. At the within-person level, increased social application use was followed by slightly higher negative and lower positive affect, while an increase in positive affect predicted a small decrease in entertainment application use. Our results provide partial support for some pathways in mood management theory among certain adolescents. Our results imply that public concerns about the severe harms of smartphone use to short-term psychological well-being may be overstated.

SP01 The Impact of Technologies on Well-Being

SP 03 Does social media time matter for adolescents? Exploring reciprocal relationships between time on social media and social well-being and ill-being

Rubén Olveira-Araujo[1], Michaela Šaradín Lebedíková[2], G. Martínez

[1] University of the Basque Country, Audiovisual Communication and Advertising Department, Leioa, Spain
[2] Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Social media (SM) platforms such as Instagram and TikTok are deeply embedded in the daily and social lives of adolescents, yet research remains inconclusive about whether SM use benefits, harms, or has no effect on adolescents' social well-being. While the Displacement and Stimulation Hypotheses predict opposite effects of SM use on social outcomes, the Social Compensation and Social Enhancement Hypotheses suggest that feelings of loneliness or social support may in turn influence time spent on social media (TSSM). This study examines the long-term reciprocal relationship between time spent on social media (TSSM), peer support, and loneliness—two key indicators of social well-being and ill-being—using a random-intercept cross-lagged panel model (RI-CLPM). The analysis draws on a large, nationally representative, quota-based sample of Czech adolescents (N = 2,500; ages 11–16; 50% female) surveyed across three waves. Results indicate that TSSM has no significant long-term effect on adolescents' peer support or loneliness. In other words, TSSM neither displaces nor stimulates adolescents' social connections. These findings suggest that interventions focused solely on limiting TSSM are unlikely to improve adolescents' social well-being or reduce loneliness. Instead, broader strategies that address underlying social and emotional needs are warranted.

SP01 The Impact of Technologies on Well-Being

SP 04 Modifiable media-related factors of sleep health in Czech adolescents: Findings from a nationally representative study

Michal Tkaczyk[1], Rubén Olveira-Araujo[2], Lenka Dedkova[3], David Smahel[3]

[1] Masaryk University, Faculty of Informatics, Brno, Czech Republic
[2] University of the Basque Country, Audiovisual Communication and Advertising Department, Leioa, Spain
[3] Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Media-related factors capture contextual conditions of media use rather than time spent on media activities. Many are modifiable and may contribute to improvements in adolescent sleep. Identifying the factors most strongly associated with sleep can inform parental guidance and interventions. However, evidence remains limited, with most studies focusing on single factors or only one level of influence. To address this gap, the present study examined the relative contributions of multiple media-related factors at individual and family levels to adolescent sleep health, accounting for their co-occurrence, and controlling for age, sex, bedroom sharing, and screen time. Data were drawn from a nationally representative sample of Czech adolescents (N = 2,500; aged 11–16) and their caregivers. Phone use during sleep hours was negatively associated with sufficient sleep duration (OR = 0.75, 95% CI [0.68, 0.83]) and sleep quality (β =-0.16, 95% CI [-0.21,-0.11]), and positively associated with daytime sleepiness (β = 0.31, 95% CI [0.26, 0.35]). Keeping smartphones out of reach during sleep was positively associated with sleep quality (β = 0.06, 95% CI [0.01, 0.11]). Parental rules on evening phone use were positively associated with sufficient sleep duration (OR = 1.12, 95% CI [1.02, 1.24]) and sleep quality (β = 0.12, 95% CI [0.07, 0.18]). Adolescent phone autonomy was negatively associated with sufficient sleep duration (OR = 0.76, 95% CI [0.67, 0.85]). Technical mediation of computer use was negatively associated with sleep quality (β =-0.06, 95% CI [-0.11,-0.00]). Other factors were not associated with sleep outcomes. Findings suggest that parental guidance and interventions should prioritize reducing phone use during sleep hours, the most consistent correlate of adolescent sleep health, though reverse causality cannot be ruled out, and more broadly focus on individual-level factors, which accounted for more variance than family-level factors.

SP01 The Impact of Technologies on Well-Being

SP 05 Understanding effects of digital media on wellbeing: Advancing theory through interventions and health frameworks

David Smahel[1], Adéla Svestkova[1]

[1] Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Information and communication technologies (ICTs) have become deeply embedded in adolescents' everyday lives. They shape adolescents' development, social relationships, and well-being in ways that require continuously updated theoretical frameworks. This presentation introduces the Integrative Model of ICT Effects on Adolescents' Well-being (iMEW; Smahel et al., 2022), which integrates the Differential Susceptibility to Media Effects Model (Valkenburg & Peter, 2013), Problem Behavior Theory (Jessor, 2014), and Bronfenbrenner's Ecological Systems Theory (1977). The iMEW conceptualizes adolescents' well-being as a multidimensional construct encompassing psychological, social, and physical dimensions, and explains how digital media use relates to well-being through differential susceptibility variables operating at individual, social, and country levels. While the iMEW has advanced our understanding of how digital media use relates to adolescents' well-being, the field is now confronted with growing public and policy demands for evidence-based interventions promoting healthier digital media use. Intervention research is essential to provide causal answers to questions such as which interventions effectively support adolescents' well-being and what the effects of restrictive measures, such as school mobile phone bans, actually are. However, existing media effects theories provide little insight into the underlying mechanisms of media-related interventions, that is, into who benefits from interventions, under what conditions they are effective, and which processes drive sustainable behavioral change (Vanden Abeele et al., 2025). To address this gap, in this presentation we propose a direction for future theoretical work: enriching the iMEW with health behavior change frameworks, namely the Health Action Process Approach (HAPA; Schwarzer, 2008) and the Temporal Self-Regulation Theory (TST; Hall & Fong, 2007). We propose first theoretical ideas related to this integration and outline how it could be further elaborated and tested in upcoming research projects. Integrating these frameworks within media effects theories would enable the model to account for factors shaping interventions and to support the design of theory-driven interventions across adolescents, parents, and schools.

SP03 Paths and Connections That Outline the Future for Media – Some International Perspectives (IAMCR)

SP 06 Evolution or involution in public service media? Some reflections about recent changes in Spain, France and Sweden

Karen Arriaza Ibarra[1]

[1] Complutense University of Madrid, Spain

The role of European Public Service Media (PSM) has inevitably changed, be it slightly or drastically, in the last decades. However, the image of PSM has different perspectives according to the governing party of each specific country, as far-right governments have increased within Europe. Populist parties have traditionally opposed public service media (Holtz-Bacha, 2021), and in some cases, this is clearly manifested in the role of the opposition party, as it happens nowadays in the case of Sweden (Arriaza Ibarra & Wadbring, 2025). In Southern Europe there are other EU states where a strong, long-time tradition of public service media and public service mission have been suffering so many transformations from their respective government attempts to modify them, that it is hardly recognisable anymore as the media connected to the citizens and open to diversity and pluralism of opinions and news, as it happens today in France. Spain, on the other hand, is struggling since many years ago to legitimise a public broadcaster that has gone down in audiences and receives criticism for its reiterative role of acting as a 'a propaganda tool' for the ruling political party (Arriaza Ibarra, 2013). This presentation revises the latest changes in PSM in Spain, France and Sweden to reflect on the way they have come closer or even all the contrary, distanced themselves, from their original missions and their proximity to citizens, and in which way these initially public mission companies are changing.

SP03 Paths and Connections That Outline the Future for Media – Some International Perspectives (IAMCR)

SP 07 Understanding digital well-being in international contexts: A comparative approach

Deqiang Ji[1], Weijian Yu[1]

[1] Communication University of China, China

As a normative concept, "digital well-being" emerged from the global "tech backlash" movement, which targets digital platforms for regulation. However, through a series of technological solutionist and neoliberal discourses, coupled with market practices, platform companies have reshaped the meaning of digital well-being, steering it toward a narrowly utilitarian understanding confined to the individual. This shift has epistemologically and methodologically narrowed its public imaginary. Drawing on the critical perspective of the political economy of communication, this article examines the ambiguous relationship between digital platforms and the industrialization of artificial intelligence. It argues that digital platforms have established a global computational hegemony by monopolizing core production factors, including data, algorithms, computing power, and labor. The threefold inequalities in data production and consumption, the allocation of computing resources, and the mobility of high-skilled labor constitute the root causes of the challenges surrounding digital well-being. More importantly, by analyzing the role of platforms in defining digital well-being from an international perspective, the article indicates that although the United States, the European Union, and China share a common emphasis on strengthening government regulation of platforms, differences in their social systems shape divergent connotations and pathways for realizing digital well-being. At the same time, practices of digital well-being in Global South countries, rooted in their specific social contexts, offer a pluralistic vision that transcends data-centrism, promoting a bottom-up, context-specific approach to enhancement. The perspective of the political economy of communication re-reveals the power dynamics underlying digital well-being and calls for vigilance against new forms of power domination and discipline.

SP03 Paths and Connections That Outline the Future for Media – Some International Perspectives (IAMCR)

SP 08 Media trust and connections in times of uncertainty

Katja Lehtisaari[1]

[1] Tampere University, Tampere, Finland

Trust in news media is seen as an essential part of media ecosystem in societies. While the position of legacy news media has transformed in recent years, it still has connecting power by providing a shared platform of information. This presentation provides a case study of Finland, one of the Nordic countries which are known for a high level of news readership but at the same time for a high degree of digitalization and internet use. Both phenomena express connections, brough by communication. In this context, I'll in this presentation explore the position of news media in times of transformation and different uncertainties. According to Reuters Institute reports, people in Finland see news institutions very trustworthy: the latest report informs that 75 per cent of the Finnish respondents say that they trust most news they follow and 67 per cent believe that most news can be trusted (Newman et al., 2025). These numbers are the highest in the countries studied for the report, even though even in Finland there are challenges of the traditional business model of journalism and changes in news consumption habits. This presentation looks at different dimensions of media trust amidst these challenges. The concept of trust is here understood to be near the concepts of credibility and reliability (e.g. Fischer et al., 2020). Using data from surveys among both media professionals and audiences, it is possible to compare the views. It is also important to understand the impact of demographic and sociographic factors. The surveys show, for example, some indications of polarization and audience's concerns about disinformation, but at the same time rather firm leaning on the professionalism of legacy media (see e.g. Horowitz et al., 2024). Also, the impact of artificial intelligence needs to be taken into account when discussing the media trust.

SP03 Paths and Connections That Outline the Future for Media – Some International Perspectives (IAMCR)

SP 09 Community media as Civic hub: Responding to critical junctures

Andrew Ó Baoill[1]

[1] University of Galway, Galway, Ireland

The media scholar Robert McChesney (2007) saw critical junctures as moments of possibility, generated by the conjunction of technological change, a crisis of legitimacy in media content, and dissension among elites. This paper will offer insights from the community media sector and its responses to contemporary challenges, arguing that the critical juncture we currently face in media (and society more broadly) opens up opportunities for radical change that learn from that sector's experiences. Community media are often characterised by conditions of precarity and marginality. It is, paradoxically, often this very uncertainty that builds resilience, as the sector relies on a form of regulatory and technological arbitrage to survive and thrive, finding and leveraging the opportunities that arise from systems that were not designed with the sector in mind, and contributing to goals of community development. This contribution explores the ways in which the community media sector is responding to contemporary challenges, including the advent of AI, the rise of neo-fascist politics, and the related crises in communication and trust. Longstanding traditions within the sector of techno-scepticism and pragmatic approaches to technological adoption have a wider salience as society grapples with the potential and peril of generative-AI. Similarly, there is an intrinsic potential to contribute to both critical media literacy and a broader civic resilience. The potential for community media outlets to act as civic hubs is laid out, offering one particular bulwark against the challenges of technological change and political polarisation. In particular, the experience of the Irish community media

sector as it engages in a process of digital transformation is teased out, identifying both possible paths as well as barriers and constraints. This case study is complemented by insights from other systems.

SP03 Paths and Connections That Outline the Future for Media – Some International Perspectives (IAMCR)

SP 10 Why talk about alleged crowding out? The reality of evidence-averse public service media policy-making

Manuel Puppis[1]

[1] University of Fribourg, Communication and Media Research, Fribourg, Switzerland

The online news offers of public service media (PSM) are contested across Europe, sparking debates about the remit and funding of PSM in digitalized societies. Private media companies argue that freely accessible PSM news reduces audiences' willingness-to-pay for commercial journalism by crowding out private providers. Empirical evidence for those effects remains limited. Studies addressing online news consumption generally find no crowding-out effects (e.g., Fletcher & Nielsen, 2017; Sehl et al., 2020; Udris et al., 2024a), but they largely rely on survey data. This study thus combined a representative survey with a choice-based conjoint (CBC) analysis to examine how "SRF News", the online news offer of Switzerland's German-language PSM, affects the digital news market. While the survey measured self-reported news use and WTP for online journalism, the CBC simulations modelled how market shares would be redistributed if "SRF News" was discontinued. Results show that providers of free news websites would benefit most from discontinuing "SRF News". In contrast, paid newspaper subscriptions would increase only modestly even at price levels substantially below current market prices[PM1.1]. Evidently, the limited success of digital subscriptions is primarily driven by the widespread availability of free commercial online news offers rather than by competition from PSM. The evidence is clear – yet policymakers in various media systems aim to impose additional restrictions on PSM's online news offers. As many private media organizations reject the existing evidence, they lobby for policies that are doubtful to help their own industry and will likely diminish overall reach of quality journalism. Presenter: Manuel Puppis Co-Authors: Lukas Erbrich, Sina Blassnig, Christian Zabel, Frank Lobigs

SP07 From Knowledge Commons to Institutional Decay: How Can Academics Still Act Collectively Under Competitive Capitalism?

SP 14 Structural transformation of the university

Phoebe Maares[1]

[1] University of Tübingen, Tübingen, Germany

This contribution maps the structural shift from university as knowledge commons to university as competitive enterprise and asks how extractive governance models reshape academic subjectivities, normalizing compliance and passivity.

SP07 From Knowledge Commons to Institutional Decay: How Can Academics Still Act Collectively Under Competitive Capitalism?

SP 15 Precarity as discipline

Nivedita Chatterjje[1]

[1] University of Surrey, Guildford, United Kingdom

This contribution examines how early-career precarity functions as a structural disciplining mechanism within neoliberal academia and asks whether collective agency can emerge from academic subjects trained to be compliant on the one hand and entrepreneurial competitors on the other.

SP07 From Knowledge Commons to Institutional Decay: How Can Academics Still Act Collectively Under Competitive Capitalism?

SP 16 Academics' Political Leverage

Ioan Suhov[1]

[1] Dublin City University, Dublin, Ireland

This contribution interrogates whether early-career academics can develop shared narratives, solidarities, and communicative strategies that counterbalance competition and foster collective agency. By situating these questions within contemporary European governance structures and fragmented academic systems, it ultimately considers what forms of coordination, reflexivity, and alternative mobilization practices might strengthen young voices from the bottom up.

SP07 From Knowledge Commons to Institutional Decay: How Can Academics Still Act Collectively Under Competitive Capitalism?

SP 17 Rebuilding collective capacity

Maria Kyriakidou[1]

[1] Södertörn University, Huddinge, Sweden

This contribution turns to concrete experiments in rebuilding collective capacity, including recent strike movements and union mobilizations in the UK and explores alternative institutional arrangements that might restore collective bargaining power.

ARS02 Emotions, Affect And Engagement With Crisis

PP 0001 Protecting wellbeing, narrowing citizenship: A taxonomy of coping tactics for perceived news toxicity

Pauljan Truyens[1], Sarah Vis[1], Ike Picone[1], Sien Van de Wouwer[1], Daniël Jurg[1]

[1] imec-SMIT- Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium

More citizens perceive the news landscape as toxic, illustrated by an uptick in news avoidance, an increase in news fatigue, and an erosion of trust in journalism (Newman et al., 2025). Although this perceived 'toxicity' remains under-defined, we build on prior work and treat toxicity as an experience of harm to emotional wellbeing (Mathews et al., 2022) and operationalise 'toxic news' as news experienced as intrusive, unreliable, or divisive (Picone and Truyens, forthcoming). Many citizens have narrowed their news repertoires to cope with this perceived toxicity (Truyens et al., forthcoming).

These observations made us wonder how coping with perceived toxicity enables or hinders public connection, defined as "an orientation to any of those issues affecting how we live together that require common resolution" (Couldry et al., 2007). In the hybrid media system (Chadwick, 2017), citizens distribute public connection across multiple arenas (Moe, 2023), which may reduce the likelihood that civic 'alarm signals' are heard equally across groups.

The research questions guiding our study are: RQ1. Which tactics do citizens use to cope with perceptions of toxicity? RQ2. Which coping tactics enable or hinder public connection (by broadening versus narrowing issue attention and civic monitoring)?

To answer our research questions, we set up a three-phase qualitative study in Flanders and Ireland. First, we conducted interviews with 52 citizens on their media and news use, feelings and experiences of news, and tactics to cope with negative experiences, i.e., perceived 'toxicity'. Second, we asked those relying predominantly on social media for their news intake to donate this data (n = 10). We relied on the 'Data Mirroring' protocol (Jurg et al., 2025) to visualise news flows on participants' main social media platforms. In a follow-up interview, we used these news flows to reflect with the participants on tactics they integrated in their news practices to cope with perceptions of toxicity. We then developed a taxonomy of coping tactics through reflexive thematic analysis (Clarke and Braun, 2014). Third, we conducted four citizen labs with a diverse sample of citizens (n = 60), using scenario-based exercises and collective reflection to assess the usability of, and willingness to adopt, the identified coping tactics in news routines.

The research design enabled us to structure our taxonomy in coping tactics that enable citizens' public connection or hinder it. Moreover, preliminary findings indicate subgroups of citizens, those lower-educated and/or younger, predominantly rely on a repertoire of tactics narrowing down their already limited public connection.

A field of tension arises between coping with toxicity to protect wellbeing and coping in a way that maintains a level of public connection. The need to cope with toxic news on these platforms can lead citizens away from news, illustrated by news-avoidant-tactics such as unfollowing news accounts and avoiding discussions on news. Moreover, these tactics reallocate civic monitoring from journalism toward platforms and interpersonal networks, reshaping who receives, and who misses, civic 'alarm signals' at the expense of others.

ARS02 Emotions, Affect And Engagement With Crisis

PP 0002 'So emotional!'. The role of emotions for young adults' resilience to disinformation

Jülide Kont[1], Çiğdem Bozdağ[1], Wim Elving[2], Marcel Broersma[1]

[1] University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands
[2] Hanze University of Applied Sciences, Centre of Expertise Entrance, Groningen, Netherlands

The combination of heightened emotions and polluted information environments accompanying current political, technological, and socio-economic transformations complicates truth assessments of circulating claims and narratives. This provides fertile ground for the proliferation of disinformation. While the role of emotions in shaping disinformation beliefs and sharing is widely acknowledged, there is little empirical evidence on the underlying mechanisms. Existing research on the influence of emotions, such as anxiety and anger, presents conflicting findings (Oh & Lee, 2019; Weeks, 2015), underscoring the need for a more comprehensive understanding. This paper, therefore, asks how and under what circumstances emotions impact resilience to disinformation.

To provide an in-depth understanding, we applied a qualitative study design, conducting 29 semi-structured interviews with young adults (18–32) in Germany and the Netherlands. Based on day-in-the-life narrations and in situ social media walkthroughs, our study outlines the context in which specific emotions arise when individuals encounter potential disinformation, connected behaviors, and the consequences for resilience to disinformation.

We find that emotions of positive valence, such as feeling calm and confident, are linked to verification behaviors and can indicate and reinforce resilience to disinformation. Contrary to existing research, we find that emotions of negative valence, such as anger, discontent, and disappointment, can also be signifiers of resilience. They mainly appear with behavior such as critical information evaluation of media reporting, signaling participants' dissatisfaction with content. However, the

intensity of emotions matters, as strong negative emotions are linked to resignation, distrust in democratic institutions, and disinformation beliefs.

Our study shows how emotional responses shape and are shaped by behavior and knowledge. Identifying this reciprocal process advances the theorization of resilience to disinformation by introducing the emotional dimension and integrating interactive dynamics. This has implications for existing and future empirical research, highlighting the limitations of practical but reductionist linear approaches. Emotions are often implicitly approached as factors contributing to disinformation beliefs, best minimized not to impede rational assessments of information. Our findings offer an alternative perspective, viewing them as an integral part of resilience processes. In addition to opening novel venues for research, this provides opportunities to improve existing interventions aimed at increasing people's resilience to disinformation.

ARS02 Emotions, Affect And Engagement With Crisis

PP 0003 Feeling climate: How emotional responses to data visualisation shape political engagement

Monika Fratczak[1]

[1] Manchester Metropolitan University, Criminology and Sociology, Manchester, United Kingdom

The visual communication of data has risen significantly in recent years. Data visualisations are increasingly people's primary source of information about complex social issues, shaping understanding and potentially guiding everyday decisions. Despite their ubiquity, the affective and political dimensions of data visualisations remain largely underexplored in media research. While prior work has examined how data visualisations enhance comprehension, shape public discourse, and evoke emotions, less attention has been paid to the role of these emotional responses in shaping political engagement. Similarly, although literature on data visualisation and democracy highlights its potential to foster political engagement and support civic activities, the affective dimensions of such engagement remain under-theorised and under-researched. This study is therefore the first to empirically examine, from the audiences' perspective, how emotional responses to data visualisations encountered on social media influence different forms of political engagement, from online sharing to more formal offline political actions. The paper focuses on climate data visualisation as a particularly urgent and emotionally charged domain within a visually oriented social media ecosystem. To investigate how diverse users respond to climate data visualisations, the research was conducted in two contrasting national settings, Poland and the United Kingdom, chosen for their distinct political, environmental, and media cultures surrounding climate change. This comparative approach enabled an examination of how localised discourses, historical trajectories, and environmental politics shape emotional responses to climate data visualisations, while simultaneously decentring dominant Western perspectives in data studies. Drawing on 34 semi-structured interviews and 13 follow-up interviews with social media users from the UK (N = 18) and Poland (N = 16), the research investigates responses to 13 climate data visualisations shared on social media by six environmental organisations: Greenpeace (UK/Poland), WWF (UK/Poland), Carbon Brief (UK), and Nauka o klimacie (Poland). The visualisations were purposively selected to capture a diverse range of visual forms, design styles, and climate-related themes circulating online. The interview discussions were structured around these examples. The analysis was conducted using a thematic approach. The findings show that different emotional valences—positive, negative, and ambivalent—towards data visualisations correspond to distinct modes of political engagement: (a) sharing and discussing data visualisation with others, (b) changes in everyday practices, and (c) more formal political actions. I argue that although engagement with data visualisation on social media rarely leads to formal political mobilisation, it can foster individualised and emotionally-mediated forms of everyday engagement. This paper provides an empirical analysis of how emotional responses to climate data visualisations on social media shape different forms of political engagement, offering both theoretical insights into affective digital media practices and practical implications for environmental communication. The paper concludes by calling for further empirical research into the affective dimensions of data visualisation and their implications for political engagement, particularly in the context of online misinformation, where emotions influence both the interpretation of data visualisation and subsequent action.

ARS02 Emotions, Affect And Engagement With Crisis

PP 0004 Audiences on shifting grounds: A qualitative study of user experience with sensitive media content and a research framework for inclusive media design

Christine Linke[1], Ruth Kasdorf[1], Iris Groneick[1], Lena Krohe[1], Lisa Müller[1]

[1] Hochschule Wismar- University of Applied Sciences: Technology- Business and Design, Communication Design and Media, Wismar, Germany

This paper investigates how audiences experience and navigate sensitive media content and how inclusive design approaches can promote participation, agency, and ethical responsibility within fast-evolving media environments. In a context where automation, datafication, and algorithmic curation continuously transform media production and reception, questions of accessibility and ethics become vital to understanding how audiences negotiate their experiences with media.

From a communication studies perspective, the study explores how media industries enable or hinder the participation of vulnerable groups by analysing technological infrastructures, production logics, and user practices. Drawing on current debates around content warnings and trigger alerts—particularly in video games, streaming, and youth protection contexts (Charles et al., 2022)—the paper discusses how user wellbeing, participation, and inclusion are negotiated within broader discourses on freedom of expression, "cancel culture", and perceived censorship (Daub, 2022). While the convergence of editorial and data systems through AI and machine learning enables new modes of personalisation, such potential remains underutilised in tools designed to inform and empower audiences at moments of emotional or cognitive strain.

The study draws on theories of Human-Centred Artificial Intelligence (Shneiderman, 2020), Inclusive Design (Gilbert, 2019), and Trauma-Informed Computing (Chen et al., 2022), situating these within the cultural studies tradition of circular production and reception processes (Gay et al., 1997). This conceptual framework underpins an empirical, qualitative approach investigating media use, user experience, and design perception.

Empirical data were collected through a mixed-method study: a preliminary online survey (n = 111) explored needs and possible design solutions, followed by thirteen individual interviews, three focus groups, and one expert interview focused on experiences of violence. Participants discussed their strategies for engaging with sensitive or distressing content and evaluated a prototype for an app-based content advisory system. Data analysis followed grounded theory coding procedures (Bohnsack, 1997), supported by MAXQDA, with coding quality and reliability assured through iterative reviews (Kuckartz, 2018).

Findings provide a nuanced picture of how diverse audiences interpret and navigate sensitive content such as discrimination, violence, sexualised violence, trauma, illness, and war. Results indicate that informed choice and contextual information enhance not only safety for vulnerable users but also reflective engagement for broader audiences, suggesting that inclusive media design represents a shared cultural value rather than a niche accessibility concern.

The paper concludes by outlining a communication research framework for inclusive media design that integrates accessibility, ethics, and diversity into production and design processes. Positioned within debates on research ethics and accessibility (Bigl, Gognelashvili, & Gehrau, 2024), it calls for renewed attention to audience agency and solidarity as media environments—and their inequalities—continue to shift.

ARS02 Emotions, Affect And Engagement With Crisis

PP 0005 Revealing intersecting inequalities in digital news consumption: A quantitative approach

Paulo Couraceiro[1]

[1] University of Minho, Communication Sciences, Braga, Portugal

This study examines news consumption inequalities within a rapidly transforming media environment in which traditional and digital platforms increasingly coexist and interact. Grounded in intersectionality theory (Crenshaw, 1989; Cho et al., 2013; Collins & Bilge, 2016), originally developed to analyse overlapping systems of inequality, this research addresses limitations in audience studies, which often analyse in isolation sociodemographic factors such as age, gender, education, or income. An intersectional perspective offers an understanding of how these variables combine to shape citizens' relationships with news and journalism in a fragmented and platform-driven environment (Banjac, 2022).

The relevance of the study results from the limited integration of intersectionality within quantitative audience research (Gouma & Dorer, 2019) despite growing evidence that news interest, trust or avoidance differ along structural lines (Hanitzsch et al., 2018; Strömbäck et al., 2020; Palmer et al., 2024; Newman et al., 2025). The central problem addressed is whether sociodemographic inequalities in those attitudes towards news are better explained through intersectional configurations than through by conventional models that consider variables independently and do not account for their interactions.

A quantitative analysis was conducted using a representative sample of the Portuguese online population (N = 2014). Three sequential models were estimated: (1) a baseline model assessing isolated sociodemographic effects; (2) an intersectional model incorporating cross-classified sociodemographic profiles; and (3) a mediation model testing the influence of using

social media as a primary news source on the intersectional effects observed. Preliminary findings indicate that intersectional configurations reveal inequalities not captured by the model treating predictors as independent and additive.

This study draws inspiration from intersectionality theory as a conceptual framework, but recognises the challenge of applying it carefully so as not to result in abusive generalisations, acknowledging the specificities of the original theoretical proposal. Our main contribution lies in adopting intersectionality as a methodological approach (Byerly et al., 2023), demonstrating empirically that integrating intersectional logic into quantitative models can reveal hidden inequalities in news consumption patterns, providing more granular data for researchers, journalists, and policymakers.

ARS03 Audiences Needs and Media Repertoires Across Generations

PP 0108 (Re)imagining media repertoires: methodological challenges of audience research with Portuguese older people

Margarida Maneta[1], Maria José Brites[1], Inês Amaral[2]

[1] Lusófona University- CICANT, Porto University Center, Porto, Portugal
[2] University of Coimbra, Center for Social Studies CES, Coimbra, Portugal

The world is ageing: while average life expectancy is increasing, birth rates are declining. According to the data (Pordata, 2024), Portugal is the oldest country in Europe, and the fourth oldest in the world. Statistics predict that by 2030, in Portugal, there will be 215 senior citizens for every 100 young people. However, this change does not occur in isolation: society is becoming increasingly digital. Research indicates that older adults are also experiencing a significant rise in Internet access. In Portugal, only 16.4% of individuals aged 65 to 74 had access to the Internet in 2012; twelve years later, in 2024, this proportion had increased to 61.1% (Pordata, 2025).

Digital media are now ubiquitous, alongside traditional media. There are multiple media consumption options, requiring citizens to make refined choices, as they continue to have limited time to consume them (Hasebrink & Domeyer, 2012). However, audience studies have focused mainly on young people's perspectives, making the discussion biased (Rosales et al., 2023) and not very oriented towards older people (Azevedo, 2019; Olsson et al., 2019).

This leads us to the need to reflect on the methodological challenges and opportunities arising from research with these audiences, which have been less explored until now. The aim of this presentation is to explore the methodological approach used to understand how older Portuguese audiences construct their media repertoires (Schrøder, 2012) and how they engage and interact with the media in an era of cross-media logic. However, achieving this can be challenging because we are faced with (1) a fragmented media landscape; (2) a very heterogeneous population (Loos, 2012), highly influenced by interdependent aspects that go beyond age, such as education, family structure and profession; (3) media repertoires that emerge and disappear throughout life (Peters & Schrøder, 2018; Ytre-Arne, 2019).

Therefore, we employ mix methods, including semi-structured interviews, with Q-Sort exercises and think-aloud protocols, and reflexive processes, with media diaries, that are a crucial tool for validating the results (Author 2 et al., Year). This study was conducted based on 35 semi-structured interviews with people over 60 years old living in northern Portugal. Through this approach, this paper is not only able to identify these media repertoires, but also to tactically assist in the construction of fair and situated public policies that encompass the diversity and dynamism of media practices among older adults.

ARS03 Audiences Needs and Media Repertoires Across Generations

PP 0109 Negotiating public value: Young audiences' understandings of public service media in Sweden and Estonia

Fredrik Stiernstedt[1], Maria Kyriakidou[1], Indrek Ibrus[2]

[1] Södertörn university, Department of Media and Communication Studies, Huddinge, Sweden
[2] Tallinn University, Baltic Film- Media and Arts School, Baltic Film- Media and Arts School, Estonia

Public service media (PSM) are undergoing significant transitions around the world, some necessitated by technological shifts, such as the dominance of digital platforms, others precipitated by political and ideological developments in increasingly polarized societies. Common across these processes is that they call into question the value(s) of PSM, or the *public values* that these organisations could or should provide. In doing so, they also make assumptions about the audience(s) of PSM, who are largely seen as fragmented across different media platforms and, therefore, elusive. The concept of public value has been central in defining and defending the mission of PSM and their role in democratic public spheres. Despite its various (re)iterations, however, the concept of public value remains largely undefined and unspecified. Pertinent research has attempted to define (Cañedo et al., 2022; Moe & Van den Bulck, 2014), or even measure (Ibrus et al., 2023; Murschetz et al., 2023) public value. These studies, largely focused on normative understandings of PSM in policy documents (Donders, 2021; Martin & Lowe, 2013), have further highlighted the elusiveness of the concept, as well as the need for more empirical research on its role in PSM (Murschetz et al., 2023).

We address these debates by moving away from normative conceptualizations of public value and exploring how audiences perceive and experience it instead. We start from an understanding of public value as dynamic and evolving and emerging through processes of negotiation and legitimation among different stakeholders (Bolin, 2004; Ibrus et al., 2023). As such,

the concept of public value "is not static but an emergent property" that is "always context-specific and changing" (Ibrus et al., 2023: 6744).

Against this background the overall purpose of this paper is to explore how young audiences in Sweden and Estonia understand and experience the public value of public service media. More specifically we ask: What meanings do young people attach to public service media in their everyday media lives? Which values are articulated as central when young audiences talk about PSM? How are these understandings shaped by national and media-system contexts?

We found that our research participants did not generally use PSM, but instead mostly employed social media platforms for information and entertainment in their daily lives. Nevertheless, the young people we talked to in both countries were highly appreciative of PSM and described them as necessary. Discussions were furthermore underlined by sentimental descriptions of PSM, expressing emotional attachments to them bound both to personal experiences and collective national identities. We argue that PSM values, as understood by our participants, were constructed around three main themes, namely decommodification, national identity and nostalgia. These themes were common in both countries, although they were attached to different aspects, for example to school education in Sweden and the preservation and protection of language in Estonia. Overall, our exploratory study indicated that lack of use is not equated with lack of relevance of PSM or their public values.

ARS03 Audiences Needs and Media Repertoires Across Generations

PP 0110 Between autonomy and social needs of the young audience: A critical revision of digital maturity concept

Tanja Oblak Črnič[1], Plaskan Jure[1], Koren Ošljak Katja[1], Šiša Anamarija[1]

[1] University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

The integration of media technologies into our daily routines is inevitable, greatly influenced by the 'culture of constant updating' (Bucher, 2018). While adults' dependence on digital media is widely accepted, the way in which young people experience digital environments is often controversial. Some argue in favor of young people's need for autonomy and their right to access digital spaces; however, there is also a growing tendency to restrict their access to social media platforms, even at a national policy level. These contradictory views highlight disputes about public perceptions of young people's maturity as 'native' digital audiences. This paper proposes addressing such challenges by recognizing digital technology as socially beneficial infrastructure. From this perspective, digital maturity is a multi-layered construct encompassing the ability to use technology autonomously, overcome challenges in digital environments and establish socially responsible interactions (Laaber et al., 2023). However, the paper challenges the conceptual model of the original study on digital maturity and its methodological premises. First, we propose a theoretical shift whereby the core dimensions of digital maturity — autonomous technology use, responsible social interaction, and coping with digital challenges — are understood as reflections of the diverse roles of media technologies in everyday life across generations (see Bengtsson et al., 2022). As these capabilities are not inherent to the digital context, young people encounter individual and structural divides within their own generation. This implies that, when considered within the context of deep mediatization (Couldry & Hepp, 2016; Hepp, 2019), digital maturity is a multifaceted rather than a singular phenomenon.

The paper aims to provide empirical reinforcement of this thesis. A quantitative study of 1,544 secondary school students, conducted in 2024, identified four types of digital maturity. The first type, self-regulatory maturity, is characterized by high levels of autonomous technology use and low tendencies to seek support when problems arise. Reflective digital maturity is on the contrary characterized by high autonomy within digital environments and the ability to seek support. Socially responsible digital users understand the structural limitations of ubiquitous technologies and do not impose personal burdens on others. Individualized digital maturity refers to users who find it difficult to regulate their impulses towards others, yet who are highly autonomous in digital environments. The findings also suggest that, although young users experience a high degree of sovereignty within digital environments and exhibit independence in their digital activities, they simultaneously feel confined within the digital realm. Therefore, digital maturity should be also accompanied by in-depth qualitative research. To this end, the study draws on a larger set of focus group interviews with 41 secondary school students to explore young people's feelings about the pleasures and obstacles of digital autonomy, as well as their social needs in digital spaces. The paper argues that addressing these needs is crucial for improving our understanding of 'alternative types of digital maturity' among young people. Finally, the study aims to combine an original developmental approach to digital maturity with audience perspectives on the experiences of young users within multiple digital environments.

ARS03 Audiences Needs and Media Repertoires Across Generations

PP 0111 Alternative news use reimagined: Audience pathways of belonging and critique

Leif H. Pedersen[1], Eva Mayerhöffer[1]

[1] Roskilde University, Communication and Arts, Roskilde, Denmark

Across Europe's shifting grounds of communication, audiences increasingly encounter information outside traditional news channels. Scholarship on alternative news has mapped how such outlets fit into users' repertoires and relate to trust and political attitudes, offering a baseline for mainstream–alternative dynamics. Yet we still lack audience-centered

accounts that treat "alternative news" more broadly – as practices and contents spanning diverse actors, formats, genres and platforms – and ask how audience practices around non-traditional sources and arenas shape identity, community and patterns of societal critique.

This paper addresses that gap by reorienting research on alternative news use further from a media-centric to an audience-centered perspective. Rather than focusing exclusively on the uses of specific alternative news sites, the study examines how Danish mainstream-critical media users traverse a wider periphery of non-traditional sources, formats and initiatives, including, but going beyond, (self-)perceived alternative media outlets – and how these traversals relate to identity, belonging and critique in everyday life. Building on recognition theory and Douglas Giles' distinction between affirmational and transformational recognition struggles, the paper refines an audience-centered model, asking when and how audience engagement with alternative sources of information remain situated efforts to affirm identity and communities versus move into more publicly oriented struggles over critique and recognition.

Empirically, the analysis draws on 32 in-depth interviews with purposively sampled Danish users from both left- and right-wing positions of the political spectrum that are critical of the media mainstream. Each interview begins with a Q-sort-inspired card-sorting exercise to locate informants' alternative-to-mainstream sources of news and information, followed by narrative probing on recognition-related sentiments, experiences and opinions, and closes by exploring relationships – if any – to alternative social media platforms and initiatives. Participants were also invited to make data donations of their media-use histories, enabling triangulation of reported practices with digital trace data.

In line with ECC 2026's emphasis on paths, connections and futures, the paper contributes by proposing a typology of audience pathways through alternative-to-mainstream information and situating these within broader dynamics of identity construction and societal critique. This framework helps explain how audiences negotiate belonging and critical reflexivity across intersecting scales – and how these negotiations may matter for democratic futures.

ARS04 Disinformation, Misinformation and Hostile Narratives

PP 0112 Stability or transformation – How the ban on pro-Kremlin media impacts the news repertoires of Russophone audiences in Latvia and Estonia?

Mihhail Kremez[1], Jānis Juzefovičs[2], Oksana Žabko[1]

[1] University of Latvia, Institute of Philosophy and Sociology, Rīga, Latvia
[2] Rīga Stradiņš University, Faculty of Social Science, Rīga, Latvia

By the studies conducted in 2019–2025, we explore the dynamics of the news repertoires of the Russophone audiences in Latvia and Estonia before and after the ban on pro-Kremlin media outlets following Russia's full-scale invasion of Ukraine in 2022.

Building on Hasebrink and Domeyer's (2012) conceptualization of media repertoires as "the whole variety of media regularly assembled by a person … not merely the sum of different media he or she uses, but a meaningfully structured composition of media" (pp. 759–760), news repertoires can be understood as personalized, cross-media constellations of news sources that individuals routinely rely on to stay informed about current affairs. Prior research offers mixed evidence regarding the stability of news repertoires over time. Major societal disruptions, such as the COVID-19 pandemic, could reasonably be expected to prompt changes in individuals' news repertoires. This expectation is supported by studies documenting a reconfiguration (either an expansion or a narrowing) of news repertoires during the pandemic (de Bruin et al., 2025; Johansson et al., 2024; Syvertsen & Ytre-Arne, 2023; Vandenplas & Picone, 2024; Vandenplas et al., 2021). Additional support comes from evidence of increased news consumption during the pandemic, albeit concentrated in specific media types, including television news, online news, and social media (Van Aelst et al., 2021). At the same time, other studies provide countervailing evidence, showing the persistence and ritualized character of news repertoires even in times of crisis (Andersen et al., 2022; de Bruin et al., 2025; Valenzuela et al., 2025).

Based on a data collected by the combination of quantitative (surveys in 2019 (n = 802); 2023 (n = 645); and 2025 (n = 2090)) and qualitative research (four focus group discussions in 2024 (participants in total n = 24); three waves of the diary studies in 2024–2025 (n = 24 per each wave)), conducted before and after the full-scale invasion of the Ukraine we analyze an impact of the ban of the pro-Kremlin news providers on the Russophone audiences' news repertoires in Latvia and Estonia. The findings indicate that the share of Russophone audiences who have exercised the pro-Kremlin news repertoire has declined markedly following the ban; however, a significant part of them have found access to pro-Kremlin news sources and continue to use them. The analysis also reveals a pronounced shift toward news consumption through social media platforms. Hence, a part of former users of banned pro-Kremlin media sources have adapted their media practices by relocating their news use to social media environments where such content remains accessible.

In conclusion, despite substantial transformations in the media environment, the news repertoires of Russophone audiences in Latvia and Estonia following Russia's full-scale invasion of Ukraine exhibit a high degree of continuity. Accordingly, these findings are consistent with prior scholarship highlighting the persistence of news repertoires, even in the context of major societal disruptions (Andersen et al., 2022; de Bruin et al., 2025; Valenzuela et al., 2025).

ARS04 Disinformation, Misinformation and Hostile Narratives

PP 0113 Generational differences in response to divisive misinformation: Focus group evidence from Serbia, Poland and Romania

Stefan Janjic[1], Sabina Mihelj[1]

[1] Loughborough University, School of Social Sciences and Humanities, Loughborough, United Kingdom

This paper examines how people of different generations respond to divisive misinformation in three post-socialist European societies: Serbia, Poland and Romania. Research on generational differences in susceptibility to misinformation has produced mixed and sometimes contradictory findings. Some studies link older age to greater vulnerability to false content, due mostly to cognitive ageing and limited digital literacy (Guess, Nagler & Tucker 2019; Brashier & Schacter 2020). Others find no clear differences, or even lower susceptibility among older adults, especially in health-related contexts (Roozenbeek et al. 2020; Sultan et al. 2024). These inconsistencies suggest that age alone is not a reliable predictor, and that methodological choices and contextual factors may shape observed patterns.

To explore these issues qualitatively, we conducted 18 focus groups (six in each country) in April and May 2025. Groups were stratified by age into three cohorts (18–30, 31–50, and 51–75). Participants were selected based on questionnaires capturing demographic, media and political characteristics. In total, 125 people took part. Each group was given four examples of misinformation: two related to the war in Ukraine and two concerning LGBTQ issues. These examples contained conspiratorial or stigmatizing claims familiar from public debates in the region. Participants discussed whether and why they found the claims credible, how they felt while reading them, and which cues they used when making judgements.

Recordings were transcribed in the original languages and coded in NVivo. After an initial coding round, individual arguments were classified according to their proximity to the text: "close" arguments grounded in textual features, "prior knowledge" arguments referring to broader context, and "distant" arguments detached from the specific claims. This allowed us to trace shifts in reasoning patterns across age groups.

Preliminary findings point to three tendencies. First, younger participants often treated the task as a form of fact-checking. They scanned details, questioned sources and were more comfortable leaving uncertainty unresolved. Second, older adults drew more frequently on lived experience and broader moral or political narratives. Rather than scrutinizing details, they used the examples as prompts for articulating existing beliefs, concerns or memories. These contributions were not necessarily less critical; many older participants relied on accumulated knowledge to reject implausible claims, echoing work showing the protective role of crystallised knowledge (Brashier & Schacter 2020; Cosgrove et al. 2023). Third, across all groups, cues of trust – such as familiarity with the sender or perceived moral alignment – shaped interpretations more strongly than factual content alone.

ARS04 Disinformation, Misinformation and Hostile Narratives

PP 0114 Narratives of extremism: Far-right content in YouTube accounts

Jaume Suau[1], Elena Yeste[2], David Puertas[3], Sue Aran[4]

[1] Ramon Llull University, Blanquerna School of Communication and International Relations, Barcelona, Spain
[2] Blanquerna School of Communications and International Relations, Journalism, Barcelona, Spain
[3] Fundació Tecnocampus - Pompeu Fabra University, Journalism, Barcelona, Spain
[4] Blanquerna School of Communications and International Relations, Audiovisual Communication, Barcelona, Spain

Recent research has identified a widening gender gap in political orientations, with young men increasingly gravitating toward far-right and authoritarian positions more than women (de Boise & Hjalmarsson, 2021). In parallel, individuals aged 18 to 40 are progressively disengaging from traditional news media and instead relying on digital platforms—particularly YouTube—for political information, commentary, and interpretation (Zimmermann et al., 2022). Within this environment, content creators who position themselves as "alternative," anti-mainstream, or anti-elite actors have become influential intermediaries in political communication. These creators often disseminate far-right narratives and disinformation through indirect modes of address, including satire, irony, appeals to "common sense," and populist anti-establishment frames (Munger & Phillips, 2020; Finlayson, 2022).This paper examines how contemporary forms of extremism circulate less through explicit propaganda and more through ambiguous, decentralized, and affectively charged online ecologies. Drawing on a large-scale mixed-methods study of YouTube videos and comment sections, we combine automated content analysis with qualitative interpretation to identify far-right and authoritarian narratives across 100 YouTube channels in Spain and 100 in the United States. Importantly, many of these channels are not overtly political but attract large young male audiences. The analysis focuses on the co-construction of meaning between content creators and their audiences, showing

how far-right narratives delegitimizing democratic institutions and fostering mistrust are normalized through humor, irony, and ostensibly apolitical discourse. The findings reveal two distinct yet interconnected patterns. On the one hand, explicitly ideological channels display dense clusters of far-right narratives, often accompanied by shared linguistic codes, slang, and recurring symbolic references actively reproduced by audiences in comment sections. These channels, however, tend to have relatively limited reach in terms of subscribers and views. On the other hand, and more concerningly, far-right narratives also appear within high-visibility, mainstream-oriented channels in subtler and more diffuse forms. In these cases, creators occasionally engage with social or political issues using depoliticized language, avoiding overt ideological markers while nonetheless circulating themes and frames commonly associated with far-right discourse. This process contributes to the normalization and legitimation of such narratives within broader cultural contexts. Comparative analysis reveals striking similarities between Spanish and U.S.-based channels, two contexts of particular relevance given the global reach of English and Spanish-language content and their transnational audiences. By tracing the rhetorical strategies, affective cues, and participatory dynamics that allow extremism to operate "under the radar," this research advances understandings of contemporary far-right communication in digital environments. It contributes to debates on online extremism by conceptualizing ambiguity not as a weakness, but as a central communicative resource through which disinformation, trust erosion, and ideological legitimation intersect in platformized public spheres.

ARS04 Disinformation, Misinformation and Hostile Narratives

PP 0115 The challenge is the message: Uses and gratifications across positive, neutral, and negative social media challenges

Or Krispil[1], Azi Lev-On[1]

[1] Ariel University, School of Communication, Ariel, Israel

Social media challenges (SMCs) constitute a widespread social practice in contemporary digital culture, particularly among adolescents and young adults. These challenges invite users, explicitly or implicitly, to perform specific actions, document them, and share the outcomes on social media, generating visibility, imitation, and collective participation. While previous research has addressed the diffusion, content, risks, and normative framings of social media challenges, comparatively little attention has been paid to the everyday gratifications that motivate participation across different types of challenges.

Grounded in Uses and Gratifications (U&G) theory, this study examines how users experience participation in three types of social media challenges: positive, neutral, and negative. Positive challenges are understood as promoting pro-social values or contribution, neutral challenges as entertainment-oriented and low-risk, and negative challenges as involving risky or harmful behaviors. The study asks whether these different framings are associated with distinct gratification patterns, or whether participation in challenges is primarily shaped by the format itself.

The study employs a quantitative within-subject design that enables systematic comparison across challenge types within the same participants. An online questionnaire was administered to 172 U.S. participants aged 13–35, all of whom reported prior participation in at least one positive, neutral, and negative challenge. A validated 96-item instrument measured seven gratification dimensions: entertainment, sociability, cognitive stimulation, escapism, self-expression, social status, and social recognition. Each gratification was assessed separately for the three challenge types, with scenario order randomized to reduce order effects.

Analyses using repeated-measures ANOVA and Friedman tests reveal a high degree of consistency in gratification patterns across challenge types. Entertainment emerges as the most dominant gratification in positive, neutral, and negative challenges alike. Significant differences across challenge types are limited to sociability, cognitive gratification, and social status, and these differences are modest in size. Positive challenges are associated with slightly higher sociability and cognitive gratification, whereas negative challenges show a modest increase in status-related gratification. No significant differences are found for entertainment, escapism, self-expression, or social recognition.

Overall, the findings indicate that users approach different types of social media challenges in largely similar ways. Rather than redefining users' motivations, challenge framing primarily adjusts the relative emphasis of secondary gratifications. Participation is anchored in the perform-document-share structure that characterizes challenges as a communicative format. In this sense, engagement is driven less by what the challenge represents and more by how participation is organized.

By examining social media challenges as a recurring participatory practice rather than as isolated content types or platform features, this study contributes to audience and reception research by showing how user gratifications remain stable across shifting digital contexts. The findings extend the application of Uses and Gratifications theory to participatory digital formats and offer an empirically grounded account of how audiences engage with challenges as a routine form of digital entertainment and social interaction.

ARS04 Disinformation, Misinformation and Hostile Narratives

PP 0116 Beyond passive consumption: Audience engagement and the normalization of hostile narratives among youth on TikTok, Instagram, and YouTube

Félix Ortega[1], María Teresa Martín García[1]

[1] University of Salamanca, Department of Sociology and Communication, Salamanca, Spain

Problem Statement

For youth audiences, social media is not merely a source of information but a primary space for identity construction, social recognition, and peer interaction. However, this "connected" lifestyle exposes adolescents—who are in a highly permeable developmental stage—to a digital ecosystem where hostility is no longer an outlier but a structural layer. This proposal explores how youth audiences actively interact with hate speech, transforming it from a consumed product into a conversational engine.

Project and Data Overview: Drawing on the **CeMIYA project** (2024), this study analyzes a corpus of **22,123 publications** targeted at or consumed by youth across YouTube (49.5%), TikTok (30.4%), and Instagram (21.1%). Using multimodal automated detection and topic modeling, the project mapped eight categories of hate, including misogyny, racism, and "aspectism" (lookism).

Audience Behavior and Interaction Findings

1. **Hostility as a "Conversational Engine":** The data reveals a clear divergence in audience behavior: while neutral content receives more social validation via "likes" (≈27% more), **hate-filled content drives significantly more active participation**. Specifically, **56.88% of all comments** in the sample were concentrated on hostile posts.
2. **Platform-Specific Engagement Patterns:**
   - **TikTok:** In this platform, hostility acts as a massive engagement trigger. Hate-filled posts generate **double the average number of comments** compared to neutral ones ($F = 14.99$, $p < .001$), and it is the only network where hate posts also receive significantly more "likes" (20,800 vs. 6,900). This suggests that the memetic and humorous affordances of TikTok facilitate the normalization of hate as "entertainment".
   - **YouTube:** Audiences here engage with more complex, "multi-hate" narratives. Content often functions as a "thesis" for discrimination, where the comments section acts as a long-term archive for radicalizing positions.
   - **Instagram:** Youth behavior is oriented toward aesthetic performance. Audience hostility is frequently channeled through **aspectism** (lookism), where physical appearance becomes a vector for symbolic violence and social judgment.
3. **The Structural Role of Misogyny:** Across all platforms, misogyny remains the "backbone" of youth-targeted hate. Audiences participate in narratives that penalize female autonomy, often combining gender-based hate with racism or lookism (intersectionality appearing in 38.4% of cases).

Conclusion

The behavior of youth audiences suggests that hostility has been integrated into their digital "attention economy". Hostile content is not just "seen"; it is commented on and debated, serving as a resource for visibility. We conclude that digital literacy must move beyond teaching youth to *identify* hate to addressing the *incentives* that make engaging with hostility a primary form of social interaction. Engaging with digital hate for a young person is like attending a **chaotic neighborhood bonfire**. While most people (the audience) might "like" the quiet, safe parts of the park (neutral content), they are far more likely to gather, shout, and stay longer around the fire that is burning most aggressively (hate speech). The problem is that as they spend more time circling the fire, the smoke (the hostile narrative) becomes a smell they no longer notice on their own clothes—it becomes a normalized part of their daily environment.

ARS05 News Repertoires and Information Practices

PP 0212 News repertoires between habitus and the reflexive project of the self

Maria Bakardjieva[1]

[1] University of Calgary, Department of Communication- Media and Film, Calgary, Canada

This paper takes a phenomenological approach to news repertoires informed by theorists such as Schutz (1945), Ihde (1990), Silverstone (2007), Knoblauch (2013) and contemporary implementations (e.g., Couldry & Hepp 2017, Bengtsson and Johansson 2021). It construes news repertoires as interfaces that establish different types of relations between the news user and the public world. In that capacity news repertoires represent sites where some of the most pressing questions faced by current media scholarship could be holistically investigated. The paper poses the question of how different news repertoires are formed and seeks to construct a realistic model of the interplay between agency and structure in that process.

The variety and complexity of the practices through which individuals search, select, assess and share the news that connect them to the public world have grown explosively in the hybrid media environment. This has stimulated cross-media research focused on the patterns in which audiences combine available news channels and content to form distinct repertoires. Repertoires are the dynamic outcome of the choices that citizens make as knowledgeable agents with a view to their social situatedness and personal relevance, interpersonal sharing and collective identity (Hasebrink and Domeyer, 2012; Schrøder, 2015; Swart et al., 2017).

Based on the analysis of data collected from a theoretically diversified sample of 50 Canadian respondents through a Q-sort activity and in-depth interviews, the study charts the continuum between reflexive choice in the assembling of an individual news repertoire and the habitual adherence to sources and practices imposed by contextual circumstances or handed down by family and peer influence as well as authoritative opinion leaders of various provenance. That continuum is conceptualized as flanked by Bourdieu's idea of habitus on one side (Lindel, 2017), and Giddens' vision of the "reflexive project of the Self" on the other. While the cross-media environment in principle affords reflexive navigation and selection aligned with the "reflexive project of the self," entrenched limitations outside of users' control not only persist, but sometimes dominate repertoire formation.

Parsing the distribution of repertoires across socio-demographic categories and inquiring into the reasons, feelings and motivations underlying respondents' repertoire construction and maintenance, modification and transformation, the analysis uncovers significant inequalities of material opportunity, media literacy and critical skills that hinder the reflexivity of the project. These inequalities contribute to a widely divergent sense of interest, engagement and agency vis-à-vis the public world. They create critical vulnerabilities reproduced through systematic enculturation into subject positions and mindsets.

Is there a meta-practice of news use that could reconcile a reflexive project of repertoire construction and a structured habitus, product of economic and social positioning? Is a reflexive news habitus possible or is it a contradiction in terms? A solution to this dilemma is sought by sifting through the deliberations, discoveries and innovations presented by respondents' accounts.

ARS05 News Repertoires and Information Practices

PP 0213 "Too far away?" The subjective experience of distance in multimodal news reception

Stephanie Geise[1], Nieki Samar[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

Geographical proximity is a well-established news factor that enhances relevance not only in the eyes of journalists but also in the perception of audiences (Eilders, 1997). Beyond this cognitive framing, people are more likely to feel compassion for distant suffering when they perceive personal or cultural similarity to those affected (Huiberts, 2020; Huiberts & Joye, 2018). Yet, these subjective dimensions of perceived proximity and identification remain underexplored—particularly in multimodal news reception. This gap raises a critical question: Why do audiences still feel emotionally distant from news that, by conventional standards, should be relevant?

The growing tendency to avoid news, driven by emotional fatigue and the desire to escape negative emotions (Edgerly, 2022; Kuhlmann et al., 2014), suggests that perceived distance is not merely a matter of geography but a complex interplay of cognitive, emotional, and multimodal factors. Drawing on framing and multimodal media effects, this study investigates how recipients subjectively perceive distance in news content. We ask:

(1) How do visual and textual frame elements shape perceptions of proximity or distance?
(2) What personal and emotional explanations do audiences give for feeling distant, and what conclusions do they draw?
(3) What transformative demands does this perspective place on journalistic practice?

To address these questions, we conducted qualitative semi-structured interviews with 33 participants who retrospectively reconstructed their reception of three multimodal news items—on climate policies, economic inflation, and health policy—using think-aloud techniques. Transcripts were analyzed via qualitative content analysis.

First results show that participants rely heavily on visual cues for initial meaning-making, as mirrored in this quote: "That's India or somewhere else far away" (89f8df2f_B, 21). This reflects a tendency to perceive distant countries as interchangeable (Scott, 2014) and highlights how visual markers—such as skin color, landscape, or architectural style—immediately signal perceived distance. Moreover, this sense of remoteness translates into reduced engagement: "I didn't find the text all that interesting […] because it's kind of too far away" (13c34bf1_B_2, 133). Consistent with prior research (Eilders, 1997), participants linked perceived proximity to heightened relevance: "News from the neighboring town […] affects me much more than if it happens thousands of kilometers away" (818a71e_B, 43). This aligns with Trope and Liberman's (2010) theory of psychological distance, which shows that physical closeness enhances affective engagement.

Yet, beyond geography, emotional responses were shaped by subjective factors: personal experiences, perceived cultural congruence, and affective resonance. These findings suggest that empathy is not triggered solely by proximity, but by the possibility of emotional identification.

Our study thus challenges the assumption that proximity alone ensures relevance. Instead, it suggests that journalism might benefit from actively creating points of identification—making distant stories not only visible but also more relatable. Future studies should explore how visual modalities—particularly in contrast to text-only formats—shape perceptions of distance and identification, asking whether images amplify or mitigate emotional detachment in distant conflict reporting, and how their presence or absence influences the audience's sense of connection.

ARS05 News Repertoires and Information Practices

PP 0214 Alarmed citizens' information-seeking repertoires

Kjersti Thorbjørnsrud[1], Ustad Figenschou Tine[2]

[1] Kristiania University College, Department of Communication, Oslo, Norway
[2] Faculty of social sciences, Department of journalism and media studies, Oslo, Norway

Aim

In the contemporary, high-choice media landscape, citizens use different combinations of media and non-mediated sources to stay informed and connected. Extending the analytical frameworks of media repertoires (Popp & Hasebrink, 2006), news repertoires (Peters & Schrøder, 2018), communication repertoires (Helles et al, 2015) and information source repertoires (Sommerfeldt, 2015), the present paper analyses *alarmed citizens' information-seeking repertoires* (Johansson, 2025). This approach emphasizes citizens' active information seeking; it focuses on information beyond institutional sources and examines how citizens find information about specific topic(s) in practice.

At present, official epistemic authorities face falling trust levels, and knowledge is increasingly politicized an polarized. The ongoing 'crisis of expertise' have gained much scholarly, media and political attention, as scholars and specialists are attacked for being politically biased; the financial structures of universities and research centers are under pressure; and lay people dismiss established expert authority to seek advice from alternative sources beyond and in opposition to official authorities. In this paper we analyse one under-researched dimension of this larger issue, more precisely we trace the information-seeking repertoires of citizens with high political engagement and low trust in established experts, who actively seek out information that confirm their worldviews and challenge public authorities. Building on in-depth interviews with informants in opposition to established medicine and official health policies, we ask: What characterizes alarmed citizens' information-seeking repertoires and how do they understand trustworthy expertise?

Data and Method

The study builds on 25 interviews with Norwegian citizens (Thorbjørnsrud & Figenschou, 2022) with three common features, as alarmed citizens: i) They were participants in the oppositional social media networks that formed during the Covid-19 pandemic, and are deeply engaged in contested health issues, ii) they have low institutional trust and feel that governing elites, experts and media professionals fail to keep them safe and informed, and, iii) they are highly engaged in finding and sharing alternative information, and inhabit strong feelings of fear and mistrust, combined with an urgency to seek out information and support for their worldview. Interviewees were recruited based on their engagement in Facebook groups, alternative health media, and health pressure groups. The interviews were conducted between January and June 2024. They lasted 80–90 minutes on average and interview transcripts were coded in HyperResearch.

Preliminary findings

The interviewees' information-seeking repertoires consists of alternative epistemic authorities (Bartsch et al, 2025), primarily international alternative media, alternative (news) influencers, and banned, rogue experts. Their networks are established through active curation and information-sharing, in which the interviewees are actively contributing and taking the role as lay-experts. The alternative epistemic authorities deemed trustworthy by the interviewees, share some characteristics: These 'alternative experts' are outspoken individuals, who are strongly opposed to or have broken with established institutions (e.g. research institutions or established news media). They are often banned or condemned by established authorities, and they primarily distribute their insights and analysis online. Overall, we find that conferred trust is based on perceived personal characteristics of integrity, independence, and courage rather than institutional belonging, displaying hyper-individualised, digital information-seeking repertoires.

ARS05 News Repertoires and Information Practices

PP 0215 Sketching bodies at wait: Mobile media use in everyday transit

Susana Tosca[1], Emanuela Marchetti[2]

[1] University of Southern Denmark, Department of Design- Media and Educational Science, Odense, Denmark
[2] University of Southern Denmark, Department of Mathematics and Computer Science, Odense, Denmark

This paper presents work in progress on an alternative, low-intervention method for studying mobile media use as embodied, spatial, and largely pre-reflective practice. The study responds to a recurring methodological problem in media and communication research: much everyday mobile media use unfolds in situations of waiting, boredom, and low-level immersion that resist verbalisation and tend to disappear in methods oriented toward intensity, engagement, or spectacle. Interviews, surveys, or data-driven approaches are poorly calibrated to capture such banal practices, despite their centrality to everyday media use.

We explore rapid observational drawing as a method. The empirical material consists of 100 hand-drawn sketches produced in public spaces, primarily sites of transit and waiting (stations, trains, trams). Each drawing was completed in one to three minutes and depicts individuals or small tableaux of people using mobile phones. The drawings deliberately avoid prolonged observation or interaction with participants. In some cases, brief notes were added about visible on-screen activity when this could be observed unobtrusively; in many cases, only bodily posture, gesture, and spatial orientation were recorded. The material is explicitly exploratory and non-representative.

Analytically, the drawings are treated as a corpus for identifying recurring bodily configurations of mobile media use. Attention is given to posture and position, macro versus micro bodily focus, stillness versus movement, solitary versus collective use, and standing versus sitting bodies. Particular emphasis is placed on non-spectacular behaviours such as slumped postures, repetitive thumb movements, and arrested motion. These configurations are approached as indicators of how mobile media reorganise attention, time, and presence in mundane situations of waiting and transition.

Methodologically, the paper argues that rapid observational drawing offers a way of accessing embodied media practices without relying on verbal articulation or extractive forms of documentation. By foregrounding banality and boredom as central analytical concerns, the method extends existing approaches to media reception into the bodily domain and proposes sketching as a complementary tool for studying everyday media use where "nothing much seems to happen," yet media are nonetheless deeply worn into posture, gesture, and everyday life.

ARS05 News Repertoires and Information Practices

PP 0216 Introducing the "Social Night Monitor": Towards an understanding and measurement of participation levels between citizens and journalism

Fábio Ribeiro[1]

[1] University of Trás-os-Montes e Alto Douro UTAD- CICANT UTAD delegation, Department of Humanities- Arts and Communication UTAD, Vila Real, Portugal

Getting to know audiences seems to be central to journalism. In contemporary approaches, technology is often regarded as the facilitator model for wider chances for people to interact with media (Hendrickx et al., 2024). Notwithstanding this slightly enthusiastic framework, there is significant scientific literature dealing with the other way around: studying the non-participants, ranging from those who do not want to interact or share content (Mentzel et al., 2023), collaborate, correct and suggest (Mathews et al., 2022), to the ones who act only as lurkers (Spiley, 2024).

This communication follows the concept of "social night", as proposed by Manuel Pinto (2009) to address those non-participants in the media sphere, "living in the same continent, but remaining silent and silenced, barely seen and visible in the news". In doing so, this presentation seeks to present an ongoing methodological instrument conceived to characterize participatory strategies between audiences and journalists.

The "Social Night Monitor" features a small-scale survey, designed to easily interact with users, thus evaluation some of the following aspects: participation onsite, online comment, content sharing or collaborations, just to name a few participatory

strategies. Participants are also required to share some social and demographic characteristics and news media consumption routines as for further cross-analysis and possible correlations.

This monitor has already been tested, featuring a sample of 50 participants, within a specific set of common attributes: audiences in a university level-based, same graduation (Communication Sciences). Preliminary results provide relevant insights: there is a quite obvious "social night" when it comes with dealing with interaction and comments in the journalism, but participation seem to be alive somehow: reactions, likes and sharing are predominant.

Starting from this prototyped experience, this monitor seeks to evaluate the participatory relationship between citizens and journalistic media organizations, if any. The potential of such instrument remains in its easiness of implementation, this targeting into specific groups which arguably provide relevant data for the definition of media strategies with their audiences.

ARS06 Audiences, Democracy and Polarisation

PP 0217 Psychological closeness and partisan television news in a disruptive hostage release media event

Yaron Ariel[1], Vered Elishar-Malka[1], Dana Weimann-Saks[1]

[1] The Max Stern Yezreel Valley College, Communication, Yezreel Valley, Israel

How do audiences experience, interpret, and respond to a nationally salient crisis broadcast when the media environment is hybrid and politically polarized? This study examines audience reception in Israel of the October 2025 televised release of Israeli hostages from Hamas captivity. We treat the broadcast as a disruptive media event and foreground reception as an empirical object: the felt intensity of the event, the evaluative interpretations it elicits, and the civic responses that follow.

Classic media event theory emphasizes integrative broadcast rituals capable of momentarily suspending social divisions. However, in hybrid and politically polarized media systems, crisis broadcasts can simultaneously concentrate collective attention and intensify contestation over meaning. Building on scholarship on disruptive media events in divided societies, we argue that the intensity of audience experience is not reducible to partisan channel choice. Rather, it is shaped primarily by psychological proximity—perceived closeness along temporal, spatial, social, and hypothetical dimensions—which heightens self-relevance and triggers concrete processing.

We conceptualize Media Event Perception (MEP) as a reception construct capturing experiential intensity across five dimensions: behavioral, cognitive, emotional, communal, and national engagement. A one-day online survey was conducted immediately after the live broadcast ($n = 400$), using quota sampling and post-stratification weighting. Analyses requiring a single primary channel were conducted among respondents who identified one main channel ($n = 321$): Channel 12 (52.6%), Channel 14 (27.1%), Channel 13 (13.1%), and Channel 11 (7.2%).

Findings reveal shared affective reception alongside partisan divergence in interpretation and civic action. Emotional and national engagement were the most intense MEP dimensions, whereas behavioral engagement was consistently the weakest, indicating strong affective resonance without equally strong ritualized viewing practices. Support for the hostage deal differed markedly by primary channel (Welch's $F(3, 76.4) = 33.30$, $p < .001$): Channel 14 viewers reported lower support ($M = 3.25$, $SD = .92$) than Channel 12 viewers ($M = 4.35$, $SD = .68$). Hostage-related civic activities also varied ($F(3, 317) = 5.71$, $p = .001$, $\eta^2 = .051$), with higher engagement among Channel 12 viewers ($M = 2.47$, $SD = 1.11$) than among Channel 14 viewers ($M = 1.91$, $SD = .97$).

In contrast, reception intensity was primarily driven by psychological proximity. Proximity was strongly associated with MEP ($r = .64$, $p < .001$). In hierarchical OLS regression, channel indicators explained limited variance in MEP ($R^2 = .027$), whereas adding psychological proximity and deal support substantially increased explanatory power (final model $R^2 = .460$). Psychological proximity was the dominant predictor ($\beta = .632$, $p < .001$), and most channel differences attenuated after adjustment.

The findings contribute to audience and reception research by distinguishing an affective layer of shared experience—where emotional and national engagement converge—from an interpretive and behavioral layer structured by partisanship in polarized hybrid media environments. They also advance understanding of how psychological proximity operates as a central mechanism through which mediated crises become subjectively "eventful."

ARS06 Audiences, Democracy and Polarisation

PP 0218 Citizens' assemblies as media accountability forums: Deliberation and audience sense-making of journalism in Serbia

Čedomir Markov[1]

[1] University of Belgrade, Institute for Philosophy and Social Theory, Belgrade, Serbia

Research on audience–media relations has documented growing dissatisfaction with journalism across many political and media systems, yet much of this work relies on surveys or interviews that capture individual attitudes in isolation. Far less is known about how audiences articulate expectations and negotiate normative claims when they are provided with structured opportunities for collective discussion. At the same time, citizens' assemblies have gained prominence as

democratic innovations designed to strengthen collective reasoning and evidence-based public participation. Yet, with only a few notable exceptions, citizens' assemblies have rarely been implemented and studied in the context of audience–media relations. This contribution does exactly that by examining how citizens articulate expectations, critiques, and normative claims toward news media when provided with structured deliberative space.

Empirically, the study draws on qualitative data from three one-day events inspired by the format of citizens' assemblies in the highly polarized media environment of Serbia, shaped over the past decade by democratic backsliding and pervasive state influence over public communication. Two assemblies – on the public service broadcaster Radio Television of Serbia (RTS) and on the sustainability of local media – were conducted in May and December 2025, respectively. The third assembly, on news reporting in minority languages and in marginalized communities, will have been completed before the conference. Each assembly brings together socio-demographically diverse participants (n = 50 each) and is designed to facilitate informed deliberation through small-group peer discussions and plenary sessions with relevant experts and decision-makers. The analysis is based on full transcripts of the deliberative sessions and employs thematic analysis to trace how participants articulated evaluations of journalism, defined public-interest standards, reflected on the constraints under which media operate, and responded to counter-arguments and competing interpretations.

The paper examines how deliberation reshapes both the form and content of audience talk about the media. The findings show the potential of deliberative conditions to enable participants to move beyond generalized expressions of distrust or dissatisfaction toward more differentiated and reflexive evaluations. This was evident in discussions about RTS, where participants recalibrated their criticisms in relation to the common good rather than primarily from individual or self-referential perspectives, and displayed a growing sense of responsibility for the future of public service media. In the assembly focused on local media, participants' understanding of sustainability shifted from a question of market viability toward a relational perspective linking public funding, editorial integrity, and citizens' right to access information in the local public interest. In both cases, participants demonstrated a capacity to hold ambivalent and context-sensitive positions, acknowledging structural constraints while upholding diverse normative ideals of journalism. The paper argues that citizens' assemblies offer a valuable methodological lens for audience research by scrutinizing how media perceptions are socially produced, contested, and revised through interaction, and what role deliberation can play in these processes.

ARS06 Audiences, Democracy and Polarisation

PP 0219 Relational polarization and trust dynamics in media-audience interactions: Examining how people assess three controversial issues

Aukse Balcytiene[1], Rūta Kupetytė[2], Giedrė Plepytė-Davidavičienė[2]

[1] Vytautas Magnus University, Department of Public Communications, Kaunas, Lithuania
[2] Vilnius University, Centre for Journalism and Media Research, Vilnius, Lithuania

In this study, we explore public opinion formation as a mutually integrating process that treats media and audiences as an amalgamated whole – something that emerges from the relationship between media and audience, rather than from two separate worlds. Drawing on a human-centered framework (O'Boyle, 2022) and empirical findings from a public opinion survey on media's assessments, we examine how people engage with thematically controversial issues. Our analysis reveals that the outcome of such "relational dynamics" – an interaction between media "supply" and audience information choices, i.e., "demand" features – may lead to "relational polarization" (Mepham et al. 2025), a process in which divisions become embedded in social ties and people's media interaction patterns.

Despite extensive research on transformations in the public sphere (Mansell et al., 2025; Fischer & Jarren, 2023), little is known about how people engage with media channels, develop trust, and form opinions in hybrid media environments (Baden et al., 2025). Anything that weakens the reliability of public information – an abundance of content of unclear origins and authority, algorithmically managed manipulations of people's attention – distracts opinion negotiations, undermines social cohesion, and contributes to polarization in society. These challenges are a result of big structural shifts in the modern media environments, which have produced conditions where reliable and verifiable information is very hard to sustain. They also feed into broader processes of audience fragmentation – a phenomenon that is often addressed by various scholars as the key outcome of the transformed "knowledge order" in contemporary societies (Neuberger et al., 2023). Because the system of public knowledge organization has changed, including the ways societies produce, distribute, negotiate, and validate knowledge, people's relationships with media – how they use, perceive, judge, and trust the media – have also been transformed.

To test these observations in practice, we present an empirical study – a 2024 representative survey of Lithuanian residents (N = 1000) – which is focused on people's assessments of three controversial topics, defined here as social, political, and cultural. We examine how people think about the selected issue (what their opinions and concerns are), and what their views on the media's portrayals of that specific issue (its accuracy, thoroughness, audience inclusion, media's attempts to seek dialogue, etc.) are. The analysis compares media perceptions between two groups with opposing opinions on selected issues: supporters and opponents.

The results indicate that polarization of society seems to be closely tied to how the groups perceive the media's coverage, rather than to general trust or distrust of the media. Differences in how much people trust media coverage depending on

the topic ("this media is for people like me") show that reliability judgments push people to align with some media channels and reject others – thereby polarizing media-audience relationships. By examining relational factors, our results add to recent scholarship on how the public sphere is fragmenting (Mansell et al., 2025; Fletcher et al., 2025; Splichal, 2024) and how media roles are shifting, especially when reporting on controversial and polarizing issues.

ARS06 Audiences, Democracy and Polarisation

PP 0220 Distrust and polarisation: Citizens' perceptions of journalism in Spain, Italy and Slovakia

Miguel F. Santos Silva[1], Jaume Suau Martínez[2]

[1] Blanquerna School of Communication and International Relations, Department of Humanities, Barcelona, Spain
[2] Blanquerna School of Communication and International Relations, Department of Communications, Barcelona, Spain

In today's political and media landscape, trust in both journalism and public institutions plays a crucial role in shaping how citizens engage with news. According to the Digital News Report (Newman et al., 2024), news media increasingly face challenges stemming from mis- and disinformation, political attacks, and an unstable business environment. At the same time, the growing relevance of platforms such as TikTok, Instagram, and YouTube for news consumption further complicates public perceptions of journalism and its boundaries. Building on Mayer et al. (1995), who define trust as "the willingness to be vulnerable to another party based on expectations of their integrity, ability, and benevolence," and on subsequent work highlighting the role of emotional and social experiences in shaping a broader "propensity to trust" (McAllister, 1995; Baer et al., 2018; Liu & Li, 2023), this study examines perceptions of journalism and levels of trust and distrust in news media in Italy, Spain, and Slovakia.

Drawing on nationally representative surveys (N = 1,000 per country), we conducted factor analysis to identify five key dimensions explaining cross-national variation in trust and distrust. Two dimensions capture trust in journalism: perceived independence and credibility of journalistic reporting, and confidence in journalists' professional skills and working conditions. Three dimensions reflect distrust: preference for alternative news sources outside journalism, perceptions of external influences shaping news coverage, and extreme distrust rooted in a negative assessment of the contemporary information environment. In Italy and Spain, trust-related factors cluster around indecision (3 points in a 0 to 5 scale), while distrust-related factors display greater variability and positive skew, marking a higher degree of polarization around distrust than trust. In Slovakia, by contrast, although trust factors also hover near indecision, distrust—particularly the "extreme distrust" dimension—is markedly higher, indicating a more polarized and distrust-dominated media environment.

The findings also point to a substantial erosion of institutional credibility. Among younger audiences (18–29), independent YouTubers are trusted at levels comparable to traditional news media, signalling a significant reorientation of trust toward digital actors. Notably, age does not emerge as a differentiating variable in the factor structure itself, as trust and distrust patterns are similarly distributed across age groups, gender, and educational levels. Instead, institutional trust—measured through satisfaction with political institutions, perceptions of democracy, and evaluations of political parties—emerges as the most influential explanatory factor across all three countries. These results suggest that journalism is increasingly perceived not as an autonomous societal actor, but as part of the broader institutional and political establishment, with important implications for understanding contemporary dynamics of media trust and legitimacy.

ARS06 Audiences, Democracy and Polarisation

PP 0221 The weight of ideals: Democratic commitment and media experiences in Europe

Giulia Ferri[1], Andrea Miconi[1], Alessandro Nanì[2]

[1] IULM University, Communication, Milan, Italy
[2] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

Across Europe, citizens often express support for democratic values such as freedom, equality, participation, and collective self-determination. At the same time, their everyday encounters with democracy—largely shaped by news media, social platforms, and political communication—frequently reveal frustrations, confusion, or a sense of disconnect from these ideals (Voltmer, 2013). This paradox, in which strong attachment to democratic principles coexists with critical or disillusioned experiences of their practical enactment, highlights persistent challenges in how democracy is lived and perceived.(Mouffe, 2014; Norris, 2011).

While previous research has mainly approached this paradox at the institutional or normative level, this study examines how it is lived and negotiated by citizens through media practices. Drawing on qualitative data from ten European countries collected within an Horizon Europe project, the paper investigates how citizens make sense of democracy through their routine engagement with news media, social platforms, and political discourse, and how these mediated encounters shape perceptions of democratic functioning and legitimacy.

Media are not treated here as neutral channels of information, but as key arenas in which democratic values, political authority, and participation are framed, contested, and evaluated. Mainstream media are often perceived as institutionally authoritative yet distant from citizens' everyday concerns, while digital platforms broaden opportunities for participation and visibility while simultaneously amplifying conflict, polarization, and distrust (Esser & Strömbäck, 2014). Through these

media environments, citizens encounter democracy primarily as a communicative process rather than as direct institutional participation (Couldry & Hepp, 2018).

Empirically, participants articulate forms of reflective skepticism and selective engagement that emerge from these mediated experiences. Their strong attachment to democratic principles coexists with critical assessments of how democracy is represented, debated, and performed in the media. Rather than rejecting democracy, citizens negotiate its tensions by recalibrating how, when, and through which media they engage with political information and debate. These negotiations often take the form of practical strategies, such as cross-checking news sources, avoiding overly polarized discussions, or selectively participating in online debates, highlighting the active role citizens play in managing their own democratic experience.

By conceptualizing the democratic paradox as a mediated and experiential phenomenon, this paper contributes to debates on democratic legitimacy, political trust, and everyday civic engagement. It highlights the central role of media in shaping not only citizens' evaluations of democratic performance, but also the practices through which democratic commitment is sustained under conditions of communicative complexity.

ARS07 News Consumption and Public (Dis-)Connection

PP 0324 From urban vision to action: Paths between media engagement and civic participation

Kristiina Raud[1]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

Adopting a constructivist perspective (Burr, 2015), this study investigates the relationship between subjective media engagement and civic participation. Focusing on the audience of a social media account dedicated to improving the urban environment in Tallinn, the capital of Estonia, the study explores the construction of civic participation as a meaningful act for its performers and how this meaning can emerge from the subjective, situated process of media engagement. To do this, I follow Dahlgren and Hill's (2020) model of media engagement parameters which conceives of engagement as "an energising internal force … that can propel us to do things" (p. 2). The parameters include the context of engagement, its motivations, modalities, intensities, and consequences. I also employ Dahlgren's (2009) circuit of civic cultures, that is, the resources that facilitate engagement and participation, consisting of knowledge, practices, spaces, identities, values, and trust. This framework supports the exploration of the symbolic and material contingencies of participation.

The data for this study were generated in 18 semi-structured interviews with followers of the account who self-identified as wanting to or having acted to change the urban environment. The differentiation between and the inclusion of these two sets of people allows the study to address not only the account's influence on people's behavior, but also the possible constraints or obstacles that people may encounter in the process of changing their behaviour. The participants constitute a combination of a convenience and volunteer sample, with the latter recruited via posts shared by the social media account itself. The data were subjected to an abductive reflexive thematic analysis (Braun & Clarke, 2019; Thompson, 2022).

The findings show that participants' engagement with the account involves multifaceted and multidirectional influences. The account provides a lens for experiencing and interpreting the urban environment, with many describing a 'click' when the content enabled them to reassess familiar spaces and norms, like parking practices and car-centered mobility. Although learning about existing conditions often produces frustration, affective responses also include hope that, as a group of like-minded and motivated people, change is achievable. This relates to the emergence of a communicative space that connects people who would otherwise not meet. The account also offers knowledge and skills, as participants gain information and learn to engage in practices that strengthen their civic agency. Finally, the analysis suggests that beyond the six elements of the circuit of civic cultures (Dahlgren, 2009), the relationship between engagement and participation is contingent upon the cultivation of a particular imaginary. On the account pages, participants encounter a vision and a vocabulary for an alternative future that feels entirely possible, and it fosters the belief that, as citizens, they can achieve it.

PP 0325 Mapping the social space: Information-oriented media practices and societal values in Germany

Hannah Immler[1]

[1] Leibniz Institute for Media Research - Hans-Bredow-Institut, Communication Science, Hamburg, Germany

Practices of public communication enable people to perceive, evaluate and participate in social and political realities and processes (Hasebrink 2020). In particular, using media can help individuals to develop ideas and notions of what social life should look like and what kind of values a society should strive for (or reject). To better understand the shifting grounds of contemporary society in terms of media transformation as well as value shifts such as challenged democratic ideals and the rise of authoritarian attitudes, it is crucial to examine the relationship between media use and societal values. Both aspects are essentially social phenomena that must be properly examined taking into account the social stratification of society at various levels.

Drawing on Bourdieu's (1987) work on social differentiation through three main kinds of capital- economic, cultural and social- this project identifies segments of German society that are characterized by specific information-oriented media use and attitudes towards society. By analyzing variables of social position, information-oriented media use and societal values, the German population is visually structured according to these three factors.

Building on a representative population survey in Germany (N = 8.876, 2021), a multiple correspondence analysis based on chi-square statistics is applied to visualize different social positions within society as two-dimensional space, using a set of active variables of economic, cultural and social capital. Subsequently, information-oriented usage of different categories of media (e.g., local or national newspaper outlets; commercial or public-service broadcasting; social media accounts of political, journalistic or celebrity actors) and indicators of societal values (e.g., democratic, egalitarian, liberal, authoritarian or populist attitudes) were projected onto that social space as passive variables.

The results illustrate that a higher frequency of information-oriented media use corresponds with larger amounts of all three kinds of capital and vice versa. Populist attitudes, on the other hand, increase with lower levels of capital overall. However, informational use of social media is rather associated with an average amount of overall capital and a tendency towards higher levels of cultural and social capital than economic capital. Low levels of economic capital correspond with the non-usage of public service media and the rejection of democratic and liberal values. Authoritarian attitudes receive more approval at low levels of cultural and social capital, while they decrease at high levels. This also corresponds to the non-usage and frequent usage of newspaper outlets respectively.

The project illustrates that segments of society less equipped with societal resources use public communication practices less frequently and hold rather disintegrative and disruptive notions of society. Further differentiation could be made by identifying specific combinations of the three aspects (as exemplified above) through the visualization of multiple correspondence analysis, presenting one approach to structuring the German population. The proposed presentation contributes to the overall theme of the ECREA 2026 by demonstrating how disciplinary and methodological openness can help to analyze and further understand the shifting grounds of society and its associated challenges in terms of media practices and societal values.

ARS07 News Consumption and Public (Dis-)Connection

PP 0326 Hope for public life through social media disconnection

Karoliina Talvitie-Lamberg[1], Leena Ripatti-Torniainen[2], Sanna Valtonen[3]

[1] University of Jyväskylä, Department of Language and Communication, Jyväskylä, Finland
[2] Tampere University, Faculty of Education and Culture, Tampere, Finland
[3] Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Disconnection from digital and social media has emerged both as a coping strategy for the pressures of everyday digital life (Talvitie-Lamberg et al. 2024) and as a key skill for responsible digital citizenship (Kaun 2021; Vanden Abeele & Mohr 2021). At the same time, critical media and data research shows that many people struggle with platform demands yet feel increasingly excluded from democratic society (Nikunen et al., forthcoming). A broader decline in societal belonging suggests that citizens are becoming frozen out of society (Fenton et al. 2023; Latzer et al. 2025). Against this backdrop, it is vital to understand how digital disconnection shapes experiences of belonging in public life. We investigate how social media disconnectors define public life and how appealing alternative forms of participation are to those who voluntarily withdraw, situating our analysis within research on digital disconnection and public life in a Nordic data welfare context (Andreassen et al. 2021; Syvertsen et al. 2014), where digital and social media increasingly reshape what belonging means. Our guiding research question is: "How do social media disconnectors understand and experience belonging and agency in public life?"

We use hope as our theoretical lens. Hope involves longing, a sense of incompleteness in the present, entailing agency and an orientation toward a better future (Bugajska 2024). Hope may help explain why people disconnect from social media. Previous research shows that, although people disconnect for various reasons, their often do so in hopes of achieving

something specific: increasing well-being, mitigating the ill-being caused by digital environments, being more present offline, avoiding distraction, or escaping the social pressure to be online (Gilbert et al., 2025; Nguyen & Hargittai, 2025, Ngyen 2023). While much research frames disconnection at the individual level, recent research calls for more socially and politically informed perspectives (Enli & Fast 2023) that would recognise collective aspirations for a better society (Kania-Lundholm 2021). We therefore explore social media disconnectors experiences of public life through the concept of hope which involves a belief in a common good worth striving for (Bugajska 2024).

Our study, which draws on thematic interviews and media diaries from young adults, refugee-background immigrants, journalists, and academic leaders (N = 64) in a Nordic welfare state, analyzed through situational analysis (Clarke et al., 2017; 2022), shows that disconnection is not merely an individual coping strategy that reshapes one's self-understanding. Rather, disconnection was viewed as a moral obligation with the hope of prompting collective-level consequences for reshaping communication cultures on social media. Our study reveals that opting out of social media does not equate to withdrawing from society (Adams & Jansson, 2021). Rather, opting out can strengthen one's sense of agency and meaningful participation in public life.

ARS07 News Consumption and Public (Dis-)Connection

PP 0327 News avoidance and public connection in the context of the German federal election campaign

Julia Behre[1]

[1] Leibniz Institute for Media Research, Societal functions of communication and media, Hamburg, Germany

In democratic societies, news media act as a connective force between individuals and the public by providing political information and enabling political opinion formation and participation (Schudson, 2008; Swart et al., 2017). This is particularly evident during election periods when the demand for political information is high, even among segments of society that tend to be rather disengaged from political issues (Andersen et al., 2021). At the same time, the omnipresence and redundancy of political information during such periods may increase the risk of news avoidance due to issue fatigue (Gurr & Metag, 2022). News avoidance can pose a challenge for democracy when it reflects a lasting detachment from the news and the political sphere (Palmer & Toff, 2020; Toff & Nielsen, 2022). However, intentional news avoidance that occurs alongside regular news consumption may also serve as a coping strategy for managing information overload or negative emotional effects, which can potentially foster rather than hinder political engagement (Ohme et al., 2023; Woodstock, 2014). Therefore, to assess the democratic implications of news avoidance, it is essential to systematically differentiate between distinct types of news avoidance and consider their varying causes (Newman et al., 2025; Skovsgaard & Andersen, 2022). Drawing on the concept of public connection (Couldry et al., 2007; Swart et al., 2017), this study examines the relationship between different types of news avoidance and individuals' connection to the national public sphere during an election campaign.

The study is based on a survey of the German adult online population (N = 2,047) conducted as part of the Reuters Institute Digital News Report (Newman et al., 2025). Data were collected between mid-January and the end of January 2025, ahead of the early German federal elections. Following previous research (Betakova et al., 2025; Damstra et al., 2023; Skovsgaard & Andersen, 2022), the analysis distinguishes between consistent news avoidance, defined as low levels of news consumption, and intentional news avoidance that occurs alongside regular news use. Public connection is analyzed across multiple dimensions (Hasebrink et al., 2023): the feeling of connection to Germany and its population (affective dimension), the perception of the most important problem in Germany (e.g., immigration, climate change) (cognitive dimension), and political participation (e.g., demonstrating, volunteering) (action-oriented dimension).

Preliminary results indicate that patterns of public connection vary, at least in part, depending on the type of news avoidance. While both consistent news avoidance and intentional news avoidance that occurs alongside regular news consumption are associated with lower levels of emotional belonging to the German public, intentional news avoidance is not related to diminished political participation. Further analyses will explore the relationship between news avoidance and public connection while accounting for additional relevant factors, such as reasons for intentional news avoidance and political orientation. Overall, this study contributes to a more nuanced understanding of the democratic implications of news avoidance in times of political disruption.

ARS07 News Consumption and Public (Dis-)Connection

PP 0328 Understanding news avoidance repertoires in Spain: A multidimensional and behavior-specific approach

Lidia Valera-Ordaz[1], Elsa Moreno-Moreno[2]

[1] University of Valencia, Theory of Languages and Communication Sciences, Valencia, Spain
[2] University of Navarra, Departamento de Periodismo, Pamplona, Spain

Research on news avoidance has grown recently, though not without ongoing theoretical debates. This paper seeks to advance a more nuanced understanding of this phenomenon by examining not only general intentional news avoidance but also the specific behaviors through which individuals limit their news exposure. Drawing on the Digital News Report data for Spain (N = 2,031), we conduct logistic regression analyses to explore how individual-level factors predict both general and specific forms of intentional news avoidance.

Our approach distinguishes between eight specific avoidance practices—ranging from very selective behaviors (e.g., avoiding certain news sources or topics) to more indiscriminate strategies (e.g., turning off notifications or checking the news less frequently). This variety captures a spectrum of coping strategies that audiences employ to navigate an overwhelming and often untrustworthy media environment (Andersen et al., 2024; Skovsgaard & Andersen, 2020).

Our findings show that no single model explains all news avoidance behaviors. Instead, each practice is shaped by a distinct combination of sociodemographic factors, political attitudes, and media-related perceptions. While younger people, women, and those with lower education are more likely to generally avoid news, these variables do not uniformly predict specific behaviors. Notably, strategies like reducing notifications or limiting news consumption at specific times are significantly more widespread among highly educated and politically interested individuals.

Crucially, concern about fake news emerges as a consistent predictor of four avoidance behaviors—avoiding certain topics, avoiding specific sources, reducing the frequency of news checks, and prioritizing non-news activities—suggesting that news avoidance may act as a situational strategy of self-protection against disinformation (Wenzel, 2019; Hasell & Halversen, 2024). Political ideology also plays a key role: individuals on the right are more likely to generally avoid news, while far-right voters tend to engage in targeted avoidance of ideologically incongruent sources.

This study contributes to ongoing theoretical debates by demonstrating that news avoidance is not a uniform phenomenon but rather a repertoire of context-sensitive practices. We argue that understanding the motivational, social, and structural diversity behind news avoidance is key to developing effective audience engagement initiatives. Indeed, our findings align with recent literature that moves beyond the notion of a uniform news avoider and call for disaggregated, behavior-specific approaches that account for audience agency within digital, platformized, and polarized media systems.

ARS09 Audiovisual Audience Practices

PP 0550 "Have you also seen this video?" – Assessing content overlap in YouTube watch histories among dyads of friends and strangers using data donations

Nico Pfiffner[1], Thomas Friemel[1]

[1] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

Today, many young people consume media content primarily through intermediary platforms such as YouTube. These platforms offer access to large amounts of diverse content produced by many different creators. As a result, each person is exposed to a unique set of content, depending on the available content, personal characteristics (e.g., interests), personalization algorithms, and the social context (Thorson & Wells, 2016). This raises the question of how much content overlap exists between users on a specific platform, both in a larger population and between friends. However, empirically identifying overlap of the media use histories of specific individuals within a certain demographic group is difficult and thus rarely done. This study addresses this gap by exploring *to what extent content overlap can be observed on YouTube among young users and which factors are related to greater content overlap* based on a mixed-method design combining survey-based self-reports with YouTube data donations.

Participants were recruited through Instagram Ads targeted at people aged 18 to 25 living in [ANONYMZED] and then asked to invite a friend to also take part in the study. This resulted in a sample of 296 participants (M_age = 20.7, N_female = 128) with 134 individuals being part of a friend-dyad and 162 participants without social ties to other participants. Participants answered a questionnaire covering sociodemographics, YouTube use, and content interests. Additionally, participants donated their watch histories and channel subscription lists by downloading their YouTube data from the Google takeout page and uploading them through the data donation tool *DDM*.

The analysis focused on the watch activities within a 65-day period ranging from October to December 2023 covered by all watch histories. In this period, participants watched 256,258 unique videos (Median = 493) of which 19.5% were watched by more than one person and the most popular video occurred in 31.3% of watch histories. To explore the extent of content overlap and its predictors, we calculated the Szymkiewicz-Simpson coefficient (i.e., the fraction of videos watched by the participant with fewer watched videos that the other participant has also watched) for all possible dyads in the sample (43,956 dyads including 67 friend-dyads). We did so for *watched videos* (M = 0.02; M_friend-dyads = 0.05), *watched channels* (M = 0.11; M_friend-dyads = 0.22), and *subscribed channels* (M = 0.04; M_friend-dyads = 0.10).

For each overlap measure, we performed a bootstrapped fractional logit regression (2,000 bootstrap samples consisting of 120 dyads; 60 friend- and 60 non-friend-dyads) incorporating demographic similarity (age, gender, education), interest similarity, and friendship status as predictors. Being friends was the strongest predictor of a higher content overlap in all three models.

Our results demonstrate that the content overlap on YouTube, even among users belonging to a relatively narrow socio-demographic group, is rather small while also highlighting the importance of social ties for the explanation of content overlap. The study offers important and thus far lacking insights into the extent of content overlap on YouTube among demographically similar individuals. The presentation will discuss these results, the methodology, and its limitations in more detail.

ARS09 Audiovisual Audience Practices

PP 0551 Advancing data donation as a scalable method for studying digital media trends: A Danish YouTube case study

Jessica Walter[1], Anja Bechmann[1], Miriam Brems[1]

[1] Aarhus University, Media and Journalism Studies, Aarhus N, Denmark

High-choice media environments are marked by individualization and audience fragmentation, blurring boundaries between creators and users (Sullivan 2020). At the same time, researchers face growing restrictions in studying digital media behavior, as many platforms have limited API access since the Cambridge Analytica scandal, leading Bruns (2019) to announce the 'APIcalypse'. Yet, in a context where citizens' everyday lives are increasingly recorded (Lazer et al. 2021), developing and assessing new methods for collecting and analyzing digital media data remains essential. Such methods can help address questions about how digital platform users are influenced and by whom. Investigating research questions that "require systematic, unbiased, individual-level data" (De Vreese and Tromble 2023, p.356) is challenging under current conditions. Consequently, user centric alternatives to API access, such as tracking or data donation, are gaining importance—though data donation is rarely applied at scale.

This paper presents a new – donation centric- approach for scaling data donation to a national population level to understand media usage trends and discuss challenges for digital democracies, focusing on Denmark as a representative case of a Democratic Corporatist media system (Olesen 2020). Building on existing data donation research (e.g., Breuer et al. 2023; Welbers et al. 2024; Ohme et al. 2024; Van Driel et al. 2022), it introduces a method for applying data donation at scale to collect information from a YouTube population.

The study collected data donations from 1,068 adult Danish YouTube users, recruited via quotas for age, gender, and education aligned with the adult Danish YouTube user population. Donations included search and watch histories, subscriptions, and data on comments. The study was implemented in four consecutive steps between August and December 2024, concluding with a post-survey on media use, political attitudes, health, and personality traits. The first component screened participants and obtained consent; the second and third instructed them to request, download, and donate their YouTube data.

We present the study design and discuss implications for data quality, focusing on sample composition and dropout across components. Findings from logistic regressions confirm lower participation and donation likelihood among older users, partly due to technical barriers. Men show a slightly higher tendency to complete participation and donate data than women, while educational level has no effect. Besides socio-demographic factors, we find evidence for trust and YouTube usage in general affecting the likelihood to consent and donate data. Dropout analyses are evaluated regarding data quality and implications for applying the method in other contexts are discussed.

ARS09 Audiovisual Audience Practices

PP 0552 Micro-mobility and attention in the age of the appisation of television: Emerging viewing cultures across screens

Patience Gombe[1]

[1] Tallinn University, Baltic Film Media and Arts School, Tallinn, Estonia

The "appisation" of television—the integration of apps as a primary mode of accessing television content via smart TVs, connected devices, smartphones, and tablets (Johnson, 2020)—has reshaped television viewing cultures and audience practices. While the internet era is often associated with multitasking (Carrier et al., 2009; Kätsyri et al., 2016) and distracted media consumption (Hassoun, 2019), television occupies a distinctive position within this environment. Rather than rendering the television set obsolete, appisation enables television content to circulate across an extended ecology of screens while maintaining continuity through personalised profiles and app-based infrastructures.

The research in this abstract explores how appisation influences everyday TV audience viewing cultures and practices. There is an emergence of cultures and practices characterised by continuity, mobility, and variable attention. As television content "travels" with viewers across devices, rooms, and geographical locations, audiences engage in what is conceptualised here as a culture of micro-mobility—short, everyday movements between screens and activities that allow viewers to sustain engagement with content without being anchored to a single viewing context. These practices complicate binary distinctions between attentive and distracted viewing (Hassoun, 2019), revealing attention as a negotiated and situational process.

The study draws from data from my first-year PhD qualitative audience research, "Exploring TV Audience Viewing Cultures in the Streaming Era", based in Tallinn, Estonia. Eighteen pilot interviews were conducted in March and April 2025 with three audience groups: Estonian-speaking Estonians, Russian-speaking Estonians, and expatriates (English- and Russian-speaking) aged 18–45 (Gen Z and Millennials). The research design and interview questions were based on a modified framework of TV as a technological and cultural form (Johnson, 2019). Questions were divided into five sections, asking participants about: devices, content, services, frames, and marketing channels. Two types of interview methods were employed: narrative interviews (Bauer & Gaskell, 2000; Frost, 2009), for participants who could talk more freely about their TV consumption habits and semi-structured interviews, for the participants who struggled to talk. Thematic analysis (Braun & Clarke, 2012) was used to analyse the data.

The findings revealed a significant correlation between activities, content, and devices—a phenomenon I refer to as micro-mobility, characterised by participants (regardless of their audience group) transitioning between activities, rooms, or devices while engaging with content. Viewers strategically pair high-attention content with low-attention activities, while more ambient or familiar content accompanies tasks requiring greater focus. The device used is often determined by the level of mobility and the size of the audience. Though at times participants moved from room to room with their device, at times they moved the same content from one device to another, e.g. phone to TV. Other factors also come into play: for instance, the logic of daily activities determines the device and content, e.g. cooking while watching trash political content on a tablet, then eating while watching a series that the whole family is watching on TV.

This study contributes to Audience and Reception Studies by advancing the study of television in the streaming era and emerging viewing cultures, such as micro-mobility, continuity and variable attention.

ARS09 Audiovisual Audience Practices

PP 0553 Rally audiences, platform participation and narrative negotiation in televised coverage

Linn-Birgit Kampen Kristensen[1]

[1] BI Norwegian Business School, Department of Communication and Culture, Oslo, Norway

Motorsport broadcasting offers a productive empirical site for examining how contemporary audiences operate as active participants in the circulation, interpretation, and transformation of media texts. Drawing on theories of audiences as performers (Abercrombie & Longhurst, 1998), convergence culture (Jenkins, 2006), and communicative agency in a datafied media environment (Ytre-Arne & Das, 2021), this paper explores how rally fans engage with and rework live broadcast content across social media platforms.

The analysis is based on recordings of televised rally coverage from the 2025 World Rally Championship season, combined with qualitative discourse analysis of interactions in fan groups during and after the broadcasts. These online spaces function as hybrid arenas where official coverage is shared, contested, and recontextualised. Fans actively frame moments of drama and controversy, circulate highlights, and negotiate interpretations of events, contributing to the construction of rally narratives beyond the broadcast itself.

Conceptually, the paper engages with debates surrounding the "end of audiences" (Livingstone & Das, 2013) by demonstrating how distinctions between producers and consumers are increasingly blurred through platform-based participation. Rally fans' practices exemplify collective forms of communicative agency shaped by platform affordances and data infrastructures, situating audience participation within processes of platformisation (van Dijck, 2013) and deep mediatization (Hepp, 2020). At the same time, these practices must be understood within the ambivalent political economy of digital media. Drawing on notions of free labour (Terranova, 2000) and the audience commodity (Smythe, 1977), the paper situates fan participation as unpaid cultural production that generates value for platforms and rights-holding broadcasters.

Ultimately, by mobilising Couldry's (2016) concept of the media manifold, the paper shows how rally fandom unfolds across interconnected media environments where television, social platforms, and data-driven infrastructures intersect. The findings highlight tensions between institutional media power (Castells, 2009) and grassroots meaning-making, revealing how participatory practices simultaneously reproduce and challenge dominant broadcast narratives.

ARS09 Audiovisual Audience Practices

PP 0554 The representation of queer TV characters and their significance for the identity of queer audiences: A qualitative reception analysis

Lena Rech[1], Freya Sukalla[2]

[1] Leipzig University, Institute of Communication and Media Studies., Leipzig, Germany
[2] LMU Munich, Institute of Communication Studies and Media Research., Munich, Germany

Queer representation in the media has historically been marginalized and stereotyped, negatively affecting the identity development of queer audiences. Recent shifts toward more nuanced and affirming portrayals open new potentials for identity exploration, validation, belonging, and emotional support. Research shows that parasocial relationships with such representations can be particularly meaningful for LGBTQIA+ individuals (Bond, 2023). This study investigates how queer audiences experience queer representation in Netflix's Heartstopper, how they relate to its characters, and which role these portrayals play in identity development and belonging.

The theoretical framework draws on D'Augelli's (1994) model of LGB identity development, conceptualizing identity across six dynamic processes: *exiting a heterosexual identity, developing a personal LGB identity status, developing an LGB social identity, claiming identity as an LGB offspring, developing an LGB intimacy status,* and *entering an LGB community.* Second, the study builds on McMillan and Chavis' (1986) Sense of Community model, which conceptualizes belonging through four interrelated components: *membership, influence, needs fulfillment,* and *shared emotional connection.*

The study is based on 16 semi-structured interviews with queer individuals aged 18–55 and analyzed using reflexive thematic analysis (Braun & Clarke, 2024). Four overarching themes emerged: (1) *Recognition in realistic representation,* (2) *Parasocial experiences of acceptance,* (3) *Characters as sources of guidance and empowerment,* and (4) *Safe spaces in fiction and reality.*

(1) Recognition in realistic representation

Participants described the characters as authentic and emotionally complex, forming strong parasocial bonds. Many recognized their own identities, struggles, and coming-out experiences. The portrayal of distressing experiences was painful for some participants, yet it was regarded as essential for achieving a realistic depiction.

(2) Parasocial experiences of acceptance

Some viewers experienced the series as idealized, especially regarding acceptance and support within families, friendships, and school environments. Nevertheless, these idealized portrayals created feelings of acceptance, emotional comfort, and helped reducing internalized homophobia. Heartstopper modelled desirable realities and provided an emotional substitute space, where viewers could witness openness and support.

(3) Characters as sources of guidance and empowerment

Participants viewed the main characters as emotional anchors and role models. They offered guidance on self-disclosure, relationships, and mental health and encouraged resilience, identity exploration, and self-reflection. This theme highlights the educational and empowering function of the series.

(4) Safe spaces in fiction and reality

Heartstopper served as a parasocial safe space and "comfort series," helping viewers regulate emotions, process past experiences, and find reassurance. Beyond the fictional world, it strengthened social connectedness through fan communities and supportive networks. This theme demonstrates how narrative spaces can foster personal and collective belonging.

Overall, Heartstopper supports queer identity across multiple aspects of D'Augelli's model by encouraging self-reflection, -exploration and -acceptance, by validating identity and by motivating coming-out and modeling affirming relationships and communities. Although the series plays a minor role in political engagement or broader community involvement, it fosters an individual sense of belonging and fan-community with shared symbols, emotional connections, and a sense of belonging. These findings underscore the importance of multidimensional, realistic, and hopeful LGBTQIA+ representation for identity development and emotional well-being.

ARS10 Algorithmic Curation and Platform Power

PP 0555 Automating publics: A multi-level framework for analysing algorithmic public formation

Jannie Møller Hartley[1], Andreas Birkbak[1]

[1] Roskilde University, Communication and Arts, Roskilde, Denmark

This paper advances a conceptual framework for analysing how publics are shaped through and across personalised, datafied, and hybrid media infrastructures. The increasing implementation of AI-driven and personalised content recommender systems across the media industry raises fundamental questions about how algorithmic curation reconfigures citizens' engagement with issues of public concern. While existing scholarship has typically examined personalisation and in particular News Recommender Systems (NRS's) at the level of single platforms or single news outlets- often focusing on measurable effects such as click behaviour or the values inherent in the design of NRS- there is a lack of theoretical frameworks capable of explaining how automated media environments reshape public formation and linking these developments *across* individual, organisational, and societal levels. This article mobilizes previous literature on three levels combining audience studies with issue publics theory and media sociological approaches to develop the framework:

At the **micro level**, the model conceptualises personalised media use as a communicative practice of decoding within what we term *personalised mediascapes*: cross-platform flows of content characteristic of contemporary, datafied, hybrid media environments. Building on encoding/decoding theory (Hall, 1991) and research on media experiences, this level highlights how individuals interpret personalised content normatively and emotionally. At the **meso level**, the model includes personalization algorithms as *algorithmic assemblages* (Ananny, 2019) and the cultural dimensions of algorithms, conceptualizing NRSs as socio-technical systems that encode normative values and organisational imaginaries into processes that match users with public issues. This builds on previous work showing that personalisation systems embed assumptions about users and their concerns. Through "ethnographies of algorithms," this level captures how personalisation collapses traditional boundaries between encoding and decoding as aggregated user data become integral to producing personalised content flows. Finally, at the **macro level**, the model mobilises the concept of *issue publics*(Dewey, 1927) to theorise how algorithmically distributed content shapes collective attention, controversies and the emergence of public issues. In contrast to platform-specific notions such as networked (boyd, 2011) or calculated publics (Gillespie, 2014), issue publics emphasise how shared stakes in problems generate publics across media sites and institutional arenas with algorithmic systems as co-constituting actors in both media production and media use. We show how this perspective enables analysis of how automated media modulates the visibility, articulation, and coherence of issues across the broader media ecology.

Finally, the article discusses how these levels can be linked, and how researchers can approach the analysis of algorithmic public formation empirically and methodologically.

ARS10 Algorithmic Curation and Platform Power

PP 0556 One of many voices: Understanding the role of journalists through news users' personal curation practices

Sarah Vis[1], Ike Picone[1], Giordano Zambelli[1], Alicia Navarro Hernandez[1]

[1] Vrije Universiteit Brussel, SCOM/ SMIT imec, Brussels, Belgium

As news users, specifically young adults, increasingly turn to social media for news, they navigate an environment in which journalistic, non-journalistic, and alternative voices blend (Newman et al., 2025). Within this environment, journalists no longer operate as primary gatekeepers but compete with a wide range of other actors for news users' limited attention. This raises questions about whether, how, and when these news users still assign authority to journalists (Carlson, 2017).

At the same time, social media users have become increasingly autonomous in managing their information exposure. Faced with an abundance of content, users actively shape their media environments through personal curation practices, defined as "the active and intentional customization of one's media environment in pursuit of individual goals" (Thorson & Wells, 2016, p. 316). Through everyday actions such as (un)liking, (un)following, or muting content, users now construct personalized news feeds aligned with their interests, emotional needs, and values (Merten, 2021; Thorson & Wells, 2016). As a result, each news user assembles their unique everyday news intake.

Against this backdrop, this study examines how personal news curation practices shape the authority young adults assign to journalists within their self-curated news environments. Rather than treating journalistic authority as given or declining, the study investigates how journalistic authority is actively negotiated through everyday curation decisions. It asks how young adults regulate their exposure to news, and under which conditions journalists are included, excluded, or selectively relied upon. The study draws on a mixed methods 'data mirroring' approach: 21 participants (aged 18–24) donated their Instagram or TikTok Data Download Packages, which were filtered and visualized using '4CAT: Capture and Analysis Toolkit' to create individualized data mirrors of their most engaged news-related content over time. These visualizations were used as elicitation tools in in-depth interviews, enabling participants to reflect more accurate on their media behaviour.

The findings show that these young adults curate their news feeds in pursuit of a personalized news '*comfort zone*' that is both meaningful and emotionally manageable. They engage in a constant balancing act between protecting their autonomy through self-curation and selectively granting journalists access to their curated spaces. While journalistic content is often avoided when perceived as negative or overwhelming, journalists remain valued as sources of *clarity*, *credibility*, and *diversity* when users seek explanation in times of confusion. These findings highlight journalism's ambivalent yet persistent role within young adults' current news experience and show how journalistic authority is negotiated through everyday personal curation practices in a digital news ecosystem shaped by both user and platform logics.

ARS10 Algorithmic Curation and Platform Power

PP 0557 Imagining culture and technology: Audience reflections on algorithmic curation in everyday life and at the museum

Eva Pina Myrczik[1]

[1] University of Southern Denmark, Department of Design- Media and Educational Science, Odense, Denmark

This paper explores how audiences imagine and negotiate the role of algorithmic recommendation and curation systems in everyday media use as well as cultural institutions. In times of transformation, as technologies such as algorithmic recommendation systems are implemented across both commercial media and public cultural institutions, audiences are seldom

invited to articulate how they imagine these systems should be used; instead, they navigate, respond to, and adapt within evolving media environments.

The paper presents findings from two creative workshops conducted in collaboration with ACMI, the Museum of Screen Culture, in Melbourne, Australia (spring 2025). I will highlight methodological reflections, exploring the use of creative methods to approach abstract phenomena such as algorithms as well as crucial choices regarding sampling. The study draws on two so-called "playshops", creative workshops inspired by and developed in cooperation with Caitlin McGrane & Larissa Hjorth (2025) to "use play to enhance and enrich critical creative reflective thinking and self-reflection". Each workshop had nine participants and included three creative activities: 1) a visit to the exhibition to interact with the museum's digital collection discovery device, 2) writing postcards about algorithmic understanding, and 3) drawing individual maps of people's everyday media use. Participants were recruited through distinct strategies to capture diverse perspectives: Workshop 1 involved non-visitors with mixed educational backgrounds, while Workshop 2 engaged loyal museum members with higher education levels. Comparing these groups illuminates how everyday algorithmic imaginaries (Bucher, 2017) intersect with other attitudes towards culture and entertainment, as well as institutional trust.

Through the playshops, participants had the opportunity to explore the presence of algorithmic recommendations in their everyday lives and eventually expressed ambivalent attitudes. While they valued features such as search, recommendation, and personalization for their convenience and ability to facilitate content discovery, concerns about commodification and commercial platforms "pigeonholing" users dominated discussions. When considering algorithmic applications in museums, reactions were divided more strongly: some saw potential for personalized communication, while others resisted the idea, framing museums as "sacred" spaces for human connection where commercial technologies feel intrusive. This tension reflects a persistent cultural imaginary that positions technology as separate from culture—a view that contrasts with contemporary scholarship challenging such dichotomies (Peters, 2016; Striphas, 2023).

The analysis reveals and analyses the juxtapositions and tensions expressed by participants. Especially at the Museum of Screen Culture, which mediates film, video games, and digital art, this distinction seems to stem from a deeper understanding, or rather values, that might not match with peoples' lived realities.

The findings contribute to audience studies with methodological reflections as well as by highlighting how people negotiate the growing presence of algorithmic systems in everyday media use as well as cultural institutions. They reveal a clear distinction most participants draw between museums, culture, and technology—echoing the classic nature–culture–technology triad—while also exposing contradictions between discourse and experience. The paper argues for a more nuanced understanding of how audiences imagine and engage with algorithmic mediation in contexts beyond commercial media.

ARS10 Algorithmic Curation and Platform Power

PP 0558 Navigating algorithmic power: Audience strategies for discoverability and cultural sovereignty in digital media ecosystems

Fernanda Pires de Sá[1], Xavier Ribes[1], Gómez-Bernal Gemma[1], Massaguer Lluc[2]

[1] Universitat Autònoma de Barcelona, Audiovisual Communication and Advertising, Bellaterra, Spain
[2] Universitat Oberta de Catalunya, Information and Communication Sciences Department, Barcelona, Spain

In this presentation, we analyse how young adult users navigate algorithmically governed media environments and the strategies they employ to maintain autonomy in content discoverability. Platforms such as Instagram, Netflix, Spotify,YouTube, among others increasingly govern how audiences discover audiovisual content through algorithmic recommendations, raising questions about how audiences assert agency and develop strategies to discover content within algorithmically curated environments. Drawing on more than 30 in-depth interviews conducted within the ALCOM Research Project (PID2023-1-48682OA-I00 – funded by the Spanish Ministry of Science, Innovation and Universities), this study explores the conscious and unconscious tactics users adopt to negotiate algorithmic influence while constructing personalised audiovisual experiences.

Our analysis addresses three core questions:

1. What practices do users employ for content discoverability?
2. How do they perceive and evaluate the role of algorithms in shaping their media diets?
3. How do they move across platforms, creating personalised journeys of discovery, validation, and consumption?

Findings reveal a spectrum of agency expressed through six distinct user journeys: (1) Total Algorithmic Acceptance, (2) Selective Internal Acceptance, (3) Guided Exploration, (4) Contrast with External Sources, (5) Critical Valuation, and (6) Autonomous Choice. These journeys illustrate varying degrees of engagement, from complete trust in platform recommendations to deliberate avoidance of algorithmic influence. Some users rely entirely on algorithmic suggestions for convenience, while others actively curate their feeds, seek external validation, or prioritise human recommendations over automated ones.

These varied practices demonstrate that user engagement with recommendation systems is far from uniform. While some embrace algorithmic suggestions, others resist or supplement them through external checks and human curation. This

latter typology therefore challenges deterministic views of algorithmic governance, showing that it does not uniformly diminish user autonomy but interacts with diverse strategies of negotiation and resistance.

Strategies include leveraging platform tools for targeted searches, cross-referencing recommendations with external sources, and constructing heuristic frameworks for critical evaluation. Furthermore, cross-platform practices such as verifying platform suggestions through trailers or reviews on other sites highlight how users integrate algorithmic, social, and critical signals to form independent judgments.

By mapping these journeys, the presentation contributes to debates on algorithmic power and user agency, offering a nuanced understanding of how cultural sovereignty is enacted in digital ecosystems. It argues that autonomy is not a binary condition but a dynamic negotiation shaped by technological affordances, social trust, and individual values.

ARS11 AI and Audiences - Heat, Health and Hate

PP 0660 The paradoxical heat of Generative AI: Why a cool medium feels hot

Eva Luise Knor[1]

[1] University of Hamburg, Journalism and communication science, Hamburg, Germany

Generative AI (GenAI) represents a significant shift in how we interact with AI technologies. Users have historically engaged with AI indirectly through computational systems and interfaces that mediated the interaction. Now they communicate with AI directly through natural language, experiencing its fluent and contextually adaptive output as authoritative despite its well-documented tendency to produce plausible but factually incorrect responses. As a consequence, users frequently place a level of trust in GenAI output that exceeds its epistemic reliability. In this conceptual contribution, I argue that this tension arises from a widespread misperception of GenAI as a *paradoxically hot medium*.

Drawing on Marshall McLuhan's hot–cool media continuum, hot media deliver high-definition information that requires minimal audience participation, whereas cool media are low-definition and demand active interpretation to complete meaning (McLuhan & Gordon, 2003). In essence, hot and cool media differ in their informational density and, crucially, in their demandingness on recipients (Anton, 2014; Boulding, 1967). Dominant cultural and technical narratives frame AI as brain-like yet epistemically superior to human cognition, more rational, precise, and less prone to error (Campolo & Crawford, 2020; Floridi & Nobre, 2024). Interface and design choices actively humanize GenAI systems through conversational formats, affective rhetoric, and emotionally expressive language (Guzman & Lewis, 2020; Maeda & Quan-Haase, 2024), contributing to GenAI's perceived hotness as a medium.

To explain why this is a misperception, I draw on the thermosensory phenomenon of Paradoxical Heat Sensation (PHS) (Mitchell et al., 2023), in which the nervous system misinterprets cold temperature as heat on the skin. Just as sensory perception can diverge from physical reality, media temperature can diverge from underlying structure. GenAI produces precisely this misalignment: it appears hot while remaining fundamentally cool. GenAI outputs are uncertain, ambiguous, and often miscalibrated, requiring users to interpret, verify, and critically evaluate generated content on a case-by-case basis. Yet it appears hot through design choices that combine multiple cognitive and perceptual faculties at scale and speed. The fluency and surface-level reliability of outputs hide GenAI's probabilistic nature, making responses feel self-sufficient and authoritative. This impression obscures the demandingness of the medium. GenAI mimics hot media's defining characteristic- delivering information in ways that appear to require minimal audience participation- even though the underlying epistemic structure demands active interpretation. In McLuhan's terms, the medium feels hot because it appears to extend multiple human senses simultaneously in high definition, even though meaning remains underdetermined and participation remains necessary.

Critical scholarship has raised concerns that such dynamics erode epistemic truth and influence independent judgement (Hamed et al., 2024; Araujo et al., 2020). Yet the problem is not user incapacity, but the medium's deceptive appearance. By framing GenAI as a *paradoxically hot medium*, this paper shifts critique from user deficits to medium effects. Open questions remain. What would it take for GenAI systems to feel and look fundamentally cool, to signal their low-definition, probabilistic nature and invite active participation in meaning-making? This reframing invites new thinking about how to design GenAI interfaces that signal and enact its cool, low-definition nature.

ARS11 AI and Audiences - Heat, Health and Hate

PP 0661 Artificial intelligence–driven mental health chatbots: User perspectives on adoption, engagement, and privacy

Hina Bashir[1]

[1] University of Salzburg, Communication, Salzburg, Austria

The global rise in mental health issues has increasingly highlighted the need for interventions that are accessible, efficient, and scalable. Artificial intelligence (AI) driven mental health chatbots such as Woebot, Wysa, and Tess are emerging as

technology-mediated tools that provide psychoeducation, mood tracking, and low-intensity mental health support (D'Alfonso, 2020; Prakash et al., 2020; Caldarini et al., 2022). These tools have the potential to complement traditional services and address persistent barriers, including affordability, social stigma, and limited availability of healthcare providers (Naslund et al., 2017; Lund et al., 2018).

Despite their growing visibility and potential benefits, user adoption and continued engagement with AI-driven mental health chatbots remain inconsistent. Prior research indicates that users frequently encounter challenges such as repetitive or impersonal interactions, limited perceptions of empathy, and reduced trust in AI-driven mental health solutions (Haque & Rubya, 2022). These experiences can shape how users engage with chatbots over time and may influence their willingness to rely on such systems for mental health support. Understanding users' perspectives on AI adoption, engagement, and privacy-related trade-offs is therefore essential for the development of interventions that are both effective and acceptable within technology-mediated mental healthcare contexts (Aceto et al., 2018; Krishnamoorthy et al., 2023). In addition, there is a need to examine how users themselves perceive processes of adaptation, everyday usage, sustained engagement, and potential privacy concerns when interacting with AI-driven mental health chatbots. This study is informed by two complementary theoretical frameworks: the Unified Theory of Acceptance and Use of Technology 2 (UTAUT2) (Venkatesh et al., 2012) and Privacy Calculus Theory (PCT) (Culnan & Bies, 2003). UTAUT2 is employed to examine factors influencing adoption and use, including usability, effort expectancy, social influence, and facilitating conditions. Privacy Calculus Theory provides an additional perspective by focusing on how users evaluate perceived benefits and perceived risks when deciding whether to share personal information with AI-driven technologies. Together, these frameworks allow for a more nuanced analysis of both adoption behaviour and privacy-related decision-making.

Furthermore, insights from ICT-mediated communication research are used to conceptualise AI-driven mental health chatbots as communicative agents rather than neutral technological tools. This body of research highlights the relational and interactive dimensions of chatbot use, emphasising how such systems can influence user engagement, decision-making processes, and the development of trust (D'Alfonso, 2020; Caldarini et al., 2022). This perspective enables an examination of how communication dynamics shape users' experiences of AI-mediated mental health support.

A qualitative research design was adopted, combining a literature review with semi-structured interviews conducted with Woebot users recruited through convenience sampling. Semi-structured interviews were carried out to explore participants' motivations for adoption, experiences of engagement, and views on privacy. Additional data sources included user narratives, reflective accounts, and chatbot interaction logs collected over a period of 15 days. The data were analysed using thematic analysis (Braun & Clarke, 2006) to identify patterns related to adoption behaviour, privacy considerations, and communication dynamics. Particular attention was given to relational, cognitive, and trust-building aspects of user–chatbot interactions.

ARS11 AI and Audiences - Heat, Health and Hate

PP 0662 Audience hate and human-AI interpretive gaps in an influencer crisis

Camelia Cmeciu[1], Camelia Cusnir[1]

[1] University of Bucharest, Faculty of Journalism and Communication Studies, Bucharest, Romania

Audiences increasingly participate in shaping the visibility, legitimacy, and moral accountability of influencers and brands. When influencers engage in perceived transgressions, online publics mobilize affect, judgement, and collective criticism, creating rich terrains for reception and meaning-making research. This study investigates how audiences construct hate and moral blame in response to the widely debated crisis involving Romanian influencer Sânziana Negru and Lidl. Building on research on influencer crises (Sng et al., 2019; Rynarzewska et al., 2025; von Mettenheim & Wiedmann, 2023), brand hate (Kucuk, 2021; Kumar et al., 2023; Odoom et al., 2024; Zhang & Laroche, 2020), and online aggression (Blitvich, 2024; Cmeciu, 2025; Droz-dit-Busset, 2022; Yasmin et al., 2025), we analyse Instagram comments collected before and after the influencer's deleted apology post.

We apply a three-tier hate typology (soft, moderate, hard) to examine how audiences evaluate the influencer's behaviour, negotiate responsibility, and expand their criticism from the individual to the partnering organization. To interrogate how meaning is captured (or lost) through computational tools, we compare human-coded interpretations with classifications produced by a large language model (LLM). The comparative analysis reveals significant human-AI divergences: human coders better identify contextual cues such as irony, cultural references, and moralizing discourse, whereas AI tools (e.g., ChatGPT-5) overestimate moderate hate and struggle with implicit, affectively nuanced evaluations (Ahmed et al., 2022; Breazu et al., 2024; Curry et al., 2024; Gillings et al., 2024). These discrepancies highlight how audiences articulate complex layers of judgement that resist reductive algorithmic categorization.

The findings contribute to audience and reception studies by showing how digital publics co-produce narratives of blame, negotiate moral expectations toward influencers and brands, and engage in affective participation during crisis events. Moreover, the human-AI comparison underscores the methodological stakes of studying audience discourse in an era where automated tools increasingly mediate what researchers and organizations perceive as "public sentiment." The study

calls for a critical integration of computational and human-centred approaches to better understand how audiences make sense of influencer transgressions and express antagonism in digital environments.

PP 0663 Explaining AI adoption in science communication: A comparative UTAUT analysis across scientists, communicators, intermediaries and citizens

Gerta Lokaj[1], Xiran Liu[1], Damiano Lombardi[1], Daniela Mahl[1], Sophia C. Volk[2], Mike S. Schäfer[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland
[2] Ludwig-Maximilians-Universität München, Department of Communication and Media Research, Munich, Germany

Rationale

Artificial intelligence (AI) is increasingly shaping science communication, affecting how scientific information is produced, mediated, and accessed within contemporary media environments (Guzman & Lewis, 2024; AUTHORS, 2025). Recent research has examined both the use of AI in science communication and how it is perceived by different actors. However, much of this work remains descriptive or focused on single actors, offering limited insights into the mechanisms underlying AI adoption across the broader science communication landscape.

We draw on six large-scale, national surveys conducted in Switzerland, covering six actor groups involved in the *production* (1. communication professionals working at research, higher education, or science-related organizations; 2. scientists), *intermediation* (3. Wikipedians; 4. science content creators; 5. science journalists), and *reception* (6. citizens) of science communication. The study builds on the Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh et al., 2003), a well-established framework for explaining technology adoption across diverse contexts, and applies it to AI use in science communication using a comparative perspective. We assume that AI perceptions differ between experts and the public (Bao et al., 2024), making groups comparisons particularly interesting. We ask:

RQ1: To what extent does UTAUT explain AI adoption in science communication?

RQ2: How does the explanatory strength of UTAUT and its components vary across the six groups?

Methods and Data

Data collection spans November 2025 to March 2026, with respondents being recruited through collaborations with institutions, professional associations, and communities of practice, complemented by curated mailing lists, snowball sampling on social media platforms, and third-party polling companies. The study draws on data from 2,000 citizens, with expected samples of approximately 250 respondents for the other groups, except science content creators and science journalists, resulting in an estimated total sample of at least 3,000 respondents. All surveys are conducted in German, French, Italian, and partly in English.

Across all surveys we adapted the core UTAUT predictors *performance expectancy*, *effort expectancy*, *social influence*, and *facilitating conditions* using two items each (Venkatesh et al., 2003; 2012; cf. Trang et al., 2024). We measured *behavioral intention* and *use behavior* as outcome variables, as well as the moderators *age*, *gender*, and *use experience*. Items were adapted to the specific actor groups while preserving comparability.

Data analysis will rely on multi-group structural equation modeling to test the UTAUT hypothesis structure (RQ1) and analyze similarities and differences in explanatory power across groups (RQ2). The study has obtained ethical approval and is in the process of preregistration. The authors have not yet accessed the data.

Expected Contribution

This study offers theory-driven insights into AI adoption across key actor groups involved in the production, intermediation, and reception of science communication. By systematically comparing the explanatory power of UTAUT across actors, it contributes to a more differentiated understanding of AI-driven change in contemporary science communication. The comparative analysis will inform actor-specific approaches to supporting, training, and governing the adoption of AI, while also assessing the scope and limits of UTAUT by exploring additional factors that shape AI adoption.

ARS11 AI and Audiences – Heat, Health and Hate

PP 0664 Atmospheres of email spam

Hario Priambodho[1]

[1] Lund University, Communication, Lund, Sweden

As our online worlds shift and expand at an exponential speed, it is still worth considering technological features that already exists but are oftentimes hiding in plain sight. Email spam is one of these features whose continued existence illustrate an online reality mired by potential hazards that can potentially have implications on the offline reality. Although email spam is often recessed into the background or dismissed as digital noise, this paper will argue they still contain untapped insights in how media audiences are able to engage emotionally with digital media and how it shapes their perception on online content. The paper revolves around the central question: *What emotions do media users feel when encountering email spam and how are atmospheres of trust/distrust constituted?* Through qualitative interviews with Swedish residents, the study will explore how cultivated technological fluency and cultural contexts shape audiences' feelings and emotions when encountering email spam. It grounds itself in the theory of technological capital (Romele 2024), atmospheres (Böhme 2017), but also the notions of felt experiences around technology (Bucher 2018; Ruckenstein 2023) to elucidate how an experiential study on media audiences and email spam can offer new insights into how digital content is felt, interpreted, and perhaps resisted. This paper advances the idea that by gaining knowledge on audiences' perception on email spam, we can shed light on how digital media texts are able to generate an atmosphere of trust or distrust, which in turn may provide additional wisdom in countering practices of reality distortion such as dis/misinformation campaigns that have been rampant in contemporary society. It invites a discussion on how we might reframe digital spam –such as email spam in this case- not merely as a technical issue but shift towards an understanding that spam is in essence a cultural and affective phenomenon embedded in everyday media practices.

ARS12 Trust, Disorder and Reception

PP 0665 Shifting grounds of gendered meanings. European youths' reception of serial dramas in transnational media environments

Louise Brix Jacobsen[1], Paola De Rosa[2]

[1] Aalborg University, Department of Culture and Learning, Aalborg, Denmark
[2] LINK University, Department of Human Sciences, Rome, Italy

Within contemporary media and audience studies, serial dramas have become a crucial lens through which to understand how cultural meanings surrounding gender and diversity are shaped, circulated, and debated. Through their long-form storytelling, character development, and sustained engagement with social themes, these narratives are recognised as dynamic cultural spaces in which questions of identity, relationships, and belonging are both mirrored and reinterpreted. In doing so, they bring together well-known gendered patterns and more progressive portrayals, reflecting the tensions that characterise current discussions about gender and diversity.

Drawing on research carried out within the EU research-action project GEMINI-Gender Equality though Media Investigation and New training Insights (CERV-2022-GE), this paper examines how these dynamics unfold among European upper secondary school students, focusing on their everyday engagement with serial dramas and on the ways such texts intersect with their understandings of gender-related issues.

Empirically, the study draws on 15 focus group interviews involving 190 students aged 16–19 in Denmark, Ireland, Italy, and Romania. This qualitative, cross-national approach enables an exploration of three interconnected dimensions: 1) the social and cultural contexts shaping young students' attitudes toward gender; 2) their interpretations of how gender and diversity are represented in serial dramas; 3) and their perceptions of whether and how these narratives influence their views and behaviour.

Findings show that students are best understood as transnational audiences whose media repertoires combine globally circulating serial dramas with national productions, and that engagement with gender-related content is strongly mediated by family, peers, school environments, and digital networks. Two interconnected paradigms emerge. First, students value the "normalization" of diversity, appreciating representations that present gender and sexual diversity as ordinary and authentic rather than exceptional or overtly didactic. Second, participants articulate a discourse of "minimal media effects", emphasising that serial dramas rarely change their personal beliefs but instead tend to confirm existing viewpoints. However, rather than signalling media irrelevance, this limited influence points to subtle forms of connection, in which serial dramas offer emotional and symbolic resources that support everyday reflections on diversity.

By foregrounding audience interpretations on these shifting grounds, the paper contributes to audience and reception studies by showing how young people actively negotiate paths of meaning-making, and translate global media narratives into locally resonant understandings. In doing so, the study argues for a context-sensitive understanding of media influence, highlighting the role of serial dramas in fostering reflexive, if incremental, cultural change within uncertain and fragmented media environments.

ARS12 Trust, Disorder and Reception

PP 0666 Diffuse trust in times of polycrisis: Czech Television as keystone media

Lukáš Slavík[1], Lucie Čejková[1], Jakub Macek[1], Marína Urbániková[1]

[1] Masaryk University- Faculty of Social Studies, Department of Media Studies and Journalism, Brno, Czech Republic

Trust in media is essential for their ability to fulfill informational and integrative roles, especially during crises (Melki & Kozman, 2021; Usher, 2020). A body of research has explored trust in the media (Aharoni, 2025) and documented fluctuations in media trust under disruptive conditions (Adam et al., 2023; Knudsen et al., 2023), yet the reasons behind its stability in times of crisis remain unclear even though it was particularly public service media that tended to maintain stable trust during the recent polycrisis formed by the COVID-19 pandemic and the impacts of the war in Ukraine (Henig & Knight, 2023; Newman et al., 2020, 2021, 2022). We examine the causes of this stability and suggest a possible path for conceptualizing stable trust in public service media (PSM).

Drawing on and adapting the classical distinction between diffuse and specific support (Easton, 1975) for public institutions, we theorize that trust in PSM may either stem from long-term institutional significance (diffuse trust) or from short-term performance during crises (specific trust). Empirically, we conduct an exploratory case study focused on Czech Television, the Czech public service media, and investigate whether its stable trust reflects continuity in the drivers of trust or whether crises alter these effects, with some factors enhancing trust and others diminishing them, ultimately balancing each other out.

Using three representative cross-sectional surveys from the Czech Republic (2019, pre-crisis, N = 3,251; 2020, COVID-19 pandemic, N = 3,763; and 2022, war in Ukraine, N = 2,340) and hierarchical regression analysis, we analyze how socio-economic, media-related, and socio-political drivers (Fawzi et al., 2021; McLeod et al., 2017; Tsfati & Ariely, 2014) of trust in Czech Television evolved before and during the polycrisis. Media-related variables consistently exhibited the strongest positive drivers of trust, particularly trust in most media, trust in journalists, and adherence to normative standards of professional media work. News consumption frequency had only a marginal effect. Socio-economic factors were similarly marginal. Among socio-political variables, antipathy toward the European Union was the most persistent and intensive negative driver of trust, while other variables showed minor volatility or negligible effects.

Based on our analysis, we argue that the relative continuity of these drivers suggests that trust in Czech Television predominantly has a diffuse character, anchored in audiences' long-term experience and perceived societal value rather than short-term crisis performance. The composition of active drivers leads us to propose a modified concept of keystone media (Nielsen, 2015) as a tool for explaining and conceptualizing diffuse trust in PSM. In this view, trust in PSM acts as a nodal point within the media ecosystem, setting benchmarks for quality and professionalism through regulated, non-commercial governance. Furthermore, the everyday relevance behind diffuse trust may be rooted in programming beyond news including extensive locally produced educational and entertainment content delivered with situational adaptability to changing contexts. We also discuss the limits of keystone-based diffuse trust, which may stem from perceived politicization and bias among viewers who see PSM as favoring pro-European, pro-liberal, and pro-Western positions at the expense of national concerns.

ARS12 Trust, Disorder and Reception

PP 0667 Disordered social media use and eating disorders: A survey study on the role of self-objectification and body appreciation

Lena Maria Küpper[1], Felix Reer[1]

[1] University of Muenster, Department of Communication, Muenster, Germany

In the broad field of research on social media and body image, the question is increasingly arising as to how addictive forms of use, also known as disordered social media use (DSMU), are linked to the onset and persistence of eating disorders

(ED; Mader et al., 2023). In our study, we examine this relationship using a quota sample of German internet users. To gain a deeper understanding of the underlying mechanisms, we consider self-objectification and body appreciation as explanatory factors.

We understand self-objectification as the socio-culturally learned perception of one's own body as an object evaluated by third parties, which is often reinforced by the consumption of idealized media content (Fredrickson & Roberts, 1997). Corresponding beliefs and behaviors can be reinforced by social media use (Watson et al., 2016), impair one's own body image, and are considered a risk factor for ED (Schaefer & Thompson, 2018). In contrast, a respectful view of one's own body reduces the risk of developing an ED (Linardon et al., 2022). Based on theoretical considerations and existing studies, we model the relationship between DSMU and ED as a serial mediation, whereby increased DSMU is associated with higher self-objectification, which, in turn, is related to less body appreciation and a higher risk of ED.

Method

A professional survey institute recruited a sample of 1,424 German internet users (quotation criteria: age, gender, region) via an online panel. Only social media users were included in the analysis (N = 1,358; average age: 43.0 years; 688 women, 662 men, 8 diverse). Validated scales were used, showing good reliabilities (Cronbach's $\alpha > .80$). The assumed serial mediation model was estimated using SPSS PROCESS (Model 6), and indirect paths were tested using bootstrapping.

Results

A significant effect of DSMU on ED was found: people who use social media in a disordered manner are more likely to show symptoms of ED. One explanatory factor for this is the increased self-objectification associated with DSMU. Our analysis shows that DSMU is associated with a stronger tendency to view one's own body as an object to be evaluated. Self-objectification is directly associated with an increased risk of ED and is also associated with less body appreciation, while a higher body appreciation is associated with fewer symptoms of ED. The indirect paths from DSMU via self-objectification to ED, and from DSMU via self-objectification and body appreciation to ED are also significant, so that self-objectification and body appreciation can be assumed to be explanatory factors (partial mediation) of the relationship between DSMU and ED.

Discussion

One limitation of our study is its cross-sectional design, which does not allow for causal conclusions. However, the effects examined are theoretically and empirically sound. One strength is the large quota sample, replicating the findings of earlier studies using smaller, less diverse samples. Valuable conclusions for future studies and preventive or therapeutic practice can be drawn from the correlation shown between DSMU and ED and in particular from the mediating effects of self-objectification and body appreciation.

ARS12 Trust, Disorder and Reception

PP 0668 Ambivalent use of technology and digital well-being: An audience-centered European perspective

Maria del Mar Grandío[1], Elena De Lara Gil[2], Rocío Zamora[2]

[1] University of Murcia, Information and Communication, Murcia, Spain
[2] University of Murcia, Comunicación, Murcia, Spain

AbstractThe growing centrality of digital technologies in everyday life has intensified scholarly attention to digital well-being, particularly from an audience and reception perspective that foregrounds how users experience, interpret, and negotiate their everyday digital practices. This study examines the relationship between intensive technology use and perceived digital well-being among adult audiences, adopting a comparative European approach grounded in reception studies and Uses and Gratifications Theory. Drawing on data collected from more than 3,000 adult Internet users in Spain, Italy, and the United Kingdom, the research explores how digital gratifications and adverse effects coexist across personal, professional, and social domains of everyday life. Rather than focusing exclusively on the intensity of technology use, the study emphasizes audiences' subjective perceptions and meanings, capturing both enabling dimensions—such as functionality, connectivity, and productivity—and problematic experiences, including perceived dependency, information overload, cognitive fatigue, and difficulties in maintaining boundaries between online and offline life. The study is conducted within the framework of the European University Alliance EUniWell, situating the analysis within a broader European context concerned with digital well-being, social impact, and responsible technology use. This cross-national perspective allows for the identification of shared patterns and contextual differences in how adult audiences relate to digital technologies across Europe. The findings reveal a markedly ambivalent reception of digital technologies among adult audiences. While digital media are widely perceived as essential resources for work organization, social connection, and everyday coordination, these benefits coexist with persistent concerns about constant connectivity and its effects on attention, autonomy, and well-being. Importantly, the results indicate that perceived digital well-being is not directly determined by the amount of technology use, but by how audiences manage and integrate digital media into their daily routines. By foregrounding audience experience and a European comparative perspective, this study contributes to audience and reception research by extending Uses and Gratifications Theory to account for ambivalence and negotiated outcomes in digital media use. It underscores the value of European university alliances such as EUniWell for advancing interdisciplinary and socially relevant

approaches to digital well-being and points to the importance of media literacy initiatives that support reflective, balanced, and sustainable forms of digital engagement.

ARS12 Trust, Disorder and Reception

PP 0669 "I'm reactionary like no other!" – Humor as a coping and well- being strategy among older adults struggling with digital media

Mia-Marie Hammarlin[1]

[1] Lund University, Department of Communication, Lund, Sweden

When interviewing Swedish citizens aged 75 and older (21 participants) about the challenges of having to handle digital devices in everyday life, both resistance to digitalization and a sense of loneliness became evident. Many interviewees seemed to manage these difficult feelings with humor, also those who had a computer or a smartphone and the sufficient skills to use them. They were critical of what they described as the "absurdly fast technological development" and called themselves "old fashioned", "reactionary", and "stupid", with a tangible sense of irony.

These older adults were all well aware that digital communication has become the default format for interaction between people and the welfare system in Sweden, as well as for solving everyday practical issues, such as parking, public transportation, and managing bank accounts. As a result, they relied heavily on so-called warm experts to navigate everyday life (Olsson & Viscovi 2018; Søgaard Nielsen 2025). Research shows that expressions of humor play an important role for those who feel excluded from opportunities to engage as citizens (Doona 2020), perhaps particularly so when individuals lack the digital skills and knowledge required for basic civic engagement.

This presentation aims to understand expressions of self-defeating (lowering), self-enhancing (boosting), and affiliative (social bonding) humor in the data, seen as variants of older adults' coping strategies (Damianakis & Marziali 2011). As humor is often multifaceted and ambivalent, the humor categories are investigated through the implicit emotions they encompass, connected to identity and community construction, with a special focus on senses of inclusion and exclusion. In this respect, the interviewees' use of dark humor is important to understand as it helps people to engage with the experience of loss, at least momentarily. Dark humor is not a superficial response, but "an attempt to articulate the impact of grief and ascribe meaning to loss" (Murray 2016: 55). However, dark, self-defeating humor might appear affiliative but can be harmful to one's self-esteem.

Hakkarainen (2012: 1211) briefly mentions that older adults use numerous images to describe themselves as non-users, articulated in humorous, self-deprecating manners, describing themselves as having "fallen off the boat" and being "past expiry date", but does not delve into the deeper meaning of such expressions. Life satisfaction studies more frequently address these issues but not from a citizenship perspective. There is a research gap to fill here.

ARS13 Influence and Influencers in Digital Landscape

PP 0765 "Because he drives electric, I will too" – The impact of celebrities in advertising on consumer acceptance of electric vehicles

Anika Herzig[1]

[1] Julius-Maximilians-Universität Würzburg, Media and Business Communication, Würzburg, Germany

Electric vehicles (EVs) are not fundamentally a new technology but are gaining social relevance due to global climate and environmental goals (Vimal et al., 2024. Political measures, such as the EU target to allow only zero-emission vehicles from 2035 (European Parliament, 2023), aim to speed up the shift to cleaner mobility and help fight climate change. Nevertheless, setbacks can be observed. For example, a decline in new EV registrations in Germany (ADAC, 2025). In addition to technical (Mpoi et al., 2023) and financial (Bhat et al., 2024) barriers as well as socio-economic factors (Yang et al., 2023), general consumer reluctance toward new technologies is a key obstacle to EV acceptance (Rahma et al., 2025). Targeted communication strategies may help reduce prejudices (Ouyang et al., 2020).

A common marketing strategy is celebrity endorsement. Celebrity endorsers can attract attention and influence attitudes as well as purchase and usage intentions (McCormick, 2016; Spry et al., 2011). Credibility and attractiveness are key mechanisms (Osei-Frimpong et al., 2019). Although celebrity endorsement research is well-established (Bergkvist & Zhou, 2016), few studies examine celebrity endorsement effects on product innovations (Biswas et al., 2006), especially in innovative vehicle technologies (Myrick et al., 2019). Research on EV acceptance mainly addresses usage barriers (Yang et al., 2023), while communicative factors remain underexplored (Ouyang et al., 2020).

This study investigates whether celebrity advertising can increase EV acceptance. Theoretically, it integrates the Source Credibility Model (Hovland et al., 1953) and the Source Attractiveness Model (McGuire, 1985) into the Technology Acceptance Model (TAM; Venkatesh & Davis, 1996). Credibility and attractiveness are assumed to positively influence perceived usefulness and perceived ease of use, which in turn determine behavioral intentions toward EVs.

An online survey was conducted with N = 427 participants (M = 25.30, SD = 6.52, 50% female), aged 18 or older and holding a class B driving license. The stimulus was a commercial featuring former football coach Jürgen Klopp promoting an EV (*Opel Corsa-e*). Measures included testimonial credibility (α = .90) and attractiveness (α = .83), perceived usefulness (α = .90), perceived ease of use (α = .68) and behavioral intentions (α = .88) toward EVs. Data were analyzed using structural equation modeling.

Model fit indices indicated a limited fit (χ^2/df = 4.59, RMSEA = .09, NFI = .79, CFI = .82). Credibility significantly affected perceived usefulness (β = 0.17, p = .006) and ease of use (β = 0.20, p = .003). Attractiveness had no effect on usefulness (β = 0.09, p= .162) or ease of use (β = 0.10, p = .156). Ease of use positively influenced usefulness (β = 0.21, p < .001). Neither usefulness (β = 0.76, p = .784) nor ease of use (β = 0.02, p = .844) predicted behavioral intentions.

In summary, the results emphasize the importance of celebrity credibility for evaluating innovative technologies. Behavioral intentions toward EVs, however, cannot be explained only by TAM constructs and are likely influenced by other external factors such as technical and financial barriers.

ARS13 Influence and Influencers in Digital Landscape

PP 0766 Performing victimhood, fueling outrage: audience negotiations of deservingness and victimhood in the Nordic welfare state through the scandalization of Danish influencer Cathrine Wichmand

Eva Frijns[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Influencer scandals have become key sites where online audiences negotiate moral norms and political values, including claims to victimhood. As social media influencers, they are highly visible and subject to constant public scrutiny, making them more susceptible to scandalization, particularly when their social position conflicts with dominant expectations of authenticity and deservingness (Enli, 2015; Trottier, 2019). Yet, influencers are rarely recognized as legitimate victims within processes of scandalization (Valenzuela-García et al., 2023). In a digital media context, scandals function as arenas where audiences debate transgressive acts and moral boundaries, often grounded in particular cultural and political contexts (Adut, 2008; Hammarlin, 2021). This paper examines how audiences negotiate moral and political norms, welfare deservingness and claims to victimhood through an influencer scandal in the context of the Nordic welfare state.

To explore these dynamics, this paper empirically focuses on the case of Danish influencer Cathrine Wichmand, who sparked moral outrage after revealing on Instagram that she, due to her ADHD diagnosis, received municipal aid for a personal assistant to support her work as a fashion entrepreneur. Although framed by Wichmand as an authentic disclosure, her claim to victimhood and deservingness of welfare support clashed with the national public's expectations of welfare recipients. As a result, it triggered a broader debate in Denmark on the deservingness of welfare support and privilege. Subsequent attempts to diffuse the backlash and reframe herself in legacy media as a victim of unjust online hate paradoxically intensified the scandalization process, highlighting the contested legitimacy of victimhood and deservingness.

Drawing on theories of influencer logic and authenticity (Kristensen & Jerslev, 2025; van Driel & Dumitrica, 2021), deservingness in the Nordic welfare state (Attewell, 2020) and the 'ideal victim' (Christie, 2018; Valenzuela-García et al., 2023), I argue that audiences actively negotiate and evaluate who can claim victimhood and deserves welfare support, based on the cultural expectations of vulnerability and respectability. Methodologically, the paper draws on a thematic analysis of the top 50 comments from six Reddit threads in r/InfluencergossipDK and r/GossipDK (n = 300), as well as the top 50 comments on the two Instagram posts in which Wichmand responded to her scandalization (n = 100).

Preliminary findings show that online audiences framed Wichmand as undeserving of support and inauthentic, arguing that she failed to acknowledge her perceived privilege and benefited from the system at the expense of others. As a result, her claim to victimhood was delegitimized in discussions across social media platforms. More broadly, this paper contributes to audience and reception studies by demonstrating how social media audiences negotiate welfare norms and victimhood. The case further highlights how influencer scandals make visible shifting boundaries of deservingness and the contested social position of influencers.

ARS13 Influence and Influencers in Digital Landscape

PP 0767 Simulating alternative and traditional media influence in a fragmented digital landscape

Maud Reveilhac[1], Rieser Rebekka[2]

[1] LUT University, Department of Social Sciences, Lappeenranta, Finland
[2] Public Sphere and Society, Department of Communication and Media Research, Zurich, Switzerland

This study presents an agent-based model that simulates the evolution of media trust and opinion dynamics within a competitive information landscape. The model builds on theories of cognitive rebalancing, social embeddedness, and influence hierarchies, while extending these perspectives with contemporary research on algorithmic gatekeeping, selective and incidental exposure, and influencer-driven persuasion in networked publics. Theoretically, it integrates classic accounts of conformity and spiral-of-silence dynamics with minority influence and credibility-based persuasion, allowing majority pressure, minority consistency, and trust asymmetries to operate simultaneously rather than in isolation. Agents in the model are characterized by a media preference and an attitudinal trait, and they update their states through three interdependent processes: (1) cognitive rebalancing, where dissonance between attitudes and media trust probabilistically reshapes preferences; (2) social influence, shaped by tie strength (close-peer effects), charisma and homophily (influencers), and reputational pressures such as fear of disapproval or social exclusion; and (3) structural constraints defined as the initial share of traditional and alternative media consumers, as well as a constant share of news avoiders. These mechanisms allow the model to distinguish between influence driven by normative conformity and influence driven by credibility and cognitive internalization. All simulation scenarios are accessible through an accompanying interactive Shiny application, which allows users to vary key parameters and directly observe how micro-level assumptions translate into emergent macro-level dynamics. Simulation experiments reveal that macro-level outcomes depend less on initial group sizes than on the configuration of normative pressure and credibility. When direct majority influence is present, reputational conformity and spiral-of-silence dynamics rapidly consolidate traditional media dominance, confining alternative media to small but resilient enclaves. Removing direct majority pressure produces stable coexistence, as numerical advantage alone proves insufficient to generate further consolidation. In contrast, high trust in alternative media enables a dispersed minority to exert strong indirect influence, triggering gradual but sustained growth that can ultimately reverse majority–minority hierarchies. Together, the findings demonstrate how decentralized interactions between cognitive mechanisms, social influence, and credibility structures generate emergent patterns of dominance, pluralism, or minority-driven realignment. The model contributes to media-effects theory by clarifying when alternative media remain marginal, when pluralistic equilibria persist, and when credibility-driven minority influence allows alternative outlets to scale into majority positions within fragmented information environments.

ARS13 Influence and Influencers in Digital Landscape

PP 0768 The influence of short video content in the sense making of societal challenges under conditions of epistemic uncertainty

Elisa Haralampides[1]

[1] University of the Bundeswehr Munich, The Institute of Educational Sciences – Chair of Intercultural Communication and Conflict Research, Munich, Germany

This paper explores how young people make sense of societal challenges through short-video content on algorithmically curated social media platforms in times of epistemic uncertainty. Short-video formats such as Instagram Reels, TikTok, and YouTube Shorts have become central sites of everyday meaning-making. Beyond entertainment, short videos function as sources of information about social and political issues, including social polarisation, economic insecurity, elections, migration, and war.

Building on qualitative empirical data, the paper examines how audiences engage with short-video content and how they perceive, interpret and integrate mediated information into their everyday sense-making of society. Rather than engaging with content in isolation, young people describe their media use as an ongoing interaction with what they refer to as “the algorithm.” The study shows that audiences give agency to algorithmic systems and perceive them as actors in their social media environments. Drawing on Actor-Network Theory, the paper conceptualises social media use as part of a socio-material collective in which human and non-human entities jointly participate in the mediated construction of reality.

A central analytical focus lies on processes of knowledge construction under conditions of epistemic uncertainty. In an information environment increasingly shaped by misinformation, emotionally charged content, and AI-generated material, young people face growing challenges in assessing the credibility and relevance of information encountered in short-video formats. Drawing on Berger and Luckmann’s sociology of knowledge, the study examines how new information is interpreted and integrated into existing stocks of knowledge.

Preliminary findings indicate that young people predominantly rely on plausibility-oriented sense-making strategies rather than validation-oriented sense-making strategies when engaging with short-video content. Credibility assessments are often based on the source and the content of information. In a social media environment, platform-specific indicators such as numbers of views, followers, and likes also play a significant role in young people’s plausibilisation strategies.

In addition, participants frequently draw on what Berger and Luckmann describe as common-sense knowledge. They evaluate information with the help of their "gut feeling," "common sense," or "logical thinking" to overcome the epistemic uncertainty they are in. Comment sections play a particularly significant role, as they provide socially shared interpretations and therefore serve as a collective frame for assessing the credibility of short-video content.

The empirical basis of the study consists of qualitative research conducted at a vocational school in Germany. Semi-structured interviews were conducted with 20 students in July 2025. In addition, participant observation was employed to capture situated meaning-making processes: participants scrolled through their short-video feeds together with the researcher on their preferred platforms. The dataset currently comprises approximately 25 hours of audio recordings and 5 hours of video material.

Positioned within a constructivist and interpretive research paradigm, the project follows a Grounded Theory approach that emphasises the iterative interplay of data collection, analysis, and theory building. The paper contributes to audience and reception studies by offering a socio-material perspective on algorithmically mediated meaning-making and by empirically examining how audiences navigate epistemic uncertainty and negotiate knowledge in everyday encounters with short-video content.

ARS14 Engagement With Generative AI

PP 0874 Making sense of the imitation game: Communicative authority in student interactions with AI chatbots

David Mathieu[1]

[1] Roskilde University, Department of Communication and Arts, Roskilde, Denmark

This paper presents the main lines of a research that reframes authority in Generative AI (GAI) communication by questioning the relevance of the concept of "epistemic authority" (Jäger, 2025) as grounded in relations of truth and knowledge, and instead introducing the notion of "communicative authority": the capacity of GAI chatbots to imitate convincing conversations that seem knowledgeable, supportive, and responsive.

GAI has entered everyday life most visibly through conversational interfaces such as *ChatGPT*, which promise help, personalization and immediacy. While debates have focused on accuracy, bias and the training of large language model, this research addresses a different question: how do non-expert users such as students assess the authority of GAI outputs as they lack the epistemic resources to verify these outputs?

The research hypothesizes that users come to accept GAI outputs as trustworthy based on the success of its "imitation game" (Turing, 1950). To explore this idea, I first draw on linguistic (Roman Jakobson's six functions of language, 1978) and discourse analysis (James Paul Gee's seven building tasks, 2025) to analyse how chatbots enact communicative authority through i.e. phatic friendliness, conative guidance, metalingual explanations, and stylistic mimicry of academic discourse. Such communicative design simulates expertise and fosters trust, even when epistemic warrant is opaque. Next, the research draws on Hall's Encoding/Decoding model (1980) and Schrøder's multidimensional model of sense-making (2000) to analyze how students decode this "imitation game", accepting, negotiating, or rejecting outputs based on perceived communicative adequacy.

Methodologically, the study combines discourse analysis of student-GAI chat protocols obtained through data donation with a reception study based on semi-structured interviews with university students and think-aloud sessions on those protocols. Specifically, I aim to examine how students accept outputs when communicative authority appears sufficient, negotiate outputs through additional prompting or repair strategies when it does not, and reject outputs when authority cues fail or conflict with their own positions or needs. The focus on students is motivated by their heavy use of GAI in learning contexts and by their novice status relative to epistemic expertise involved in learning contexts.

This research moves GAI scholarship toward an audience perspective, showing that authority in human-machine communication is a communicative achievement first, and only secondarily an epistemic one for many non-expert users. Reframing authority as communicative carries significant implications for literacy, democracy, and broader societal concerns. As epistemic and communicative authorities become conflated, the danger is an intensification of post-truth dynamics. Truth and knowledge may recede as priorities, while the emphasis shifts to making communication appear acceptable, personalized, and immediately relevant, underscoring the urgency of equipping users to critically interrogate not only what GAI says, but how it says it.

ARS14 Engagement With Generative AI

PP 0875 How audiences envision the societal impact of AI: A study of attitudes and imaginaries

Brita Ytre-Arne[1], Hallvard Moe[1]

[1] University of Bergen, Department of information science and media studies, Bergen, Norway

How do audiences envision the impact of artificial intelligence (AI) on society, and what do they have in mind when making such considerations? To answer these questions, we analyse quantitative and qualitative data from a representative citizen survey panel in Norway, by applying a folk theory approach.

Currently, contradictory imaginaries of AI co-exist in academic scholarship and public debate, including dramatic and transformative scenarios. Our paper contributes to research on evolving sociotechnical imaginaries of AI, but instead of analysing narratives or public communication, we highlight ordinary citizens' considerations of emergent technologies, with a people-centred approach (Lomborg et al, 2023) and future-looking perspective (Hepp, 2025). As different applications of AI become prolific, it is difficult to know which concrete or imagined examples that inform attitudes. For audience scholars, it is essential to understand how different experiences with AI in mediated communication relate to societal imaginaries.

Our theoretical approach is folk theory analysis, building on former work on perceptions of algorithms (Ytre-Arne and Moe, 2021). Folk theories are intuitive causal theories people construct to explain the world (Gelman and Legare, 2011) and envision abstract and specific impacts. We draw on this framework in audience-focused analysis of AI, exploring how citizens relate to optimistic and pessimistic discourses, and which timescales and examples they refer to when envisioning the future impact of AI.

Methodologically, we analyse data from the Norwegian Citizen Panel, which regularly asks a representative sample of the Norwegian population to evaluate the direction society is taking, and assess the positive and negative impacts of different factors. In early 2025, approximately 60 percent responded that they found AI to have a somewhat positive, positive or very positive impact on society, indicating a high prevalence of techno-optimism. But what do such figures really mean? In late 2025, we repeated the question with an added prompt for open-ended replies, asking respondents to explain in their own words what they had in mind, including different consequences and short and long-term timescales.

Through this integration of qualitative data into a representative population survey, we contribute to a deeper understanding how audiences envision the role of AI in transformative media environments.

ARS14 Engagement With Generative AI

PP 0876 Sailing uncharted AI waters: How early adopters navigate normative expectations around AI chatbots

Thilo Von Pape[1], Etienne Yerly[1], Camille Rollinat[1]

[1] University of Fribourg, Department of Communication and Media Research DCM, Fribourg, Switzerland

The arrival of the generative AI chatbot ChatGPT in 2022 confronted early adopters with a distinctive challenge of appropriation: expansive claims about the technology's civilization-shifting potential—voiced in celebratory and alarmist discourses—combined with a minimalist textbox interface. Not since Apple's 2009 claim that the iPhone offered "an app for just about anything" has such hyperbolic projection been paired with so limited design direction. While subsequent years brought new models, features, paid tiers, a mobile app, and a GPT Store, these developments offered little additional orientation regarding appropriate use. At the same time, accompanying discourses in mass media, educational institutions, professional contexts, and everyday interpersonal communication sent inconsistent descriptive and injunctive signals about the legitimacy of chatbot use.

This study examines how early adopters of ChatGPT navigated these conflicting and shifting normative expectations over the course of their appropriation in 2024 and 2025: where did users look for guidance, and which conditions of use and normative frames did they attend to or distance themselves from? How did these orientations evolve as both the technology and its surrounding discourses continued to change?

Empirically, we draw on two waves of hour-long semi-structured interviews conducted in 2024 and 2025 with 15 early adopters from Switzerland (7 female, 8 male; aged 20–26). Our participants were university students as typical early adopters of communication technologies, but the analysis extends beyond study-related practices to diverse everyday uses. We performed a thematic content analysis of the interview transcripts using the collaborative tool *Dedoose*. Initial coding categories were deduced from an established heuristic on the dynamic appropriation of smartphones (goals sought, attitudes, descriptive and injunctive norms, constraints, forms of metacommunication, and use of device features; Wirth et al., 2008), enhanced by Human–Machine Communication scholarship on relationships with AI and meaning-making. These categories were refined and extended inductively, with all transcripts double coded.

Our participants described their ongoing appropriation in reference to observations and discourses from interpersonal, institutional, and mediated contexts. We identified patterns in how users relied on these references, following the metaphorical conceptualization of norms as navigational tools (Morris et al., 2015).

- In the **autopilot mode**, users relied on perceived descriptive norms through largely unreflected practices that avoid normative risks.
- In the **radar mode**, users oriented themselves toward perceived injunctive norms, actively monitoring social expectations among different identity-relevant groups, and strategically signalling and adjusting their use across these contexts.
- In the **compass mode** (added in our inductive analysis), users guided their practices through internalized personal norms, such as ethical principles, relatively independent of situational social cues.

While many participants' trajectories showed a shift from radar-based navigation (wave 1) toward autopilot use (wave 2), our analysis also revealed countervailing trajectories and parallel reliance on multiple modes. These patterns differ from smartphone appropriation, where norm orientation had quickly stabilized into a dominant autopilot mode. Rather than stabilizing linearly, the three modes remained relevant as chatbot practices entered new normative contexts (e.g., through voice interactions). Our presentation maps these trajectories and their context-dependency to visualize the nonlinear dynamics of AI chatbot appropriation.

ARS14 Engagement With Generative AI

PP 0877 "It's a Swiss Army knife": A social-constructivist account of generative chatbots use

Jan Pácl[1], Jakub Macek[1]

[1] Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Since the release of ChatGPT in November 2022, text-based generative LLM chatbots have become a part of people's everyday lives. However, the interactions of ordinary users with chatbots have received little attention in contemporary research, as the focus is primarily directed at specific user groups, such as students or customers. Furthermore, the vast majority of the scarce research on ordinary users employs psychological frameworks, whereas the social-constructivist perspective is largely absent. The resulting categorizations of chatbot usage and motivations for use lack the context of users' lived experiences, which is critical for a comprehensive understanding of chatbots' relevance for them. By employing the concept of use genres, which considers the act of technology use as a situated, typified, and meaningful action, this article provides a rich and detailed account of chatbot usage embedded in the everyday lives of ordinary users (N = 18) in the Czech Republic. The research conducted in 2025 utilized semi-structured interviews to collect data, which were subsequently analyzed using reflexive thematic analysis. The results indicate that several factors—including the nature of users' occupations, the (non)existence of routine and overall stability in their lives, the people around them, societal narratives about artificial intelligence, and user-technology relations—influence the actual usage of chatbots. Furthermore, the analysis enabled the articulation of six genres of chatbot use that were typical for participants included in the study. These comprise initial or long-term experimentation and the gradual identification of real-life applications, performing routine tasks connected to office jobs or education, getting help with tasks requiring specialized knowledge and skills the users did not have, acquiring fast and comprehensive advice anywhere and anytime, utilizing chatbots for brainstorming, planning, constructive feedback, and further minute assistance with their inputs, and having more-than-human conversations. Each of these categories encompasses diverse uses, motivations, actors, and objects, connected by typical situations in which users have found themselves. Consequently, this research provides a non-reductive insight into the usage of text-based generative LLM chatbots, centered on ordinary users and their everyday situated practices.

ARS14 Engagement With Generative AI

PP 0878 Adolescent's engagement with generative AI: A user typology

Christina Ortner[1], Christine Trültzsch-Wijnen[2], Sascha Trültzsch-Wijnen[3]

[1] University of Applied Sciences Upper Austria, Communication and Knowlegde Media, Hagenberg, Austria
[2] Salzburg University of Education Stefan Zweig, Institute for Impulses in Education, Salzburg, Austria
[3] University of Salzburg, Department of Communication, Salzburg, Austria

Since the release of ChatGPT, we have experienced an increase of easy-to-use generative AI applications (GAI), which commonly offer a free version accessible for everyone. This leads to increasing use among children and adolescents (Stoilova et al., 2025; Zhang et al., 2025). The most popular GAI practices among this target group are asking questions, doing homework and searching for entertainment (Picton et al., 2025). Studies on young peoples' GAI use address a variety of topics, including children's development and well-being (Hashem et al., 2025), trust in GAI (Solyst, 2024), teenagers' emotional reactions to GAI (Vandenbosch & Schreurs, 2025), parental mediation of GAI use (Zhang et al., 2025, Yu, 2025), or the use of GAI in educational settings (Coblentz et al., 2025; Bao et al., 2025; Isodori et al., 2024).

Despite these diverse strands of research on young people's engagement with GAI, studies often focus on specific situations or single parts of the holistic ways in which young people interact and engage with GAI, and how they appropriate this technology in the context of their daily lives. Hence, our main research interest lies in the perspective of adolescents, aiming to identify the tasks for which GAI is used, as well as associated imaginaries of GAI including hopes, fears, and ideas of a future with GAI. Therefore, we conducted 42 interviews with Austrian adolescents aged between 13 and 17 years, as part of a broader international qualitative comparative study in 14 European countries. Participants were purposefully recruited on the principle of highest heterogeneity.

Within the Austrian sub-sample, which is in the focus of this contribution, we developed a typology of adolescent's engagement with generative AI, based on the following factors: knowledge, reflectivity of use, and variety of use. Self-confidence in dealing with GAI tools, and imaginaries of a future with GAI emerged as additional factors that helped explain and describe four types of adolescents' GAI engagement (experts, experienced users, pragmatic users, insecure users). Age, gender, formal education, and SES were not associated with the affiliation to these types. However, enabling parental mediation and co-using appeared to be relevant, as adolescents who experienced such media education at home, were more likely to be experts or experienced users.

ARS15 Seeking Information in AI Environements

PP 0979 The disclosure dilemma: How AI disclosure shapes advertising evaluations in social media contexts

Laura Müller[1], Neil Thurman[1]

[1] University of Munich LMU, Department of Media and Communication, Munich, Germany

The rapid diffusion of generative artificial intelligence (AI) in advertising has intensified debates about transparency and the ethical implications of AI-generated content (AIGC). As platform-specific requirements and regulatory developments—such as the EU AI Act—increasingly mandate explicit labelling of AIGC, advertisers face growing pressure to disclose AI involvement.

Prior research suggests that such disclosure may negatively affect advertising effectiveness (Baek et al., 2024; Wortel et al., 2024). However, the psychological mechanisms underlying these effects remain insufficiently understood, particularly in the context of social media advertising (Koning & Voorveld, 2025).

Drawing on AI aversion literature, effort heuristic theory, and prior work on advertising creativity, this study investigates how different AI disclosure labels shape consumer attitudes toward advertisements, examining consumers' perceptions of the effort and creativity invested in the advertisements' production as underlying mechanisms.

A between-subjects online survey experiment (N = 316) was conducted in which each participant viewed an Instagram-style advertisement with one of three disclosure conditions: No label, AI-generated, or Human-AI Collaboration. Ad attitudes, perceived effort, and perceived creativity were measured using semantic differential scales. Mediation and serial mediation analyses were employed to test the hypothesized relationships.

The results reveal a clear AI disclosure penalty: advertisements labelled as involving AI were evaluated less favourably than unlabelled ads. Both perceived effort and perceived creativity significantly mediated the relationship between AI disclosure and ad attitudes. Moreover, the findings support a serial mediation pathway in which AI disclosure reduces perceived effort, which in turn lowers perceived creativity, ultimately leading to less favourable ad attitudes. Contrary to prior work, we find that labelling the ad as a Human-AI Collaboration did not mitigate the negative effects of AI involvement. Advertisements with the AI-generated and the Human-AI Collaboration labels did not differ significantly in terms of ad attitudes, perceived effort, or perceived creativity.

This study contributes to communication and advertising research in three ways. First, it extends AI disclosure research to the social media advertising context, where disclosure cues are often processed under low-attention conditions. Second, it identifies perceived effort and perceived creativity as robust, interrelated serial mechanisms shaping evaluations of AI-generated advertising content. Third, it contributes to emerging debates about the effectiveness of Human-AI Collaboration labels as an AI-aversion mitigation strategy, suggesting that minimal cues may be insufficient in low-attention digital environments.

Overall, the findings highlight a disclosure dilemma for advertisers, showing that transparency about AI involvement can undermine ad evaluations by lowering perceptions of effort and creativity.

ARS15 Seeking Information in AI Environements

PP 0980 Conversational AI vs. news media as sources of political information- An experimental study on the effects on trust, knowledge acquisition, and cognitive dissonance

Fatemeh Asadi Pour[1], Claudia Wilhelm[1]

[1] University of Vienna, Communication, Vienna, Austria

Conversational generative AI, such as ChatGPT, has become an increasingly embedded part of contemporary information-seeking, with significant relevance to social and political processes. With generative AI models continuously evolving and undergoing rapid technological advancements, the number of users approaching it for information-seeking purposes are rising. Generative AI is therefore transforming how citizens encounter, process, gain, evaluate and acquire information. While prior research has examined the accuracy of AI-generated information on news and political topics, its integration into journalistic practices, and general perceptions and levels of trust in AI- generated content (Simon et al., 2025), little is known on how conversational AI functions as an information source compared to online news media, and shapes political knowledge acquisition, trust formation and political education processes. Further, research on how various factors such as

the AI's output tone and style as well as user characteristics such as political leaning, prior interest, knowledge and attitude towards the topic, may play a role in this process is still scarce.

This study addresses these gaps by investigating how different characteristics of political information outputs and individual user characteristics shape political knowledge acquisition, trust, engagement, and attitudes. Focusing on the topic of transgender rights, as a current and highly contested and polarized political issue, the project examines how AI-based and journalistic political information is perceived and processed under varying conditions of source, tone, and response completeness. The study relies on the theoretical frameworks on trust and cognitive dissonance theory (Festinger, 1957), allowing for an analysis of how engagement with AI-generated content on political news shapes informational trust, attitudinal alignment with the content, or creates dissonance.

An online survey with a between-subjects experimental design (N ≈ 1,200) among adult German online users with prior experience using AI tools will be conducted in March 2026. Participants will be randomly assigned to one of five experimental conditions that vary (1) information source (conversational AI vs. online news article), (2) tone (factual/formal vs. opinionated/less formal), and, specific to AI, (3) response completeness (informative response vs. refusal/non-response). The stimuli will consist of screenshots of AI-generated responses or journalistic articles presenting political information on transgender legislation.

In light of the current global political climate, marked by the rise of populism and right-wing ideologies alongside rapidly evolving conversational AI models, vulnerable to manipulations and misinformation, understanding how conversational AI shapes political information processing and knowledge gaining, trust, engagement, and the experience of cognitive consonance or dissonance in different contexts and scenarios (e.g., different tones, non-response/refusal) has become increasingly crucial.

PP 0981 Coping with opinion-challenging information through communicative AI: A mixed-methods study of conversational information seeking with ChatGPT

Evelyn Jonas[1], Monika Taddicken[1]

[1] TU Braunschweig, Institute for Communication Science, Braunschweig, Germany

In online information environments, users may encounter opinion-challenging information (Steinfeld & Lev-on, 2024), which can evoke cognitive dissonance (Festinger, 1962). Prior research shows that when coping with such dissonance using traditional search engines, some users struggle during the orientation phase of information seeking, resulting in prolonged emotional discomfort (Wolff & Taddicken, 2024). Communicative artificial intelligence (ComAI), such as ChatGPT, may help overcome such challenges by offering a dialogical, personalized, and simplified mode of information search (Schäfer, 2023). However, it also raises concerns regarding confirmation bias, fueled by hypercustomization, reduced source visibility, or sycophantic responses (Lopez-Lopez et al., 2025).

Against this backdrop, this study investigates how regular users of ComAI search for information on nuclear power after encountering opinion-challenging content. Specifically, it examines (RQ1) how users approach dissonant information when using ComAI, and (RQ2) whether and how ComAI users draw on a broader online information repertoire beyond ComAI.

This preregistered laboratory study conducted in July/August 2025 at a German university combined screen-captured information search tasks, post-exposure walkthrough interviews, and standardized surveys. Participants were 50 regular ComAI users from the general public (29 women; 26 with a university degree; age range 18–65, M = 30.62, SD = 11.85), who were initially skeptical toward nuclear power. During participation, they were exposed to a video proposing three arguments in favor of nuclear power. Participants subsequently searched for information using ChatGPT, with the option to consult other online sources. Walkthrough interviews followed key phases of the information search process (Kuhlthau, 1991), while pre-, mid-, and post-surveys assessed affective responses to the stimulus and information search, and attitudinal changes toward nuclear power.

First findings indicate that ComAI supports users in completing information searches perceived as satisfactory, with participants rarely restricting themselves to explicitly opinion-confirming content. Attitudes toward nuclear energy also became significantly more positive, yet still skeptical, after exposure and remained more favorable following information search. However, users tended to rely mostly on ChatGPT and consulted alternative online resources less frequently. After the information search, positive affect significantly exceeded negative affect, particularly feelings of confirmation, suggesting a reduction of cognitive dissonance.

Overall, while ComAI can help to reduce cognitive dissonance by facilitating manageable and satisfying information searches, users' strong reliance on a single conversational interface highlights the need to rethink information-seeking models, ComAI design, and information literacy under conditions of conversational information access.

ARS15 Seeking Information in AI Environements

PP 0982 Chatting with biased bots: Impacts of gender stereotypes and counter-stereotypes in chatbot interactions

Alexandra Wölfle[1], Desirée Schmuck[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

While chatbots have become increasingly integrated into everyday life, increasing concerns are being raised regarding gender stereotypes in their outputs. For instance, studies employing the *Stereotype Content Model* (Fiske et al., 2002) show that the stereotype of women being warmer and less competent than men also shapes AI models (Schuster et al., 2025; Sun et al., 2023). Further, *Stereotype Priming* (Blair & Banaji, 1996) suggests that exposure to such stereotypes may impact individuals' self-perception, while *Stereotype Threat Theory* (Steele & Aronson, 1995) highlights potential implications for performance in stereotyped domains. Yet, newer AI models exhibit less gender bias (Chua et al., 2025) and may even risk overcompensating in their attempts to mitigate bias, creating counter-stereotypical outputs (Fulgu & Capraro, 2024). This study thus seeks to explore the possible impacts of gender stereotypes as well as counter-stereotypes on users' self-perception, self-evaluation, and performance.

Method

We conducted a laboratory experiment with female students ($N = 371$, $M_{age} = 25.89$) in Austria in December 2025. Participants were randomly assigned to interact with either a stereotypical, a counter-stereotypical, or a control chatbot for 7 minutes (for details, see online appendix: https://osf.io/2dsy6/files/osfstorage?view_only=b5f9edab6090417381d7b31c1a21cb57). Subsequently, we measured participants' warmth and competence self-perception (McCarty & Burt, 2024) as well as their self-evaluation regarding social sensitivity (Chen et al., 2018) and cognitive ability (Rammstedt & Rammsayer, 2003). We further utilized subsets of the *Reading the Mind in the Eyes Test* (Baron-Cohen et al., 2001) and the *International Cognitive Ability Resource* (Condon & Revelle, 2014) to assess performance in stereotyped domains. For exploratory purposes, we also measured participants' bias perception (Messingschlager & Appel, 2025), trust (Gulati et al., 2019), and usage intention (Wang et al., 2023) of the chatbot. The study was preregistered (https://osf.io/zqayj/overview?view_only=400a8a7e20c146a88d4f149c82242665) and IRB approved.

Key findings

The stereotypical chatbot was perceived as most focused on warmth, while the counter-stereotypical chatbot was seen as giving recommendations most centered around competence, indicating successful manipulation. We analyzed the data using structural equation modelling (see online appendix for details). The structural equation model ($CFI = 0.94$, $RMSEA = 0.04$) shows that participants who interacted with the counter-stereotypical chatbot self-evaluated their cognitive ability as significantly higher ($b = 0.29$, $p = .045$) compared to the control group. Yet, we found no significant differences between participants who interacted with the stereotypical or counter-stereotypical chatbot and the control group in terms of participants' self-perception, social sensitivity self-evaluation, and performance in stereotyped domains. An exploratory analysis using SEM ($CFI = 0.93$, $RMSEA = 0.07$) additionally shows that the stereotypical ($b = 0.62$, $p < .001$) and counter-stereotypical ($b = 0.35$, $p = .013$) chatbots were perceived as significantly more biased than the control chatbot. Further, participants' usage intention was significantly lower ($b = -0.34$, $p = .028$) for the counter-stereotypical chatbot compared to the control group.

Limitations and implications

Although our study has certain limitations, notably regarding the sample, it has relevant implications for both researchers and AI developers. Our findings indicate that the overcorrection of gender bias may have positive implications for self-evaluation, yet at the expense of reduced usage intention, underscoring the need for balance in AI development. Our results further suggest that longitudinal research may be required to assess potential long-term effects.

ARS15 Seeking Information in AI Environements

PP 0983 AI competence in practice: Divides in information-oriented engagement with generative AI

Monika Taddicken[1], Esther Greussing[1], Evelyn Jonas[1], Irene Broer[1]

[1] TU Braunschweig, Institute for Communication Science, Braunschweig, Germany

Research on digital inequality has shifted from disparities in physical access to differences in audiences' skills, usage, and outcomes. The emerging AI divide can be understood as a continuation of these dynamics, with recent studies indicating that women, older adults, and individuals with lower levels of education are less likely to use generative AI (GenAI) tools such as ChatGPT (Suárez & García-Mariñoso, 2025). At the same time, GenAI tools introduce new demands. Because they generate content through opaque processes and simulate communicative agency, meaningful engagement requires not only instrumental use but also the ability to critically assess machine-generated content – especially when using it for information purposes. Hence, this study places AI competence at its core and conceptualizes it as a multidimensional construct encompassing knowledge about AI, AI-related skills and usage practices, and attitudes toward AI (Carter et al., 2020; Wang et al. 2025).

Research on the AI divide has predominantly relied on self-reported measures of perceived AI competence (e.g., Wang et al., 2025), offering limited insight into how individuals actually engage with GenAI tools in practice. To address this limitation, the present study combines survey data with behavioral evidence from a real-time information-oriented interaction with a GenAI chatbot. Specifically, the study investigates (1) how socioeconomic and demographic factors are associated with differences in AI competence, (2) which population segments differ systematically in their configurations of AI competence, and (3) how these segments engage with a chatbot during an information-oriented task.

Empirically, the study draws on a preregistered online survey conducted in October 2025 with a quota-based sample of 1,500 adults representing the German population in terms of age, gender, and education. Besides established self-report measures of AI competence and socioeconomic and demographic characteristics, respondents completed a task-based interaction with a GenAI chatbot embedded in the survey interface. The interaction involved acquiring information about either nuclear energy or young adults' social media use. Interaction logs captured how users engage with AI-generated content during the interaction. Results indicate that socioeconomic and demographic differences are reflected across the dimensions of AI competence. Latent profile analysis identifies distinct competence segments that differ not only in self-reported knowledge and attitudes, but also in how they interact with the chatbot during the task. Integrating self-reported and behavioral data, the study demonstrates how social inequalities translate into qualitatively different forms of everyday communicative engagement with generative AI, thus advancing our understanding of divides related to media use.

ARS16 Young Audiences and News

PP 1080 How do young adults value and organize Generative AI in everyday life? A repertoire approach

Julie Vulpius[1]

[1] Roskilde University, Department of Communcation and Arts, Roskilde, Denmark

Communicative interactions between humans and genAI systems have rapidly become an everyday experience for large groups of people. Tools as ChatGPT are increasingly woven into ordinary practices including studying, information seeking, creative work, interpersonal communication and emotional self-support. Rather than appearing as discrete technological innovation, genAI is encountered through situated, repeated practices that are integrated into everyday routines. However, less is known about how users themselves make sense of these practices, how they differentiate between them, and how they evaluate what forms of AI use are meaningful, appropriate, or problematic in everyday contexts (Ofcom, 2025)). Accordingly, this paper employs a repertoire-approach (Brown 1993) and asks: How do young adults organize, prioritize, and value different genAI practices in everyday life?

Recent research on genAI increasingly foregrounds its role in everyday life, showing how AI practices are domesticated through mundane routines. Across empirical contexts, we see users actively interpret and negotiate their AI practices rather than simply adopting technologies as neutral tools (Ammari et al., 2025; Maeda & Quan-Haase, 2024, Depounti & Natale, 2025). This sense-making work involves ongoing negotiation of trust, responsibility, and legitimacy, as well as reflections on dependence, effort, and ethical boundaries (Shin et al., 2024). Additional research suggests that users' understandings of genAI often blur distinctions between instrumental use and relational engagement (Ammari et al., 2025). Together, these studies point to generative AI as a set of situated practices whose meaning and value are continuously negotiated in everyday life.

Extending these insights, this paper offers a repertoire-based perspective to capture how genAI practices are organized and made meaningful in everyday life. While existing studies document a wide range of AI-related activities, they often focus on individual practices in isolation. A repertoire approach instead examines how users combine, prioritize, and shift between different AI practices across situations, revealing how everyday uses are structured in relation to users' values, norms, and context.

Empirically, the paper draws on a mixed-method research design combining Q-sort methodology, think-aloud protocols, and semi-structured interviews with young adults. Participants are invited to sort a set of cards representing diverse generative AI practices, such as information seeking, academic assistance, creative exploration and emotional support using a forced-ranking grid. By requiring participants to prioritize certain everyday AI practices over others, the Q-sort elicits not only patterns of engagement but also participants' valuations of different forms of AI use (Brown, 1993). Combined with participants' verbal reflections during the sorting process, this approach captures how perceptions, priorities, and normative orientations toward generative AI practices are articulated through everyday sense-making.

This way, the paper contributes an audience-oriented account of how AI practices are made meaningful in daily life through constellations of practices shaped by values, norms, and situational constraints.

PP 1081 Now sense of place: A socio-technical approach to the transforming information practices of young adults

Stina Bengtsson[1]

[1] Södertörn University, Media and Communication Studies, Huddinge, Sweden

This paper addresses contemporary audiences of news and digital information from a socio-technical perspective. News and information practices are transforming across the world, particularly among young audiences, and explaining factors that have been put forward are for example 1) the unwillingness to pay for news, 2) the massive amount of news and information flooding contemporary audiences, and 3) the negative character of news journalism. In this paper I take a different approach and depart from Benedict Anderson's *Imagined Communities: Notes on the Spread and Origin of Nationalism* (1983), to analyse young audiences use and meaning making of news and other kinds of information. Anderson put forward four key aspects of early print culture that made nations and nationalism possible: 1) changes in the use and understanding of languages, 2) the transformation of the meaning of power and territories, 3) synchronisation of time, and 4) the spatial logic of print capitalism.

In relation to news and information they are essential as they also show in which cultural dimensions that technological change made *journalism* possible: *language*, *space* and *time*. Building on classic and contemporary media research (Meyrowitz 1986; Massey 1994; Bucher 2020; Lupinacci, 2022, Reynolds, 2025, etc.) I use these three categories to analyse 67 phenomenological interviews with young Swedish adults (18–26 years old). The analysis shows that 1) the young adults seamlessly use online news and information in Swedish, English (and sometimes other languages) to find information about the world they find relevant, 2) they construct relevance based on personalised spatialites, following their own and connected others' experiences of places, paralocal relationships to places, and a topics-based news interest, which guide what information about the world they find important to engage in, and 3) that they relate to a "personalised now" rather than a shared, or joint, now, making the newness of news relational and interest-based (rather than event-based). This is shown in everyday preferences and practices such as a personalised approach to the novelty of news, and tailored sharing and receiving of news, memes and information (to/from specific individuals and groups). This analysis explains, from a socio-technical perspective, young adults changing information practices, and contributes to our understanding of the struggles of contemporary news journalism.

ARS16 Young Audiences and News

PP 1082 Institutional constraints and digital news: How young people in residential care make sense of information

Teresa Castro[1], Maria José Brites[2], Maria João Carvalho[3], Margarida Maneta[2]

[1] Universidade Lusófona, Cicant, Lisboa, Portugal
[2] Universidade Lusófona, Cicant, Porto, Portugal
[3] NOVA School of Social Sciences and Humanities, Interdisciplinary Centre of Social Sciences, Lisboa, Portugal

Access to credible news and information (N&I) plays a central role in young people's civic participation, and construction of worldviews. However, youths living in formal residential care are particularly exposed to intersecting social, digital, and institutional inequalities that shape their trust in information. Drawing on the concept of the "inequality loop" (Ragnedda et al., 2022), this presentation focuses on how this scarcely studied population engages with N&I as audiences.

This gap is partly explained by restricted access to residential care settings (Author1, Author3 & Author2, Year) that are often under-resourced and face heavy caseloads, limiting institutional capacity to support research needs (Author3 et al., Year; Author2 & Author1, Year).

Three research questions guide this presentation: how do young people in residential care access news? which sources do they rely on to stay informed about world events? and how do perceptions of credibility and emotional responses to news shape their engagement, avoidance, or selective reception of information? Results draw on data from a nationally representative online survey conducted in Portugal with young people aged 15–24 (N = 1,362; 95% confidence level; 2.7% margin of error), focusing on a subsample of youths living in residential care institutions. We aimed for a sample of 100 young people in residential care institutions but few granted permission for survey application. The final subsample includes 75 youths aged 15–24 (M = 18.13; SD = 2.208).

Findings show that media and news practices in residential care are strongly shaped by institutional routines and rules. Television remains a central source of N&I, particularly during mealtimes, while social media dominate access outside institutional settings with participants reporting low levels of trust in online news, reflecting broader young audiences trends (Newman et al., 2025).

N&I verification practices rely primarily on peers, especially older institutional friends underscoring the importance of proximity-based trust in contexts marked by limited informational resources and support. Emotional responses to news are predominantly negative, with news often perceived as sad, biased, or overwhelming, leading to selective exposure and disengagement. Content preferences focus mainly on sports, celebrities, and influencers, reflecting gendered patterns and experiences of displacement.

Considering that young people are the first generation to grow up in environments of N&I overload structured by algorithms and platform logics (Author2 et al., 2024), this study demonstrates how institutional regulation and mediated access shape news reception, credibility assessments, and emotional engagement. These dynamics ultimately constrain news literacy and reinforce digital and civic inequalities among youths in residential care, perpetuating the inequality loop (Ragnedda et al., 2022).

ARS16 Young Audiences and News

PP 1083 Redefining news in everyday life: Generation Z audiences in the Italian media environment

Chiara Bresciani[1]

[1] Università degli Studi di Milano, Dipartimento di Scienze politiche- economiche e sociali, Milano, Italy

In contemporary hybrid and platformized media environments, the boundaries of what counts as news have become increasingly blurred. While much scholarship on Generation Z (often referred to as "Gen Z") has focused on patterns of news consumption—such as reliance on social media, selective exposure, and news avoidance—less is known about how young audiences themselves define and attribute meaning to news in everyday life. Yet, understanding these shifting perceptions is crucial, as they shape how information circulates, how journalistic authority is negotiated, and how democratic engagement is enacted in contemporary societies. Building on theories of media generations (Bolin, 2016; Hepp et al., 2017) and audience-centered approaches to journalism (Deuze & Witschge, 2020; Truyens & Picone, 2024), this paper argues that shifts in news perception—rather than consumption alone—are key to understanding Gen Z's evolving relationship with information. As digital natives who have grown up within a high-choice, algorithmically curated media environment, Gen Z audiences tend to encounter news embedded in social and visual flows rather than within clearly demarcated journalistic spaces. Previous research suggests that for younger audiences, the distinction between news, entertainment, and personal communication is increasingly fluid, with social networks and peer interactions playing a central role in determining

relevance and credibility (Edgerly & Vraga, 2019; Ray, 2023). These transformations challenge traditional, journalism-centered definitions of news and call for an audience-oriented reconceptualization of it (Peters, 2012; Swart et al., 2016).

The study focuses on the Italian context, where generational perspectives on news audiences remain comparatively underdeveloped despite profound transformations in the national media system. Adopting a qualitative, audience-centered methodology, the project combines digital news diaries with follow-up, in-depth interviews involving 30 Italian Gen Z participants selected through maximum variation sampling. Participants are asked to record over time everything they personally consider to be news, allowing the research to capture not only what content is encountered, but how news is subjectively recognized, categorized, and valued within their everyday routines. These diary entries are subsequently used as elicitation tools in interviews, enabling a reflexive exploration of the relationship between practices, discourses, and media infrastructures in Gen Z members' everyday life. By privileging Gen Z's lived experiences and interpretative frameworks, this paper contributes to audience studies debates on media meaning-making in conditions of platformization and mediatization of information. It argues that the urgency of studying Gen Z lies not merely in their changing consumption habits, but in their redefinition of news itself—an evolution with significant implications for trust, public knowledge, and democratic life. Understanding how young audiences make sense of news today is therefore essential for rethinking the role of journalism and public information in increasingly fragmented and personalized media environments.

ARS16 Young Audiences and News

PP 1084 'For you' and 'for us': How youth media practices challenge the post-mass media narrative

Marika Lüders[1]

[1] University of Oslo, Department of media and communication, Oslo, Norway

The idea that communal media experiences no longer exist is gaining traction. Writing from a US context, Lotz (2025) argues that the last couple of decades have been characterised by audience fragmentation, to the extent that the notion of mass audience no longer captures the reality of how people watch screen stories. Relatedly regarding social media, some scholars understand contemporary online culture as having reached a 'post-viral' state, reflecting how we are segregated into ephemeral groupings (Hagen et al., 2025), or clustered into fragmented publics based on interests rather than social ties (Gerbaudo, 2024). Young people are especially interesting in this regard, since their media practices have been formed during years where streamers and social media were already commonplace (at least in the Global North).

Following a cross-media approach, this paper examines the mediated publics young audiences are part of, how abundance and choice affect the types of media content youth turn to, and if different generations live in separate media worlds. Why does certain content resonate, that is, what is it about these cultural encounters that instigate feelings of being moved and affected, perhaps disturbed and repelled, or 'simply' entertained?

Based upon an interview study with 24 Norwegian teenagers, aged 15–19, the analysis brings forth how fragmentation is but part of what characterises contemporary media publics. The first part of the analysis portrays what TV shows and films participants like to watch and indicates that intra-generational differences are almost as substantial as inter-generational differences. These fragmenting tendencies exist alongside how some nation-gathering shows still bring audiences (across generations) together. The second part of the analysis addresses the common practice of exploring the back catalogues of TV and music streaming platforms. What binds an interest in old TV shows and old music is not a backward gaze but a platform-enabled horizontality of time, where the near-past is part of the shelf. The cultural consequence is twofold: adolescence is lived in temporally distributed publics, and taste formation stretches across generations. The final part of the analysis illustrates how social media facilitate flexible and layered publics. On the one hand, the 'For-you'-logic enables youth to assemble an 'inner circle' that mirrors their evolving self-concept. One the other hand, and somewhat contrary to Gerbaudo's thesis of clustered publics, the same recommender systems also surface peer-driven signals that keep users tethered to broader intersecting publics.

Ultimately, the paper argues that while 'mass audience' may have transformed, contemporary media life is defined not by total fragmentation, but by an interplay of algorithmic niches and shared cultural anchors.

CYM01 Methodologies for Youth Participation

PP 0071 Development and validation of the Digital Agency Scale for Adolescents (DASA)

Imran Khalid[1]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Adolescents' social media use is increasingly shaped by engagement-prolonging designs (EPDs) such as infinite scroll, autoplay, and algorithmically curated feeds. While social media can support connection and self-expression, these design features are deliberately engineered to maximise attention and time spent on these platforms, contributing to patterns of overuse that can interfere with sleep, schoolwork, and offline relationships. Importantly, emerging evidence suggests that negative outcomes are not necessarily driven by time spent on social media, but by how adolescents experience and (un)successfully regulate their use. This has led to growing interest in *digital agency*—the capacity to intentionally manage social media use in ways that align with one's goals and wellbeing. However, despite increasing theoretical attention, there is no agreed-upon conceptualisation or validated measure of digital agency that is tailored to adolescents navigating EPD-driven platforms.

The present study addresses this gap by developing and validating the *Digital Agency Scale for Adolescents (DASA)***.** Building on Passey et al.'s (2018) multidimensional framework and integrating recent work on agentic social media use, we conceptualise digital agency as consisting of three subdimensions: *Digital Confidence* (belief in one's ability to exert control over social media use), *Digital Competence* (knowing how to use platform settings to mitigate overuse), and *Digital Accountability* (willingness to prioritise control over social media use at the cost of short-term gratifications).

Scale development followed best practices and involved multiple phases. An initial pool of 27 items was generated through theory-driven deduction and expert review, then refined through cognitive interviews with nine adolescents aged 12–18. The scale was subsequently administered in a two-wave survey study with UK adolescents (Wave 1 $N = 543$; Wave 2 $N = 290$). Exploratory factor analysis supported a three-factor structure, and item reduction resulted in a parsimonious 12-item scale (four items per subscale). Confirmatory factor analysis demonstrated excellent model fit and showed that the three-factor model substantially outperformed one- and two-factor alternatives.

The final DASA demonstrated good internal consistency across each subscale and sufficient test–retest reliability. Validity analyses revealed that Digital Confidence and Digital Competence were related to lower levels of negative outcomes and higher levels of positive outcomes, whereas Digital Accountability was only associated with negative outcomes. Yet, Digital Accountability showed the strongest associations with taking actions to regulate one's social media use, suggesting that adolescents who experience the negative effects of social media are the most motivated to alter platform settings to regain control. Together, these findings highlight digital agency as a multidimensional construct with theoretically meaningful and practically relevant distinctions. The DASA provides a validated tool for advancing research on adolescents' social media use and for informing interventions aimed at fostering healthier, more intentional engagement with EPD-driven platforms, whilst also helping us to further understand the complex relationship adolescents have with social media.

CYM01 Methodologies for Youth Participation

PP 0072 How participatory research shapes adolescents' sense-making of data-driven technologies

Aline Duelen[1], Lotte Vermeire[1], Wendy Van den Broeck[1]

[1] Vrije Universiteit Brussel, imec-SMIT, Elsene, Belgium

This paper examines how Belgian adolescents (14–17 years old) make meaning of data-driven technologies and how these meanings shape their actions or inactions. In addition, we focus on questions and concerns that accompany adolescents' everyday engagements with such technologies, including Generative AI and AI chatbots, algorithmically steered platforms, and personalised recommender systems. While data and AI increasingly shape adolescents' everyday lives, decisions about data-driven platforms are often made without consulting them, and current curricula barely mention data-related competences. Strengthening young people's data and AI competences is essential for safe participation in a datafied society, with scholars stressing the importance of participatory and creative approaches to data education (Werning, 2020; Bhargava et al., 2022).

Therefore, the goal of this study is twofold. Firstly, we explore how adolescents (14–17 years old) in the Dutch-speaking part of Belgium experience their daily interactions with data-driven technologies. Secondly, we look at how engagement with participatory research influences their sense-making of these technologies. We therefore base our research on the following questions:

1. A) How do adolescents (14–17) understand and experience the presence of data-driven technologies in their daily lives?

2. B) How does engagement in participatory research activities influence adolescents' (14–17) sense-making of data-driven technologies?

We apply a multi-stage participatory approach, conducting individual semi-structured interviews with each participant focused on their current user practices of data-driven technologies. This is followed by two rounds of interactive focus groups with all participants (N = 60), exploring their questions, challenges, and needs. Each focus group will consist of 10 participants. During the first round of focus groups, we zoom in on participants' contextual knowledge and experiences with data and AI. The second round builds on the first by examining how participatory and interactive research formats contribute to shared understandings of everyday data practices. For both methods, we use creative and projective techniques (i.e., visual tools and cards, vignettes, and scenarios) to allow us to discuss complex and abstract issues of data-driven technology in adolescents' lives (Gauntlett, 2007; Rainford, 2019).

All data collection will be finalised by May 2026. During the conference, we will be able to give an overview of all results, from both the interviews and the focus groups. Preliminary analysis focuses on identifying recurring themes in adolescents' lives and explores how participatory formats shape collective reflection on data and AI practices. Building on these results, the study contributes empirical insights into adolescents' experiences with data-driven technologies, while also offering methodological reflections on participatory research as a space for youth sense-making. By foregrounding adolescents' voices, this study will give us insights for policymakers, educators, and community organisations to help young people better understand their digital and data environments.

CYM01 Methodologies for Youth Participation

PP 0073 How can we evaluate media literacy interventions with children (10–12 years old)? Methodological insights from a school-based mixed method study

Lemonie De Moortel[1]

[1]*imec-SMIT- Vrije Universiteit Brussel, Communication Sciences, Elsene, Belgium*

Media and digital technologies play an increasingly important role in many areas of our daily lives (Ytre-Arne, 2023), making the ability to critically, consciously and constructively engage with these technologies an essential skill. Over the years, a growing number of interventions, tools and educational programs have been developed to strengthen individuals' media literacy skills. However, assessing the effectiveness of media literacy interventions remains a complex task (Donoso et al., 2021), especially when such interventions target children. Drawing on the evaluation of a school-based media literacy program, this paper explores how different approaches can meaningfully capture children's experiences with media literacy interventions.

Between May and June 2025, an evaluation was conducted of '*De Schaal van M*', which is a school-based media literacy program developed by the Flemish Knowledge Centre for Digital and Media Literacy (Mediawijs). The program targets children in the last two years of primary education (10–12 years old) in Flanders and Brussels. Over a two-week period, teachers and pupils engage with a variety of media literacy topics using the program's educational materials. At the end, classes can also participate in a competition to be recognized as the "most media literate class of Flanders".

The evaluation took place in 10 schools across Flanders and Brussels. Three complementary data collection methods were used: a questionnaire, semi-structured interviews and a creative drawing task. The questionnaire assessed children's knowledge of the topics addressed during the program, while the interviews explored their experiences and reflections. The drawing task invited children to visually represent their associations with the program, oTering access to aspects of their experiences that may be diTicult to articulate verbally.

This paper adopts a reflective, methodological perspective. The evaluation of '*De Schaal van M*' is used as a case to explore the suitability, feasibility and limitations of diTerent methods for assessing media literacy interventions with children. The following research questions will be addressed:

1. How do different data collection methods (a questionnaire, interview and drawings) provide insights into children's experiences with a school-based media literacy program?
2. What methodological challenges and opportunities arise when using these methods to evaluate a media literacy program in a school-based context?
3. What is the added value of a creative method, such as drawings, in capturing children's experiences during the evaluation process?

CYM01 Methodologies for Youth Participation

PP 0074 Creative Engagement and Knowledge Co-production: Arts-Based Approaches with Young People from Vulnerable Communities

Ana Filipa Pereira Oliveira[1]

[1] Lusófona University, CICANT, Porto, Portugal

Conducting research with intergenerational vulnerable communities presents significant methodological and ethical challenges. Power dynamics, language barriers, and the marginalisation of specific age groups – particularly children and older adults – complicate efforts to grasp authentic voices and experiences (Doucet et al., 2021; Huard et al., 2024). Vulnerability emerges as a multidimensional, intersectional condition shaped by economic, social, environmental, and political factors converging across identity traits such as race, gender, class, age, and immigration status (Adger, 2006; Turner et al., 2003). Within vulnerable communities, individuals face deprivation, marginalisation, and potential exclusion that constrain their participation, access to resources, and community recognition (Taket et al., 2009; Xu et al., 2023). When vulnerability intersects with intergenerational dynamics, research complexity intensifies, as not all age groups possess equal capacity for verbal expression, and traumatic experiences often resist conventional linguistic communication (Coemans et al., 2015). Arts-based methods – encompassing visual arts, drama, music, photography, drawing, and performance – provide innovative pathways for engaging participants, exploring sensitive topics, and bridging linguistic and generational divides (Bagnoli, 2009; MacDonald & McMahon, 2017). These approaches position art not as an end product but as a medium within research processes that enables nonverbal expression, fosters creative communication techniques, and reduces power asymmetries between researchers and participants (Barone & Eisner, 2012; Lo & Wiseman, 2023). By facilitating knowledge co-creation, arts-based methods transform marginalised populations from research subjects into active knowledge producers, disrupting exclusionary dynamics perpetuated by traditional research frameworks (O'Neill et al., 2017; Strand et al., 2022).Building on this theoretical foundation, this paper discusses the practical application of arts-based methods within the STORYline project. This exploratory participatory action research project combines community-based research with ethnographic characteristics, aiming to deepen knowledge about intergenerational and youth citizenship. The research seeks to answer three central questions: 1) How do intergenerational relationships shape young people's experiences and perceptions of citizenship? 2) What influence do adult figures—particularly those present in non-formal educational contexts—have on young people's perspectives on citizenship? 3) What impact do digital media have on the construction of citizenship narratives? Through preliminary focus groups (conducted in November 2025) and arts-based workshops (to be held in February-March 2026) with participants aged 18 to 29, the project creates spaces to explore lived experiences and citizenship perspectives. Based on the experiences of these two phases of empirical work, this paper aims to explore the results as well as the empirical dimension that demonstrates that arts-based methodologies, when implemented with ethical reflexivity, represent transformative practices that value participant agency, facilitate authentic expression across age groups, and contribute to healing alongside knowledge production (Huard et al., 2024; Paterson-Young et al., 2025), while fostering possibilities for community action and social change (Purcell, 2009; Thiele & Marsden, 2003).

CYM01 Methodologies for Youth Participation

PP 0075 Reflective approaches to video game diversity: Engaging children in science communication

Ourania Ventista[1], Katharine Sarikakis[1], Grigoris Arkoumanis[1], Oleksandra Gudkova[1], Ayca Becerir[1], Lisa Baumgartner[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

This paper examines how research on character diversity in video games can be communicated to children through workshops that combine pedagogical innovation, participatory approaches, and reflective research practice. Science communication has been drawn an increasing attention, yet it has mainly focused on adult audiences outside academia (Buslón et al., 2020; Ruiz-Eugenio et al., 2023). As a result, children remain overlooked as legitimate stakeholders. This study recognises children as active citizens and participants in science communication. It positions them not only not as recipients of knowledge but as co-creators who can reflect critically on research and contribute insights that inform both practice and future scholarship.

In the context of video games, children are considered as current and future gamers, potential developers, industry actors, and parents in this study. Workshops were designed to communicate empirical findings on character representation and diversity into formats that are accessible, engaging, and actionable for children, enabling them to critically reflect on their experiences and perceptions of video games. This participatory approach challenges traditional deficit-oriented models of science communication, treating children not as passive recipients but as active contributors capable of co-creating knowledge (Bucchi & Trench, 2016). During the workshops, children engaged in discussions of representation, diversity, and equity in video games. The workshops encouraged critical thinking, ethical reflection, and awareness of broader social issues.

The study adopts a collective self-study methodology to promote reflexivity among researchers and support continuous pedagogical improvement. By reflecting on workshop design, implementation, and children's feedback, the research team

identified strategies to foster inclusive participation and enhance the effectiveness of science communication initiatives. Our findings demonstrate that children's engagement with research on character diversity in video games goes beyond understanding content. Children can be involved in co-producing knowledge, reflecting on personal experiences, and questioning social and cultural narratives about video games.

Moreover, by employing a collective self-study approach, the team evaluated their pedagogical decisions, refined their methods for communicating research to children, and adopted more inclusive and responsive practices. Based on findings from the workshops and self-study reflections, the study argues that children can participate in science communication as active citizens. It also demonstrates that science communication can be both participatory and ethically informed, effectively bridging research and everyday experiences.

CYM03 Young People's Mental Health and Wellbeing

PP 0181 Adolescents' self-diagnosis of mental illness in algorithmic social media environments: A cross-sectional study on predictors and protective factors

Hannah Bauer[1], Sophie Mayen[2], Anne-Linda Camerini[2], Kathrin Karsay[3], Ruth Wendt[1]

[1] Ludwig-Maximilians-Universität Munich, Department of Media and Communication, Munich, Germany
[2] Università della Svizzera Italiana, Faculty of Biomedical Sciences, Lugano, Switzerland
[3] University of Vienna, Department of Communication, Vienna, Austria

The increasing discourse around mental illnesses (MI) on social media shapes adolescents' perceptions in different ways: while MI content can increase awareness and support disorder recognition, algorithmic amplification of MI content may also foster biased interpretations. According to the *Prevalence Inflation Hypothesis*, frequent exposure to MI content can lead individuals to overestimate the prevalence of MI. As a result, they might interpret normal emotional experiences as pathological and engage in self-diagnosis (SD). Although SD can reflect accurate self-assessment, it entails risks when based on misinterpretation or lacking professional validation.

Research on SD in social media contexts has mostly relied on qualitative approaches, focusing on narratives, motivations, and attitudes toward SD. Quantitative evidence on the mechanisms linking exposure to MI content and SD, as well as on factors that may mitigate these effects, is scarce. Algorithm literacy (AL), including awareness of and knowledge about algorithmic mechanisms, may serve as a protective factor. As it has been associated with more critical media reception, AL may reduce unreflective internalization of MI information.

Guided by the *Differential Susceptibility to Media Effects Model* (DSMM), this study understands media effects as the result of dynamic interactions between individual (susceptibility) factors and media use. In our case, this means that adolescents' traits (e.g., developmental stage, prior knowledge) interact with their exposure to MI content to shape outcomes such as SD intentions. Applying this framework allows us to examine not only whether exposure to MI content affects SD, but also how both individual differences and media mechanisms influence the process. We focus on adolescents because they are not only highly active social media users but also in a critical phase of identity formation, increasing their susceptibility to media influences.

The primary aim of this study is to examine the associations between exposure to MI social media content and adolescents' SD intentions. We hypothesize that both incidental (H1a) and intentional exposure to MI content (H1b) are positively associated with SD intentions. Furthermore, we test whether these associations are mediated by an increased perceived MI prevalence (H2a,b) and by greater knowledge about MI (H3a,b). Finally, we examine if algorithmic awareness (H4) and algorithmic knowledge (H5) weaken the relationship between MI content exposure and SD intentions, acting as protective factors.

Analyses are based on cross-sectional data from the first wave of a three-wave longitudinal survey including approximately 1,500 adolescents aged 12–19 years from Germany, Austria, and Switzerland. Measures include exposure to MI content, SD intentions, perceived prevalence of MI, MI knowledge, and algorithm literacy. Using structural equation modeling, we will assess direct, indirect, and moderating effects. In exploratory analyses, we consider demographic and psychosocial covariates, representing individual susceptibility factors within the DSMM framework.

As T1 data collection has just concluded, findings will be presented at the conference and will offer novel quantitative insights into how algorithmic environments shape adolescents' interpretations of MI content. Examining underlying

mechanisms associated with SD, our results contribute to a deeper theoretical understanding of SD and offer practical implications for media literacy and mental health education.

[2] University of Alberta, Alberta School of Business, Edmonton, Canada

What is the appropriate timing for an adolescent to get his or her own smartphone? This question has become important in the current era, where connectivity has become almost inevitable. Previous studies have largely been grounded in the assumption that mobile media is detrimental, leading to recommendations that parents postpone children's smartphone adoption. However, recent studies found that people can perceive the positive effects of mobile media, and when the positive effects they perceive in the cognitive, emotional, and social domains outweigh the negative effects, they perceive a sense of digital well-being. Therefore, this exploratory study advocates a shift in focus from mitigating the negative effects of mobile media to fostering the positive outcomes of digital connection, examines the symbolic (a marker of "grown up") and instrumental (a social tool) values of the smartphone for adolescents, and seeks to identify family- and individual-level boundary conditions under which earlier smartphone adoption yields more positive outcomes for Chinese adolescents.

The data of this study come from the 2010, 2014, 2018, and 2022 Chinese Family Panel Studies. Participants aged 6–9 years old in 2010 and who completed all measurements for the key variables in all four waves of the study were selected as the sample for this study ($N_{Model\ 1}$ = 306, 49.7% girls; $N_{Model\ 2}$ = 336, 49.1% girls). Two multiple linear regression models were estimated, examining the symbolic (Model 1) and instrumental (Model 2) value of the smartphone, respectively. Model 1 showed that among children with higher self-esteem (+1 SD) and whose parents focus more on education (+1 SD), an earlier age of smartphone adoption was linked to a lower score of depression in late adolescence, b = -0.98, p = .003. Meanwhile, Model 2 showed that among girls whose family social connectedness was weak (-1SD), an earlier age of smartphone adoption during adolescence was linked to more time online in late adolescence, b = 32.58, p = .03. However, among girls whose family social connectedness was strong (+1SD) in pre-adolescence, an earlier age of smartphone adoption during adolescence was linked to less time online in late adolescence, b =-27.56, p = .09.

The results of this study revealed that earlier smartphone adoption was linked to lower depression in children with higher self-esteem and whose parents focus more on education (representing a "*guan*" culture of Chinese education), which could be because receiving a smartphone as *a symbol of "growing up"* could serve as a source of accomplishment during their high-pressure adolescence. In addition, the age of smartphone adoption had different effects on girls' online time, depending on their families' social connectedness. This could be because (compared with boys) girls place a greater emphasis on social interactions during adolescence; those whose families have a weak social connectedness (indicating a lower social interaction supply) more treated smartphones as *a social tool* for compensation. More detailed survey and interview studies should be conducted to further reveal the mechanisms behind the current exploratory results.

PP 0183 Parental mediation of media use: Effects of restrictiveness of rules on teens' social media practices and well-being/mental health

Florence Van Hove[1], Anh Nguyen-Danse[2], Gregor Waller[3], Mirjam Jochim[3], Benoît Bediou[2], Daphne Bavelier[2]

[1] University of Fribourg, Department of communication and media studies, Fribourg, Switzerland
[2] University of Geneva, Faculty of Psychology and Educational Sciences- Brain and Learning Lab, Geneva, Switzerland
[3] ZHAW School of Applied Psychology, Media Psychology, Zürich, Switzerland

In today's platformed media environments, adolescents' media use is shaped by both technological affordances and family mediation strategies. This contribution examines how parental mediation of media use, defined here by either the presence or absence of rules or by the total number of restrictive rules, influences two key dimensions: (1) digital practices on social media and (2) adolescent well-being. We draw on two communication frameworks: Uses & Gratifications Theory (U&G), which explains the motivations behind media choices, and the Parental Mediation Model (PMM), which addresses how rules structure media uses.

In line with recent refinements of the PMM, we adopt a broad understanding of restrictive rules, encompassing not only time or content-based limits, but also contextual restrictions that structure when and how media can be used, such as banning media use during meals or prohibiting screen use until homework is completed (Shin & Kang, 2016).

Social media practices are grouped into two categories: active use, including social interaction (messaging, commenting, sharing) and content production (posting, live streaming), and passive use (browsing, scrolling), following a commonly employed distinction (Lin et al., 2016). Building on a U&G and PMM perspectives, this study thus asks whether adolescents

under different parental rule constraints tend to privilege active practices or consumption-oriented behaviors, and how these distinct patterns of use are associated with their well-being and mental health.

Using longitudinal survey data from the MICAH study (N ≈ 800 adolescents, three semi-annual waves), we explore associations between parental mediation profiles (more or less restrictive rule-setting vs. no rules), reported social media behaviors (active/passive), indicators of well-being (WHO-5), and mental health measures (depression, anxiety).

Preliminary findings suggest that adolescents with a higher number of restrictive family rules report lower overall screen time and lower frequency of media checking behavior, as well as more active and socially oriented uses of social media. This suggests that adolescents under tighter constraints appear to concentrate their limited time on intentional and socially gratifying activities, while reducing passive scrolling. Interestingly, teens under more restrictive rules also showed lower levels of depressive symptoms both concurrently and over time. The possible moderating influence of additional factors (gender, FOMO, motivations) will be also explored.

These findings support the idea that restrictive parental mediation of media use can be seen as a form of communication regulation, shaping not only how much time adolescents spend online but why and how they use it, with significant consequences for their psychological health.

CYM03 Young People's Mental Health and Wellbeing

PP 0184 "I didn't ask for it, I didn't want it, and I wasn't asked if I wanted it": How young people experience and cope with unwanted sexual communication on the internet

Claudia Lampert[1], Kira Thiel[1]

[1] Leibniz Institute for Media Research - Hans-Bredow-Institut, Growing up in digital media environments, Hamburg, Germany

Since almost all online platforms provide the opportunity to get in touch with others, young people are facing various online contact risks (Livingstone & Stoilova, 2021). One of them is unwanted sexual communication (Barbovschi et al., 2021). Specifically, this includes receiving unwanted sexual pictures, sexualized and misogynistic messages, requests for sexual information, and cybergrooming. Despite relatively high prevalences (Smahel et al., 2020; MPFS, 2025), there is a lack of in-depth data on how adolescents experience such situations and how they cope with them.

To shed light on young people's perceptions of and coping with online contact risks, we conducted 16 semi-structured interviews with 12- to 17-year-olds (7 girls and 9 boys) in Germany between July and September 2022.

The interviews illustrate the multifaceted nature of unwanted sexual communication online, encompassing unsolicited sexual images and messages from strangers, peers, or bots on different platforms, as well as cybergrooming. Reported stress responses ranged from feelings of annoyance, irritation, and confusion to more intense negative emotions such as shock, disgust, anger, or fear. Adolescents who experienced these encounters as more stressful emphasized their involuntary and non-consensual nature, describing them as direct invasions of privacy: "I didn't ask for it, I didn't want it, and I wasn't asked if I wanted it" (girl, 14 years). In contrast, adolescents explained less intense—or no—stress reactions by referring to habituation and a sense of confidence in knowing how to handle such situations: "You kind of get used to it. You just block them, or delete it, or whatever, and don't think about it any further" (girl, 16 years). Interestingly, adolescents who experienced cybergrooming reported initially positive feelings linked to attention and compliments, which shifted to negative emotions as the encounter progressed.

Regarding coping, the results point to a minimum standard coping repertoire, which includes technical strategies such as blocking, reporting, and deleting, or ignoring the contact. Depending on the extent of stress responses, negative affect and potential negative consequences, this repertoire is enhanced by using cognitive (e.g., repression, distancing, humor) or emotion regulation (e.g., going for a walk, listening to music) strategies, and seeking social or institutional support. While participants usually perceive technical strategies and support seeking as effective ways of coping, they find defense mechanisms such as avoidance and repression, as well as humor rather ineffective. In cases of cybergrooming, effective coping seems to be complicated or counteracted by the perpetrator's efforts to establish a relationship.

Overall, our findings point to an increased need for practitioners to strengthen young people in their right to sexual self-determination, self-esteem, and digital self-assertiveness, and help them balance conflicting opportunities and risks (so-called risky opportunities, Haddon & Livingstone, 2017). Further research is needed on the long-term impact of (repeated) cyberharassment and the effectiveness of coping strategies. As we observed that some adolescents had difficulty describing and evaluating the situation retrospectively or expressing their feelings, future studies should seek to address these challenges with more innovative research designs and tools (e.g., diary studies or in situ research).

CYM03 Young People's Mental Health and Wellbeing

PP 1050 A Tale of Two Adolescences: Problematising the epistemological orbit of Adolescence on Netflix

Emilie Owens[1], Elisabeth Staksrud[1]

[1] University of Oslo, Media and Communications, Oslo, Norway

In March of 2025, the popular streaming service Netflix released a limited television series produced in England titled *Adolescence*. The four-episode series follows the story of thirteen-year-old boy Jamie who murders his female classmate Katie, tracking the impact of the murder and subsequent arrest across Jamie's family and community. Critical reception of the series was positive, but more notable was the international "frenzy of debate" following its release (Ging and Baker, 2025, p. 2), much of which was centred on the show's portrayal of internet media and their negative influence on teenagers (see, among many others, Jones, 2025; Kohatsu, 2025; Wex, 2025; Williams, 2025). In Norway, for example, *Adolescence* became a catalyst for reporting concerning online extremism and the experiences of young Norwegians with the internet (Aasmundsen, 2025; Heggen, 2025). The reception of the series also had concrete political effects: following its release governments in the UK, France, and Ireland implemented screenings of the series as part of the secondary curriculum (Hui, 2025; Le Monde with AFP, 2025; O'Brien, 2025), and some researchers link *Adolescence* to the "push for blanket social media bans for children" (Ging and Baker, 2025, p. 5) in various countries (Reuters, 2025). In his recent New Year address, Norwegian Prime Minister referenced *Adolescence* directly as an example of how "young people live in digital spaces that we adults do not always see," (Støre, 2026).

How is it that a fictional television series has been met in the public discourse as documentary evidence? And do the journalistic and political reactions to *Adolescence* reflect the reality of adolescents online? We suggest that the 2025 Netflix series *Adolescence* was produced and received in a distinct *epistemological orbit*: a cultural sphere where persistent assumptions concerning teenagers and internet technologies inform and ultimately construct what comes to count as knowledge on adolescence in the digital age.

We begin with a brief analysis of the production of *Adolescence*, building on previous research to show how its representations of contemporary life are constituted in/constitutive of popular and problematic narratives concerning youth, adulthood, gender, and most importantly internet media. This is what we term the *epistemological orbit* into which the series has emerged: where narratives inform key assumptions that go on to establish what is perceived as *universal knowledge* concerning young people and the internet, and where a fictional television show created by adults to be viewed by adults can be received as documentary evidence of the 'actual experience' of adolescents. Then, using qualitative data from a series of creative TikTok workshops with teenagers aged 16–17 in Oslo in 2024 and quantitative data which was collected via a survey of 9- to 15-year-olds across Norway in 2025, we directly compare the representations of youth and media presented by *Adolescence* with the perspectives and experience of adolescents in context. In doing so we problematise the assumptions that underwrite the epistemological orbit of the series as being adult-centric and reflective of a powerfully affective paradigm of fear, rather than the empirical reality of teenagers using the internet.

CYM04 Navigating AI in the Daily Lives of Children and Young People

PP 0147 What can I help you with? Young people's experiences and perceptions of artificial sociality

Giovanna Mascheroni[1], Niamh Ni Bhroin[2], Mariya Stoilova[3], Tijana Milosevic[4], Davide Cino[5]

[1] Università Cattolica del Sacro Cuore, Department of Communication and Performing Arts, Milan, Italy
[2] University of Agder, Department of Nordic and Media Studies, Kristiansand, Norway
[3] London School of Economics, Department of Media and Communications, London, United Kingdom
[4] University College Dublin, UCD Centre for Digital Policy, Dublin, Ireland
[5] University of Milano-Bicocca, Department of Human Sciences for Education "Riccardo Massa", Milano, Italy

GenAI tools-including both AI companions and LLMs chatbots-are designed to enter in a communicative relationship with their users and mimic an emotionally responsive dialogue. Indeed, the ability to mimic credible emotional responses is constitutive of the success of chatbots. The resulting experience has been defined as "artificial sociality" (Natale & Depounti, 2025) to emphasise its simulated character. The feelings artificial sociality generates, however, are experienced as authentic by users, and this explains why children and young people are increasingly turning to Gen AI not just as a search engine-to seek information and advice on a range of topics, including practical and issues, as well as more sensitive topics relating to health and sexuality- but also as a source of companionship and emotional support. Perceived as always accessible and non-judgemental, chatbots and AI companions provide young people with a seemingly safe and private space to perform emotional work (Vecchione, 2025). This leads to an emergent form of sociality "in which individuals form relational dependencies not just with networks of people but also with socially responsive AI agents that offer companionship and support" (Brandtzaeg et al., 2025, p. 3), that they call "AI individualism". In their work, they highlight the enabling as well as constraining character of AI individualism, which, as networked individualism before, is susceptible to lead to both empowerment and disempowerment. In fact, while AI individualism may enhance autonomy, personalisation and control in the maintenance and management of interpersonal relationships, it equally intensifies users' dependence on "data relations" (Couldry & Mejias, 2019), reconfiguring the very conditions of sociality around platforms' business logic

and data greed. Potential benefits of artificial sociality include loneliness alleviation and emotional support, whereas risks encompass increased anxiety and loneliness, emotional manipulation and mis- or disinformation, affecting children's rights to access quality information, wellbeing, development and agency. Based on a comparative analysis of 63 interviews with 13–17-year-olds from Italy, Norway, Serbia and the UK, we examine their experiences with chatbots as "friends", "advisers" or "romantic partners" and show how artificial sociality depends on human projections of social meanings and feelings, including joy, happiness, excitement and surprise. Anthropomorphisation, triggered by chatbots' ability to mimic a personal and emotional relationship, is also a meaning-making practice through which children and young people try to make sense of GenAI's functioning and compensate for their lack of AI literacies. In fact, interviewees engage in emotional conversations and trustful relationships with chatbots when they believe in their human-like nature and express positive feelings around engagement with GenAI. Conversely, those who consider chatbots to be more machine-like do not attribute particular feelings to artificial sociality. Rather, they question the credibility of GenAI's outputs and resist its manipulative language by refusing politeness and giving orders. These findings contribute to the understanding of artificial sociality and help outline both AI literacy interventions to minimise its risks and children's rights-respectful design principles.

CYM04 Navigating AI in the Daily Lives of Children and Young People

PP 0148 Human or AI? Young people's analytical and intuitive processes in evaluating AI-generated information

Emelie Van Der Vinne[1], Joëlle Swart[1], Bart Verheij[2], Marcel Broersma[1]

[1] University of Groningen, Media and Journalism Studies, Groningen, Netherlands
[2] University of Groningen, Artificial Intelligence, Groningen, Netherlands

AI-generated content is becoming increasingly common on social media, which is a primary source of information for young people, making them particularly likely to encounter such content. Research on AI-generated information has primarily focused on people's ability to recognize AI-generated content and on the perceived credibility of this content (e.g. Waddell, 2018; Frank et al., 2024; Jia et al., 2024). Less attention has been paid to the processes that shape these evaluations. This study examines how intuitive and analytical thinking influence how young people evaluate AI-generated content. It is grounded in dual-process theory, which posits that judgment formation is influenced by these two distinct cognitive systems (Tversky & Kahneman, 2002). Intuitive thinking is characterized by rapid, unconscious responses shaped by prior experiences, while analytical thinking involves a deliberate, slower process that relies on reasoning and explicit knowledge (Tversky & Kahneman, 2002; Glöckner, 2009). Although some research shows that higher analytical thinking ability is associated with better detection of AI-generated content (Pehlivanoglu et al., 2021; Frank et al., 2024), it remains unclear how analytical and intuitive processes shape these evaluations.

Employing a mixed-method design, an evaluation task is combined with follow-up qualitative interviews to capture both reaction times and self-reported accounts of evaluation formation. Participants include childhood (8–12 years), adolescence (13–17 years), and emerging adulthood (18–25 years). These ages are particularly relevant, as youths news consumption is largely social-media based, often passive and incidental, and shaped by heuristics and intuitive judgments rather than deliberate fact-checking (Swart & Broersma, 2022; Tamboer et al., 2022). Participants view AI- and human-generated content presented in the style of Instagram and TikTok platforms in a game-like setting and evaluate whether the content is AI-generated via a button-press. The stimuli in the game cover a range of topics and are modeled closely on material circulating online.

The quantitative analyses give insight into decision times as a behavioral indicator of intuitive versus analytical processing, with faster responses reflecting intuitive thinking (Petty & Cacioppo, 1986; Glöckner, 2009; Betsch & Glöckner, 2010). Regression-based models and descriptive statistics are used to examine speed–accuracy trade-offs, detection accuracy, and the impact of demographic factors on the evaluation process. Following the button-press task, qualitative interviews explore participants' reasoning, motivations, and strategies. Qualitative coding of the interview data reveals whether reaction time is correlated with intuitive or analytical thinking and how participants construct and justify their judgments, revealing interactions between analytical and intuitive processes.

This study contributes to research on how youth evaluate credibility in complex media environments by demonstrating how intuitive processes interact with analytical reasoning in evaluating AI-generated content. A key innovative aspect of the study is the use of a play-based method to examine how youth assess the credibility and trustworthiness of AI, which enables the inclusion of younger age groups. In doing so, it points to gaps between theoretical models of reasoning and the everyday social media experiences of youth, offering guidance for media literacy education that fosters critical evaluation behaviors by engaging both intuitive and analytical processes.

CYM04 Navigating AI in the Daily Lives of Children and Young People

PP 0149 Artificial intelligence, human–machine communication and interpersonal communication competences in childhood and youth: A systematic literature review

Patrícia Dias[1], Dhemy Brito[2], José Gabriel Andrade[3]

[1] Universidade Católica Portuguesa, CECC, Lisbon, Portugal
[2] Universidade do Minho, Instituto de Educação, Braga, Portugal
[3] Universidade do Minho, ICS - Instituto de Ciências Sociais, Braga, Portugal

The growing integration of Artificial Intelligence (AI) into the everyday lives of children and young people has generated an expanding body of research, particularly concerning forms of interaction between humans and intelligent systems. Despite this increase, the literature remains conceptually and methodologically fragmented, and systematic analyses that explicitly connect AI use—within the field of Human–Machine Communication (HMC)—to the development, mediation or transformation of interpersonal communication competences in childhood and youth are still scarce. Addressing this gap, the present study aims to map and critically analyse the scientific literature indexed in Scopus that examines the use of AI by children and young people, with a specific focus on communicational and relational dimensions.

Methodologically, the study adopts a systematic literature review design, guided by the PRISMA 2020 guidelines. The search strategy was developed iteratively in the Scopus database, using search strings that articulated three core conceptual blocks: (i) Artificial Intelligence and conversational agents (e.g., chatbots, social robots, virtual assistants), (ii) children and young people, and (iii) interpersonal communication, social interaction and Human–Machine Communication. Following the stabilisation of the final search query, filters were applied regarding document type (articles and reviews) and language of publication (English, Portuguese and Spanish), resulting in the identification of 507 records for the selection phase. The systematic screening of titles and abstracts, followed by full-text analysis and data extraction, is currently ongoing.

Preliminary findings already allow for the identification of a set of emerging analytical categories. These include: (a) the conceptualisation of AI as a communicational and relational agent; (b) the mediation of human peer interactions through AI-based systems; (c) the impact of child–machine interaction on the development of competences such as empathy, cooperation, emotional regulation and turn-taking; and (d) ethical and normative tensions associated with the substitution, complementarity or reconfiguration of interpersonal relationships. Additionally, the review reveals substantial methodological and conceptual heterogeneity, as well as a predominance of instrumental approaches to communication, often at the expense of sociological and critical perspectives on childhood.

It is argued that this systematic review will contribute to the consolidation of HMC research applied to childhood and youth, offering an analytical framework that foregrounds children and young people as competent social actors in their communicational relationships with AI systems. The study further highlights implications for future research, educational practices and public policy development.

CYM04 Navigating AI in the Daily Lives of Children and Young People

PP 0150 Mapping AI literacy integration in higher education: Challenges, responses, and practices

Lucia Mesquita[1], Agnieszka Stępińska[2], Agnieszka Filipiak[2], Denis Halagiera[2]

[1] Lusófona University, CICANT, Porto, Portugal
[2] Adam Mickiewicz University, Faculty of Political Science and Journalism, Poznań, Poland

The rapid adoption of generative artificial intelligence (GenAI) in higher education is transforming how knowledge is produced, assessed, and legitimised, while simultaneously intensifying concerns around academic integrity, epistemic trust, and AI-driven disinformation (e.g., Rojas Contreras et al., 2023; Chan & Colloton, 2024). These developments challenge established models of media and information literacy (MIL), calling for future-oriented frameworks that integrate AI literacy, ethical reasoning, and civic responsibility (e.g., Buele & Llerena-Aguirre, 2025; Ngoveni, 2025). This study presents work in progress from the Erasmus+ project AI-LITERATE, which investigates how European higher education institutions are responding to these challenges, with a focus on youth and disinformation resilience.

The project examines how AI literacy, institutional agency, and disinformation resilience are conceptualised and operationalised across five countries (Portugal, Italy, Croatia, Poland, and Belgium). It asks: How are higher education institutions integrating generative AI into institutional policies and educational practices? How are issues of ethics, responsibility, and disinformation addressed in these institutional policies and practices? What futures of media and information literacy are being imagined and enacted through these institutional responses and practices?

Methodologically, the research integrates a literature review on AI literacy in higher education with a comparative analysis of policy frameworks at European and national levels, institutional guidelines and policies, relevant syllabi, and a structured programme of national roundtables. The study adopts a macro–meso–micro analytical framework (e.g., Serpa and Ferreira, 2019) within a mixed-methods design. At the macro level, policy frameworks are examined; at the meso level, institutional regulations and ethical guidelines are analysed; and at the micro level, course materials are reviewed. All documents are

assessed using a shared analytical matrix structured around six dimensions: agency and responsibility; ethics, integrity, and transparency; disinformation and critical literacy; risk management; equity and accessibility; and pedagogical integration.

In addition, data from five national roundtables – organised in Italy, Croatia, Poland, Belgium and Portugal and collected using a standardised template to ensure comparability with the document analysis – complement the study by capturing the perspectives of faculty, students, institutional stakeholders, and policymakers who are directly involved in the development and implementation of AI-related policies and practices. Each roundtable produces a country-specific analytical report, which is subsequently synthesised into a comparative European report.

While data collection is ongoing, preliminary findings suggest a growing emphasis on ethical governance and institutional guidance, contrasted with uneven pedagogical integration and limited incorporation of disinformation literacy into AI-related curricula. By September 2026, the project is expected to deliver a comparative mapping of AI literacy maturity in higher education, identifying patterns of convergence and divergence across national contexts.

The study argues that the future of MIL in an AI-driven Europe depends on repositioning AI literacy as a civic and epistemic competence. By combining standardised institutional mapping with deliberative roundtables, the study contributes a transferable framework for anticipating and shaping responsible, democratic futures of higher education.

CYM04 Navigating AI in the Daily Lives of Children and Young People

PP 0151 The role of generative AI in teens' exploration and management of intimacy, sexuality, and romantic relationships

Francesca Ieracitano[1], Maria Francesca Murru[2], Lorenza Parisi[1], Cosimo Marco Scarcelli[3]

[1] Sapienza University of Rome, Communication and Social Research, Rome, Italy
[2] University of Bergamo, Departiment of Humanities- Phylosophy and Communication, Bergamo, Italy
[3] University of Padua, Department of Philosophy- Sociology- Education and Applied Psychology, Padua, Italy

As part of a larger national study on Intimacy, Gender, and Digital Practices, this research examines how adolescents use Generative AI (GAI) to address sexual and romantic concerns. GAI has become increasingly pervasive in everyday life (Han et al. 2025), but it becomes even more significant when considering the role GAI plays for adolescents who are experiencing their first affective relationships and related intimacy, gender, and sexuality issues.

Studies about GAI and affective or sexual relationships have primarily focused on the existence of forms of romantic affection that users may develop toward GAI, due to its anthropomorphic nature (Song et al., 2022), or on users' engagement with GAI to replicate romantic interactions or make them more satisfying (Saga et al.,2025). It has also been examined how GAI can function as a stimulus for sexual purposes, generating sexualized content for personal consumption or to stimulate romantic partners (Willoughby et al., 2025). Few studies have investigated how adolescents use and make sense of GAI in their intimate lives to manage sexuality, affective relationships, and sexual orientation-related dynamics.

The RQs guiding this study are:

- How does adolescents' use of GAI shape the construction of digital intimacy?
- What level of trust do adolescents place in GAI when managing their affective/sexual relationships?
- Are there differences in the ways heterosexual adolescents engage with GAI compared to LGBTQIA+ peers?

Through a participatory method, 49 interviews with Italian teenagers (16–8 yo) have been conducted and qualitatively analyzed (Mayring, 2021).

The results show that GAI is a companion to whom adolescents can turn for advice at any time. It helps resolve the uncertainty that is inherent in relationships by providing immediate, situation-specific support, extending to the interpretation of others' behaviors and the real-time management of relationships (e.g., how to respond to a potential partner's message).

GAI compensates for knowledge gaps, filling the voids left by primary socialization agents (family and educators), particularly in affective, gender, and sexual education. Moreover, interactions with GAI can be personal, personalized, and continuous, making it highly competitive when compared to institutional actors.

GAI turns out to be even more supportive than educational and parental contexts when considering the higher level of use among LGBTQIA+ teenagers for intimate purposes compared to heterosexual ones. For the former, the portability of these platforms and their confidentiality provide an intimate and protected space for disclosure and for expressing doubts, fears, and insecurities related to their sexuality.

Even if GAI compensates for knowledge gaps about intimate topics, it is not primarily knowledge-oriented but rather used for immediate problem-solving of emotional issues that may arise on other platforms (WhatsApp). Teenagers also express skepticism about the reliability of GAI for intimate matters. This mistrust does not concern relationship management itself but is limited to the sexual knowledge that GAI can provide. Such skepticism stems from the univocal nature of AI-generated responses compared to search engines, such as Google. GAI tends to offer a single answer to questions that limit teens' critical reflection, leaving little room for their agency.

CYM05 Youth Empowerment, Rights, and Responsibility in Digital Spaces

PP 0290 Digitally brave. Stimulating positive bystander behavior in cyberbullying among secondary school pupils through an interactive narrative intervention

Renske Van Enschot[1], Sara Pabian[1], Jan de Wit[1], Eefje van Moorsel[1], Bianca Sips[1], Marije van Amelsvoort[2], Thorsten Erle[3]

[1] Tilburg University, Department of Communication and Cognition, Tilburg, Netherlands
[2] Tilburg University, Tilburg Center of the Learning Sciences, Tilburg, Netherlands
[3] Tilburg University, Department of Social Psychology, Tilburg, Netherlands

Cyberbullying can have a substantial impact on the well-being of its victims and bystanders (Kwan et al., 2020). Bystanders can play a crucial role in encouraging or discouraging cyberbullying, for instance by reporting hurtful incidents or showing their disagreement, but often remain passive (Karasavva & Mikami, 2024). The present study contributes to the growing body of research on cyberbullying interventions directed towards bystanders by developing and testing an intervention presented as an interactive narrative. This format has been shown to be an effective intervention strategy (Scholl et al., 2022; Zhou et al., 2020). We have developed a role-playing interactive narrative allowing players to adopt the bystander perspective. At various points in the narrative, interactors can choose how they respond to cyberbullying as a bystander (e.g.,comforting, reporting, confronting the bully) after which they experience the consequences of the choices made.

This intervention was tested in a cluster-randomized controlled trial in Dutch secondary schools (first and second grade). To test the effectiveness of the interactive narrative, two extra intervention conditions were developed: a non-interactive version of the interactive narrative and an expository text with the same information but without the narrative. These three conditions were randomly distributed over different school classes. Within each class, pupils were individually exposed to the same intervention condition. The main DVs in this study were persuasive effects (beliefs, attitudes and intentions regarding cyberbullying and positive bystander behavior) (Moyer-Gusé & Dale, 2017) and perceived self-efficacy (feeling confident about executing positive bystander behavior) (Sargioti et al., 2023), together with narrative experience (identification with and empathy for the main character and transportation to the story world) (Appel et al., 2015; de Graaf et al., 2012; Fabi et al., 2019; Huang & Fung, 2024). The measurements were done right before the intervention (T0), right after the intervention (T1), and 5–7 weeks after the intervention (T2). In total, 633 pupils participated in the study, divided over 78 classes and 8 schools at nearly all educational levels.

The results showed that the interactive narrative yielded higher transportation to the story world and higher identification with and empathy for the bystander than the traditional narrative. Persuasive effects were equal for all intervention formats immediately after exposure (T1). After 5–7 weeks (T2), all persuasive effects disappeared for the traditional narrative and expository text, but the persuasive effects of the beliefs persisted for the interactive narrative. Finally, the interactive narrative consistently led to higher perceived self-efficacy than the traditional narrative and outperformed the expository text on most self-efficacy subscales. The traditional narrative and expository text did not differ in terms of self-efficacy.

This study demonstrates the potential of interactive narratives, and helps to optimise interventions against cyberbullying and ultimately reduce the number of victims.

CYM05 Youth Empowerment, Rights, and Responsibility in Digital Spaces

PP 0291 Beyond protection and participation: Theorizing recognition rights in children's digital environments

Stine Liv Johansen[1]

[1] University of Aarhus, School of Communication and Culture - Centre for Children's Literature and Media, Aarhus C, Denmark

Debates about children's digital rights have largely centred on protection from harm and participation in digital culture. Recent developments in regulation and governance – including proposals to introduce or strengthen age thresholds for social media use – illustrate how protection has increasingly become a key organising principle as well as a moral argument.

While such measures address important concerns, they also raise questions about how exclusion from digital platforms may affect groups of children and young people for whom online communication forms an important part of everyday social life. This includes young people living with disability, many of whom rely on digital environments for connection, identity work, and access to supportive communities.

This paper develops an empirically informed and theoretically grounded framework for *recognition rights* as a possible third dimension of children's digital rights. Building on critical media access studies (Alper, 2021) the paper approaches digital rights not only as a matter of technical availability or formal participation, but also as involving questions of cultural recognition and legitimacy. The framework is informed by research examining how young people living with disability navigate social media in everyday life.

Three interrelated aspects of recognition rights are outlined. The first, representational sovereignty, concerns how young people seek to manage the visibility and meaning of difference in digital spaces. The second, cultural participation rights, highlights how children and young people contribute to shaping wider understandings of youth, ability, and belonging through their ordinary digital practices, sometimes reproducing and sometimes unsettling dominant norms (Johansen, 2024). The third, affective justice, draws on work on social access and embodied participation in digital culture (Kaur &

Saukko, 2022) to describe the emotional and relational labour that may accompany digital participation for those who experience marginalisation.

These perspectives offer a way of understanding digital rights as not only a matter of safety and inclusion, but also of recognition. They also highlight tensions that arise when protection-oriented regulation intersects with young people's everyday needs for social connection and forms of cultural legitimacy, echoing broader critiques of what constitutes "meaningful access" (Ellcessor, 2016).

The presentation will outline this framework and illustrate it with examples from qualitative research involving young people living with disability. The intention is to open discussions about how recognition might be conceptualised within children's digital rights, and how this perspective may inform future research and debates about governance and everyday media use.

CYM05 Youth Empowerment, Rights, and Responsibility in Digital Spaces

PP 0292 Youth perceptions of empowerment through cultural game jams

Gonçalves Costa Maria da Conceição[1], Maria Gonçalves[1]

[1] Lusófona University - CICANT, ECATi, Lisbon, Portugal

Scholarly discussions across media studies, education, and psychology often frame video games in terms of their benefits and risks, highlighting their potential for learning and personal development alongside concerns about possible harms, including gaming disorder. The present study examined young people's perceptions and experiences of empowerment through their participation in Cultural Game Jams. The conceptualisation of empowerment is ambiguous. Empowerment is understood here through a critical social theory of youth empowerment, which emphasises collective action to create social change (Jennings et al., 2006). Participation in cultural game-making provides young people with opportunities to critically engage with and reflect on their everyday media experiences, as well as to transform culture. The concept of Cultural Game Jams — linking game-making with cultural heritage, participation, and co-creation — has been developed in recent research, particularly within the context of PROJECT NAME (Author1 et al., 2025; Eriksson et al., 2025). The Values at Play (VAP) design framework (Flanagan & Nissenbaum, 2007) was used to intentionally embed European values such as democracy and freedom in games.

A reflexive thematic analysis (RTA) was conducted by three researchers following Braun and Clarke's (2022) six-phase inductive approach, generating codes and themes through constructive and reflexive engagement with the data. Data were collected through interviews, surveys, and game pitches with youth participants in a Cultural Game Jam (CGJ). The CGJ took place in REGION, COUNTRY, from 4 to 7 February 2024. A total of 38 young people aged between 16 and 25 years (M = 19.52; SD = 2.54) participated. The CGJ theme centred on a historically significant secret meeting in COUNTRY that played a decisive role in the military movement leading to the end of the dictatorship.

From the RTA, three themes emerged: *Cultural Game Jams as Social Events*, *Learning in Cultural Game Jams*, and *Youth as Cultural Game Makers*. Participants engaged with the material and spatial dimensions of the theme as a socially situated experience in REGION and valued the richness of interactions with cultural experts, game industry professionals, researchers and peers. In relation to learning in CGJs, the most influential activity was a guided tour of the historically significant building where the secret meeting took place, which participants regarded as crucial to their games' ideation processes.

Regarding Youth as Cultural Game Makers, participants embraced their roles as creators of culture through games, often critically reflecting their achievements while expressing pride and overall satisfaction with the experience. Nine game prototypes were developed, inspired by struggles for freedom and liberation from authoritarian regimes, and by the role of player or citizen choices in preserving democracy and freedom. The findings demonstrate that young people raised awareness of the importance of freedom and democracy, with these values intrinsically embedded in the games they created. The successful implementation of the CGJ is attributed to the extended duration of the event and the continuous cultural support provided throughout, highlighting the importance of time and real-time feedback in supporting meaningful learning experiences.

CYM05 Youth Empowerment, Rights, and Responsibility in Digital Spaces

PP 0293 Understanding adolescents' withdrawal from political talk in private and (semi-) public spheres

Maximilian Klesl[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Although youth participation in political talk is often described as declining (Henn & Foard, 2014), recent research shows that disengagement is not simply inactivity: Adolescents may deliberately avoid political conversations (Kligler-Vilenchik et al., 2022). This study investigates why young people may avoid political talk in private settings (peer and family discussions) and in (semi-)public contexts, thus communicative spaces where opinions can form between both private interactions and public debates (Habermas, 2022), such as social media. By exploring barriers that hinder political talk, this research extends beyond traditional participation-focused explanations to highlight a frequently overlooked aspect of political socialization.

Theoretically, Habermas' (1989) concept of the public sphere helps explain adolescents' hesitation to engage in (semi-) public contexts: When spaces for political discussion are perceived as inaccessible, adult-dominated, or hostile, adolescents may withdraw rather than participate (Kligler-Vilenchik et al., 2022). Similarly, Noelle-Neumann's spiral of silence theory (1974) posits that individuals refrain from expressing opinions if they believe their views are unpopular or fear social exclusion. Political efficacy also remains central: Low internal or external efficacy can contribute to avoidance of political engagement (Levy & Akiva, 2019). Finally, developmental frameworks are considered. Early adolescence (10–12) serves as a formative period for political values and beliefs. Starting from middle adolescence (13–16), opportunities for participation increase while identities consolidate (Eckstein et al., 2012).

This study, conducted in Austria during the election year 2024, draws from 47 peer group discussions with adolescents (aged 12–19) from diverse educational tracks. Discussions involved 3–10 ($M = 5.19$, $SD = 1.28$) participants and lasted between 19 and 41 minutes. The analysis followed a qualitative content analysis approach after Kuckartz (2018).

Findings show that in (semi-)public spheres like social media, limited political discussion is often linked to concerns about social exposure and low political efficacy. Many adolescents avoid posting because they fear judgment, as David (16–17) said: "So basically, we all censor ourselves, so we don't get into hot water." The long-term visibility of online content hence appears to affect self-censorship with adolescents feeling partly observed and vulnerable (Noelle-Neumann, 1974; Pew Research Center, 2022).

Adolescents also avoid political discussions when they feel unqualified or powerless. Fatima (16–17) noted: "There are political debates occasionally, but I mostly stay out of them because I know very little," suggesting that avoidance often reflects perceived inadequacy and low political efficacy rather than a lack of interest.

Many avoid discussing politics in peer groups to maintain harmony. Politics is often perceived as too complex and tedious to discuss, as spending time with friends is "the only time you actually want to unwind and relax" (Mary, 18–19). Avoiding politics, therefore, helps preserve enjoyable peer interactions (Kligler-Vilenchik et al., 2022).

To foster youth political engagement, interventions should reduce fear of social judgment by providing safe spaces where they can express their opinions freely. Programs aimed at enhancing political efficacy, such as educational initiatives or mentoring, can help adolescents feel that their voices are valued. Together, by reducing fear and boosting perceived influence, these efforts may encourage more active participation and discussion, enabling adolescents to move beyond self-censorship and disengagement.

CYM05 Youth Empowerment, Rights, and Responsibility in Digital Spaces

PP 0294 Children's democratic agency in the digital realm: The paradigmatic case of misinformation

Thomas Enemark Lundtofte[1], Ayo Næsborg-Andersen[2], Lene Heiselberg[3], Lena Frischlich[4], Claes de Vreese[4], Jonas Nygaard Blom[3], Janne Rosholm Tørresø[2], Freja Sørine Adler Berg[3], Patricia Bianca Lyk[3]

[1] University of Southern Denmark, Design- Media and Educational Sciences, Odense, Denmark
[2] University of Southern Denmark, Law, Odense, Denmark
[3] University of Southern Denmark, Journalism, Odense, Denmark
[4] University of Southern Denmark, Digital Democracy Centre, Odense, Denmark

In a world where digital media increasingly shapes how children learn, connect, and participate, safeguarding their rights online has become a pressing democratic imperative. Our paper advances current understandings of children's democratic agency in the digital realm by considering their encounters with misinformation as a paradigmatic case. In 1989, the United Nations' Convention on the Rights of the Child (UNCRC) laid responsibility on adults to ensure children's participation in society and to protect them from harm while doing so (1989). According to General Comment No. 25 to the UNCRC, these rights apply in the digital realm as well (2021). Children's practices with digital media and technologies are many-facetted and interwoven with everyday practices that take place across arenas and social configurations (OECD, 2025). In many cases, they can be viewed as "the glue" of modern socialisation and coordination in straightforwardly practical manners as well as cultural consumption and participation. All these aspects can be viewed as components in democratic citizenship, inasmuch as they lay the foundation for participatory practices.

The internet presents complex challenges to overcome in relation to the UNCRC responsibility to enable participation safe from harm. One such challenge is the spread of digital misinformation, threatening democracy globally (World Economic Forum, 2024). Misinformation can foster distrust, lead to misperceptions and can fuel polarisation (Li & Yang, 2024; Pummerer et al., 2022), . Meanwhile, dealing with misinformation through legal measures is fundamentally challenging, as they must not threaten freedom of speech (c.f. Livingstone & Sylwander, 2025).

Our interdisciplinary project "Safeguarding Children's Democratic Agency: Tools to navigate mis- and disinformation on social media (SafeChilDe)" brings together legal research on implemented law and policies regarding children and digital misinformation with a mixed-methods study of 5–12-year-old children's experiences with digital misinformation. The results of these studies feed into the design of a gamified learning experience by which 10–12-year-olds are invited to reflect critically on what motivates misinformation and how to detect it. The purpose of this paper is to bring the three aspects of the project together to clarify how we can aid children's democratic agency through 1. inquiring children's perspectives on pertinent phenomena such as misinformation, 2. competence-building and literacy interventions, and 3. law- and policy-based shielding. In essence: how can we combine such efforts in a way that ultimately strengthens children's rights in the digital realm?

We will present a model that clarifies the connections between the above aspects. In connection to the task of striking a balance between participation and protection as per the UNCRC, we will consider the fundamental legal principle of proportionality (Duarte and Sampaio, 2018), and ask: which measures are necessary to suitably safeguard children's democratic agency from the harms of digital misinformation? To do so, we will map the actors relevant to this problem and consider how children's experiences with and perceptions of digital misinformation call said actors to action.

CYM06 Media Literacy and Education

PP 0260 Media literacy in European educational legislation: A comparative case study of Finland and Spain

Lucía Campos-González[1], Ángel Vizoso[1], Xosé López-García[1]

[1] Universidade de Santiago de Compostela, Faculty of Communication Science, Santiago de Compostela, Spain

Media literacy has become a strategic priority in European educational policies in response to the challenges posed by digitalization, misinformation, and the transformation of the media ecosystem (European Commission, 2020; Sádaba & Salaverría, 2023). Despite this recognition, its incorporation into national educational legislation varies significantly across member states, both in terms of explicitness and scope (McDougall et al., 2018; Pérez-Femenía & Iglesias-García, 2022). This study examines how media literacy is integrated into the educational frameworks of Finland and Spain through a qualitative multiple case study design. The selection of these countries responds to a purposeful contrast identified in previous research: Finland represents a highly structured and explicitly integrated model, where media literacy is embedded in national curricula, teacher education, and ministerial-level strategies (Palsa & Salomaa, 2020; 2023; Kupiainen, 2019). In contrast, Spain exemplifies a more transversal and implicit approach, in which media literacy is incorporated across subjects and competencies without a fully centralized or standalone policy framework (Gil & Marzal-Felici, 2024; Navarro Pérez, 2024).

The methodological design is based on a systematic analysis of official documents, including national laws, curricula and policy strategies. The data are organized using a coding system guided by European and international frameworks for media and digital literacy, including DigComp, the Council of Europe, and UNESCO guidelines. The analysis is carried out in two complementary phases: first, an intra-case analysis to identify the normative profile of each country, examining the level of integration, curricular coverage, and pedagogical orientation of media literacy; second, an inter-case comparison to explore similarities, differences, and potential transferable practices between Finland and Spain.

Results reveal a pronounced contrast between Finland's comprehensive and systematically implemented model and Spain's cross-curricular, partially implicit approach. This comparative perspective provides insights into how media literacy can be institutionalized differently across European educational contexts and highlights the implications for curriculum design, teacher support, and policy development.

The study helps to understand the variety of ways media literacy is included in European education and suggests which approaches might be applied in other countries. It informs both academic discussions and practical policy considerations, aiming to enhance critical, responsible, and participatory media use among students. By combining a systematic analysis of official documentation with a structured comparative framework, this research emphasizes the opportunities and challenges of embedding media literacy in national educational legislation and provides a methodological approach that can be applied to further comparative studies in European contexts.

CYM06 Media Literacy and Education

PP 0261 Beyond bans: how Portuguese teachers understand student smartphone use

Ana Kubrusly[1], Lidia Marôpo[2]

[1] CICS.NOVA- NOVA University of Lisbon and Polytechnic University of Setúbal, Department of Communication Sciences, Lisbon, Portugal
[2] Polytechnic University of Setúbal and CICS.NOVA, Escola Superior de Educação/Departamento de Ciências da Comunicação e da Linguagem, Setúbal- Portugal, Portugal

Smartphones are the most popular digital device among European youth (Smahel et al., 2020), raising concerns — among scholars, policymakers, and the general public — regarding its potential negative effects on youth. In this context, debates and policy around smartphone bans and regulations in schools have gained international traction, despite the lack of evidence regarding the impact of these strategies in improving students' behaviour, academic performance, or well-being (Rahali et al., 2024). In Portugal, a recent decree-law — implemented in summer 2025 — banned smartphones in schools for students up to the second cycle of primary education.

This paper explores Portuguese teachers' perspectives on students' smartphone usage, aiming to understand emergent challenges and transformations. To do this, we rely on two datasets: 20 semi-structured interviews conducted in spring 2023 with ICT teachers across Portugal regarding students' digital culture and skills, as well as their perspectives on smartphone use and policy in formal education. Second, we analyse ongoing ethnographic observations (conducted from November 2025 to April 2026) at a school in the Lisbon Metropolitan Area attended by students in the third cycle of primary education and high school.

In interviews, teachers appear to dismiss youths' digital cultures as unimportant or unproductive, imagining students as passive and uncritical consumers of digital content. What they perceive to be young people's central digital practices — socializing and seeking entertainment — are deemed to hold little value, with several interviewees describing them as "superficial," tied to "immediate pleasure," and not raising students' "cultural level."

Smartphone use in schools raises concerns among our interviewees, who associate it with students' lack of concentration, social isolation, and instances of cyberbullying. However, most teachers do not deem the prohibition of mobile phones to be the ideal solution. Some point to the danger of a "forbidden fruit effect," while others consider that it would be difficult to enforce and unrealistic in a context where schools are understaffed and lacking basic material resources. Other teachers regard that banning smartphones would mean losing an important pedagogical tool, especially since most schools have poor digital infrastructure (e.g., faulty wi-fi, old computers).

Preliminary results from the ethnographic observations show that students use their devices frequently, both inside and outside of the classroom. Telling students to put their mobile phones away or place them on the teacher's desk is common practice before class begins. However, this sometimes creates tensions, with students resisting and arguing their devices are "private property." Teachers themselves use their smartphones for classroom management (e.g. calling a students' parent when they are misbehaving). Both teachers and school staff often discuss smartphone usage as having changed schools for the worse, frequently adopting a nostalgic tone with references to their own childhood as "simpler."

Overall, teachers agree that students' smartphones usage is a major challenge, being considered detrimental to students' social lives and disruptive when it comes to classroom dynamics. Nonetheless, they situate this issue within broader systemic failures — underfunding, poor infrastructure, and overstretched staff — considering smartphone bans to be both impractical and insufficient.

CYM06 Media Literacy and Education

PP 0262 Development of instruments for examining the reception of multimodal stories in the context of multimodal literacy development

Iva Nemec[1], Maša Rimac Jurinović[1]

[1] Faculty of Education- University of Zagreb, Department of Croatian Language and Literature- Performing Arts and Media Culture, Zagreb, Croatia

Contemporary understandings of text emphasize its multimodal nature, whereby meaning is generated not solely through linguistic, but also through visual, auditory, gestural, and spatial modalities. Today's children participate in such multimodal communication practices from an early age, which substantially transforms the ways in which they receive, interpret, and construct meaning. Consequently, new demands are placed on educational systems regarding literacy development, which in the 21st century is no longer understood merely as the ability to read and write, but as a dynamic set of interrelated competencies—reading, media, information, and cultural—necessary for understanding and creating meaning across diverse modes of expression.

The theoretical framework of this study draws on the concepts of multiliteracies and multimodal literacy (Cope & Kalantzis, 1997; Kress & van Leeuwen, 2001; Jewitt, 2008; Serafini, 2015), which highlight the interdependence of linguistic, visual, and performative codes in the construction of meaning. Additionally, the study builds on reception theory (Jauss, 1970), which posits that the reader is not a passive recipient of a message but an active participant in interpreting a text.

In the context of children's reception of multimodal narratives, meaning is constructed not only on a cognitive level but also on perceptual and emotional levels, mediated through various sensory–semiotic channels.

When storytelling is transferred from a reading to a performative context, as in the case of kamishibai, reception also acquires bodily, affective, and interactive dimensions (Fischer-Lichte, 2015; McGowan, 2015; Lwin, 2020).

At the centre of the planned doctoral research is an examination of the relationship between the modality through which a story is mediated and the ways in which students process multimodal content. Special attention is given to performative–narrative forms such as kamishibai, a Japanese picture-based narrative medium integrating verbal, visual, and performative channels, thereby constituting a distinctive form of multimodal narrative. In this study, multimodal literacy is operationalized through five interconnected aspects: comprehension of content and event sequence, recall of information, vocabulary understanding, level of interest in the story, and students' creative expression.

The aim of the research is to present the conceptual framework and to develop, test and validate research instruments capable of precisely examining children's reception of multimodal stories. In the pilot phase, two instruments are tested: the Story Reception Questionnaire and the Vocabulary Acquisition Questionnaire. The study will be conducted with a sample of 80 fourth-grade primary school students to examine the clarity, temporal suitability, and initial validity of the instruments.

The developed instruments encompass two complementary aspects of reception: the cognitive aspect, which includes content comprehension, and the linguistic aspect, focused on the acquisition of target vocabulary from the text. The resulting data will be used to compare the effects of different story mediation modalities on children's understanding and construction of meaning.

It is expected that the pilot study findings will confirm the importance of multimodal approaches in fostering students' reading engagement, comprehension, and creative expression, and will contribute to the development of contemporary pedagogical approaches to literacy in early education.

kamishibai; multimodal literacy; reception; pilot study

CYM06 Media Literacy and Education

PP 0263 Critical media literacy and AI: From TikTok analysis to multimodal pedagogical design

Mitsuko Matsumoto[1], Pilar Lacasa[2], Nerea Rúbio-López[3]

[1] University of Alcala, Educational Sciences, Alcala de Henares, Spain
[2] International University of la Rioja, Vice-Chancellor's Office for Knowledge Transfer, Logroño, Spain
[3] Universidad de Sevilla, Psychology, Sevilla, Spain

This presentation introduces a series of educational resources designed to foster young people's critical and responsible engagement with Artificial Intelligence (AI) embedded in TikTok—one of the most influential platforms among youth. TikTok's success is driven by ByteDance's algorithmic recommender system, crystallized in the "For You" feed, which shapes visibility and cultural production (Kaye et al., 2022). AI is also increasingly present in content creation through filters, editing tools, and generative features, making TikTok a key site for studying algorithmic and AI-mediated practices.

To inform the design of these resources, we combined two complementary studies. First, we conducted a platform analysis of TikTok videos tagged with AI-related hashtags (e.g., #AIfilter) using scraping (Apify) and visualization (Tableau) to identify high-engagement posts, followed by (AI-assisted) qualitative coding (NVivo) of videos and comments on the most-commented video. Second, we ran a year-long ethnography with 19 young people to contextualize platform practices and perceptions.

Our findings show that AI operates on TikTok at two intertwined levels: distribution and creation. Participants in our ethnographic study emphasized that becoming visible requires learning to navigate and "control" the algorithm, often through speculative strategies—such as timing posts or using specific hashtags—rather than technical knowledge. In conversations with participants we also discussed concerns about privacy, misinformation, and ethical responsibility. On the other hand, AI-driven filters, particularly those involving face and body transformation, are found to be popular among the users, audience discourse centering on appearance and identity and revealing tensions between playful experimentation and pressures linked to beauty norms. These findings underscore the need for a deeper algorithmic and AI literacy.

In response, we developed multimodal resources that could be applicable for diverse educational settings, including:

1. A seven-chapter guide addressing themes such as algorithmic "bubbles," misinformation, privacy, and AI filters and self-image, combining conceptual explanations with educational activities and curated resources.
2. Short videos created by young participants, targeted at youth audiences.
3. Educator-focused videos produced in collaboration with a cultural organization dedicated to promoting audiovisual literacy.
4. A podcast series featuring professionals and youth voices.

We will also share some insights from pilot workshops held in a secondary school, highlighting how these materials support critical reflection and creative engagement with AI. By translating empirical findings into practical resources, this work

contributes to equip young people and educators to critically navigate algorithmic environments and AI-mediated cultural practices, much needed habilities in our current society.

CYM06 Media Literacy and Education

PP 0264 Speaking about children without children? Mobile phone policies in European schools and the marginalisation of young people's voices

Sara Pereira[1], Manuel Pinto[1], Pedro Moura[1]

[1] University of Minho, Communicaton and Society Research Centre, Braga, Portugal

Across Europe, mobile phone use in schools has become a highly prominent policy issue, frequently framed as a response to concerns about distraction, addiction, mental health, and declining social interaction among children and young people. While these debates are often presented as being "in the best interests of the child", they tend to be dominated by adult-centric perspectives that prioritise control, restriction, and protection. This raises critical questions about how children are represented in policy discourse, whose voices are legitimised, and to what extent children's rights to participation and expression are recognised in decisions that directly affect their everyday school lives.

This paper aims to analyse how mobile phone policies in schools are constructed across the 27 Member States of the European Union. It draws on theoretical debates on children's digital lives that challenge risk-dominated narratives and highlight tensions between protectionist approaches and children's agency, participation, and digital citizenship. The study is informed by the UN Convention on the Rights of the Child, particularly the right to be heard, alongside critical scholarship on media regulation, digital well-being, and media literacy as sites of power and governance.

Empirically, the paper is based on a comparative qualitative documentary analysis of policy-related texts produced at national, regional, and institutional levels. Data collection followed a systematic search strategy using predefined Boolean queries (e.g. "smartphones/mobile phones", "schools", "policies" combined with each country's name), complemented by targeted exploration of official Ministry of Education websites and referenced institutional, media, and stakeholder sources. The analysis is structured through a comprehensive coding grid that captures policy trends (prohibition, regulation, free use), policy status and scope, regulated devices and spaces, stated exceptions (notably pedagogical use), and the presence—or absence—of media and digital literacy initiatives.

Crucially, the analytical framework foregrounds questions of voice, representation, and power. It examines who speaks in and through these documents (politicians, experts, teachers, parents, industry actors), on whose behalf they speak, and whether children and young people are consulted, quoted, or meaningfully acknowledged. The findings reveal a strong dominance of adult-driven discourses centred on risk, discipline, and behavioural control, with children largely positioned as passive subjects of regulation rather than as competent social actors with situated knowledge of their own media practices.

By critically mapping how children are talked about—but rarely listened to—in European school mobile phone policies, this paper contributes to debates on children, youth and media by questioning the democratic legitimacy of current policy approaches and arguing for the inclusion of children's perspectives in the governance of their mediated school environments.

CYM07 Mediated Childhoods in the Context of the Home

PP 0372 Digital inclusion at home: Intergenerational digital media practices among families with a migration history

Rosa Dijkstra[1], Çiğdem Bozdağ[1], Marcel Broersma[1]

[1] University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

6–7, Roblox and TikTok. Children's everyday media practices increasingly unfold on platforms that parents do not always fully understand. While children's digital learning mostly takes place informally within the family context, many parents express concerns about what their children do online, but struggle to translate these into parenting practices. These everyday struggles point to broader issues of socio-digital inequalities that endure despite material access to digital technologies (Molla et al., 2024).

Most research about children, media and digital parenting covers Western and highly educated families, though the aim of this paper is therefore to provide insights into the intergenerational experiences of families with a migration history. To do so, this paper takes an emic approach and applies an intersectional lens to explore how digital inclusion and exclusion takes place for families with migration histories. Moving away from deficit-oriented frameworks, it explores factors such as gender, ethnicity, cultural background, class, and age that shape how families position themselves in relation to digital media (Alper et al., 2016). Particular attention is paid to affective dimensions such as belonging, trust, and negotiations about AI-driven systems that increasingly shape children's everyday media use.

The paper asks how digital inclusion is shaped through intergenerational practices in migrant families and how children and parents negotiate roles, responsibilities and agency around digital media. Empirically, the paper draws on an ethnographic study with 20 families with a migration history. It focuses on families of Turkish, Moroccan, and Surinamese descent, as their perspectives remain underrepresented in research on digital inclusion and digital parenting. The study includes parents and

children aged 8 to 15 years old in Rotterdam, The Netherlands, a highly diverse international harbor city marked by growing inequality.

The ethnographic methods combine semi-structured interviews, observations in the home, and intergenerational participatory design activities. The latter is used to co-create prototypes for mobile applications that tap into inclusive, future-oriented media imaginaries and foreground children's and parents' mutual perspectives, challenging top-down assumptions about digital needs.

Findings reveal that intergenerational learning and negotiation around digital media includes the reversal of parenting roles in which children regularly act as digital mediators for their parents. We explain how children and parents navigate intersecting identities across home, school, religious spaces, play, and friendships and how this impacts their digital media use. By foregrounding intergenerational family life and children's lived experiences we offer bottom-up insights for digital inclusion policy, media education, and intergenerational participatory design approaches that aim to give greater agency to populations that are being marginalized.

CYM07 Mediated Childhoods in the Context of the Home

PP 0373 Parental support, parent-teen communication, and adolescent AI use for health: A mediation analysis

Carli Ochs[1], Sina Horner[1], Michelle Möri[1], Thomas Friemel[1]

[1] University of Zurich, Department of Communication and Media Research - IKMZ, Zürich, Switzerland

Teenagers are increasingly using AI for sensitive topics such as mental and physical health. This trend is concerning for multiple reasons: AI may provide false or even detrimental information (Park et al., 2023), and research has shown teenagers relying on AI for social support is associated with increased loneliness and anxiety (Carter & Grace, 2025; Herbener & Damholdt, 2025). In contrast, parents are an important source for health-related information/advice (Lau et al., 1990), and parental social support is a well-established predictor of adolescent wellbeing (Wu & Lee, 2022). Given the associated risk of AI use for health questions, we wanted to test if perceived parental support can reduce the likelihood of using AI for such questions. We hypothesized that adolescents who perceive higher parental social support would be more likely to talk to their parents about health-related topics (H1). We further predicted that more frequent conversations with parents about health topics would be associated with lower AI use for health-related questions (H2). Finally, we hypothesized that the association between parental social support and AI use for health-related questions would be mediated by adolescents' conversations with their parents about health topics (H3).

To test this, we collected survey responses in schools from teenagers (N = 1981, Mage = 15.98, SDage = 1.58, 47% female) regarding their use of AI for health-related topics. We analyzed the data using a mediation model with parental social support as a predictor, parent-teen health discussions as a mediator, and AI use for health as an outcome while controlling for age, gender and wellbeing.

While we found evidence for partial mediation, the results revealed two partially competing pathways. First, as expected, we found a direct negative effect of parental support on AI use while controlling for the mediator, indicating that lower social support leads to increased AI use for health. Second, as hypothesized, social support positively predicted parent-teen discussions. However, contrary to expectations, parent-teen discussions had a small positive effect on AI use.

These results reveal two pathways: compensatory AI use, where teenagers with lower social support rely more on AI for health-related questions and complementary use where teenagers who discuss health with parents are also more likely to use AI for health-related questions. This unexpected complementary pattern might be explained by confounding variables, such as increased health concerns that lead adolescents to seek information from both parents and AI. These findings suggest that parental support should not be viewed as complete protection against young people's use of AI for health-related issues. Rather, we argue in our presentation that it can and should be considered a crucial factor in promoting informed and critical use of AI tools. The presentation discusses this argument in more detail with a view to developing public health strategies that involve both parents and young people.

CYM07 Mediated Childhoods in the Context of the Home

PP 0374 Mediating digital childhoods at home: Family practices in preschool children's media use in Istanbul

Esra Ercan Bilgic[1], Gizem Arıkan[2], Ayten Bilgin[3]

[1] Istanbul Bilgi University, Department of New Media and Communication, İstanbul, Turkey
[2] Ozyegin University, Psychology, Istanbul, Turkey
[3] University of Essex, Psychology, Essex, United Kingdom

Children's everyday encounters with digital media are increasingly shaped within the home, where families play a central role in mediating access, meanings, and practices. Early childhood represents a particularly sensitive period in which digital media use is closely intertwined with care, learning, and emotional development. While existing research has examined parental mediation strategies, there remains a need for contextually grounded, ethically attentive studies that capture how family mediation unfolds in the lived experiences of preschool children and their caregivers in Turkish context. Addressing this gap, this study explores how families in Istanbul mediate preschool children's (aged 3–6) digital media practices at home, with a focus on positive and educational forms of family mediation and the involvement of extended family members.

The study is designed as a qualitative extension of a nationally representative survey supported by the British Council's ISPF programme and aims to enrich quantitative findings with in-depth, experience-based insights. Through semi-structured interviews, the research will examine how caregivers initiate, facilitate, scaffold, extend, and meaningfully connect children's digital media use to everyday family routines, play, and learning activities. Particular attention is given to ethical considerations of care, responsibility, and agency in early childhood digital media use, as well as to how mediation practices are negotiated within family relationships.

The planned sample consists of 18 households in Istanbul, selected through maximum variation sampling to capture diverse family contexts. In each household, at least one primary caregiver will be interviewed, and where possible, an additional adult family member, such as a grandparent or adult sibling, will also participate. Interviews are expected to last between 45 and 60 minutes and will focus on daily digital media routines, household rules, mediation strategies, perceived developmental influences, and family dynamics surrounding digital media use. All interviews will be audio-recorded with informed consent, transcribed verbatim, and analysed using thematic analysis (Braun & Clarke, 2006). The analytical process will combine sensitising concepts from family mediation and digital childhoods research with themes emerging inductively from participants' accounts.

By foregrounding families' lived experiences and everyday practices, this study seeks to contribute to children, youth, and media scholarship that is ethically grounded, inclusive, and socially relevant. In line with the aims of the ECREA Children, Youth and Media section, the research emphasises methodological reflexivity and contextual nuance, offering insights into how family mediation shapes young children's digital media experiences within contemporary home environments.

CYM07 Mediated Childhoods in the Context of the Home

PP 0375 Digital competencies and mediated childhood: Parental regulation and digital competency levels among Alpha Generation children in Transylvania

Barbara Petru[1]

[1] Babes-Bolyai University, Doctoral School of Communication- Public Relations and Advertising, Cluj-Napoca, Romania

The Alpha Generation represents the first cohort to grow up entirely within a digitally mediated environment, where everyday communication, learning processes, and forms of entertainment are deeply intertwined with networked technologies. From early childhood, digital devices and online platforms shape media consumption patterns and also the development of digital competencies, communication habits, and emerging forms of agency. At the same time, parental mediation practices and the growing use of digital supervision tools introduce new layers of regulation that may significantly influence how children engage with digital media and how autonomous they can become within these environments.

This study examines the relationship between parental regulation practices and children's digital competencies within the Alpha Generation. Rather than relying solely on age-based generational categorization, the research proposes an internal segmentation of Alpha Generation children based on varying levels and dimensions of digital competence. By doing so,

it addresses a recurring limitation in existing research, where children within the same generation are often treated as a homogeneous group, despite notable differences in skills, practices, and attitudes toward digital media.

The theoretical framework integrates three complementary perspectives. First, the study adopts a multidimensional understanding of digital competence, conceptualized as a combination of information and data literacy, communication and collaboration skills, digital content creation, safety awareness, and problem-solving abilities. This approach allows for a structured and comparative assessment of children's digital skills beyond basic access and usage. Second, the research draws on a motivational perspective that emphasizes children's active role in media use, focusing on the informational, social, and entertainment-related needs that guide their engagement with digital platforms. Third, an acceptance-oriented perspective is employed to explore how children perceive digital technologies in terms of usefulness, ease of use, and experiential engagement, while also considering age-specific factors such as playfulness and exploratory behavior.

Empirically, the study is based on qualitative data collected through focus group discussions with children aged 10–14 across seven cities in Transylvania, Romania, involving approximately 20–30 participants per location. The discussions focus on everyday digital practices, communication preferences, experiences with parental regulation and perceptions of digital autonomy. In addition, a qualitative content analysis of widely used digital supervision tools is conducted to examine how these technologies conceptualize safety, control, and the development of digital competence.

The study contributes to audience and reception research on children's digital media use by deifining competence-based segmentation. The findings aim to enrich academic discussions on generational diversity within the Alpha Generation and to support practical considerations related to digital education, parental mediation strategies, and the evolving role of children as active participants in digital culture.

CYM07 Mediated Childhoods in the Context of the Home

PP 0376 Guiding or guarding adolescents' screen use? A narrative review of the relationship between screen-use measures in the home context and adolescents' well-being

Mara Fennema[1], Chiara de Jong[1], Serena Daalmans[2], Esther Rozendaal[1]

[1] Erasmus University Rotterdam, Erasmus School of Social and Behavioural Sciences, Rotterdam, Netherlands
[2] Radboud University, Communication & Media - Behavioral Science Institute, Nijmegen, Netherlands

Adolescents' screen use has increased substantially, while their well-being has declined. These parallel trends have raised concerns among caregivers, creating a growing demand for evidence-based measures to guide adolescents' screen use. This demand is reflected in newly introduced national guidelines on healthy screen use in the Netherlands, Sweden, and Australia, which recommend, for example, that caregivers limit adolescents' daily screen time.

Studies suggest that screen-use measures can indirectly improve well-being by affecting the quantity (i.e., time) or quality (i.e., type) of screen use. In these studies, it is often assumed that reducing screen time or changing the type of content adolescents are exposed to is beneficial to their well-being. However, changing screen use, particularly reducing screen time or access to specific platforms, can also be detrimental to adolescents' well-being, as it may negate any positive effects of screen use on adolescents' well-being (as demonstrated in previous media effects research). Moreover, beyond indirect effects, screen-use measures may also have direct effects on well-being. For example, general parenting research has shown that authoritative parenting styles and autonomy support positively influence adolescents' well-being. These insights may also extend to digital parenting.

A comprehensive understanding of how different screen-use measures in the home context, both indirectly (via screen use) and directly relate to adolescents' physical, social, and mental well-being, is still lacking. Moreover, little is known about how these relationships vary by individual and contextual factors. To address these gaps, the aim of this narrative literature review with systematic approach is two-fold. First, we synthesize empirical findings on the relationship between screen-use measures in the home context and adolescents' well-being. Second, we explore how individual and contextual factors influence this relationship.

Method

Following PRISMA guidelines, a systematic search was conducted on 29 July 2025 in Web of Science, Scopus, PsycINFO, and ERIC. The search included English- or Dutch studies published between 2015 and 2025. Eligible studies were peer-reviewed, empirical, focused on adolescents with a mean age between 12 and 18, examined any type of screen use measure and well-being outcome, and were conducted in the home context. After deduplication, 1,027 studies were initially screened, with 456 remaining after title-abstract screening. Full-text screening is currently being conducted.

Preliminary Results

Preliminary results indicate that the literature is dominated by research on parental mediation, particularly restrictive mediation (e.g., rules, limits) and active mediation (e.g., discussions about screen use). Co-use strategies (i.e., adolescents and caregivers using screens together), whole-family approaches (i.e., both adolescents and caregivers adopt screen-use measures), and child-initiated measures (i.e., children initiate measures or mediate parental screen use) are far less studied. Commonly assessed outcomes relate, for example, to sleep (physical well-being), depression and anxiety (mental well-being), and cyberbullying (social well-being). Initial findings also suggest considerable variability when it comes to

adolescents (e.g., age, gender) and home contexts (e.g., parenting styles, parental screen use), although individual and contextual factors are rarely examined systematically. In the presentation, we will delve deeper into the findings of this literature review and its theoretical and practical implications.

CYM08 Media Literacy Under Pressure: Children's Needs, Educational Constraints and Policy Gaps in Deeply Mediatized Societies

PN 37 Young people's (but not only!) audience literacies within the social media literacies framework

Maia Klaassen[1], Gretel Juhansoo[1], Maria Murmaa-Mengel[1]

[1] University of Tartu, University of Tartu, Tartu, Estonia

We propose the development of a theoretical concept, "audience literacies," where both being aware of the different audiences of one's messages and regulating oneself as a member of various audiences entails crucial skills, knowledge, values, and attitudes. In our opinion, people as audiences deserve a thorough exploration to understand how messages are being en/decoded, or when people apply civil inattention and look away, pretending not to listen, or ignoring as a social norm of respect. We rely on several of our studies that allow us to take a new, recontextualizing look at young audiences. The data comes from interviews (n = 10) and focus groups (n = 36) with young audiences' perceptions of social norms on different social media platforms, focus groups with digital activists and leaders of civil society organizations (n = 13), moderators and audiences of public shaming sites (Murumaa-Mengel and Muuli 2021), microinterventions carried out in disinformation and incivility-heavy social media spaces by 28 students (Klaassen et al. 2024), and students' five-day-long digital disconnection diaries from 2016–2024 that explore, among other themes, various modes of participation and audiencing. By combining studies from various perspectives, we can propose an empirically supported framework for audience types and their associated social media literacies. The typology moves from more passive modes of participation and "being an audience" (Invisible Audiences) to more active practices of audiencing (Resilient Reactors and Activist Produsers). Furthermore, after identifying a lack of algorithmic literacies in younger age groups, we carried out a pracademic intervention – the TikTok House, which we view as one of the creative, playful solutions to gaps in media education. Described as invisible mechanisms that influence internet users' perception of reality (Cotter et al., 2022), algorithms have a profound impact. The rise of personalized platforms like TikTok has highlighted the need for algorithmic literacy, understanding how these often opaque, "black box" systems (Oeldorf-Hirsch & Neubaum, 2023) influence social media consumption and decision-making – especially among younger generations (Head et al., 2020; Henderson et al., 2020). To spotlight these algorithmic mechanisms shaping our information spaces, we created the physical TikTok House. Despite its potentially abstract name, the TikTok House was a uniquely designed intervention blending media education, vibrant aesthetics, and easily digestible information within a physical space. We set up a thematically decorated (LED lights, a mirror designed as the For You Page, scattered with various objects from current trends, etc.) small glass house at the centre of the city, aiming to bring a familiar digital space to physical life. In the TikTok House, visitors could quickly learn about the TikTok algorithm, how it works, and which data it collects. Additionally, it provided guidance on how to nudge and take control of what appears on one's homepage – For You Page. We wanted the space to attract younger generations and offer interactivity with the mirror as a central object, but from our observations can claim that such spaces facilitate intergenerational dialogue and informal knowledge sharing.

CYM08 Media Literacy Under Pressure: Children's Needs, Educational Constraints and Policy Gaps in Deeply Mediatized Societies

PN 38 Between emotional exposure and curriculum overload: Teachers' perspectives on children's news engagement and digital well-being

Maria José Brites[1], Teresa Sofia Castro[1], Margarida Maneta[1]

[1] Lusófona University, Lusófona University, Lisbon, Portugal

This study explores the multifaceted reasons influencing how Portuguese students (ages 6–13) engage with news and digital media, leveraging the Digital Well-being (DWB) ethical framework, which refers to the impact of digital technologies on achieving a life that is good for a human being (Bur et al., 2020). Based on nine in-depth interviews with teachers (Mensonides et al., 2024), we argue that children's relationship with news is highly variable, dictated fundamentally by socio-cultural contexts and emotional resonance, resulting in an increasing inability to exercise critical reading over information consumed online. Addressing this pervasive gap requires urgent pedagogical responses to integrate Media and Information Literacy (MIL) effectively into the educational experience (Aguaded et al., 2025). The omnipresence of digital media in children's lives necessitates integrating MIL to equip them with the critical skills required to navigate benefits (e.g., information access), challenges (with the emergence of AI tools) and harms (e.g., disinformation, emotional stress). Teachers identify a critical tension stemming from the structural environment, consistently describing the official curriculum as "overloaded". This inflexibility leaves "very little time" to cultivate among children spontaneous discussion of civic life, severely restricting the formal environment's ability to challenge the risks of passive, unchecked information consumption. This qualitative study draws on nine semi-structured interviews conducted with experienced educators from the 1st, 2nd,

and 3rd cycles of education in Portugal. The primary research focus was to capture teachers' perspectives on the intersecting influences of students' background, specific digital practices, and the factors that motivate or erode their informed engagement with current affairs. Findings reveal that the family's socio-cultural environment strongly dictates news involvement, demonstrating that critical discussion is fostered where parents actively accompany and explain information (Seddighi et al, 2022). The presence of foreign students (namely, Brazilians) acts as a powerful catalyst for citizenship dialogue, often spontaneously introducing complex political themes (such as comparisons between local far-right parties and figures like Lula or Bolsonaro), necessitating the use of empathy tests to address prejudice. However, youth engagement with media is overwhelmingly directed towards entertainment via digital platforms such as TikTok and YouTube, contributing to "fast news" consumption. Teachers report that this results in students frequently failing to "compare" sources and readily accepting unverified online content as "reality". The reliance on generative tools like ChatGPT further compounds this challenge by encouraging students to copy information without checking its correctness. Crucially, teachers note that emotional drivers resulting from global conflicts (e.g., war news) often provoke spontaneous dialogue but also cause emotional stress and anxiety in students. Given persistent societal and emotional pressures on youth in the unpredictable technological landscape, education must move beyond rigid curriculum to integrate DWB and MIL (Aguaded et al., 2025; Bur et al., 2020). Pedagogical models must prioritise critical autonomy and socially distributed knowledge through informal learning and the cultivation of relational habitus (Underwood et al., 2013). This prepares citizens for ethical democratic participation and responsible self-management within the complex digital ecosystem, enabling them to become empowered and resilient citizens.

CYM08 Media Literacy Under Pressure: Children's Needs, Educational Constraints and Policy Gaps in Deeply Mediatized Societies

PN 39 Barriers of media literacy education: Teacher's media habitus

Anna Eder-Jahn[1], Christine Trueltzsch-Wijnen[1]

[1] Salzburg University of Education Stefan Zweig, Salzburg University of Education Stefan Zweig, Salzburg, Austria

In Austria media literacy education at school was introduced by a media education decree in 2001 (actual version: BMBWF, 2022). It says that media literacy must be addressed from classes 1 to 12 in all subjects. However, in practice, it depends on the commitment of single teachers whether and how this is realized. Some offer various ways to support media literacy, while others tend to ignore it. We were interested in teacher's perspectives and the reasons for integrating or not integrating media literacy education in their lessons. We addressed this from the perspective of media repertoires (Hasebrink & Hepp, 2017) and media habitus (Kommer, 2014), and conducted a quantitative survey (N = 174) and semi-structured interviews (N = 14) with elementary and primary school teachers. Our research questions focused on teacher's private media use (media repertoires, media habitus) (RQ1), on their motivation to deal with digital media in class (RQ 2), and on their pedagogical knowledge regarding digital media and media literacy education according to the TPACK-model (Mishra & Koehler, 2006) (RQ 3).Our findings show that although teachers' media repertoires and media habitus included a variety of digital media, analogue or at least screenless media activities were valued more. The older teachers were, the more were non-digital media valued over digital media. In this regard, particularly interviews with younger teachers revealed conflicts between teachers' private media habits and their professional media habitus. Survey data also showed an impact of teachers' private media repertoires on their motivation to include digital media and media literacy education class. Often, teachers' professional media habitus opposed the media habits and experiences of toddlers and school children. In the interviews older and younger teachers showed negative attitudes against children's experiences with digital media, when they appeared as part of their play or interaction with others. In the quantitative data set, we also found a correlation between teachers' pedagogical knowledge regarding media literacy education (TPACK), and their motivation to integrate digital media in educational settings. However, only part of the teachers claimed for more training in media literacy education. This was again more often mentioned by younger than by older teachers. In our presentation we will explain and discuss our findings more in depth. Based on this, we will propose recommendations how teachers' motivation could be encouraged across all ages in order to pave the way for a better integration of digital media and children's media experiences in elementary and primary education, as well as the support of media literacy and digital competencies in early formal education.

CYM08 Media Literacy Under Pressure: Children's Needs, Educational Constraints and Policy Gaps in Deeply Mediatized Societies

PN 40 Advancing kindergarteners' digital media and information literacies via creative, playful approaches

Inger Klesment[1], Maria Murumaa-Mengel[1]

[1] University of Tartu, University of Tartu, Tartu, Estonia

Extensive screen media experiences begin often in toddler years, as contemporary technologies allow very young children to be independent, active media users. It is crucial for children to be aware of the basic principles of (digital) media and social media logic (van Dijk & Poell, 2013), and constantly update necessary media and digital literacies. Children learn

through play, a term that encompasses both the Vygotskyan sense of imaginative acts and the more physical sense of engaging with a toy or game. Research confirms that children often make sense of media through interaction with others (Pfaff-Rüdiger & Riesmeyer, 2016), engaging in a fluid process where digital content is recreated also outside digital play, spanning imaginative, role, and outdoor activities (Arnott et al., 2020; Potter & Cowan, 2020). Methodologically, we use the action research framework (Sagor, 2010, Nazari, 2022), trying to simultaneously study and solve a problem. We started with a general research question: "How to advance the youngest age group's digital media and information literacies in a way that acknowledges their developmental preferences"? Then we collaborated with our students, enrolled in various media education courses. In that way, we hope the new generation of alumni will have a mindset of MIL collaborators, "serving as translators between the research community and the practitioners" (Powell et al, 2018).For three years now, we have carried out a playful event called DigiRapid for kindergarteners. The format follows so so-called internet safety drills- rapid learning sessions where groups of participating kids with their accompanying teachers transition to a new learning station every ten minutes. Learning stations are essentially play hubs where instructor(s) explain the short format game and then play as a group. The event takes place in springtime at the city park, with 50 students carrying out the activities and 200–300 children (mostly 6–7yos) participating with their teachers. To give an example of one 10-minute game: participate in a musical chairs type of dance game where when the music stops, children "freeze" and listen to a statement, such as "I ask my parents for permission before playing a new game" or "I click on an advertisement that promises free rewards." The children then must decide whether this action is reasonable or not. To do this, they run towards the play instructor holding yes/no signs. Then the instructor initiates a discussion with their group about why they made such choices. Guiding principle is to really listen to childrens' reasonings and their media worlds, let them interact amongst themselves and intervene with advice for safer choices if necessary. Physical play was central to our intervention because learning through play is recognized in pedagogy as meaningful, joyful and engaging in interaction-based holistic learning outcomes (Parker et al., 2022). Well-designed games do more than teach; they function like small focus groups, where children open up and share their experiences more effectively than they would through interviews or direct questioning (Parsanoglou et al., 2022). This feedback is valuable for educators (Hietajärvi & Maksniemi, 2017), providing authentic insights into children's online behaviors.

CYM08 Media Literacy Under Pressure: Children's Needs, Educational Constraints and Policy Gaps in Deeply Mediatized Societies

PN 41 Fostering inclusive digital- and media literacy education: Policies for culturally diverse societies

Denise Mensonides[1], Çiğdem Bozdag[1]

[1] Rijksuniversiteit Groningen , Rijksuniversiteit Groningen , Groningen, Netherlands

To support children in the development of the necessary skills, attitudes, and knowledge to participate safely and critically in digital environments, digital literacy education is rapidly becoming a part of the school curriculum. In the Netherlands, where this research is conducted, digital literacy will be formally embedded in primary and secondary education through attainment goals by 2027. Yet, while these policies aim to strengthen digital- and media literacies and promote digital inclusion, policymakers struggle to identify the necessary forms of support needed for students from different social and cultural backgrounds (Rožukalne et al., 2023). This is especially relevant as research shows that digital literacy development is shaped by intersecting socio-cultural factors (Goedhart et al., 2019). Yet, there is only limited research on how media education policies address digital inequalities related to socio-cultural factors. To address this gap, this project is organized around two key components. First, we conducted an intersectionality-informed thematic analysis of 48 Dutch policy documents on digital inclusion across six themes: education, public services, specific target groups, healthcare, public values, and key societal actors. The results from this study show that while the current policies include a wide range of target groups, their differing needs and the ways to address these needs remain unclear. In addition, current policies largely overlook socio-cultural dimensions of digital literacy development and digital inclusion. Building on these findings, this contribution focuses on the context of education as a critical site of change towards a more equal digital society. In the second part of this project, we aim to understand how educational policies aimed at digital- and media literacies are translated into everyday teaching practices and negotiate aspects of cultural diversity and inclusion in the classroom by conducting twenty interviews with teachers and educational and policy experts. The presentation highlights the gaps between policy intentions and everyday educational practices, identifying key barriers for implementation and inclusive digital- and media literacy education in the process. In addition, we present a framework to understand the role of policy in digital and media literacy education from an intersectional perspective of digital inclusion. Building on these findings, we argue for a lived experience approach to policy making, accounting for the situated needs of different populations to be meaningfully included in a digital society. Finally, we propose concrete recommendations for both policy makers to develop more inclusive policies and initiatives for digitally disadvantaged groups and for teachers to foster inclusive educational practices that consider socio-cultural contexts and the needs of varying target groups.

CYM09 Critical Perspectives on Youth and Generative AI

PP 0591 AI-driven youth cultures: Rethinking media literacy through algorithmic feel, platform practices, and critical digital competence

Luisa Magalhaes[1]

[1] Universidade Católica Portuguesa, Faculdade de Filosofia e Ciências Sociais, BRAGA, Portugal

This article examines how expanding access to artificial intelligence tools and the rise of AI-mediated youth cultures demand a reconceptualisation of media literacy grounded in communication sciences. As generative AI, recommendation engines, and predictive analytics increasingly structure young people's media practices, traditional literacy models—focused on information evaluation or functional skills—are insufficient for addressing the complexity of algorithmically mediated communication. Drawing on Minna Ruckenstein's concept of the **"feel of algorithms"** (2024), the article argues that young users develop experiential, affective, and embodied ways of sensing AI systems that coexist with, and sometimes contradict, formal media literacy objectives. This framework is situated within broader theoretical contributions from Buckingham (media education), Livingstone (children and digital media), Potter (media literacy), and van Dijck (platform society).

Three strands of scholarship guide the analysis:

1. **Communication sciences and audience theory**, emphasising processes of mediation and meaning-making in digital environments (Couldry & Hepp, 2017).
2. **Media literacy and digital competence research**, identifying gaps in current frameworks regarding algorithmic and AI systems (Buckingham, 2020; Frau-Meigs et al., 2017).
3. **Emerging AI literacy and youth culture studies**, including Ruckenstein's exploration of algorithmic sensibilities (2024), research on adolescents' creative and playful appropriations of AI (Swist & Collin, 2023), and analyses of platform governance and automated decision-making (Noble, 2018; O'Neil, 2016).

Together, these perspectives show that youth AI practices are deeply embedded in identity work, peer cultures, and affective engagements with digital platforms.

Methodology

The study employs a **mixed-method design**:

1. **Digital ethnography** of youth interactions with AI-integrated platforms (TikTok, Instagram Reels, Snapchat's AI lenses, generative chat and image tools).
2. **Semi-structured interviews** with adolescents (12–18) exploring their interpretations, emotional responses, and trust relationships with algorithms.
3. **Critical discourse analysis** of platform interfaces and AI features to understand how technical design shapes user agency, visibility, and literacy demands.

This triangulation captures both the cognitive and affective dimensions of how young people "feel" and navigate algorithmic systems.

Argument and Contribution

The article argues that contemporary media literacy must incorporate **algorithmic awareness**, **AI literacy**, and **affective–experiential dimensions** of youth–technology interaction. Young audiences increasingly rely on AI for creativity, identity formation, and social communication, yet often lack structural understanding of data extraction, generative biases, and platform governance. By foregrounding the "feel of algorithms" and the lived realities of AI-driven youth cultures, the article proposes a renewed media literacy framework integrating critical interpretation, ethical participation, experiential awareness, and systemic understanding. The framework offers actionable insights for educators, researchers, and policymakers seeking to empower young people's agency, creativity, and safety in an AI-mediated communicative landscape.

Keywords

Media literacy; youth cultures; artificial intelligence; algorithmic awareness; digital ethnography; communication sciences; generative AI; platform studies; critical data literacy; affective engagement

CYM09 Critical Perspectives on Youth and Generative AI

PP 0592 Generative AI and affective labour among young adults with migrant backgrounds outside work and education

Gilda Seddighi[1], Lin Prøitz[2], Tina Vrieler[3], Rebecca L. Radlick[4], Benedicte Nessa[5]

[1] NORCE, Health and Society, Bergen, Norway
[2] Høgskolen i Østfold & University of Bergen, IT and communication and Center for digital narrative, Halden and Bergen, Norway
[3] Western Norway Research Institute, Technology and Society, Sogndal, Norway
[4] Norwegian Research Center, Health and Society, Bergen, Norway
[5] Norwegian Research Center, Health and Society, Stavanger, Norway

In increasingly digitalised societies, artificial intelligence (AI) and generative AI (GenAI) in particular, play a growing role in structuring everyday practices, from information seeking to emotional and social navigation. While much scholarship frames GenAI as an empowering tool, emphasising issues of literacy and skills (Sabherwal & Grover, 2024), other research suggests that its use may also have negative implications for well-being (Hashem et al., 2025). Young adults in NEET situations (not in education, employment, or training), who often face intersecting challenges such as low completion rates of secondary education, socioeconomic disadvantage, and weak institutional and social support, are particularly vulnerable (Fyhn et al., 2021). Building on research on socio-digital inequalities, which demonstrates that digital outcomes are shaped not only by technical skills but also by access to supportive social relations and by the capacity to interpret (Schellewald, 2022), negotiate, and navigate algorithmic systems (Helsper, 2021; Livingstone, 2025), this paper illuminates how such inequalities may be reproduced through everyday uses of GenAI. This study explores how young adults with migrant backgrounds in NEET situations engage with GenAI in their everyday lives, focusing on how such use can be understood as a form of *affective labour*.

Drawing on science and technology studies, particularly Susan Leigh Star's work on invisible work and marginality, the paper illuminates GenAI use as embedded in everyday forms of affective labour, coping with isolation, and managing uncertainty in precarious life situations. Rather than focusing on access or skills alone, drawing on qualitative interviews with 25 young people aged 16–29 in Neet situations, this paper highlights how inequalities rooted in non-supportive social ties are reproduced through everyday GenAI practices of coping, care, and emotional regulation.

Increasingly, young people in Europe are integrating Generative AI tools and companions (e.g., ChatGPT, Copilot, My AI, and Character AI) into everyday learning and leisure practices (Vodafone Foundation, 2025). Hence, it is essential to explore not only young people's functional skills, but also broader set of knowledge, skills, and attitudes – including critical and ethical considerations – as key competences for navigating digital life. Conceptually, this requires clarifying what constitutes AI literacy and its relevance for research. Building on ITU (2018) and recent research (Losh, 2024; Smahel et al., 2024), AI literacy can be defined as the ability to use AI tools to achieve beneficial outcomes while minimising harms. Usage of AI encompasses two main modes of engagement: (1) deliberate use of AI tools and (2) responses to AI decision-making, such as predictive systems like recommender algorithms and algorithmic media (Narayanan & Kapoor, 2024). Each demands distinct yet overlapping set of skills, knowledge, and critical awareness. Developing such literacy involves understanding visible features (e.g., prompt design, conversational interfaces) and hidden mechanisms (e.g., algorithmic moderation, personalisation engines) that shape users' experiences and choices, enabling them to meaningfully exercise their right to informed participation. This study explores adolescents' (aged 13–17) AI literacy and their awareness of structural dynamics underlying AI technologies. We focus on functional and critical dimensions – from prompt formulation to understanding operational logic, business models, ideological bias, and ethics – and analyse how these aspects are perceived and interpreted. Drawing on semi-structured interviews (N = 156) in nine European countries (Austria, Estonia, Italy, Luxembourg, Norway, Poland, Portugal, Serbia, and the United Kingdom), we explore how adolescents learn about AI-related benefits and risks, how this awareness shapes attitudes toward generative AI and its impact, and their views on remedies, policies, and regulation. Findings reveal that while young people claim to have good functional skills and generally feel confident in their AI-related abilities, their awareness of deeper structural and ethical aspects – such as operational principles, ownership structures, and bias – remains limited. Some expressed uncertainty when discussing these topics; as one 16-year-old from Estonia remarked, "I just started writing – there's not much to learn." Few participants perceived gaps in knowledge or expressed interest in further development. Although most could identify at least one AI-related risk, this was largely confined to privacy concerns, fear of being accused of cheating because of using AI for homework, and hallucination. Understanding of bias, data governance, co-creation, copyright, or ethical principles was rare, and few also raised environmental concerns about the impact of AI or addressed limits or biases in diversity and cultural representation. These results raise concerns for equity, inclusion, and age-appropriate design of AI tools. We propose an AI literacy model that incorporates a critical disposition as central to AI literacy – combining functional skills with awareness of AI's social and structural dimensions, on the grounds that understanding young people's experiences and perspectives is a vital starting point for designing media education policy.

CYM09 Critical Perspectives on Youth and Generative AI

PP 0594 Emotional responses and critical autonomy towards generative artificial intelligence: An ethnographic study on beliefs, emotions and text production among secondary school students

José Luis Capón García[1], García-Orosa Berta[2]

[1] USC Universidade Santiago de Compostela, IACODI, Santiago de Compostela, Spain
[2] USC Universidade Santiago de Compostela, Communication, Santiago de Compostela, Spain

The emergence of generative artificial intelligence (GAI) in youth communicative environments represents a paradigm shift that demands well-founded educational responses. Secondary school students access these tools mediated by a set of informally acquired beliefs (regarding their accuracy, neutrality, reliability or potential threat) that trigger significant emotional responses such as distrust, enthusiasm or frustration. These emotional dispositions, shaped outside formal schooling, condition students' capacity to employ GAI critically and productively in academic tasks. This paper presents the findings of an ethnographic study examining the relationship between beliefs, emotional responses and competence in using GAI for argumentative text production among a group of 22 upper secondary students (aged 14–16).The theoretical framework integrates three complementary perspectives. First, the literature on AI literacy, which distinguishes between

technical knowledge about these tools and the competence to employ them in contextually appropriate ways. Second, theories of emotional cognition in technology adoption, which conceptualise trust as a multidimensional construct comprising cognitive, affective and behavioural components. Third, and most centrally, a critical pedagogical approach grounded in Paulo Freire and Gert Biesta. Drawing on Freire, we assume that education must be oriented towards the emancipation of the subject, overcoming 'banking education' that deposits content without problematising the conditions of knowledge production. Uncritical interaction with GAI would reproduce this depositary logic, whereas critical pedagogy must enable students to interrogate both the tools and their own dispositions towards them. From Biesta, we incorporate the distinction between qualification, socialisation and subjectification as dimensions of educational action, emphasising the latter: the goal is not merely for students to use GAI competently, but for them to constitute themselves as autonomous subjects capable of positioning themselves critically in relation to it. The methodological design adopts an ethnographic approach that privileges understanding the meanings participants attribute to their experience with GAI. Data collection employed four triangulated techniques: analysis of argumentative textual productions created with GAI interaction, revealing usage patterns and integration strategies; focus group discussions exploring the collective construction of beliefs within peer contexts; structured questionnaires on emotional dispositions and technological beliefs; and life history journals where students narrate their trajectory of interaction with GAI tools, critical moments and transformations experienced. This latter instrument proves particularly coherent with the Freirean approach by positioning the student as narrator of their own experience. Findings indicate that beliefs about GAI shape emotional dispositions that operate as either facilitators or inhibitors of critical competence. The educational intervention accompanying the study, guided by critical pedagogy principles, demonstrates how explicit work on these beliefs and emotions enables the development of what we term 'critical autonomy': students' capacity to employ GAI as a tool serving their own argumentative voice, without subordination or unreflective rejection. This research contributes to ECREA 2026's theme 'Shifting Grounds' by examining how GAI is reconfiguring youth communicative landscapes and by proposing educational responses that transcend mere technical literacy, committed to forming subjects capable of critically inhabiting new technological environments.

CYM09 Critical Perspectives on Youth and Generative AI

PP 0595 Designing Inequalities: Generative AI and the remaking of children's worlds

Mariya Stoilova[1], Ivelise Fortim[2], Sonia Livingstone[1], Jennifer Kaberi[3], Kruakae Pothong[4], Usha Raman[5], Ayça Atabey[6], Kim Ringmar Sylwander[4]

[1] LSE, Media and Communications, London, United Kingdom
[2] Pontifícia Universidade Católica de São Paulo, Faculty of Human and Health Sciences, São Paulo, Brazil
[3] Mtoto News, Mtoto News, Nairobi, Kenya
[4] LSE, Digital Futures for Children centre, London, United Kingdom
[5] formerly University of Hyderabad, Department of Communication, Hyderabad, India
[6] Edinburgh University, Edinburgh Futures Institute, Edinburgh, United Kingdom

Generative Artificial Intelligence (GenAI) represents a new phase in the platformisation of childhood, extending algorithmic mediation across children's media ecologies. As GenAI tools become embedded in educational platforms, social media, creative practices, and domestic spaces, they reshape how children communicate, learn, play, and form relationships (Atabey et al., 2025). However, the rapid diffusion of these technologies has outpaced the development of governance frameworks that adequately address children's rights, experiences, and media practices (UNICEF, 2025; UNESCO, 2024). Existing AI regulation remains largely adult-centred and informed by Global North perspectives, offering limited insight into how children in the Global South encounter and negotiate the uneven consequences of platformised media environments (Stoilova et al., 2025).

Drawing on qualitative research with 84 children aged 13–18 in Brazil, India, Kenya, Thailand, and the UK, this paper examines how GenAI mediates children's everyday media practices and identity work. It asks: how do children make sense of and appropriate GenAI within their social and communicative worlds, and in what ways do digital infrastructures reproduce or challenge existing social and cultural inequalities?

Children's accounts highlight how GenAI use is shaped by the logics of platform capitalism, datafication, and commercialisation. While participants used GenAI for schoolwork, creative production, and emotional expression, their engagements were constrained by unequal access to devices, connectivity, and subscription-based features. Moreover, the design of GenAI systems privileges English-language inputs and Western cultural frameworks, marginalising non-dominant languages, local knowledges, and cultural identities. Children, particularly in the Global South, were acutely aware of these exclusions, describing AI outputs as irrelevant, inaccurate, or erasing their lived realities.

The findings also point to the emergence of affective and relational attachments to GenAI tools, suggesting a deepening entanglement between children's sociality and automated media systems. Some participants described AI companions as more predictable, responsive, or understanding than human relationships, raising critical questions about the delegation of care, intimacy, and emotional labour to commercial platforms.

By situating children's engagements with GenAI within the political economy of media infrastructures, this paper argues that GenAI intensifies the datafication of childhood while obscuring structural inequalities across contexts. It concludes that media and communication research on childhood must foreground power, access, representation, and children's voices,

and calls for AI governance, design, and media education grounded in children's rights and epistemic justice (5Rights Foundation, 2025).

CYM10 Digital Families Across Borders: Relational, Cultural, and Institutional Contexts

PN 63 Parents' new normal? Examining coerced digital participation in Denmark's welfare state

Victoria Andelsman Alvarez[1]

[1] Center for Tracking and Society at the University of Copenhagen, Communications, Copenhagen, Denmark

This paper analyzes how digital parenting—the integration of digital media into parents' everyday caregiving practices—is shaped by state institutions and care infrastructures rather than individual preference. It asks: How do state-mandated apps mediate parenting practices, and what are the consequences for parental agency and responsibility? Based on 47 in-depth interviews with 20 Danish parents conducted over one year, the study examines how interpersonal routines and institutional expectations intersect with the broader "infrastructuralization" of digital media in family life. The analysis emphasizes the importance of attending to mundane digital routines rather than focusing solely on high-profile cases such as sharenting or smart toys. Parents' experiences with Aula, Denmark's parent-school communication platform, illustrate how digital systems establish expectations of attentiveness, availability, and competent parenting. The platform's ubiquity shows how deeply digital technologies have become embedded in care infrastructures. Parental agency thus cannot be understood as a matter of personal choice alone; it develops through continual negotiation with digital systems integrated into the educational system and the welfare state. The study advances research on digital parenting and contributes to debates on what Barassi terms "coerced digital participation," in which engagement with digital systems becomes necessary to access essential services and sustain social relationships. The findings highlight the increasingly blurred line between voluntary and coerced digital practices. When digital platforms are required for basic caregiving—receiving school information, coordinating activities, or tracking deadlines—participation ceases to be optional. Institutional expectations and the deep integration of digital infrastructures restrict parental choice and raise questions about data privacy, consent, and the state's role in the datafication of childhood. These dynamics indicate that safeguarding children's privacy cannot rely on binary positions for or against digital technology, nor on choosing between private companies and public institutions to handle data. A more effective approach recognizes both the benefits and risks of datafication and the shared responsibilities of parents, institutions, and technology providers. Although the study focuses on Denmark, it offers insights relevant to other contexts where digital technologies have become foundational to public services and care relationships. The Danish case demonstrates that even within a welfare state with strong privacy protections, the datafication of childhood poses significant concerns for children's futures and for the evolving nature of care.

CYM10 Digital Families Across Borders: Relational, Cultural, and Institutional Contexts

PN 64 Streaming in European families: A shared family activity or an individual practice?

Bogumiła Mateja-Jaworska[1], Maja Nordtug[2], Gustavo Herrera-Urízar[3]

[1] Adam Mickiewicz University, Faculty of Sociology, Poznań, Poland
[2] University of Oslo, Department of Education, Oslo, Norway
[3] Department of Didactics and Educational Organization Faculty of Education, Universitat de Barcelona, Barcelona, Spain

Streaming platforms such as Netflix, YouTube or Spotify, are gaining significant traction worldwide, and are increasingly integrated into modern family lives. They are designed with certain functions and anticipated individual user behaviours in mind, yet families operate according to diverse needs and values. To examine how streaming platforms intersect with family practices, we explore the question: How and under what circumstances is streaming constructed as a shared family activity and/or an individual practice in European families? Our analysis is based on 279 interviews with children and youth, parents, and grandparents from 93 families from five European countries: Poland, Norway, Spain, Romania, and the UK. The interviews were conducted between autumn 2023 and spring 2025 and were part of a large European qualitative research project. Our analysis shows that many families value shared viewing and listening, attributing this practice for creating physical closeness, fostering bonding through shared tastes and emotions, providing material for conversation and activities, and integrating streaming into family rituals. This demonstrates continuity of cultural patterns even in a rapidly changing media environment–formerly expressed in collective gatherings around the radio or television, now reflected in attempts to transfer this practice into the realm of streaming. However, this process is marked by tensions and frictions. The extent to which streaming platforms afford streaming as a shared family or an individual practice depends on various factors. These factors include attributes that can be linked to family members such as differences and similarities amongst family members (in age, gender, tastes), as well as whether family streaming is considered a desired "quality" family activity. Furthermore, our analysis shows that despite far-reaching transformations in cultural values, genre preferences still partly reflect gendered patterns, especially among parent and grandparent generations. However, the micro-power traditionally exercised by fathers has diminished in favour of the decision-making influence of children and younger generations. Our study thus highlights how family cultural values and emotions shape streaming practices. Moreover, we raise the question of how streaming platforms—through their technological affordances and business features—shape streaming practices. By examining device features and the spaces in which they are used, we highlight the persistent role of materiality even in

an era of immaterial digital platforms. We demonstrate that certain hardware and shared physical spaces (like living rooms or cars) form part of family infrastructure, fostering togetherness and counteracting tendencies towards individualisation offered by personalised recommendations and modes of use. We note that the opposing logics of striving for shared family time and the logic of streaming platforms (which offer a multitude of options and tailoring to individual, not collective preferences) often pose a challenge for families, leading to disputes and quarrels. From this perspective, these conflicts and the strategies families develop to resolve them (for example, seeking compromises about what will be listened to or watched and when) may be seen as crucial for maintaining shared family practices.

CYM10 Digital Families Across Borders: Relational, Cultural, and Institutional Contexts

PN 65 Social relationships and digital transitions: How family ties restructure whatsapp (dis)engagement

Mora Matassi[1]

[1] Universidad de San Andrés, Department of Social Sciences, Buenos Aires, Argentina

Relationships established with digital media are dynamic. People appropriate, leave, and come back to different media technologies throughout their life course (boyd, 2014; Madianou & Miller, 2013; Nguyen, 2023; Taipale et al., 2018). This study examines how social relationships—particularly family ties—act as a structuring force in digital (dis)engagement to WhatsApp, a hybrid between instant-messenger and social media platform that has become, in many cultures, a central element to the management of everyday life (Johns, Matamoros-Fernández, & Baulch, 2023).Specifically, I ask: (1) How do close ties, specifically those concerning family relationships, shape individuals' processes of use of, and disconnection from, WhatsApp? (2) What social obligations and expectations shape digital presence and absence in familial contexts?Methodologically, the research was conducted using a qualitative approach, integrating semi-structured interviews and focus groups to capture a broad range of perspectives on social media (dis)engagement. A total of 143 participants from different regions of Argentina were interviewed. Data analysis followed an abductive framework, iteratively refining theoretical insights by linking empirical observations with broader communication theories. Findings suggest family relationships play a substantial role in structuring social media use and disconnection, in general, and WhatsApp, in particular. In their discourses, participants display how caregiving responsibilities, family expectations, and social obligations shape their platform use. Others frame digital presence as a moral obligation to remain available for close family members. While digital disconnection may be perceived as an act of personal well-being, for some participants it entails consequences for others who depend on these platforms for communication. Social pressure attached to parental roles also play a role in digital use. At the same time, overwhelming feelings associated with family ties are a cause for disengaging from some WhatsApp functionalities, like groups, causing some irritation among family members. In some cases, care work seems to make digital presence unavoidable, leading to reusing WhatsApp. These findings underscore how digital (dis)engagement is relational, shaped not only by personal preferences or technological features, but also by caregiving structures and social dependencies highlight the relational nature of digital engagement and disengagement. While previous research emphasizes individual autonomy in digital disconnection (Ross et al., 2024) as well as the role played by the design of technology (Vanden Abeele, Halfmann, & Lee, 2022), this study seeks to make a contribution by underscoring how processes of technology use and disconnection are deeply embedded in social structures, as individuals must negotiate their withdrawal within broader networks of care and obligation—oftentimes associated with family ties. This study contributes to discussions on the role of digital platforms in mediating family relationships (Madianou & Miller, 2013), particularly in contexts where digital infrastructures become central to maintaining intergenerational ties. While digital platforms such as WhatsApp offer connection, convenience, and reachability, they also seem to impose relational expectations that complicate efforts at disengaging (Ling, 2012)—showing that family ties mediate the role of digital platforms in turn.

CYM10 Digital Families Across Borders: Relational, Cultural, and Institutional Contexts

PN 66 Parenting tween girls on roblox: Negotiating expectations, responsibilities and play

Ana Kubrusly[1], Natalie Coulter[2]

[1] CICS.NOVA NOVA University of Lisbon and Polytechnic University of Setúbal, Department of Communication Sciences, Lisbon, Portugal
[2] York University, Institute for Research on Digital Literacies, Toronto, Canada

Roblox has emerged as one of the most popular 'digital playgrounds' targeting children and tweens as core audiences. Often referred to as the 'YouTube of Games', there are over 150 million daily active users on Roblox, with roughly 40% being under the age of 13 (Roblox, 2025). In the aftermath of several investigations regarding child safety in the platform, including a highly mediatized report by Hindenburg Research (2024) that characterized it as a 'pedophilic hellscape.' In response Roblox invested in bettering their safety guidelines and features, as well as parental controls. However, it is unclear how parents experience these changes. This paper focuses on parents' expectations, challenges, and playful negotiations of their daughter's Roblox use within the family sphere. As part of a bigger study, we interviewed 14 parents and 17 tween daughters living in Toronto, Canada in the fall of 2025 which were later thematically analyzed. We aim to understand parents' perceptions and knowledge of Roblox, how the platform fits into their families' media routines, the challenges and the opportunities associated with the platform, as well as the issue of responsibility when it comes to supporting their daughter's safety and wellbeing. In our study most parents express a distrust of Roblox as a platform, due to negative

experiences of other families and portrayals of the platform on the news. To deal with this, parents employ diverse strategies, from the usage of Roblox's parental controls — which a few deem to be 'unsophisticated' — to ongoing conversations and negotiations around digital safety with their children. Many Participants further reported feelings of inadequacy regarding their digital parenting practices. Parents often felt the need to 'apologize' for their lack of knowledge on Roblox, with very few saying they had heard of the platform's own safety and family resources. Some parents also expressed they felt like they were 'aging out of what is relevant' which makes it hard for them to guide their children through digital experiences they consider 'foreign'. Nonetheless, the positive role of Roblox for play and socialization in their daughters' lives was a point of consensus among our participants as many of the girls played Roblox with friends, cousins, and siblings. Media use rules in the family sphere mostly revolve around limiting screen time and ensuring content is age-appropriate, with the latter being harder to reinforce, as parents report the existence of 'scary' and 'violent' games in the platform, even when parental controls are in place. Parents express the wish that Roblox offered better support for parents and prioritize the platform as a space for children to learn and express themselves creatively in a safe way. Overall, our results largely echo previous research on the pressures and responsibilities of digital parenting (Livingstone & Blum-Ross, 2020) with parents often feeling inadequate as 'role models' for their children. This highlights a relevant gap regarding Roblox's solutions — that responsibilize parents as the main agents for their children's safety — while parents' feel overwhelmed and struggle to take on such tasks.

CYM10 Digital Families Across Borders: Relational, Cultural, and Institutional Contexts

PN 67 From "shitty mom" to "super dad": (Re)framing gendered parenting scripts in Italian digital media

Davide Cino[1]

[1] University of Milano-Bicocca, Department of Human Sciences for Education "Riccardo Massa", Milan, Italy

In contemporary Italy, digital media have become central arenas for constructing, reinforcing, and contesting gendered parenting norms. While caregiving is often presented as a universal and biologically rooted responsibility, its enactment remains profoundly gendered: mothers are positioned as moral and epistemic guardians of the family, while fathers are portrayed as lacking but improvable. This paper examines how Italian digital platforms contribute to the (de)construction of these roles, drawing on interdisciplinary literature on digital parenting, media cultures, and gendered care. In line with recent scholarship, digital media are approached as spaces that accompany transitional moments and shape parental experiences and expectations. Italy offers a compelling case for investigation. Its familistic culture privileges maternal caregiving and informs institutional and everyday expectations of who performs emotional labour and assumes responsibility for children. Parenting scripts are understood here as culturally embedded narratives that delineate how caregiving roles are performed, evaluated, and legitimised. These scripts reproduce asymmetries in responsibility, yet they are not static: they are negotiated, reframed, and challenged through media discourses and interactions. Drawing on a long-term digital ethnography conducted in Italy since 2020, this paper analyses two contrasting but culturally interdependent platforms: the satirical feminist initiative Mammadimerda ("Shitty Mom") and the Super Papà ("Super Dad") app. These cases exemplify divergent strategies for reconfiguring parenting scripts. The study combines digital ethnography and critical discourse analysis, with particular attention to the subjects of enunciations and their epistemic and deontic authority. Findings indicate that Mammadimerda functions as a space for counter-hegemonic reflection, where the burdens of intensive motherhood are made visible and laughable. Through recurring devices, such as the psicoteramerda ("shitty psychotherapist") persona and the motto "be a penguin", the platform reframes maternal ambivalence as legitimate and socially structured rather than pathological. Analysis of Instagram threads shows how metaphors circulate as cognitive tools: followers appropriate them to narrate struggles, validating experiences of fatigue, frustration, or self-doubt. The platform's mix of satire and testimonials enables mothers to renegotiate expectations and imagine caregiving as shared rather than solitary. Super Papà, in contrast, positions fathers as involved but pedagogically guided actors. Its interface structures paternal participation through checklists and monitoring tasks, encouraging men to oversee maternal behaviour, bodies, health, and decision-making. Findings reveal that while fathers are invited to be present, they are positioned as supervisors rather than co-caregivers. Prompts around pregnancy, nutrition, and breastfeeding emphasize paternal responsibility for ensuring maternal compliance, framing fatherhood as management rather than embodied care. Taken together, the analysis shows that Italian digital parenting cultures do not simply disrupt established scripts but participate in rewriting them. Mammadimerda destabilizes the moralized figure of the "good mother", whereas Super Papà repackages paternal engagement through managerial logics. The study argues that digital platforms are pedagogical environments in which gendered expectations are simultaneously challenged and reproduced, revealing the ambivalence of change in contemporary family life.

CYM11 Young People Navigating Online Hate Speech and Disinformation

PP 0838 Spreading hate speech on social media as a cultural phenomenon among adolescents and young adults

Antonio García-Jiménez[1], Rebeca Suárez Álvarez[1]

[1] Rey Juan Carlos University, Communication and Sociology, Madrid, Spain

Introduction

Hate on social media is a cultural phenomenon that goes beyond individual behaviour. From a media studies perspective, this research delves into the reasons for exposure to social media content that attacks or discriminates against groups of people based on their identity traits. It examines the arguments used by young people to legitimise this type of content as a reaction to defend their identity or ideas, and how they trivialise and downplay the harm caused. They exonerate themselves by blaming the victim through mechanisms of moral disengagement and ideological alignment (Wachs et al., 2002; Ieracitano et al., 2024). This phenomenon would be consistent with Social Dominance Orientation (SDO), which addresses the legitimisation and justify hostility towards groups perceived as subordinate (Celuch et al, 2022). Finally, existing individual attitudes are analysed within the framework of cultural structures that validate hatred.

Methodology

Firstly, the research is based on a representative survey conducted in 2025 among 1,800 adolescents and young people aged 14–24 living in Spain. The aim was to determine the predictive factors that shape the spread of hate speech in which younger generations are growing up and its legitimisation. Secondly, and complementarily, a qualitative approach is adopted, grounded in the use of social listening software, which has enabled the automated monitoring of comments posted on social media. It has been possible to identify patterns of hate speech in participation in polarised digital communities and to detect clusters of interaction using centrality metrics. Ten LGBTI influencers are examined based on their discursive influence. Concurrently, a comprehensive examination of 20,000 comments was conducted, with a focus on the misogynistic discourse prevalent within the inceldom community.

Initial results

Of particular note is the frequency of exposure to hostile content directed against individuals based on their origin, nationality or ethnic group (35.3%, M = 3.01) and content directed against gender identity or sexual orientation (34.7%, M = 2.95). To a lesser extent, although not marginal, content related to functional diversity or neurodiversity (29.1%, M = 2.78). The justification of hatred in terms of defending ideals or one's own group is the main justification as a defence of the in-group, with a high average proportion of 42.3% (M = 3.08), above trivialisation (26.7%; M = 2.64) and victim blaming (20%, M = 2.36). In both cases, boys show higher gradients than girls, particularly in the 18–24 age group. Boys (aged 18–24) are the ones who trivialise this content the most, justifying it as a joke (35.8%, M = 3.01; girls 22.7%, M = 2.50), and who claim that the people who are the targets of hate are usually to blame (27.3%, M = 2.71; girls 17.5%, M = 2.20). These results present a problematic pattern in which boys show greater adherence to mechanisms of moral disengagement by trivialising the harm, disguising aggression as harmless humour and shifting responsibility onto the victim. Furthermore, while LGBTI influencers do not articulate narratives of identity empowerment, the incel community propagates misogynistic and male victimisation discourses as a cultural backlash against feminism, thereby reinforcing exclusionary ideals of hegemonic masculinity.

CYM11 Young People Navigating Online Hate Speech and Disinformation

PP 0839 The structural layer of hostility: A multimodal and intersectional mapping of youth-targeted polirasation and hate speech on TikTok, Instagram, and Youtube (2024)

Félix Ortega[1]

[1] University of Salamanca, Department of Sociology and Communication, Salamanca, Spain

Problem Statement

Digital hate speech is no longer an isolated anomaly but has become a habitual discursive practice within social media ecosystems, particularly impacting young audiences. During adolescence, individuals are highly permeable to digital models as they seek references and consolidate their identities, making them vulnerable to hostile content that can deteriorate psychological well-being and translate into offline discriminatory practices.

Methodology

This proposal presents findings from the **CeMIYA project** (Countering Media Intolerance in Young Audiences), which analyzed a massive corpus of **22,123 posts** from TikTok (30.4%), Instagram (21.1%), and YouTube (49.5%) throughout 2024. The study utilized multimodal automated detection, transformer-based topic modeling, and hierarchical clustering to categorize eight types of hate: misogyny/gender, racism/xenophobia, LGBTQ+phobia, islamophobia, antisemitism, antigipsyism, lookism (*aspectismo*), and anticlimatism.

Key Findings

Prevalence and Platform Dynamics: Nearly half of the analyzed content (**44.24%**) contained hate or toxicity. **YouTube** emerged as the primary hub for hostility, concentrating 62.31% of hate posts and the highest levels of severe toxicity. Conversely, TikTok showed the lowest proportion (19.72%), suggesting that platform **affordances**—such as YouTube's long-form, argumentative nature versus TikTok's ephemeral micro-formats—mediate the intensity and sedimentation of hate.

The Misogyny Axis: Misogyny and gender-based hate act as the **structural backbone** of digital hostility across all platforms, being the most frequent category (e.g., appearing in 45.84% of hate posts on YouTube).

Platform-Specific Varieties: In **Instagram**, lookism (discrimination based on physical appearance) is a distinctive trait, appearing in 10.01% of posts and reflecting the platform's visual and performative logic.

Interaction and Engagement: Hate content functions as a powerful **interaction engine**. While neutral posts often receive more "likes," hate posts accumulate **56.88% of all comments**. In **TikTok**, hostile messages significantly drive conversation, generating double the average number of comments compared to neutral posts.

Intersectional Complexity: Intersectionality is a structural phenomenon rather than a marginal one; **38.4% of hostile content involves "multi-hate,"** combining multiple forms of discrimination. The most frequent pairing is **misogyny + racism/xenophobia**.

Conclusions

The results indicate that hate speech has been normalized as an **expressive resource** and a lever for visibility within the youth digital attention economy. The study underscores the urgent need for platform-specific prevention strategies designed through an **intersectional lens** to address the convergence of multiple axes of discrimination. To understand the presence of hate speech in the digital lives of youth, we can view social media platforms as different **urban soils** where young people grow their identities. In some soils (like YouTube), the ground is deep and allows for the thick, complex roots of "multi-hate" to take hold and persist over time. In others (like TikTok or Instagram), the soil is shallower and the growth is faster, leading to "weeds" of micro-aggressions and aesthetic judgments that spread rapidly and are easily normalized as part of the landscape. Addressing the problem requires more than just pulling individual weeds; it requires treating the soil itself—the very architecture and incentives of the digital environment.

CYM11 Young People Navigating Online Hate Speech and Disinformation

PP 0840 Understanding online hate speech through adolescents' voices. A multi-method qualitative study

Sonja Gabriel[1], Doris Lindner[2]

[1] KPH Vienna/Lower Austria, Media Literacy, Vienna, Austria
[2] KPH Vienna/Lower Austria, Education, Vienna, Austria

Hate speech on the internet has become an increasingly visible and socially disruptive phenomenon, particularly for adolescents who encounter digital communication spaces on a daily basis. As a public form of expression, hate speech articulates and reproduces notions of inequality directed at historically and structurally marginalized groups through intentional devaluation, exclusion, and contempt. It manifests in a wide range of forms, including racist, sexist, and other discriminatory expressions, and operates across different modes, ranging from explicit calls for violence to subtle practices such as generalizations, insinuations, and equivalences. Due to its dynamic development in digital environments and its violation of human dignity, hate speech poses a significant challenge to social cohesion and democratic culture. This challenge is especially relevant for educational contexts, where young people develop social orientations, values, and interpretive frameworks.

The present qualitative study contributes to educational and pedagogical debates on hate speech in schools by examining how adolescents perceive, interpret, and deal with hate speech in online contexts. The study focuses on young people aged 14 to 18 and investigates their everyday experiences, interpretive boundaries, and coping strategies in relation to online hate speech. A particular emphasis is placed on the role of schools as sites of prevention, awareness raising, and support from the perspective of the students themselves.

The study addresses four guiding research questions:

1. How do adolescents perceive hate speech online and what experiences have they had?
2. How do adolescents distinguish between expressions of opinion and hate speech, and where do they experience uncertainty in making these distinctions?
3. Which strategies do adolescents develop when confronted with hate speech, and which factors influence their willingness to act or intervene?
4. How do adolescents perceive the role of schools in preventing and addressing hate speech, and which forms of support do they consider helpful or desirable.

Methodologically, the study employs a multi-method qualitative design combining written reflections and group discussions. Data collection was conducted between November 2025 and March 2026 at different types of secondary schools in Vienna and Lower Austria in which more than 100 students participated in the study. The written reflection instrument

consists of an anonymous qualitative questionnaire consisting of an open-ended reflective text of approximately 200 to 250 words. Participants should articulate their thoughts, experiences, and expectations regarding hate speech, supported by optional guiding questions and sentence starters.

In addition, group discussions with open-ended prompts are conducted. These include an introductory phase focused on conceptual clarification, a discussion of concrete case examples using memes and screenshots, a reflection on personal experiences and action strategies, and a concluding phase addressing perceived needs and wishes.

By foregrounding the voices of young people, the study aims to generate empirically grounded insights into adolescents' understandings of hate speech and their expectations toward schools. First results are expected in early summer 2026. The findings are intended to inform educational practice and teacher education in lower and upper secondary education, with a particular focus on fostering critical reflection, awareness of discrimination, and professional, self-reflexive pedagogical action.

CYM11 Young People Navigating Online Hate Speech and Disinformation

PP 0841 TikTok and moral disengagement: A three-wave longitudinal study of hate speech exposure among adolescents

Isabel Rodríguez-De-Dios[1], Johanna M.F van Oosten[2]

[1] University of Salamanca, Sociology and Communication, Salamanca, Spain
[2] University of Amsterdam, Communication Science, Amsterdam, Netherlands

Social media use is widespread among adolescents. They spend substantial amounts of time on these platforms, increasing the likelihood that the content they view influences their beliefs and behaviors. As hate speech proliferates on social media and algorithms increasingly personalize content to capture users' attention, adolescents are being targeted with progressively more extreme content. Prior research has linked exposure to hateful content to increased moral disengagement, which suggests that social media engagement may increase moral disengagement among adolescents, making them more desensitized to unethical behavior. However, there is a lack of longitudinal studies on this topic, leaving important questions unanswered regarding the temporal dynamics between social media use and adolescents' moral disengagement. In addition, it is important to explore the moderating effect of personal and contextual factors. Digital literacy has emerged as a promising tool to empower adolescents against the negative effects of social media, warranting empirical evidence. Accordingly, the current study analyzes the longitudinal associations between TikTok engagement and adolescents' moral disengagement, considering exposure to hate speech as a potential mediator and digital literacy as a moderator of the associations.

A three-wave longitudinal study with a one-month interval was conducted among 882 adolescents aged 16–18 years. Participants included 1,803 adolescents in wave 1 (51.5% boys, Mage = 16.70, SD = 0.70), 1,171 adolescents in wave 2 (52.3% boys, Mage = 16.71, SD = 0.70), and 1,065 adolescents in wave 3 (51.7% boys, Mage = 16.74, SD = .70). The final sample of the study was composed of 882 adolescents aged 16–18 (M = 16.69, SD = .66). Among them, 52.3% identified as men, 47.1% as women, 0.6% as non-binary, and 0.1% preferred not to answer.

An autoregressive cross-lagged panel model was conducted to analyze whether TikTok engagement prospectively predicted exposure to hate speech on TikTok, and whether this, in turn, predicted moral disengagement. The model showed a good fit of the data, $\chi2(25) = 29.74$, $p = .234$; CFI = .99; RMSEA = .015, 95% CI [.00, .032]; SRMR = .02; TLI = .99. Results showed that TikTok engagement was associated with increased exposure to hate speech at the one-month follow-up (wave 1 to wave 2; $\beta = .12$, $p < .001$), whereas this relationship reversed and became negative between wave 2 and wave 3 ($\beta = -.14$, $p < .001$). Notably, exposure to hate speech did not predict short-term changes in moral disengagement. Moreover, and contrary to expectations, digital literacy did not influence these short-term effects. Exploratory reciprocal analyses revealed that moral disengagement positively predicted TikTok engagement but showed no predictive effect on exposure to hate speech.

Therefore, in contrast to previous literature, this study found that although adolescents more engaged with TikTok were initially exposed to more hate speech, this pattern changed over time. Moreover, exposure to hate speech on TikTok did not predict moral disengagement one month later. Overall, these results advance the longitudinal understanding of the dynamic interrelationships between social media engagement, hate speech exposure, and moral disengagement in adolescence.

CYM11 Young People Navigating Online Hate Speech and Disinformation

PP 0842 "Now we feel like those who spread disinformation": A mixed-method exploration of how Dutch youth create and react to disinformation

Elske Van Den Hoogen[1], Sophie Morosoli[1], Maud Hensums[2], Aqsa Farooq[1]

[1] University of Amsterdam, Communication Science, Amsterdam, Netherlands
[2] University of Amsterdam, Child Development & Education, Amsterdam, Netherlands

Youth are among the most active users of social media, which offers social and emotional benefits such as peer support but also exposes them to harmful content, including disinformation, false or misleading information designed to deceive for ulterior motives (Popat & Tarrant, 2023). Dutch youth, in particular, often demonstrate media literacy skills below the

basic level necessary to critically assess information, making them vulnerable to both encountering and unintentionally spreading disinformation (Duvekot et al., 2024). Despite these risks, little is known about how youth actively experience disinformation. This paper thus presents a mixed-method investigation into how Dutch youth aged 16–21 *create* and *react to* disinformation, integrating qualitative and experimental approaches to provide a comprehensive understanding of these processes. The paper, therefore, combines an inductive focus group study (Study I, *N* = 17) with an experimental survey (Study II, *N* = 692).

In Study I, participants took part in focus groups and were tasked with creating disinformation using a generative AI art tool. They subsequently reflected on the content they produced, their emotions during the task, and their perceptions of the created disinformation's potential impact. This qualitative approach allowed us to examine the defining characteristics of disinformation that youth encounter, as well as the social and emotional responses elicited during the process of creating it. On top of that, it allowed us to analyse the relevant disinformation *topics* they encounter.

In Study II, a within-subjects experiment, participants evaluated five peer-generated AI disinformation items derived from Study I. We explored the impact these images had on image evaluation (e.g., credibility), behaviour (e.g., sharing intentions), and third-person effect. Besides moderating effects of education level and media literacy, developmental differences were also explored by comparing late adolescents (16–18) with early adults (19–21). We furthermore included open-ended questions exploring participants' reasoning processes when assessing image authenticity (e.g., "You mentioned that you don't think this image looks real. How could you tell that?") and their self-reported verification strategies (e.g., "Which steps would you take to check whether something you see online is disinformation?").

Preliminary qualitative findings indicate striking age and education differences in terms of disinformation *creation* and *reactions*. For instance, disinformation created by lower educated and younger youths covered topics like football and advertisement, whereas older and higher educated adolescents created political disinformation. Furthermore, reacted lower educated participants less concerned during and after creating disinformation, finding it entertaining and fun. By combining qualitative insights from the creation process with quantitative data on reactions to the peer-generated content, this study, therefore, not only provides a detailed understanding of the mechanisms through which disinformation impacts youth.

CYM12 Digital (Dis)Connection

PP 0948 "It's just second nature to do WhatsApp." Kinkeeping and boundary work by multi-generational families in the platform society

Andra Siibak[1], Sonia Livingstone[2], Bogumiła Mateja-Jaworska[3], Oana Negru-Subtirica[4]

[1] University of Tartu, Social Studies, Tartu, Estonia
[2] LSE, Department of Media and Communications, London, United Kingdom
[3] Adam Mickiewicz University, Sociology, Poznan, Poland
[4] Babes-Bolyai University, Psychology, Cluj-Napoca, Romania

Qualitative research with 65 three-generation families in four European countries explores whether "platformisation" is reshaping family life, focusing on WhatsApp as the most used messaging platform. Framed within domestication theory and social science theories of family life, the research asked: (1) How and why is WhatsApp used to meet family needs and sustain family relationships through communication, coordination, sharing and negotiation? (2) How and why are family members included or excluded from family systems or subsystems over time, using WhatsApp groups? The rationale for focusing on family dynamics across generations and countries is to explore whether diversity in long-established and highly motivated family practices reveals ways in which families counter, if not resist, the datafication and commodification strategies of powerful global platforms. The findings suggest, first, that family life is indeed platformised insofar as a data-driven business model, of which families show little critical awareness, increasingly provides the infrastructure for family communication. However, second, the findings do not reveal how the WhatsApp platform substantially shapes families' symbolic and material practices. Instead, the evident diversity in WhatsApp use by gender, generation, and country is better explained by reference to family dynamics – particularly their need to sustain meaningful relationships (kinkeeping) while limiting demands on their energy and emotions (family boundaries).

The paper raises questions about how platformisation may work differently for different types of platforms. Like most messaging services, WhatsApp is an atypical platform in that it is not (at least in Europe as yet) highly driven by the attention economy. It neither recommends contacts nor content, at least as generally used for chatting, nor provides the algorithmically personalised feed that is transforming other types of platforms (social media, streaming, gaming). Should it attempt this, the family interviews indicate this could be unsuccessful. In many families, the primary kinkeeper (often the middle-generation mother) undertakes considerable emotional labour to encourage her parents, as the oldest generation,

and her children, too, to join the intimate sphere of private family communication, often under careful conditions. To be recommended new contacts, perhaps the children of friends, or to be fed random content reels, would disrupt the intense communication of those families who, they told us, love and rely on WhatsApp as the very heart of family life. Likewise, the boundaries people navigate as they reshape the family WhatsApp group or groups in the face of divorce, death, or family conflicts are too hard-won to be interrupted by AI slop or subjected to demands to widen the network. We conclude by asking whether these findings point to the limits of platformisation. Or do they reflect the current moment, shaped by WhatsApp's business strategy to achieve market dominance, only for this to be reshaped and undermined soon, as WhatsApp and other messaging platforms incorporate profitable features of the attention economy?

CYM12 Digital (Dis)Connection

PP 0949 A biographical and multiperspective approach to understand the role of social relationships in the origin and development of problematic media use

Anneke Elsner[1]

[1] University of Leipzig, Institute of Communication and Media Studies, Leipzig, Germany

The growing relevance of digital media in the everyday lives of children and adolescents has led to increasing concern about problematic or pathological media use in this age group. Correspondingly, research indicates that adolescents and young adults in particular exhibit a higher prevalence of pathological media use (Stevens et al., 2021). Even though problematic media usage patterns in young people often do not appear to be stable, there is a small proportion of those affected for whom the problem persists over a longer period (Strittmatter et al., 2016). This raises the question of how problematic media use develops and under which conditions it persists over time. The scientific debate on this topic is largely dominated by psychological perspectives. However, these predominantly quantitative approaches tend to neglect the complexity of media appropriation processes, highlighting the need for qualitative empirical perspectives from communication and media studies.

Addressing this desideratum, the submitted dissertation project adopts a qualitative, biographical, and multiperspective approach with a particular focus on the role of social relationships. First, biographical interviews were conducted with individuals affected by problematic media use. The sample consists of sixteen participants who sought support from outpatient and inpatient services. The specific media-related issue (e.g., digital games or social media) was deliberately left open during recruitment in order to identify potentially different social motives. During the biographical interviews, participants reflected on their life courses and on significant relationships in their biographies using free network maps. Furthermore, eleven qualitative interviews with attachment figures of the affected persons (e.g., parents, siblings, or partners) were conducted to gain additional perspectives. These interviews focused on the views of individuals close to those affected regarding the development and experience of problematic media use and included visual representations (network maps) of the affected persons' social networks from the attachment figures' perspectives. Data collection took place mainly between May and September 2025.

All collected qualitative data (multiperspective interviews and network maps) will be analysed using Grounded Theory methodology following Corbin and Strauss (2015) to explore the role of social relationships in the context of problematic media use. The presentation will focus in particular on the interrelationship between social relations and the media-related practices of those affected during childhood and adolescence. In addition, it briefly reflects on the methodological potential of multiperspective interviews and network mapping for research on media appropriation.

PP 0950 Emotional gatekeepers: The critical role of parenting influencers in describing and teaching emotions

Elena Negrea Busuioc[1], Florenta Toader[1]

[1] National University of Political Studies and Public Administration, Department of Communication, Bucharest, Romania

This paper explores the growing influence of social media parenting figures on how parents understand and respond to their children's emotions. Parenting influencers leverage social media to build communities around relatable content and "sharenting" - sharing parenting experiences (Jorge et al., 2022). They often position themselves as experts, offering

advice that challenges traditional views and promotes "good parenting" practices focused on building positive parent-child relationships (Toader, 2023).

This study thus investigates the burgeoning influence of social media parenting figures and their role in shaping how modern parents understand, interpret, and respond to children's emotions. As traditional, community-based support models, often described by the "it takes a village" adage, give way to digital platforms, parenting influencers have emerged as central authorities. We use a thematic and critical discourse analysis of 100 Facebook posts from four prominent Romanian parenting influencers: Anca Zlăvog, Raluca Ștefan, Oana Moraru, and Urania Cremene. By applying Van Leeuwen's categories of legitimation, the study explores how these influencers authorize their advice through expert and role-model status while using rationalization to justify their parenting frameworks. A significant finding is the discursive shift regarding emotional deficiency. While traditional psychological literature views children as the primary subjects needing emotional socialization, Romanian influencers often portray parents as the ones lacking the necessary emotional vocabulary and self-regulation skills. Consequently, the influencers position themselves as "emotion mitigation experts" who must first educate the parent as an "emotional learner" before the parent can effectively model these skills for the child. The analysis further identifies a prevalence of negative emotions, particularly anger, anxiety, and sadness, within the discourse, reflecting the challenges parents are most eager to solve. Influencers utilize a blend of specialized psychological terminology (e.g., polyvagal theory, neuroception) and vivid figurative language, such as metaphors of "emotions as volcanoes" or "emotional cups", to make complex concepts relatable and actionable. While these influencers offer empowering tools for "resilience-oriented parenting", the study concludes that their promotional and sometimes oversimplified "recipe-based" advice can create a new form of dependency. By framing parenting as a professionalized endeavor, they may inadvertently invalidate parental intuition, making followers increasingly reliant on expert validation to navigate the complexities of child-rearing in a neoliberal risk society.

Keywords

emotional literacy, Romanian parenting influencers, sharenting, discursive legitimation

PP 0951 What is a good childhood in the digital era? The Smartphone Free Childhood movement in Sweden

Olu Jenzen[1], Magnus Johansson[2], Helena Sandberg[2]

[1] University of Southampton, Winchester School of Art, Winchester, United Kingdom
[2] Lund University, Department of Communication, Lund, Sweden

Recent initiatives aimed at restricting children's access to digital and social media across the globe, including Australia, the UK, the EU and the Nordics, for example, raise critical questions about the socio-cultural constructions of childhood. These regulatory interventions have direct impact on children's lived experiences and their capacity to exercise rights within digital environments, including participation in public life, access to information, and their rights to culture, leisure and play. The international research network EU Kids Online (EUKO) has issued a statement cautioning prohibitive measures on social media access risk undermining these rights. Alongside these policy developments, techno-sceptical parental movements are emerging as influential actors within contemporary public discourse.

Situated within this context of increased regulation of children's access to online environments (e.g., age-specific national recommendations on screen use, school phone bans, curtailment of social media access for younger adolescents) and the ongoing digital backlash defined by Albris et al (2024) as encompassing diverse practices of digital disconnection alongside critiques of technological and platform-mediated life, this paper examines the discursive dynamics and epistemic controversies shaping contested notions of a 'good childhood' in contemporary digital culture. It focuses on the emergence of normative frameworks that equate childhood well-being with minimal exposure to digital media, as promoted by parental advocacy groups across Europe. The European parental movement originates in the UK-based Smartphone Free Childhood initiative established in 2024, currently exceeding 350,000 members, and maintaining affiliations with analogous movements across many countries. The campaign employs affective and normative appeals through slogans such as *'Childhood's too short to scroll away'.*

The paper centres on the case of the corresponding Swedish advocacy organisation Ki-DS and their campaign *Föräldrapakten* [The Parents' Pact], which promotes restrictions on children's engagement with digital technologies. The initiative mobilises parents through rhetorical and visual strategies designed to foster mutual support in delaying children's access to smartphones and social media, while simultaneously engaging in lobbying and media campaigning aimed at reconfiguring conceptions of childhood in the digital age. These efforts reflect a broader shift in Swedish social norms and illuminate tensions between competing paradigms of risk and harm, benefits and digital rights. Employing critical discourse

and visual analysis of Swedish news media reporting on the parental movement as well as the organisation's social media campaign output, the paper examines how the rhetoric of parental backlash movements not only produces new parenting norms but also reproduces socially stratified imaginaries of what constitutes a good childhood within contemporary digital culture. Understanding the drivers of digital backlash is particularly important in a Swedish context, where the state assumes a significant role in the collective upbringing and education of children. The paper further considers the implications of these dynamics for children's self-perceptions of digital media practices as increasingly framed through negative associations and how such discourses shape their capacity to exercise digital rights. Ultimately, the study contributes to ongoing debates on digital parenting, media regulation, children's rights in digital environments, and the cultural politics of childhood.

CYM13 Understanding (Digitally) Mediated Childhoods

PP 1046 Tensions between digital imperatives and digital needs among young people

Anamarija Šiša[1], Katja Koren Ošljak[1]

[1] *University of Ljubljana, Faculty of Social Sciences, Chair of Media Studies, Ljubljana, Slovenia*

The paper examines how young people negotiate the imperatives of digitalised and deeply mediatised societies and how these socio-structural demands are translated into "digital needs" and everyday practices. Building on the concept of deep mediatization, we understand digital media not as an external layer of social life but as infrastructural conditions of participation, learning, work, and relationships. These conditions generate structural pressures – such as constant connectivity, availability, responsiveness, and technological competence – that are often experienced as self-evident rather than explicitly articulated. Drawing on Bourdieu's concept of habitus, we conceptualise digital imperatives as internalized normative expectations that condition what counts as being a competent, responsible, and included subject in contemporary society. In contrast, digital needs are approached as practical responses and negotiation strategies through which youth seek to maintain autonomy, belonging, and well–being within these conditions. By focusing on this relationship, the paper asks how young people experience these imperatives in everyday life, what tensions emerge from them, and how these tensions are expressed through young people's digital needs and practices.

Empirically, the study is based on in–depth group interviews conducted in 2024 in Slovenia within the Digital Maturity of Youth research project. We analysed semi–structured focus group interviews with 41 participants aged 16–24 using inductive thematic analysis. Sample is demographically diverse, including high school students, university students, and employed and unemployed youth who have already left formal education with variation across gender, urban/rural location, and educational level. We followed the principles of research ethics in the process of recruitment (informed consent, in case of minors also parental consent) and during data-gathering, management and analysis (pseudonymization and anonymization).

The analysis identifies three recurring tensions through which the relationship between digital imperatives and digital needs becomes visible. First, young people navigate the imperative to remain informed while facing information overload, negative news cycles, and uncertainty about credibility; this tension is managed through selective monitoring, avoidance, and heuristic assessments of trustworthy sources. Second, young people encounter digital competence as a taken-for-granted requirement in education and the labour market, alongside limited institutional support for developing the skills they consider relevant (e.g., privacy and security, financial and platform literacy, and credibility assessment). This tension contributes to the individualisation of responsibility and to self-initiated learning via platforms, peers, and paid courses—often described as abundant yet fragmented and difficult to navigate. Third, expectations of constant connection and affective availability in friendships and family life coexist with a need for digital disconnection; young people develop micro-strategies of limiting notifications, tracking screen time, deleting apps, and selectively disengaging, even while acknowledging that everyday infrastructures increasingly require digital access.

Conceptually, the paper advances a socio-cultural understanding of digital well-being and digital harm as emerging through situational, relational, and culturally mediated practices rather than as purely psychological states. By foregrounding negotiation as a central analytic lens, we contribute to digital media scholarship by clarifying how young people's digital needs are formed within, and not outside, the imperatives of digitalised societies.

CYM13 Understanding (Digitally) Mediated Childhoods

PP 1047 The paradox of platforms in PSMs: digital first adaptation, public value and media literacy for Generation Z at the BBC, RTBF and RTVE

Juan Manuel Prieto-Arosa[1], Marta Rodríguez-Castro[1], José Miguel Túñez-López[1]

[1] Universidade de Santiago de Compostela, Department/Faculty of Communication Sciences, Santiago de Compostela A Coruña, Spain

Generation Z consumes information and entertainment in a socio-digital ecosystem dominated by social media, where fragmentation and algorithmic personalisation are reshaping content access routines (Vázquez-Herrero et al., 2021). For PSMs (*Public Service Media*), these third-party platforms become strategic spaces for negotiation (Poell et al., 2022),

attracting and adapting to youth needs (Burgess and Green, 2018), within a framework of individualised consumption and autonomous control known as media egocentrism (Costera-Meijer, 2023), through interactive and personalised content without renouncing their public value mission (Karadimitriou and Papathanassopoulos, 2024). This scenario is linked to the ATAWADAC paradigm and the *digital first* strategy (Robotham, 2021), where Instagram, TikTok and YouTube accelerate audiovisual change and connection with young people, while media egocentrism and self-curing reinforce virtual identities and selective exposure (Li, 2023). This highlights how the platform paradox (Olsen et al., 2024) challenges PSMs to maintain legitimacy and redefine digital public value (Cañedo and Rodríguez-Castro, 2024).

This research adopts a comparative qualitative design to explain the adaptation of PSMs to the consumption habits of Generation Z in the platform ecosystem. It is structured around three case studies selected for systemic variation, according to Hallin and Mancini (2004): RTVE (polarised pluralist), RTBF (democratic-corporatist) and BBC (liberal). Semi-structured interviews are conducted with executives and professionals from the three corporations to reconstruct institutional rationalities and editorial and multi-platform distribution strategies, and non-participant observation is carried out in the newsrooms of RTBF (Liège and Brussels) and RTVE (Madrid) to analyse routines, decision-making and digital innovation.

The results show that the adaptation of PSMs to young people is organised around *audience first* reorganisation and the 360º model institutionalise youth innovation through *Nouvelles Générations*, which operates as an editorial laboratory through projects aimed at young people with short formats, participation and media literacy, upholding public value in algorithmic environments and encouraging critical thinking. At the BBC, findings show a *digital first* strategy based on on-demand products and narratives adapted to social discovery, where distribution becomes a key editorial dimension for reaching fragmented audiences. At RTVE, the commitment to video podcasts, hosts with interesting profiles and digital brands, together with native news projects such as *YaTDigo*, reflects a hybrid logic between building its own ecosystem and circulating on external platforms. In all three cases, dependence on commercial infrastructures intensifies the paradox of platforms, by demanding youth relevance without diluting autonomy, legitimacy and public value mission.

In conclusion, adapting PSMs to Generation Z requires *digital first* strategies that produce native content for networks without diluting their public value mission. The comparison shows that platformisation and dependence on commercial infrastructures force PSMs to negotiate visibility and editorial autonomy, making media literacy a key factor in sustaining legitimacy and critical thinking among young people.

CYM13 Understanding (Digitally) Mediated Childhoods

PP 1048 How short-form video exposure shapes adolescents' attention: A longitudinal data-donation study

Wout Coolen[1], Brahim Zarouali[1], Tim Smits[1]

[1] KU Leuven, Department of Communication Science, Leuven, Belgium

Purpose

Short-form video (SFV) platforms such as TikTok have attracted over 1.5 billion users worldwide. The average adolescent spends up to two to three hours per day consuming such videos. Whereas audiences once engaged with mostly narrative-rich, long-form videos that required sustained attention, they are now increasingly immersed in fast-paced, loosely connected SFVs, a trend that shows no signs of slowing down. Due to its fast-paced and fragmented nature, educators, parents, and the general public have raised concerns about the potential negative effects of SFVs, particularly about diminished attention spans and declining academic performance among young users. To investigate these concerns, the present study uniquely combines longitudinal design, data-donation methods, and content-level analysis to examine how adolescents' exposure to SFVs influences distinct attentional mechanisms over time.

Literature review

A review of the existing literature indicates that most research on SFVs and attention relies heavily on cross-sectional survey designs, yielding mixed and often contradictory findings. While some studies report associations between SFV consumption, attentional difficulties, and lower academic performance, others find no such effects. A key limitation of this body of work is that cross-sectional methods offer limited capacity for establishing causal relationships between media use and attention. Furthermore, prior research rarely examines the types of content and attention-grabbing techniques users are actually exposed to. In addition, existing studies largely fail to investigate the mechanisms through which SFVs might influence attention. Given the fast-paced nature of SFVs, repeated exposure may encourage reliance on stimulus-driven (bottom-up) attention at the expense of goal-directed (top-down) attention. Over time, such habitual attentional orientation may make it more difficult for adolescents to sustain top-down attention, e.g., in the classroom. These gaps underscore the need for longitudinal research that examines how SFV exposure influences different attentional mechanisms, while also accounting for the specific attention-grabbing techniques adolescents encounter.

Methodology

To address these limitations, we are conducting a three-wave longitudinal data-donation study in which high-school students aged 16–18 exercise their GDPR-based right of data access to retrieve their personal TikTok and YouTube watch histories. Data collection, which ends in May, takes place at four-month intervals and includes a sample size of 527 participants based on a power analysis. Through a secure survey, participants complete the Attention Style Questionnaire, which assesses their

reliance on bottom-up versus top-down attentional styles, and upload their viewing histories, enabling precise analysis of the content they have consumed. Using qualitative content analysis, we are developing an inductive codebook that captures the full range of attention-grabbing techniques present in the donated videos. This approach allows us to identify and quantify the techniques to which adolescents are exposed to. Linear mixed-effects models will then be used to examine within- and between-person changes in attentional mechanisms over time as a function of exposure to different types of attention-grabbing techniques, the amount of viewed SFVs, and demographic and interpersonal variables.

To conclude

Importantly, by the time of the ECREA conference, data collection will have been completed and analysed, allowing us to present the longitudinal data donation design, the used analytical approaches, and the study's initial findings.

CYM13 Understanding (Digitally) Mediated Childhoods

PP 1049 Stability and change in youth media use: Italian-speaking part of Switzerland (2010–2024)

Petra Mazzoni[1], Barcella Deborah[1], Amigo Laura[1], Eleonora Benecchi[1]

[1] USI Università della Svizzera italiana, Institute of Media and Journalism IMeG, Lugano, Switzerland

Adolescents' everyday engagement with society is increasingly shaped by their digital media use, which structures how they access information, socialize, and navigate public life. In linguistically and culturally plural contexts, these dynamics may remain obscured in national-level analyses, as surveys often under-represent minority groups that differ socio-culturally and socio-economically from the national majority (Laganà et al., 2013). This study examines adolescents' media diet, understood as the overall composition of media exposure, combining frequency of use and types of content across media platforms (Anderson & Hanson, 2009) with a focus on digital media used for information and entertainment in the Italian-speaking part of Switzerland (CH-I), a linguistic minority context, over time (2010–2024). The study addresses two research questions:

(RQ1) To what extent do adolescents' digital media practices for information and entertainment remain stable or change over time?

(RQ2) How do these changes reconfigure the balance between informational and leisure-oriented media use?

This study draws data from the Swiss JAMES survey, a nationally representative biennial survey of adolescents aged 12–19. Our analysis isolates CH-I subsample (comprising 2,466 respondents across waves) to examine region-specific changes in adolescents' digital media use for both entertainment and information purposes, between 2010 and 2024, that are not always visible in aggregated national reports.

Preliminary results indicate a strong continuity in adolescents' digital media use in CH-I marked by a persistent predominance of entertainment oriented use over information. Across surveys waves, leisure-oriented use form the stable core of everyday media engagement, despite major shifts in platforms and devices. CH-I is characterized by a distinctive configuration of entertainment-oriented practices, including consistently higher levels of exploratory online browsing and a comparatively stronger reliance on streaming films, documentaries, or television series. Regarding information use, adolescents in CH-I show largely stable patterns of online information access across the most recent surveys waves of the study. Information is mainly encountered through search engines, social media, video platforms, and general browsing, rather than through regular, intentional use of journalistic news outlets. This confirms a long-term tendency toward ambient or incidental news exposure within entertainment-oriented platforms.

Two contextual discontinuities punctuate this overall stability. In 2020, the COVID-19 pandemic intensified streaming and social media use, further blurring the boundaries between informational and entertainment media use. In 2024, the diffusion of generative AI introduced a new informational gateway, with adolescents increasingly turning to AI-based interfaces (e.g., ChatGPT) to inform themselves, surpassing podcasts, radio, blogs, and digital newspapers.

By combining a longitudinal perspective with a focused examination of a linguistic minority context, this study highlights the importance of context-sensitive and temporally grounded approaches to youth media research and contributes to a more nuanced understanding of how digital media environments are experienced and navigated by adolescents in culturally plural societies.

CYM14 Risk and Resilience in Digital Childhoods

PP 1146 Navigating online stress: Adolescents' coping processes across different types of stressful online experiences

Kira Thiel[1]

[1] Leibniz Institute for Media Research - Hans-Bredow-Institut, Growing up in digital media environments, Hamburg, Germany

The internet offers a wide range of opportunities for participation, creativity and learning, while at the same time exposing adolescents to various risks that may be experienced as (emotionally) stressful. As opportunities and risks often go hand in hand, adolescents cannot fully avoid negative online experiences without restricting digital participation. Understanding how adolescents cope with such experiences is therefore crucial. While the transactional model of stress and coping (Lazarus & Folkman, 1984) conceptualizes coping as a dynamic process, existing research on adolescents' online coping has predominantly examined isolated strategies or focused on specific risk phenomena, leaving a gap in process-oriented analyses across different types of online stressors.

Against this background, the present qualitative study examines adolescents' coping processes through the lens of the transactional model of stress and coping (Lazarus & Folkman, 1984). Drawing on 40 semi-structured interviews with adolescents aged 12 to 17, the study identifies four types of stressful online experiences – differentiated according to subjective stress levels and the temporal characteristics of the stressor –, each of which is associated with distinct coping patterns.

Type 1 experiences are short-term and low in stress (e.g., annoying messages, spam, minor insults). Adolescents typically employ immediate, problem-focused coping (e.g., blocking, deleting, muting), often drawing on routinized strategies that quickly terminate the situation and contribute to appraising it as manageable. Type 2 experiences are also time-limited but elicit stronger emotional stress (e.g., unwanted sexual messages, being hacked). Coping involves a combination of problem-focused strategies aimed at ending or de-escalating the situation and emotion-focused strategies (e.g., distraction, cognitive reappraisal, retaliation) to regulate distress, sometimes supplemented by social support from peers or parents. Type 3 experiences are ongoing and dynamic (e.g., cyberbullying, grooming), and perceived as highly stressful. Coping unfolds as a complex process that goes beyond reacting to single events, encompassing efforts to interrupt harmful dynamics, mobilize support, and engage in longer-term emotional processing and self-stabilization. Type 4 experiences are persistent but low in intensity (e.g., social comparison, social pressure to be available) and are managed primarily through continuous emotion-focused coping, particularly cognitive reappraisal to protect self-worth.

Overall, the findings highlight that adolescents' coping processes vary substantially depending on the intensity and temporal structure of online stressors. Prevention and support efforts should therefore move beyond teaching isolated strategies and instead foster flexible coping repertoires that can be adapted to different online stress contexts.

By applying the transactional model of stress and coping to a broad range of digital stressors, this study advances a process-oriented understanding of adolescents' coping with online stressors. Rather than conceptualizing coping as the use of isolated strategies, the findings demonstrate how coping unfolds over time in response to differences in subjective stress intensity and the temporal structure of online stress experiences.

CYM14 Risk and Resilience in Digital Childhoods

PP 1147 Digital coping: Smartphone use among Ukrainian refugee children in the first week of war

Natalia Khvorostianov[1]

[1] Ben-Gurion University of the Negev, Communication Study, Beer-Sheva, Israel

This study explores how Ukrainian refugee children, aged 10–14, used smartphones during the **first week of displacement** following Russia's invasion of Ukraine in February 2022. During this critical period of uncertainty and trauma, smartphones emerged as essential tools for emotional coping and maintaining personal and cultural identity. The research highlights how digital practices allowed children to navigate immediate crises and form early strategies for resilience.

Drawing on 35 semi-structured interviews conducted in a Polish refugee camp, the study examines the routines, strategies, and meanings associated with smartphone use. Findings reveal that children developed highly adaptive practices within just days of displacement. Smartphones functioned as instruments of **emotional regulation**, allowing children to manage stress and anxiety through messaging, video calls, games, and media consumption. One participant vividly described the intensity of this attachment: *"I didn't let it (the smartphone) out of my hands"*, reflecting the device's role as a lifeline in moments of acute fear.

Smartphones also facilitated **social connectivity**, helping children maintain contact with family, friends, and peers from their home communities. Digital tools provided continuity, mitigated isolation, and enabled children to share experiences collectively. Additionally, smartphones served as **repositories of memory and identity**, preserving photos, messages, and videos that connected children to their pre-war lives and cultural heritage.

The study highlights how young refugees negotiated **risks and boundaries** in digital spaces, balancing the need for information and connection with concerns about safety and exposure to distressing content. These practices demonstrate agency, problem-solving, and the capacity to co-create supportive social networks even in moments of acute crisis.

By focusing on smartphone-mediated coping in the first week of displacement, this research emphasizes the crucial role of digital media in **immediate crisis management**, emotional support, and identity preservation. The findings have implications for educators, social workers, and policymakers, highlighting the need for safe digital access and culturally sensitive interventions for young refugees.

CYM14 Risk and Resilience in Digital Childhoods

PP 1148 Understanding adolescents' online risk perception: The role of parenting and experience

Ainize Martínez Soto[1], Vojtěch Mýlek[1], Lenka Dedkova[1]

[1] Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Adolescents' online practices may expose them to several risks (Smahel et al., 2020). Beyond actual exposure, how adolescents perceive the likelihood and severity of such risks is central to understanding their decision-making, risk-taking, and the effectiveness of preventive communication (Mýlek et al., 2023). Within the parental mediation framework, parents are assumed to shape adolescents' interpretations of online risks through active and restrictive mediation strategies (Young & Tully, 2022). However, previous research has produced inconsistent findings, and less is known about how parental mediation operates alongside adolescents' psychological resources, peer influences, and their own experiential engagement with online risks. Understanding how they perceive the severity and likelihood of these risks is central for designing effective prevention strategies. As an illustrative example, this study focuses on risk perceptions related to meeting online contacts offline-a common concern among parents and adolescent alike that is often considered highly risky due to potential harmful outcomes such as physical or sexual assault (Auxerie et al., 2020; Greene-Colozzi et al., 2020). This study examines parental mediation practices (active and restrictive), psychological factors (social self-efficacy, self-esteem, sensation seeking), peer norms regarding face-to-face meetings and adolescents' own experiences with such meetings as predictors of adolescents' risk perception (likelihood and severity). Using hierarchical multiple regression, we analyzed data from a survey of 2,500 Czech adolescents (age M = 13.44, SD = 1.74; 50% female), of which 31.7% had experiences with face-to-face meetings.

Results show that parental mediation remains relevant for adolescents' risk perceptions, but its effects vary by mediation style and risk dimension. Active parental mediation was associated with higher perceived likelihood and severity of online risks, suggesting that parent–child communication may foster greater awareness and interpretative sensitivity toward potential online harms. Restrictive mediation showed mixed effects, being positively associated with risk likelihood but negatively with severity. Among psychological factors, sensation seeking was negatively related to perceived severity, while self-esteem was positively associated with severity but not likelihood. Gender differences emerged, with males perceiving both lower likelihood and severity of risks compared to females. Peer norms about face-to-face meetings with online contacts significantly predicted perceived severity, with adolescents perceiving risks as less severe when such meetings were more common among their friends. However, norms did not predict risk likelihood. Previous experiences with the meetings emerged as the strongest predictor, which was associated with lower risk perceptions (both likelihood and severity). Our results thus highlight the importance of viewing adolescents' online risk perception as a communicative and experiential process shaped not only by parental mediation but also by adolescents' self-concepts, peer contexts, and lived media experiences. These results underscore the importance of active parental communication and suggest that prevention efforts should address processes of risk normalization that may arise from both peer influence and repeated engagement in risky online behaviors.

CYM14 Risk and Resilience in Digital Childhoods

PP 1149 Empowering children's digital resilience: How children voice their needed support to effectively cope with online risks

H. Ying Chuck[1], Chiara de Jong[1], Serena Daalmans[2], Esther Rozendaal[1]

[1] Erasmus University Rotterdam, Behavioural Change, Rotterdam, Netherlands
[2] Radboud University, Communication & Media – Behavioural Science Institute, Nijmegen, Netherlands

To be digitally resilient in today's digital media society, it is important that children use coping strategies (e.g., self-monitoring, seeking support) that help them deal with online risks. Previous research shows that children experience several barriers that hinder them from using coping strategies when dealing with online risks. Examples of barriers include, not perceiving online risks as important, low confidence in their ability to perform coping strategies, a lack of support from the environment, and a lack of knowledge and skills.

To empower children's digital resilience, it is crucial to understand what children need to overcome the barriers that prevent them from using coping strategies. The current study aims to gain more insight into these needs. We use a qualitative approach that focuses on children's perspectives, recognizing that children themselves have valuable suggestions about

how they can best be supported to cope with online risks. By drawing on children's experiential knowledge, we explore what they need (i.e., who can support them and what they need to do) to overcome barriers to their coping strategies.

In a participatory research project, 52 children (i.e., 9 to 11 years old) explored their online world through interactive activities. During these activities, children explored their online challenges, coping strategies for dealing with them, the barriers to implementing those strategies, and co-created solutions to overcome those barriers. The co-created solutions were presented in a form of an artwork, in which children visualized who could support them and what those individuals needed to do to support them in overcoming the barriers to their coping strategies. As the data collection was completed recently, we are currently conducting an inductive thematic analysis of the data collected during the co-creation of solutions (i.e., verbatim transcripts of audio-recorded group discussions and photographs of children's artwork showcasing their solutions).

Preliminary results revealed that children need support from various people to effectively cope with online risks. Children predominantly mentioned people in their direct environment, such as family members (e.g., caregivers, siblings) and friends. They reasoned that this is because they trusted these individuals, felt these individuals knew them best, and believed they could effectively help them by providing various types of knowledge, such as explanations of the consequences and the importance of performing coping strategies and how to perform them. Moreover, children mentioned individuals outside of their direct environment, such as app developers and politicians. They expressed that they believed these individuals could effectively help them by creating a safe online environment, such as ensuring consequences for hackers or digital hostility.

Overall, this study enhances our understanding of what children need to effectively apply coping strategies to handle online risks. While sometimes difficult to articulate, children voiced their need for support from others as they desire fun and safe online experiences. In the presentation, we will delve deeper into how children articulate what their environment can do to support them in effectively coping with online risks, and discuss how these insights can be used to empower children's digital resilience.

CDE01 Democracy, AI, and the Struggle Against Misinformation in Digital Publics

PP 0076 Illiberal strategies: Disinformation in Viktor Orbán's political communication

Evert Kanse[1], Nina Josephi[2]

[1] University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland
[2] University of Antwerp, Department of Political Science, Antwerp, Belgium

Democracy has been in decline globally, with a clear pattern of democratic backsliding observable since the 1970s (Wunsch and Blanchard, 2023). This process unfolds incrementally and is frequently driven by a dominant executive that weakens institutional checks and balances (Bermeo, 2016), through limits on political participation, concentration of power, and manipulation of the media (Carothers and Hartnett, 2024). Illiberal leaders often frame politics as a moral divide, while polarisation fragments society and weakens accountability (McCoy et al. 2018). Within this polarised environment, the strategic use of disinformation has become a powerful instrument of backsliding (Boese et al., 2022).

Disinformation, defined as false or misleading information spread with intent to deceive, serves as a key mechanism through which illiberal leaders deepen polarisation and consolidate power (Bennett & Livingston, 2018). As democratic backsliding often stems from the actions of duly elected leaders (Haggard & Kaufman, 2021), this study examines how disinformation is embedded directly in their political communication. While prior research has mainly examined disinformation circulating online, in traditional media, or within specific genres such as conspiracy narratives (Douglas et al., 2019), far less is known about how illiberal leaders employ it in their political communication. Addressing this gap is crucial because political communication by state leaders lends disinformation institutional credibility.

Hungary under Prime Minister Viktor Orbán offers a highly relevant case for analysing how disinformation operates within illiberal political communication, given its designation as the European Union's (EU) first electoral autocracy (Lührmann & Lindberg, 2019). Based on a qualitative content analysis of publicly available documents (Puppis, 2019), the study examines the types and themes of disinformation in Orbán's rhetoric. The dataset consists of 40 speeches, statements, and interviews from Orbán's fourth term, selected to capture a phase of advanced backsliding. A literature-based coding framework was applied drawing on Wardle and Derakhshan (2017) and Humprecht et al. (2020) to identify disinformation types and on Kapantai et al. (2021) to capture thematic narratives. This enables a systematic and conceptually grounded assessment of Orbán's political communication.

The analysis identified three types: biased or one-sided information, conspiracy narratives, and fabricated information. Biased or one-sided information was most frequent and illustrated how Orbán selectively presents facts to polarise the public and discredit opponents. Conspiracy narratives, especially those centred on George Soros, portrayed international actors as threats seeking to undermine Hungary. Fabricated information, though less common, reinforced governmental claims and national legitimacy. Four broader themes were also identified: populist framing, delegitimization of democratic institutions, appeals to nationalism or cultural identity, and nativism. Populist framing divides the virtuous Hungarian people from corrupt elites, deepening polarisation and loyalty to Orbán. The delegitimization of democratic institutions undermines trust in the EU, the judiciary, and the opposition, weakening accountability. Appeals to nationalism and cultural identity justify exclusionary policies and frame dissent as betrayal, while nativism portrays Hungary as under cultural and demographic threat. The findings show that disinformation in Orbán's communication sustains backsliding, underscoring the need to better understand this process to envision a future built on resilience rather than erosion.

CDE01 Democracy, AI, and the Struggle Against Misinformation in Digital Publics

PP 0077 Contesting Trust, delegating Truth, resolving Uncertainty? Communicative AI as an Epistemic Authority in democratic sense-Making and Public Debate

Christian Schwarzenegger[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

In modern societies, knowledge has expanded and fragmented, making individuals dependent on trust in epistemic authorities. Epistemic authority is not confined to individuals but can also be attributed to collectives, institutions, and technologies, including AI-chatbots and LLMs (Jäger, 2025). Who and what is recognized as epistemic authority is shifting in the digital transformation of knowledge orders (Neuberger et al., 2023), generating growing uncertainty about what to accept as knowledge and whom to trust (Bartsch et al 2025). Communication research has largely framed this as an epistemic crisis, focusing on declining trust in traditional authorities like science and journalism. Less attention has been paid to how new epistemic authorities emerge and how they are communicatively constructed in public debate. Epistemic authority depends on mutual recognition of competence and credibility. Even when AI is not explicitly invoked, its potential 'summoning' shapes expectations of truthfulness, justification, and accountability (Shin, 2025).

This study examines how epistemic authority is ascribed, contested, and maintained in interaction with communicative AI, exemplified by Grok, the AI chatbot integrated into X, and how these dynamics affect democratic sense-making and participation. The analysis draws on personal epistemologies (Schwarzenegger, 2020) and folk theories of AI (diLodovico et

al., 2025; Ytre-Arne & Moe, 2021), capturing how people intuitively assess what AI can "know," how answers are produced, and when it should be trusted as a contributor to public reasoning.

Empirically, the study analyses X posts and interactions involving @Grok between late 2024 and 2025, focusing on exchanges where Grok is explicitly invoked through formulations such as "Is this true?" These mark moments when communicative AI acts as an epistemic actor in public controversies. The analysis focuses on situations of invocation, interactional positioning, and responses.

Three principal orientations of invocation are identified: verification, authentication, and explanation. Verification includes prompts such as "Is this true?" in political, social, or cultural debates, often functioning as performative gestures of epistemic superiority, delegating validation to AI to discredit others. Authentication involves requests such as "Is this real?" to verify images or videos, reflecting concerns about the boundaries of reality; Grok's responses are frequently contested. Explanation involves requests for contextualization or evaluation, positioning Grok as both fact-checker and interpreter in public sense-making.

Grok's epistemic authority remains unstable. Invocation exposes users to social correction and ridicule, shaping participation and public engagement, while others resist by highlighting alleged bias or prompt-dependency. Importantly, these negotiations are also influenced by attributions to Grok's origin and symbolic association with Elon Musk as a politically controversial figure. Grok thus functions both as a resource for activism, deliberation, and debate and as an object of (anti-) democratic struggles over meaning and authority. Simultaneously, it is mobilized to mediate disputes, adjudicate contested claims, or symbolically settle conflicts. Its authority does not stem from presumed epistemic superiority (Ferrario et al., 2024) and Communicative AI redistributes rather than resolves epistemic uncertainty. We conclude that the democratic potential of AI as epistemic authority is less a matter of informational accuracy than of continuous (politicized) negotiations of credibility, trust, and legitimacy.

CDE01 Democracy, AI, and the Struggle Against Misinformation in Digital Publics

PP 0078 Understanding older adults' management of misinformation and its relevance in the democratization of the digital sphere

Marta Cambronero-Garbajosa[1], Mireia Fernández-Ardèvol[2]

[1] Universitat Oberta de Catalunya / Open University of Catalonia, CNSC Research Group - UOC-TRÀNSIC Research Center, Barcelona, Spain
[2] Universitat Oberta de Catalunya / Open University of Catalonia, CNSC Research Group - UOC-TRÀNSIC Research Center - Faculty of Information and Communication Sciences, Barcelona, Spain

Misinformation has been widely discussed as a threat to democracy; however, the phenomenon remains underexplored in later life, among cohorts whose media repertoires are uniquely shaped by both legacy and digital logics. Our study was initially motivated by the misinformation paradox identified by Munyaka et al. (2022): although older adults report being concerned about the veracity of news and know how to verify it online, they also constitute the age cohort deemed to share most fake news. Explanations proposed in previous research include cognitive decline in very advanced age, limited digital literacy, media cynicism generated over the years, loneliness, the need for affiliation, and caring for others. Another set of findings suggests that older adults may be more susceptible to sharing misinformation simply because they are more frequently targeted, as evidenced by their being the age group most exposed to fake news on Facebook during the 2016 and 2020 US elections.

Our research contributes to this debate by examining how these explanatory factors integrate into the everyday digital practices of older adults. We defined a qualitative study involving 20 older adults (aged 65 to 87) living in Barcelona (Catalonia, Spain). Drawing on interviews, self-reported digital activity logs, and focus groups, the study investigates how older adults navigate, negotiate, and manage information and misinformation in their daily lives. Preliminary results are noteworthy. First, in line with previous research, some younger older adult participants are relatively well-equipped to protect themselves from misinformation. Thematic analysis further reveals that participants who frequently encounter fake news or distorted content do so as a result of their online behaviour, which is driven by curiosity, including access to entertainment and the exploration of diverse political views. By contrast, participants who report limited exposure to fake news tend to follow routines of restricted news consumption, which, at least in the case of left-wing participants, includes avoiding exposure to right-wing media. However, participants may relax these strict standards when engaging with meaningful personal connections and culturally relevant content.

These findings highlight the need for a broader perspective in misinformation research. Existing interventions primarily emphasise individual responsibility through digital literacy and debunking strategies, overlooking structural drivers such as the market-oriented production and circulation of distorted content (Díaz-Ruiz, 2025). In our research, older adults demonstrated awareness of misinformation threats and maintained consistent media habits. Those more exposed to misinformation are driven by behaviours that, far from being problematic, are part of intersubjective meaning-making, a core condition for communicative action and democratic life (Habermas, 1984). In other words, behaving in accordance with democratic virtues makes them vulnerable to exposure to misinformation. Beyond advocating for algorithmic and platform literacy, we also provide a more comprehensive explanation for the paradox. Taken together, misinformation and platforms'

visibility mechanisms are eroding the logic of traditional forms of intersubjectivity formation, which are still prevalent in the practices of older adults regarding politics and media consumption.

CDE01 Democracy, AI, and the Struggle Against Misinformation in Digital Publics

PP 0079 Localizing and co-designing game-based interventions to foster resilience against misinformation: A case study from the Czech Republic

Ladislava Zbiejczuk Suchá[1], Chris Coward[2], David Janda[1], Roberto Cibin[1]

[1] Masaryk University, Department of Information and Library Studies, Brno, Czech Republic
[2] University of Washington, Center for an Informed Public, Seattle, USA

Contemporary democracies are increasingly shaped by fragmented communication environments, platform logic, and polarized public discourse, in which misinformation constitutes a structural challenge to democratic participation and trust. The resilience to misinformation is closely linked to media literacy as a civic competence that supports informed participation beyond formal political institutions. While game-based interventions have been proposed as participatory tools for fostering such competencies, limited empirical research has examined how these interventions can be localized to reflect specific contexts.

This paper presents a qualitative case study of a localized educational escape game implemented in the Czech Republic and examines how participatory co-design with learners contributed to its contextual relevance and democratic communicative potential. The study asks how participatory design with learners can influence the localization and effectiveness of a game-based intervention aimed at fostering resilience against misinformation, with a focus on how learners' everyday media experiences, democratic concerns, and interpretations of public discourse shape the redesign process.

Methodologically, the study adopts a participatory design framework combining co-design workshops with iterative empirical testing involving more than 100 participants. Data was collected through surveys, workshop artefacts, observation notes, and structured qualitative feedback following gameplay. Two testing phases were conducted: an initial localized version and a revised version developed in response to participant input. Data outputs were analyzed thematically, focusing on representations of misinformation, perceptions of relevance, and engagement with the game as a communicative space.

Findings indicate that participants framed misinformation primarily through their everyday information practices, national political discourse, and perceived threats to democratic deliberation. Feedback from the first testing phase revealed tensions between the original game design and local imaginaries, prompting redesigns that emphasized culturally specific contexts, collective decision-making, and reflective discussion. The second testing phase suggests that these participatory-driven modifications affect perceived relevance, engagement, and learning potential of the game.

The paper concludes with recommendations for designers of game-based interventions and organizations (e.g., libraries, civic organizations) implementing these interventions and identifies directions for further research on long-term research on resilience to misinformation.

CDE01 Democracy, AI, and the Struggle Against Misinformation in Digital Publics

PP 0080 AI-mediated counterspeech against misinformation in Turkish media: Actors, challenges, and opportunities

Murat Akser[1]

[1] Ulster University, School of Communication and Media, Belfast, United Kingdom

In Turkey's contemporary media landscape—characterised by strong state influence, political polarisation, and intensified regulation—digital public discourse has become saturated with misinformation, coordinated harassment, and hate speech. These dynamics pose significant threats to democratic deliberation and disproportionately target journalists, fact-checkers, and marginalised voices. As professional communicators and civil society actors struggle to respond to orchestrated online attacks and disinformation campaigns, artificial intelligence (AI) has emerged as a potential support mechanism for detecting, analysing, and countering uncivil online communication.

This paper examines how AI-driven tools and practices can assist Turkish actors—particularly independent journalists, fact-checking organisations, and citizen counterspeakers—in mitigating misinformation and online abuse. Focusing on key initiatives within Turkey's fact-checking and independent media ecosystem, the study analyses the work of Teyit.org, founded by journalist Mehmet Atakan Foça, which specialises in verifying viral claims and visual misinformation; Doğruluk Payı, which evaluates politicians' statements and mobilises civic participation through its İzlemedeyiz volunteer network; and Bianet, a long-standing independent media outlet facilitating citizen journalism and counterspeech. The paper also considers the role of internationally connected but locally active initiatives such as Fact-Checking Turkey, coordinated by the Bosphorus Center for Global Affairs.

Methodologically, the research draws on qualitative interviews with journalists, fact-checkers, and civic volunteers, complemented by an analytical review of AI-enhanced tools currently deployed or under consideration by these actors. The analysis explores how AI can contribute to early detection of harmful content, assist in evidence-based rebuttals, automate

elements of verification work, and reduce the emotional and cognitive burden associated with sustained exposure to online hostility. At the same time, the paper critically interrogates the limitations and risks of AI-assisted counterspeech in Turkey's high-stakes media environment, including algorithmic bias, the erosion of perceived authenticity in AI-generated responses, and the potential displacement of human agency in civic engagement.

To address these challenges, the paper argues for a participatory co-design approach that brings together fact-checking organisations, journalists, technologists, and civil society actors in Turkey. Such collaboration, supported by transparent governance structures and context-sensitive ethical guidelines, is presented as essential to ensuring that AI tools reinforce—rather than undermine—democratic communication practices. By foregrounding specific actors and practices within a non-Western, politically constrained media system, this study contributes to broader debates on human–AI collaboration, digital democracy, and the ethics of mediated counterspeech.

CDE02 Radical Right Mobilizations and Democratic Contestation in Europe's Digital Public Sphere

PP 0081 Between free speech and digital sovereignty: European far-right party discourse on online harms and social media regulation

Christian Schwieter[1]

[1] Stockholm University, Department of Media Studies, Stockholm, Sweden

The rise of far-right parties in the US and Europe has led to growing discussions about the legitimacy of social media regulation and the need for greater digital sovereignty. In this context, this study examines how far-right parties frame online safety debates and digital sovereignty across Germany, Sweden, and the UK. While these countries have historically diverging approaches to speech regulation and democratic resilience, all of them were recently singled out by the US government, and most notably Vice President JD Vance, to delegitimise European digital governance models as censorship regimes (Wintour 2025). The analysis is hence explores the tension between the far-right adoption of transatlantic free speech rhetoric versus nationalist sovereignty appeals of 'taking back control'.

While central to contemporary platform governance discourse, there is limited scholarship on how the concepts of safety, risk, harm and (digital) sovereignty are contested by European political actors. A notable exception is Griffin (2025) and their mapping of public authorities, corporate actors and civil society organisations involved in the 'social construction' of 'systemic risk' in the EU. More broadly, research has highlighted the key role free speech tropes and censorship accusations play in contemporary far-right mobilisation (Feldman & Jackson 2014). Yet, a systematic comparison of European far-right party positioning on digital regulation remains under-explored in the literature — a significant gap given the growing political influence of far-right parties on European governments.

To address this gap, this research investigates how the German AfD, the Sweden Democrats and Reform UK/UKIP articulate their positions on digital regulation on social media. Using corpus-assisted discourse analysis of over 1,000 YouTube transcripts, the paper maps key contested concepts — safety, risk, and harm — and identifies how parties attribute sources and targets. Initial findings reveal a growing prominence of digital regulation discussions in far-right party social media content, with frequent attempts to connect debates to the key issue of contemporary far-right mobilisation, namely immigration. Similarly, censorship accusations and victimhood framing are shared across the countries, yet national contexts shape their specific articulations. For example, the AfD emphasises privacy concerns while Reform UK/UKIP focuses on child safety.

Overall the preliminary analysis suggests an emerging transnational discourse of (digital) sovereignty, driven by fundamental dissent against perceived 'mainstream' party positions. However, this discourse is not uniform; national sensitivities, historical contexts and government positions significantly shape far-right framing. More generally, this re-search contributes to a critical understanding of how far-right actors are re-conceptualising digital sovereignty — with potentially significant implications for European and transatlantic digital policy.

CDE02 Radical Right Mobilizations and Democratic Contestation in Europe's Digital Public Sphere

PP 0082 The discourse and ideology of the populist European radical right: Patriotism, nationalism, and sovereignty

Helder Prior[1]

[1] Universidade Autónoma de Lisboa, Communication, Lisboa, Portugal

This article offers a critical discourse analysis of political speeches delivered at the *Patriots Summit* by five leading figures of contemporary European radical right-wing populism: Santiago Abascal (Vox, Spain), Marine Le Pen (Rassemblement

National, France), Viktor Orbán (Fidesz, Hungary), André Ventura (Chega, Portugal), and Geert Wilders (Partij voor de Vrijheid, Netherlands). Drawing on theoretical contributions from Ernesto Laclau, Teun van Dijk, Murray Edelman, and Ruth Wodak, the study conceptualizes populism as a discursive logic that constructs antagonisms between "the people" and "the elites," mobilizing emotions, identities, and symbolic boundaries.

Methodologically, the research combines qualitative critical discourse analysis with computational text analysis. The corpus consists of public speeches delivered at the Patriots Summit held in Madrid in February 2025. After textual cleaning and preparation, lexical frequency analysis, thematic categorization, and network visualization were conducted using Python and NetworkX. Six central discursive axes were identified: sovereignty, immigration, national identity, anti-elitism, economy, and security. These dimensions structure a shared populist grammar across national contexts while allowing for strategic variation among leaders.

The findings reveal strong discursive convergence among the analyzed actors, despite differences in tone and national specificity. All speeches articulate a polarized worldview grounded in the opposition between a virtuous, homogeneous people and a set of internal and external enemies, including supranational institutions, political elites, immigrants, and liberal or progressive forces. Symbolic devices such as the "savior leader," narratives of civilizational decline, and appeals to threatened national sovereignty are recurrent. Fear emerges as a central affective resource, functioning alongside narratives of restoration and hope tied to sovereignty, tradition, and cultural identity.

The article contributes to the literature on European radical right populism by demonstrating how transnational discursive patterns are consolidated through shared rhetorical strategies, emotional appeals, and symbolic constructions. It highlights the central role of discourse in legitimizing illiberal political projects and in reshaping the ideological boundaries of contemporary European democracies.

CDE02 Radical Right Mobilizations and Democratic Contestation in Europe's Digital Public Sphere

PP 0083 Right-wing politics, pro-life movement, and personal growth influencers united against gender equality? Mapping the network of online anti-gender mobilisations in the Czech Republic

Lenka Vochocová[1], Julia Gottstein[1], Jana Rosenfeldová[1]

[1] Charles University- Faculty of Social Sciences, Institute of Communication Studies and Journalism, Prague, Czech Republic

Anti-gender discourse, typically in the form of attacks against gender equality, feminism, or the so-called gender ideology, has been spreading in the last decade in Western liberal democracies as part of the conservative backlash against liberalism. However, gendered mis- and disinformation is not limited to far-right politics, the usual scholarly focus. In the era of participatory media and lifestyle influencers, we observe how women, LGBTQ+ people, and gender and sexual minorities are disproportionately targeted by hate actors, and anti-gender narratives are among the main drivers of societal polarisation. The Czech Republic long appeared as an island of liberalism in the changing political landscape of the CEE region. Anti-gender mobilisations, although present in right-wing political discourse and agendas of a few conservative initiatives, had limited impact on official policy. After the 2025 parliamentary elections, mobilising voters around anti-liberal positions, including anti-gender discourse, has proven to be an effective political strategy, with openly anti-gender actors, some of them previous online influencers, forming part of the new government.

As media and communication scholars, we view anti-gender rhetoric not only as a strategic tool of extreme political actors but as a broader "anti-discourse" or "metalanguage" enabling diverse actors to mobilise online communities around anti-gender narratives, for political or business reasons. These narratives unite online users who may feel marginalised or alienated, offering recognition through shared, albeit imagined, collective cis-gender identities.

We focus on the Czech context and explore how these social dynamics manifest locally. Our research employs a mixed-method approach to map various actors for which anti-gender serves as a symbolic unifier. Using the AI-powered monitoring tool Gerulata Juno, adapted to the specific requirements of this study, we collected data across multiple social media and messaging platforms, including Facebook, TikTok, X, WhatsApp, and Telegram. Through a predefined set of thematic hashtags and key actors, we mapped the large-scale dissemination network of original and redistributed content related to the online anti-gender agenda in Czechia, which was then subjected to qualitative network and content analysis.

We reveal that anti-gender discourses extend beyond extreme right-wing politics to include conservative identity movements associated with religious groups, as well as content created by lifestyle and personal development coaches, pickup artists and other influencers. We demonstrate how these actors translate anti-gender rhetoric to language that is comprehensible to domestic audiences and resonates with their everyday lives, and point out the disturbing emergence of therapy-oriented profiles promoting gender essentialism, including attacks against gender equality.

By combining AI-assisted mapping with qualitative analysis of profile and actor types, their target audiences, professional focuses, and specific anti-gender agendas, we develop a framework that illustrates which agendas these mobilisations align with and the types of actors promoting them. This analysis sheds light on how anti-gender narratives are propagated across the digital landscape in a post-socialist Central European context characterised by democratic backsliding in neighbouring countries and recent shifts in domestic political development. It is thus crucial for a better understanding of the abuse of gender issues in spreading hatred and dividing European societies.

CDE02 Radical Right Mobilizations and Democratic Contestation in Europe's Digital Public Sphere

PP 1153 Navigating existential uncertainty: How do social media influence political extremism?

Qinfeng Zhu[1], Anastasija Zareckyte[1]

[1] University of Groningen, Center for Media and Journalism Studies, Groningen, Netherlands

Democratic societies are increasingly shaped by a pervasive sense of crisis. War, economic insecurity, democratic backsliding, and rapid technological transformation converge into what is described as a global polycrisis. In this context, political extremism has gained renewed momentum across Europe, posing serious challenges to democratic norms and stability. While social media are frequently implicated, dominant explanations focus on cognitive mechanisms such as echo chambers and mis- or disinformation. Howver, such accounts overlook a crucial dimension in times of polycrisis: the emotional cultivation of existential uncertainty.

This study thus conceptualizes social media as an existential uncertainty amplifier, integrating cultivation theory (Hermann et al., 2021) with the stress-based model of political extremism (Canetti-Nisim et al., 2009). This theoretical framework posits that social media may disproportionately amplify threat-oriented content about social and political issues. Repeated exposure to such content can foster "mean world syndrome," causing individuals to perceive society as far more dangerous than it actually is. This distorted perception can make extreme ideologies particularly attractive, as their rigid worldviews, strong leaders, and simplistic radical solutions offer a psychological coping mechanism (van Prooijen & Krouwel, 2019). Moreover, the study builds on scholarship on social media curation (Thorson & Battocchio, 2024; Zhu & Skoric, 2025), examining whether and how individuals manage distress from such exposure through filtering, avoidance, and disconnection.

Grounded in this framework, the study addresses three research questions: How do individuals experience threat-focused social media content, and how does it influence existential uncertain and, in turn, political extremism? Do individuals curate such content, if yes, how and why, and how does curation moderate the relationship between threat-focused content exposure and extremism?

To answer these questions, we employs a mixed-method approach, combining in-depth interviews with a two-wave panel survey conducted in the Netherlands during and after the 2025 general election—a period marked by heightened uncertainty following a year of governance by a coalition led by the far-right Party for Freedom (PVV) and the subsequent government collapse. Drawing on purposive sampling to ensure a demographically and ideologically diverse sample (N = 30), the interviews make sense of individuals' experiences and practices. Following that, the population-based panel survey (N = 1,000) tests a moderated mediation model assessing whether threat-focused content exposure is associated with heightened existential anxiety and extremism over time, and whether this process is conditioned by curation.

Preliminary analyses suggest that exposure to threat-laden content is common and often associated with feelings of insecurity, emotional overwhelm, and societal pessimism. This prompts curation practices such as unfollowing accounts, leaving groups, attempting to "train" algorithms, or disconnecting from platforms. Such practices are often motivated by efforts to regain control and protect emotional well-being, though some participants report "doomscrolling," which is associated with heightened anxiety and support for more extreme parties or positions.

This study contributes to scholarship on media and democracy: it demonstrates how social media may undermine democratic stability indirectly by cultivating existential insecurity. It reconceptualizes personal curation as an emotionally consequential democratic practice, offering insights into emotional resilience in politically turbulent times.

CDE03 Journalism, Media Legitimacy, and Democratic Transformations Across Contexts

PP 0185 Journalistic roles and dynamics of democratic backsliding in Central and Eastern Europe

Dina Vozab[1], Zrinjka Perusko[1], Antonija Čuvalo[1]

[1] Faculty of Political Science- University of Zagreb, Department of Media and Communication, Zagreb, Croatia

The goal of this paper is to explore the changes in journalistic roles and their predictors during democratic backsliding in the third wave of autocratization (Lührmann and Lindberg, 2019). Trends of autocratization and democratic backsliding are closely linked to media institutions and journalism. Maerz et al. (2020) suggest that "early warnings" of autocratization are attempts to repress civil society and media freedom. The first strategy of autocratic leaders is to "neutralize" or eliminate media and civil society institutions as watchdogs of political power. This crackdown on media and civil society paves the way to a crackdown on elections in the later phase of the autocratization (Maerz et al., 2020). However, processes of autocratization can fail as some systems show a higher level of democratic resilience, and some systems manage to democratize (Angiolillo et al., 2024). There are also ways in which media and journalism can build resilience amid various structural pressures (Relly and Waisbord, 2022). In this paper, we are interested in whether there are dynamic changes in the ways journalists perceive their role depending on the autocratizing or democratizing trends in the wider political context. Journalistic roles help to place journalistic work in the framework of meaning, are distributed differently across political and media systems, and are linked to the level of democratization (Hanitzch et al., 2019). To answer this question, we will analyze typologies of journalistic roles using Latent Class Analysis on data collected through the comparative research

project 'Worlds of Journalism' from the second wave (2012–2016) and third wave (2021–2025) of the study. Predictors used to explain typologies will be on the macro level (the political system and the democratizing/autocratizing trend), the mezzo level (the media ownership type), and the micro level (perception of influences and safety). We will analyze these dynamics in countries from the third wave of democratization, which have varying levels of democracy and media freedom, including those that have been democratizing (Albania, Czechia, Estonia) and those that have been autocratizing over the last decade (Bulgaria, Croatia, Hungary, Romania, Serbia).

PP 0186 Should journalism go platform? A comparative study in small and large European markets

Roderick Flynn[1], Kristoffer Holt[2], Mirco Liefke[3], Tim Raats[4], Beate Schirrmacher[5], Katja Schupp[6], Chiao-I Tseng[7]

[1] Dublin City University, School of Communications, Dublin, Ireland
[2] Linnaeus University, Dept. of Media & Journalism, Kalmar, Sweden
[3] Freie Universität Berlin, Communication Policy/Media Economics Unit, Berlin, Germany
[4] Vrije Universiteit Brussel, Dept. Communication Science, Brussels, Belgium
[5] Linnaeus University, Dept. of Film and Literature, Kalmar, Sweden
[6] Johannes Gutenberg-University Mainz, School of Journalism, Mainz, Germany
[7] University of Gothenburg, Dept. of Applied IT, Gothenberg, Sweden

The rapid expansion of social media and platform-based distribution has fundamentally reshaped the production, circulation, and authority of news, challenging the position of legacy journalism and raising questions about who can legitimately claim the role of journalist. This paper examines how public service media (PSM), as normative models of institutional journalism, are responding to these transformations and what these responses mean for journalism's democratic role.

Drawing on Habermasian theories of the public sphere, the study interrogates the widely accepted assumption that the decline of institutional journalism necessarily threatens liberal democracy. Rather than taking this relationship for granted, the paper asks whether the current "crisis" of journalism might create opportunities to rethink public communication in more progressive and inclusive ways. The paper presents the result of research from four European case studies assessing the extent to which platform-based journalism is reconfiguring the public sphere beyond traditional, elite-driven models towards more pluralistic and potentially agonistic forms of public discourse.

The research focuses on public service media because of their statutory commitments to the public interest and their relative insulation from purely commercial pressures. As social media platforms increasingly function as primary arenas of public discourse, PSM face strategic choices about whether and how to engage with them. The study asks: How do PSM organisations claim to use platforms? How do they use them in practice? And how does platform engagement shape journalism's role in democratic life and the public sphere?

Methodologically, the paper adopts a mixed-methods, comparative approach across. First, it analyses official platform strategy documents to identify how PSM articulate their normative and strategic goals. Second, these claims are examined through guided interviews with managers and digital content creators to assess everyday editorial practice. Third, content analysis of platform-native outputs investigates how journalistic norms are transferred or transformed in multimodal, platform-specific formats.

Overall, the paper explores whether PSM engagement with platforms reinforces existing Habermasian models of mediated public discourse or opens space for alternative conceptions of the public sphere in contemporary democracies.

CDE03 Journalism, Media Legitimacy, and Democratic Transformations Across Contexts

PP 0187 Media meltdown? Changes in media legitimacy and political orientation across Europe, 2016–2023

Marc Verboord[1]

[1] Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

Scholars have signaled that there is a crisis in the legitimacy of journalism: an increasing group of citizens appears skeptical or indifferent about how mainstream news media report on current affairs (Carlson, 2017; Liminga & Strömbäck, 2023). Mainstream media – such as newspapers, television networks, public broadcasters – are viewed upon negatively by significant parts of society. Part of this antagonism seems politically motivated as right-wing populist leaders across the world purposively attack journalistic media in order to sway public opinion (Carlsson et al., 2021; Meeks, 2020; Hameleers, 2020). At the same time, there is also a growing divergence in how people use media to inform themselves on current affairs which seems linked to socioeconomic divides (e.g. Lindell, 2018).

Using European data from the period 2016–2023, this research will investigate media legitimacy among European audiences. Despite conceptual analyses of journalism scholars-- often focusing on discursive elements (see Carlson, 2017; Tong, 2018)-- media legitimacy is not well studied. Most research has focused on trust in news media (e.g. Strömbäck et al., 2020), but – although related – this is not the same. Moderate levels of trust can also be viewed as a healthy critical stance,

making it difficult to distinguish between the "cynical" and "critical" (Wu & Wilkes, 2018), particularly because trust is often ill-defined (Fisher, 2016). Legitimacy, on the other hand, addresses the foundation of trust: the degree to which audiences find the existence and work practices of journalists and news media justified and worthwhile, and includes also additional dimensions such as perceived diversity of viewpoints and independence from other politics and commercial forces (Tong, 2018). This paper aims to take a first empirical step in studying perceived media legitimacy.

The research questions are: (a) How do various audience groups across Europe perceive the legitimacy of their country's news media, and which changes in media legitimacy have occurred between 2016 and 2023? (b) To what extent does political orientation affect perceived media legitimacy? (c) Which differences exist between citizens with various levels of SES in how they see media legitimacy over time?

Perceived media legitimacy is measured via a multidimensional indicator that asks respondents how they assess the trustworthiness, diversity of views and opinions, and independence from political and commercial pressures of their country's media. Seven Eurobarometer surveys between 2016 and 2023 are pooled to establish trends. SES is measured via occupational status, years of education, and social class. The effect of political orientation is estimated while controlling for political efficacy and life satisfaction, and country traits (GDP, media freedom). Multilevel analyses with random effects at country, time, and country-time levels (Schmidt-Catran & Fairbrother, 2016) is applied.

The first results show that there are no signs of decreasing media legitimacy in the EU countries, but countries differ according to GDP. Media legitimacy is lower among citizens with high SES. Political orientation shows negative associations of radical left-wing self-positioning and the refusing to answer category, but radical right-wing orientation has a small positive effect.

CDE03 Journalism, Media Legitimacy, and Democratic Transformations Across Contexts

PP 0188 Media-made polarization: Television news constructions of citizens activism and state authority in Pakistan

Sadia Zamir[1]

[1] Charles University, Department of Media Studies- Institute of Communication Studies and Journalism, Prague, Czech Republic

The political climate in Pakistan following the ouster of the Prime Minister in April 2022 through a vote of no confidence, gave rise to intense political upheaval, represented as a contest between state power—represented by the military establishment, legislative, judiciary, and executive—and street power, in the form of mass mobilization, protests, and digital activism. Citizen activism has been interpreted in divergent ways. Some characterize it as a personality cult centered around populist leaders or an emotionally driven youth movement lacking political maturity. Others, however, view it as a manifestation of heightened political awareness and a transformative force heralding a 'New Pakistan.' These competing interpretations play a crucial role in shaping the discourse around citizen activism, influencing how its legitimacy is constructed and how it is positioned as a democratic right or represented as a threat to democratic order.

Considering these factors, this study critically examines how these contestations and power struggles are constructed through television news discourse. The study aims to: (i) analyze whether citizen activism is represented as a legitimate democratic expression or a threat to democracy (ii) examine whether the state's response is depicted as maintaining order or an oppressive force. The main research question of the study is: How do Pakistan television news media construct citizens' activism and the state's role in the democratic struggle for social justice? The sub- research questions examine (I) the rhetorical and textual elements used to frame state-citizen conflict, (ii) the journalistic techniques that influence this representation, and (iii) the power relationships and ideological stances represented in media narratives of resistance and governance.

This study is qualitative in nature, embedded in the social constructionist paradigm, that adopts a post-structuralist approach to analyze the contested meanings in media discourse. The study analyzes 9 p.m. prime time news bulletins as they predominantly reflect the editorial stance of news organizations. The corpus includes 100 news bulletins from Geo News and ARY News, two of Pakistan's most influential privately owned channels, with distinct editorial policies. In the selected period (April 2022- November 2022), Pakistan witnessed long marches, protests and political congregations where state enforcement agencies clashed with citizen resistance amid electoral controversies and crackdowns on dissent. This study employs Norman Fairclough's Three-Dimensional Model of Critical Discourse Analysis (1992, 2003), which examines the relationship between linguistic elements, discourse context, and broader social structures. According to Fairclough (1992; 1995), the media has a critical role in promoting or opposing dominant narratives. The findings reveal that television constructions are increasingly partisan contributing to political polarization in the society. This research study is important because it demonstrates how the media shapes various realities of state power and citizen activism. In addition, it exposes societal division, a serious threat to the state-citizen relationship as envisioned by democratic theory.

CDE03 Journalism, Media Legitimacy, and Democratic Transformations Across Contexts

PP 0189 Key considerations for establishing new public service media institution(s): The (potential) case of Irish reunification

Dawn Wheatley[1], Phil Ramsey[2], Roddy Flynn[1], Stephen Baker[2]

[1] Dublin City University, School of Communications, Dublin, Ireland
[2] Ulster University, School of Communication and Media, Belfast, United Kingdom

Imagining public service media (PSM) for a newly constituted country is often purely speculative, offering scholars a chance to consider the fundamental purpose and relevance of PSM in a high-choice media age. However, in the case of Ireland, reevaluating what PSM looks like is less hypothetical: it is an increasingly urgent live issue requiring thoughtful and responsible planning. Shifting demographics, coupled with the post-Brexit context, has prompted active political debate regarding the prospect and implications of a reunified Ireland, which would reunite the six counties in Northern Ireland (a component of the UK since 1921) with the 26 counties in the South (a fully independent Republic since 1949).

Discussions around reunification have considered the practical implications of the institutional arrangements needed to facilitate such a new political dispensation. Ultimately, this paper considers how PSM might be organised in a reunified Ireland. This is currently constituted by the BBC in Northern Ireland (alongside the UK's commercial PSM providers) – where partition has left a British broadcaster operating in Ireland – and RTÉ and TG4 in the Republic of Ireland. We compare the existing overt and implied mission statements for existing PSM and postulates new institutional arrangements appropriate to a new "consociational democracy" (McGarry and O'Leary, 2006), a political unit constituted by a range of potentially antagonistic identities. PSM have long been identified as playing a key role in constructing and amplifying expressions of national identity. This is a nuanced task even in the context of relatively culturally homogenous national settings, but the challenge posed by the kind of consociational democracy envisaged in Ireland is significant (assuming it is possible at all). This article considers how any new PSM organisation would need to reflect an Ireland greatly changed in terms of economic development, ethnicity and social attitudes – while trying to operate within the norms of core PSM values.

The analysis explores six key areas: (i) the central purpose of PSM; (ii) conceiving PSM as an institution or as a network; (iii) the role of journalism and scripted/non-scripted content; (iv) governance, regulation and funding; (v) infrastructure, existing industries and staffing; (vi) digital products/services and relationships with third-party social media and streaming platforms.

The article considers how media in Ireland – as elsewhere – face a radically altered screen media market, characterised by intense commercial competition and where a plethora of distribution technologies have transformed the conditions in which audiences approach and use PSM content. A newly reunified Ireland would likely face severe pressure to move to a market-failure system: but here, we set out funding options for a new PSM, arguing for the implementation of a Finnish-style model. In so doing, we seek to project forward to the middle of the 21st century, to consider the likely nature of the relationship between technology, screen media markets, culture and identity in a society constituted by historically opposed communities.

- McGarry, J., and O'Leary, B. (2006) Consociational theory, Northern Ireland's conflict and its agreement. Part 1: what consociationalists can learn from Northern Ireland. *Government and Opposition* 41(1): 43–63.

CDE04 AI Response-Ability

PN 18 Reclaiming response-ability: Feminist perspectives on AI in the digital welfare state

Victoria Andelsman Alvarez[1], Stine Lomborg[1]

[1] University of Copenhagen, Center for Tracking & Society, Copenhagen, Denmark

The datafied welfare state increasingly relies on automated systems to manage services and govern interactions with citizens, reshaping how welfare professionals and citizens exercise agency and judgment. These shifts can be understood as a redistribution of response-ability within welfare encounters, that is, the capacity to recognize needs or problems and respond. Existing work on digital state transformation has begun to conceptualize responsiveness as an organisational or institutional capability (e.g., Papazu, Wang, Perriam, and Marttila, 2025), using response-ability to capture complex, multi-dimensional state performance. What remains under-theorized, however, is how response-ability operates as a distributed and contested relation across human actors, AI systems, and institutions. This paper develops a theoretical framework of response-ability within critical data and communication studies. Drawing on the work of Barad (2007), Haraway (2016), Tronto (2020) and others, it reclaims response-ability as a thick feminist concept shaped by power asymmetries, highlighting how obligations to respond and forms of vulnerability are unevenly allocated and redistributed within socio-technical relations. The argument is illustrated through the case of AI-mediated risk prediction in reproductive healthcare (e.g., preeclampsia, gestational diabetes, and preterm birth). In these settings, algorithmic systems harness large-scale health records and real-time monitoring to identify "high-risk" pregnancies and trigger standardized clinical protocols. Such systems hold promise for improved maternal-fetal outcomes (Wong et al., 2024). Yet, even when framed as supportive or preventive, such systems reconfigure professional judgment, patient experiences of care and surveillance, and institutional

accountability. Furthermore, their impact on health equity remains contested, with scholars warning that AI can either bridge or widen maternal health inequities, depending on how it is designed, governed, and implemented (D'Ignazio & Klein, 2020; Laguitan & Bernardino, 2025).Applying a thick notion of AI response-ability to the welfare state, this paper examines who is positioned to recognize needs, who is tasked with responding when systems fail, and how AI-mediated processes can intensify or mitigate vulnerabilities. Rather than treating AI as inherently corrosive or emancipatory, the paper shows how new forms of attentiveness, coordination, and early intervention may arise alongside harms and lapses in responsibility. Building on Haraway's claim that "the details link actual beings to actual response abilities" (Haraway 2016), I argue that specific design choices, procedural norms, and everyday practices shape responsiveness and accountability. The key question, then, is under what conditions AI mediated arrangements enable more responsive and equitable care in welfare systems, with clear implications for vulnerability, rights, and the distribution of care.

CDE04 AI Response-Ability

PN 19 Cultivating resonance-ability in the age of AI

Taina Bucher[1], Alexander Kempton[1]

[1] University of Oslo, Department of Informatics, Oslo, Norway

This paper extends the panel's focus on AI response-ability by theorizing a complementary notion of resonance-ability: the capacity to be touched, marked, and transformed by encounters with the world, while also learning what not to let resonate. Drawing on Hartmut Rosa's sociology of resonance, we argue that meaningful human agency in AI-saturated environments requires not only the ability to respond to and care for the consequences of AI, but also enabling an openness to experiences that cannot be fully controlled or predicted. Rosa's (2019) idea of resonance describes a mode of being in the world that is open and transformative, in contrast to an instrumental mode where the world is treated as a mute object for optimization and resource accumulation. LLMs and other AI systems are designed and typically used to deliver fast, efficient outputs, often at the cost of friction, surprise, and the kind of struggle that shapes a self. In such a context, Rosa's concept reminds us that human flourishing depends not only on being able to act and respond, but on being able to be touched by the world in ways that leave a mark and transform us. Heavy reliance on a LLM like ChatGPT can produce polished outputs without the cognitive and affective friction that shapes a self, fostering a kind of "metacognitive laziness" (Georgiou, 2025) where thinking is offloaded and the self is no longer shaped by the struggle of writing and reasoning. A student who lets every AI suggestion overwrite their own voice risks living an "unmarked life," where they no longer show up in the world in a way that allows them to be changed by it. Such examples show the necessity of cultivating resonance, which includes resilience towards what should not be resonant and kept at a distance. We develop this argument by combining Rosa's theory with feminist perspectives on response-ability and (non)care (Haraway, 2020; Yao, 2021). Empirically, we draw on two case studies: ethnographic work in the health sector on how medical experts negotiate reliance on AI in diagnostics, and qualitative interviews with teenagers about their everyday uses of AI, especially ChatGPT in educational settings. These cases allow us to explore how resonance-ability is cultivated (or eroded) in different institutional contexts, and how people learn to distinguish between what they want to be touched by and what they want to keep at a distance. The paper concludes by outlining resonance-ability as a normative ideal for human flourishing in the age of AI: the ability to respond, but also to be touched, to be marked, and transformed because of showing up in the world in a non-instrumental way.

CDE04 AI Response-Ability

PN 20 Civil Society at the table: AI, gender, and accountability expectations in Europe

Elizabeth Farries[1], Alexandros Minotakis[1]

[1] University College Dublin, UCD Centre for Digital Policy, Dublin, Ireland

The paper, which emerges from the EU Horizon-funded project [Anonymised], examines the perspectives of EU civil society organisations (CSOs) on artificial intelligence (AI) in general and on gender-related bias in particular. Referring to the Sociology of Expectations (SoE), it posits that technologies do not emerge in a vacuum but are shaped by social forces, including the values, beliefs, interests, and power dynamics of the stakeholders involved in their development and deployment. Furthermore, the present study seeks to expand SoE by engaging with stakeholders that are not actively developing new technologies (this is the main focus of SoE) but are engaged with its societal impact. Since technologies are imbued with meaning through social processes, their development and adoption are influenced by the interests of specific stakeholder groups, policymaker agendas, and the competitors' strategies. In this framing, the study explores existing CSO strategies, practices and partnerships aimed at addressing AI-related gender bias and empowering gender-vulnerable communities, while identifying the structural barriers that constrain these efforts. Within this framework, CSOs are conceptualised as key instruments of democratic accountability, with the potential to contribute meaningfully to AI governance in accordance with EU values and principles. At the same time, CSOs occupy a privileged position that enables direct engagement with gender-vulnerable communities and the articulation of their concerns regarding instances of algorithmic discrimination. To address the study's research questions, a mixed-methods approach was adopted, combining qualitative data from participatory workshops with quantitative data collected through an online survey. The target sample consisted

of CSO workers and activists, who were invited to reflect on AI-related risks and benefits, engage with recent European regulatory initiatives such as the EU AI Act, and describe organisational activities undertaken to address AI-related gender bias. The findings show that CSO staff and activists are increasingly concerned about AI overall, and especially about its implications for gender equality. They are eager to increase their engagement and advocacy on the issue, but they face growing obstacles, including limited resources, insufficient organisational focus on emerging technologies, and a sense of exclusion from official AI policy deliberation. Their responses are indicative of a broader trend during a time of crisis for civil society where its input into the current AI summer would be particularly valuable for gendered perspectives.

CDE04 AI Response-Ability

PN 21 Chatting with the public Agency: How citizens negotiate public values of public sector chatbots

Maris Männiste[1], Anne Kaun[2]

[1] University of Tartu, Institute of Social Science, Tartu, Estonia
[2] Sodertorn University, Media and communication, Stockholm, Sweden

In March 2025, the Wired broke the news that the initiative Department of Government Efficiency with the senior government advisor Elon Musk as one of its key people introduced a custom-made chatbot to meet the proposed cuts in the public sector and increase efficiency. According to Forbes, government employees are supposed to use the chatbot to draft emails and talking points, summarize text, and write code (Fortune, 2025). Beyond the internal use of chatbots for government efficiency, communicative artificial intelligence (AI), such as chatbots, has increasingly become a mundane part of interactions with citizens. However, it remains difficult to estimate the extent of chatbot use. A 2020 report by AI Watch (Misuraca & van Noordt, 2020) noted that the dominant form of automated and AI-based systems deployed in the public sector are actually chatbots compared to less prominent forms such as automated profiling of citizens. Municipalities and public agencies across Europe are increasingly integrating chatbots into their digital services and websites. Often, these chatbots are based on databases filled with potential search terms that are matched with appropriate answers. Although some solutions have the potential to integrate large language models (LLMs), most chatbots currently in use in the public sector are static solutions. Generally, chatbots have become a mundane encounter for internet users as they are broadly implemented by commercial actors. In this presentation, we explore the mediation of public sector communication with citizens through chatbots. The aim is to question the notion of chatbots being simple technical solutions to challenges in the public sector including accessibility and resources to meet demands by the citizens. Instead, they trigger negotiations of public and individual values that need scholarly attention. Theoretically, we draw on public value theory, and empirically, we establish a citizens' perspective with focus group discussions that include elements of data dreaming as a method. In 10 focus groups, we discussed what people think, value, and disvalue about chatbots used by public entities. Our findings indicate that the research participants emphasized public values traditionally connected with a strong welfare state, namely universal access, equality, and equity in connection with technical aspects such as functionality and intuitive design.

CDE04 AI Response-Ability

PN 22 How to build responsible AI? The case of the technology nucleus of the Homeless Workers' Movement (NT-MTST)

Tiziano Bonini[1], Yves Pessanha[2]

[1] University of Siena, Department of Social Political and Cognitive Sciences, Siena, Italy
[2] Universidade Estadual do Norte Fluminense Darcy Ribeiro, Brazil

Big tech companies increasingly deploy AI systems to enhance efficiency and profitability. These technologies are not merely technical or strategic tools, but also moral ones, insofar as they embed specific values, norms, and "scripts" into digital infrastructures that shape and discipline user behaviour. A paradigmatic example is the "system prompt" embedded in large language models such as ChatGPT or Claude (dbreunig 2025), which continuously governs how these systems respond, the tone they adopt, and the information they may withhold. Such "moral affordances" are not neutral: they reflect the moral economies of their creators, often grounded in a neoliberal ethos privileging competition, meritocracy, and individual performance. More broadly, commercial digital platforms discipline users and platform workers through algorithmic moderation practices, design choices such as gamification, and performance metrics that reward compliant behaviour while sanctioning deviation through forms of exclusion or de-platforming. From this perspective, technology companies tend to define "responsible" uses of AI as those aligned with their own moral economies (Bonini & Treré 2024). However, what counts as responsible technology is highly contested. Uses deemed responsible by designers may be experienced as harmful or unjust by users and workers—for instance, when algorithmic management fails to guarantee economic survival or incentivises unsafe working practices. Concluding the panel, and returning to the notion of response-ability, in this paper, we propose a slightly different definition of "response-ability", not simply linked to the assessment of AI's consequences but to as a collective process through which users and workers actively participate in the production, governance, and re-definition of AI technologies. Empirically, the paper draws on qualitative fieldwork conducted between May and November 2024 among members of the Technology Nucleus of the Homeless Workers' Movement (NT-MTST) in São Paulo, Brazil. Through observations, semi-structured interviews, and the analysis of key initiatives, we show how the movement not only

adopts AI-driven technologies but actively reconfigures their architectures, uses, and meanings in line with collective values and the concrete demands of popular struggles. Particular attention is devoted to the Contrate Quem Luta (Hire Those Who Struggle) platform and to the development of cooperative delivery platforms governed by alternative algorithmic logics based on solidarity, collective responsibility, and democratic control. By analysing these practices as forms of popular technopolitics, the paper contributes to debates on responsible AI by foregrounding technology as a terrain of ethical and political struggle, in which responsibility is co-produced through collective action rather than imposed from above.

CDE05 Truth, Information Integrity, and Media Contestation in Contemporary Democracies

PP 0295 Truth under scrutiny: Fact-checking and credibility in Portuguese televised election debates

Clara Almeida Santos[1], Ana Teresa Peixinho[2], Felisbela Lopes[3], Catarina Duff-Burnay[4]

[1] Universidade de Coimbra, CEIS20, Coimbra, Portugal
[2] Universidade de Coimbra, Centro de Estudos Interdisciplinares da Universidade de Coimbra, Coimbra, Portugal
[3] Universdade do Minho, Centro de Estudos de Comunicação e Sociedade, Braga, Portugal
[4] Universidade Católica Portuguesa, Centro de Estudos de Comunicação e Cultura, Lisboa, Portugal

In a post-truth context characterized by the rapid spread of information disorders through digital networks, fact-checking has emerged as a key resource for combating disinformation and uncertainty. Whether the aim is to promote media and information literacy across different domains or to stand out within a media ecosystem in which journalism must regain credibility and public relevance by strengthening trust in news brands, understanding the mechanisms that foster citizens' trust in the media is particularly important. In this context, fact-checking plays a dual role: it helps reinforce journalistic authority while simultaneously subjecting political discourse to heightened public scrutiny.

The period of televised debates between candidates in the run-up to Portugal's early legislative elections, held on 18 May 2025, constitutes a particularly relevant moment for examining fact-checking practices and their relationship with democratic processes.

This study aims to analyze the fact-checking segments produced by SIC Notícias (a private 24-hour news television channel) in collaboration with Polígrafo, Portugal's first fact-checking organization, following the 28 televised debates between the leaders of the political parties contesting the elections. The debates were broadcast by Portugal's main television channels (RTP, SIC, and TVI). Notably, SIC Notícias conducted fact-checking after every debate, including those aired by competing broadcasters. In these segments, statements made by candidates were assessed through a rapid verification process carried out under significant time constraints.

Using content analysis, this study examines how fact-checking is constructed within television news coverage during a period of heightened political relevance, with particular attention to editorial criteria, strategies of legitimization, and the role of time in the verification process. In addition, interviews will be conducted with the editor responsible for selecting the candidates' statements to be fact-checked, as well as with the fact-checkers themselves. The findings are expected to contribute to a deeper understanding of how fact-checking practices shape perceptions of credibility and legitimacy—both by reinforcing journalists' professional authority and by influencing public evaluations of political actors and their claims. More broadly, this study seeks to critically examine the central role of fact-checking as a democratic practice and its significance for informed citizenship, political accountability, and the quality of public debate in contemporary democracies.

CDE05 Truth, Information Integrity, and Media Contestation in Contemporary Democracies

PP 0296 Negotiated truth: Poly-perspectival media sources in the coverage of Gaza's Al Shifa hospital siege

Daniela Rebello[1], Will Fee [1], Christoph Raetzsch[1]

[1] Aarhus University, Department of Media and Journalism Studies, Aarhus, Denmark

Media coverage of the war on Gaza has long been politically contested, especially since Israeli authorities have refused to grant foreign journalists independent access on the ground since October 2023 (CPJ 2025). Embedded power structures within political and media institutions have sought to suppress the release of information (Jones2025), constraining how news about the conflict is produced and verified (Melamed 2025). This has created a predominance of information coming from Israeli government sources (Al-Najjar and Zaid 2025), which can shape the framing and tone of Gaza coverage, and influencing how society interprets events (Gonen 2018).

Under these conditions of limited access, new actors adopting new techniques negotiate the reliability of sources. While Gaza has become the deadliest place for journalists in the world (OHCHR 2023), local reporters continue to document the war, using phones and social media as their only channels of communication. Their work is part of a broader group of individual news creators recording and sharing live footage as a form of real-time, unfiltered evidence (Kavada & Treré 2020; Bjerknes 2022), as well as open-source investigators who verify and geolocate the origin of material (Dodds et al. 2025). Together, these actors create a "poly-perspectival assemblage of truth" (Fuller & Weizman 2021), where different forms of eye witnessing and verification fill the blank spots left by traditional media coverage. This paper analyses the siege of the Al Shifa Hospital in November 2023 as a paradigmatic case study (Flyvbjerg 2016). It takes one of the conflict's most contested events, marked by fabricated footage and disputed information (Borger 2023), to investigate

the conflicting and complementary news sourcing practices of international media outlets, on-the-ground reporters and content creators, and open-source investigators.

News sourcing practices are shaped by assumptions about power and authority and tend to privilege elite voices in the media (Hermida et al. 2014) and "authorised knowers" (Edy et al. 2024). Therefore, this study explores the role of alternative actors who may challenge these prevailing narratives. The paper examines and compares how journalists, content creators, and OSINT investigators substantiate their truth claims under conditions of restricted international access and polarised narratives. Itexamines sources used in the coverage by traditional outlets (BBC, Al Jazeera, The Guardian), on-the-ground reporters and content creators (Bisan Owda, Motaz Azaiza, Abdallah Alattar), and OSINT investigators (Forensic Architecture, Bellingcat) to understand how truth claims by non-elite, non-authorised knowers inform the politically contested discursive space of Gaza war coverage.

The paper draws on the concepts of the hybrid media system (Chadwick 2017), counterpublics (Kavada and Poell 2021), "strategic witnessing" (Ristovska 2016) and poly-perspectival truth (Fuller & Weizman 2021) to interpret how institutionalised and new sourcing practices intersect. The study reveals how digital content creation and open-source investigation can be used as alternative and complementary ways to document war and call for accountability (Charlton et al. 2024). The research highlights how the targeting of journalists and suppression of independent reporting create severe distortions in how the Gaza conflict is documented, posing fundamental risks to media and democracy.

CDE05 Truth, Information Integrity, and Media Contestation in Contemporary Democracies

PP 0297 How the Brussels Effect channels information integrity policies in Latin America

Danilo Rothberg[1], Fernando Oliveira Paulino[2], Juliana de Amorim Rosas[3], Stephani Katreem Echalar[3]

[1] Unesp - Sao Paulo State University, Human Sciences, Bauru, Brazil
[2] University of Brasilia, Journalism, Brasilia, Brazil
[3] TU Dortmund, Erich Brost Institut, Dortmund, Germany

This paper examines how European Union regulatory frameworks—particularly the General Data Protection Regulation (GDPR), the Digital Services Act (DSA), and EU-led information integrity instruments—have influenced data protection and disinformation governance policies in Latin America (LA). Grounded in debates on regulatory diffusion and the Brussels Effect, the study assesses the scope and limits of EU normative power in shaping communication-related policies beyond Europe, with particular attention to democratic resilience and information integrity. The research contributes to communication policy scholarship by moving beyond formal legal convergence and examining how EU-inspired models are adapted, hybridized, and operationalized in specific media and political contexts.

The study combines qualitative document analysis of data protection laws, platform regulation bills, and policy papers with semi-structured interviews conducted with legislators, policy experts, regulators, and journalists across selected Latin American countries. This design allows for a comparative assessment of both regulatory approximation and contextual mediation. The findings indicate that EU norms strongly influence regulatory design, especially regarding the framing of data protection as a fundamental right, transparency obligations for platforms, algorithmic accountability, and content moderation mechanisms. Brazil's General Law on the Protection of Personal Data (LGPD), alongside reforms in Mexico, Chile, Argentina, and Colombia, illustrates how GDPR principles and institutional architectures have been replicated to facilitate cross-border data flows and pursue EU adequacy status (Carrillo & Jackson, 2022; Boshe & Caride, 2024).

Existing scholarship shows that stakeholders in Argentina, Brazil, Colombia, Chile, Mexico, and Peru increasingly recognize EU law as the primary normative reference for personal data protection, outweighing U.S. influence and reshaping debates on digital rights and public policy in the region (Veronese et al., 2023). A similar dynamic is observable in the field of information integrity. As generative artificial intelligence accelerates the scale and sophistication of information manipulation, Latin American governments have turned to regulatory frameworks oriented toward safeguarding fundamental values such as freedom of expression, human rights, and democratic participation.

Comparative analyses of DSA-inspired legislative proposals reveal an emerging regulatory modeling process around EU platform governance rules (Mama & Ugarte, 2025). However, empirical evidence suggests Latin American policies are not mere transplants. Instead, they constitute hybrid regulatory models that combine EU templates with local political priorities, including election integrity, protection of democracy, and regulation of messaging applications, alongside elements from other regulatory traditions (Da Nóbrega & Ratier, 2025). The EU's Code of Practice on Disinformation and its incorporation into the DSA framework as a Code of Conduct in 2025 have further amplified this influence, particularly following the endorsement of the Global Declaration on Information Integrity Online by Latin American countries in 2024.

The paper addresses two key knowledge gaps: first, the limited empirical analysis of how EU-inspired regulations affect disinformation dynamics, media pluralism, and the protection of user rights in practice; and second, the under-theorization of cultural and political specificities—such as high media concentration, media trust, and democratic backsliding—in discussions of the Brussels Effect. By foregrounding these dimensions, the study contributes to ECREA debates on communication law, digital governance, and the future of democratic information ecosystems.

CDE05 Truth, Information Integrity, and Media Contestation in Contemporary Democracies

PP 0298 The crisis of accountability and media counter-discourse: Algorithms and civic resistance in Romania (2024–2025)

Eugen Istodor[1]

[1] University of Bucharest, Communication Science, Bucharest, Romania

The November 2024 Romanian presidential elections were marked by the unexpected success of Călin Georgescu, a candidate virtually unknown in the traditional public sphere. Georgescu's victory signifies a transition from the "logic of collective action" (centered on parties and ideologies) to the logic of connective action (Bennett & Segerberg, 2012). In this model, political participation is no longer mediated by formal structures but by digital platforms that facilitate self-organization through "underground naming practices." Supporters formed a community based on a fluid yet radical identity, transforming TikTok into a space of symbolic resistance against "The System." This mode of participation eluded traditional political gatekeeping, offering an illusion of direct democracy under the guise of digital messianism. Georgescu's campaign thrived on these connective forms of activism, where digital platforms allowed marginalized groups to bypass traditional party mediation. Supporters utilized "underground naming practices" (Williamson, 1974), ritualistically designating him as the "Messiah." This reflects Bourdieu's (1991) theory on naming as a tool for creating a new social reality. By airing the "dirty laundry" (Herzfeld, 2006) of the elite, the discourse forged a radical intersection of democracy and identity, pitting an autarkic, "Dacian" descent against a pro-European status quo. This created an "Identity-Us" (Elias, 1991) that prioritized collective belief over individual critical logic. The initial failure of state institutions underscores a crisis of democratic accountability in the face of algorithmic governance. Social platform algorithms functioned as autonomous political actors, promoting "magical thinking" and autarkic solutions without any form of public oversight or financial transparency. This opacity created a "responsibility vacuum," where electoral success was achieved through the manipulation of information flows, pushing the boundaries of electoral legislation that was unprepared for "zero-cost" campaigns with massive viral impact. In this context, the independent mainstream media assumed the role of the core of civic resistance. The "Media Reply" was not merely a journalistic act but a vital democratic intervention that dismantled the candidate's identity construction. Through investigations into falsified biographies and obscure connections, the press transformed "revelation" into verifiable reality, providing the public with the cognitive tools necessary to escape the aura of magical thinking. This civic pressure served as the catalyst that forced political institutions to move from passivity to action. To decode this "common code" of naming, the study employs a qualitative analysis of primary sources (media articles, TV broadcasts, and social media posts) from the determined period. The analysis is bolstered by interdisciplinary interviews with specialists in media, AI and NLP, cognitive psychology, and sociology/history. As a researcher, I operated from an insider positionality, leveraging my career as a journalist to ensure high-level access and trust. While this status introduced inherent subjectivity, it was counterbalanced by selecting interviewees with diverse civic involvement. The study is delimited to the "progressive" academic and media spheres of Bucharest, focusing on participants aged 40–60 from the middle class. The 2024–2025 case demonstrates that, in the absence of transparent digital governance, civic resistance through the media remains the final barrier against algorithmic populism.

CDE05 Truth, Information Integrity, and Media Contestation in Contemporary Democracies

PP 0299 The construction of the world in FIMI (Foreign Information Manipulation and Interference) discourse – Analysis using the corpus-assisted discourse studies method

Karina Stasiuk-Krajewska[1]

[1] SWPS University, Department of Law and Social Communication, Wrocław, Poland

The FIMI (Foreign Information Manipulation and Interference) category has recently replaced the disinformation category as a more precise one, as it is based on the attribution of the analyzed messages. In the case of the Polish socio-political reality, FIMI consists of messages inspired mainly by Russian actors. The presented analysis will refer to the construct of reality (the linguistic image of the world, Bartmiński 2009) and discourses (Foucault, 2002) updated in texts from several websites constituting the so-called alternative source of information in Poland. The analysis will be based on an extensive corpus of over 75,000 original texts obtained from the aforementioned websites, which the fact-checking organizations identified as being inspired by Russian disinformation activities.

The analysis of this corpus will be conducted using corpus-assisted discourse studies methods. In the first phase, key words, collocations and topics will be presented, which have been reconstructed using computer-assisted language analysis methods (Clarin-pl software). The analysis will refer to the structural and semantic features of the vocabulary used in the analyzed corpus. In addition to semantic fields, the presence of specific parts of speech and their grammatical forms will also be examined (especially nouns, verbs, and adjectives), as well as the occurrence of special vocabulary, such as emotionalisms, diminutives, augmentatives, and proper names.

In the second part, data obtained using quantitative methods will be subjected to qualitative analysis in the context of the question of the dominant worldview and discourses actualized in the discursive practices (understood as texts) included in the corpus.

In the context of discursive analysis, questions will be raised concerning (Warnke & Spitzmüller, 2008):

Transtextual layer

- Intertextuality
- Frames, topoi
- Discourse-semantic protofigures
- Social symbolism
- Indexicality
- Historicity
- Ideology/mentality
- General political and social debates

Actors (agents)

- Recipient roles
- Production (author) roles
- Social stratification, power
- Discourse communities
- Ideology brokers
- Voice (s)
- Verticality
- Patterns of action
- Forms of communication

Intratextual layer

- Metaphorical fields
- Lexical fields
- Isotopical and oppositional lines
- Topic development
- Text functions
- Text type
- Syntactic patterns
- Rhetorical tropes and figures
- Metaphorical lexemes
- Deontic meaning

The analysis, combining quantitative and qualitative methods, allows us to reconstruct the dominant linguistic image of the world (the construction of social reality, Berger & Luckmann, 1991) and the main updated discourses in discursive practices such as FIMI.

CDE06 AI, Democracy, and the Transformation of Political Communication

PP 0305 Artificial representation? Citizens' perceptions and evaluations of the use of generative AI in politics

Edina Strikovic[1], Chris Starke[1]

[1] University of Amsterdam, Communication Science, Amsterdam, Netherlands

Generative AI has rapidly become embedded in a wide range of communication professions. Tools based on large language models (LLMs) are increasingly used to draft texts, summarize information, and tailor messages to audiences, reshaping how content is produced and perceived. Most recent research in political communication has focused on the use of generative AI in the news media and journalism (see for example Kieslich, et al., 2025; Nihal & Diakopoulos, 2025; Strikovic & Cools, 2025).

Although research on the use of generative AI in political processes remains limited, the topic is increasingly attracting media attention. Most recently, the Swedish Prime Minister Ulf Kristersson received stark criticism for accusations about using generative AI in his official work (Bryant, 2025). This suggests that the adoption of generative AI by political actors may raise distinct normative concerns. Unlike other communications contexts, political communication is closely tied to

democratic representation and responsiveness. Research on political representation emphasizes that citizens' sense of being represented depends not only on substantive policy congruence but also on communicative signals that point to politicians acting on behalf of citizens and their needs (Page & Shapiro, 1983; Haversian, 2010; Aarts & Thomassen, 2008). The perceived outsourcing of communicative or decision-making tasks to AI systems may therefore challenge citizens' expectations of how representation should be enacted.

Overarching RQ: How do citizens perceive the extent to which generative AI is used in political processes, and how acceptable do they find this perceived use?

Methodology

We analyse data from a representative survey of German citizens (N = 1120) collected in January 2026, stratified by age, education, gender, and region. Participants are given a list of 16 possible uses of generative AI within the political process (such as using generative AI "*... to draft press releases, newsletters, or official statements*" or "*... to prepare for interviews, debates or public discussions by generating possible arguments and responses*") and are asked (a) how frequently they think politicians use generative AI to perform the tasks and (b) how acceptable they (would) find the use of generative AI for the tasks.

First insights

Preliminary findings reveal a pronounced perception gap: respondents perceive that politicians use generative AI frequently, yet they consider such use largely unacceptable.

These results suggest that even limited or symbolic uses of generative AI by political elites may undermine perceived democratic responsiveness if citizens believe that core representative functions are being delegated to AI systems rather than grounded in human judgment and citizen needs.

Discussion

The study contributes to emerging research on AI in politics by highlighting the importance of public perceptions (and misperceptions) in shaping democratic satisfaction in an era of synthetic communication. It also lays the groundwork for a broader research agenda, as we plan to survey politicians using the same questions to assess not only potential gaps between citizens' perceptions and actual political practices with regards to the use of generative AI, but also divergences between citizens' and politicians' normative evaluations of generative AI use in political processes.

CDE06 AI, Democracy, and the Transformation of Political Communication

PP 0306 Politics of Boom and Doom: Exploring the politicization of AI in the Netherlands

Joly-Eline Himpers[1], Dennis Nguyen[2], Mirko Tobias Schaefer[1], Iris Marijke Muis[3]

[1] Utrecht University, Information and Computing Sciences, Utrecht, Netherlands
[2] Utrecht University, Media and Culture Studies, Utrecht, Netherlands
[3] Utrecht University, Centre for Digital Humanities, Utrecht, Netherlands

Artificial intelligence (AI) is increasingly presented as a transformative force reshaping economies, governance, and everyday life. Yet public and political debates about AI often oscillate between exaggerated promises and abstract fears, obscuring concrete societal challenges related to power, governance, and public values. This study critically examines how AI has been politicized in Dutch public discourse over the period 2015–2025, asking how dominant narratives about AI relate to the actual challenges identified in debates on democratic AI governance. Central to the analysis is the growing mismatch between AI "hype" and the social, ethical, and institutional realities of AI deployment.

Drawing on the concept of sociotechnical imaginaries—understood as collectively held and publicly performed visions of desirable futures shaped by science and technology—the study analyses how AI is imagined, framed, and contested across media arenas. Empirically, the research combines intermedial and multimodal analysis of more than 14,000 texts, including news articles, LinkedIn social media posts, parliamentary documents, political party programmes, and corporate blogs in the Dutch context. Methodologically, it adopts a mixed-methods design that integrates quantitative-computational approaches (topic modelling, actor and frame detection, temporal trend analysis) with close, qualitative analysis of selected texts and visuals to capture both large-scale patterns and discursive nuance.

The findings show that the Dutch AI discourse is structured around a dominant, economics- and business-centred "master frame." Across media types, AI is frequently presented as revolutionary and inevitable, as efficient, objective, and accurate, and as a key driver of economic growth and international competitiveness. Narratives of a global "AI race" position technological adoption as a geopolitical necessity, while more extreme framings oscillate between techno-optimist promises of societal progress and existential risk narratives portraying AI as a threat to humanity. These imaginaries are most prominently articulated by actors from the technology sector, whose commercial and political interests strongly shape public understandings of AI.

While news media cover a broader range of themes than political or corporate communication—including social effects and ethical concerns—risks are often discussed in abstract terms and rarely connected to concrete governance challenges such as data bias, embedded assumptions in algorithmic design, or the social consequences of automated classification. Political

debates engage with fewer AI topics overall and tend to prioritise economic growth, though significant differences emerge between parties. Right-wing populist and nationalist actors frame AI as a tool for democratic disruption or as leverage against EU-level regulation, while libertarian and tech-aligned actors emphasise deregulation and innovation freedom.

Social media function as a space where AI imaginaries are contested, yet techno-optimist narratives remain dominant. Overall, the study demonstrates how the dominance of commercially driven AI imaginaries narrows the range of publicly visible futures, marginalising alternative conceptions of AI grounded in public values such as fairness, accountability, and transparency. By systematically comparing media and political discourse with established governance challenges, the study highlights the democratic implications of AI hype and underscores the need for more pluralistic,value-driven public debates on AI.

CDE06 AI, Democracy, and the Transformation of Political Communication

PP 0307 From digital savvy to democratic responsibility: How young citizens engage with AI

Nuša Detiček[1], Tanja Oblak Črnič[1]

[1] University of Ljubljana- Faculty of Social Sciences, Department of Media and Communication studies, Ljubljana, Slovenia

Citizens primarily develop their understanding of AI through personal experience and media representations. International research (Kong, Cheung, and Zhang 2022; Chan and Hu 2023; Ng et al. 2023; Mansoor et al. 2024; Walter 2024; Wang et al. 2025; Humburg et al. 2024) reveals a nuanced picture of young people's perceptions and uses of AI. Oblak Črnič (2020) differentiates between teachable, competent, and vulnerable youth, emphasizing that no single category adequately captures their complex relationship with technology. Although popular labels such as "digital natives" (Prensky, 2001), the "networked generation" (Tapscott, 1998; Rheingold, 2012), and the "app generation" (Gardner and Davis, 2013) have long portrayed youth as technologically adept, empirical studies highlight a persistent gap between perceived and actual digital competence (Hargittai, 2010; Kirschner and van Merriënboer, 2013; Porat, Blau, and Barak, 2018; Oblak Črnič, 2025).

Youth tend to exhibit greater familiarity with digital technologies, largely due to their psychological flexibility and adaptability (Nikolenko & Astapenko, 2023). Consequently, they are not merely users but active co-creators of digital media and technologies (Vartiainen et al., 2025). However, AI-driven decision-making, which promises "instant optimal solutions to complex problems" (Konig, 2023), risks diminishing pluralistic deliberation and may undermine the integration of diverse perspectives essential for democratic governance. Against this backdrop, this study examines how young citizens engage with AI critically and responsibly, and how such engagement manifests in practice. To explore these questions, we draw on extensive nationally representative data, employing both qualitative and quantitative methods. The survey includes 1,488 high school students and 545 young adults, while 41 Slovenian participants aged 16–24 contributed to the focus groups.

Our findings suggest that the initially cautious, sceptical, and experimental engagement with AI has evolved into a more deliberate and purposeful use, particularly among youth identified as "first" (Oblak & Brečko, 2025) or "emerging citizens" (Oblak, 2023), who actively reflect on the ethical and social implications of AI. The data further reveal a considerable degree of critical reflection on AI among young people, although patterns of appropriation remain uneven, especially among different socioeconomic groups.

With the findings, we want to underscore the need for targeted educational strategies that foster equitable digital empowerment and critical AI literacy among youth. As AI becomes increasingly embedded in everyday life, ensuring that young citizens can engage responsibly and reflectively is essential for their personal agency as also for the resilience of democratic societies. By situating youth AI practices within the broader context of democratic participation, this study contributes to understanding the interplay between emerging technologies and civic engagement, especially among younger citizens.

CDE06 AI, Democracy, and the Transformation of Political Communication

PP 0308 Identifying challenges and opportunities for AI chatbot implementation in the public sector

Ece Elbeyi[1], Kiran Kappeler[1], Stine Lomborg[1], Lisa Reutter[2]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark
[2] University of Copenhagen, National Center for Advanced Studies in Generative AI in Society, Copenhagen, Denmark

Chatbots that employ generative artificial intelligence (AI) are spreading rapidly: In Germany, 4 out of 10 internet users (Reiss et al., 2025) and in Denmark, 8 out of 10 students (Skovgaard Thomsen, 2024) are using them. As large language models become "normal technology" (Narayan & Kapoor, 2025) to support human work, local and national government institutions have started implementing such chatbots in public administration (Bright, 2025). The envisioned aim is to optimize administrative processes and enable faster service to citizens (Mergel et al., 2023). However, the empirical basis for these expected benefits remains unclear. This paper addresses this gap by providing a systematic literature review of the implementation, uses, and attitudes towards generative AI-based chatbots in the public sector. It draws on 54 empirical studies that were identified following the PRISMA (2020) guideline and that were published across disciplines since autumn 2022, i.e., since ChatGPT was made available to a wider public. The data is analysed through a combination of automated and manual coding.

Our analysis suggests that implementing chatbots in public administration carries potentials as well as challenges. For instance, chatbots can automate repetitive tasks, such as form completion and multilingual communication (Abdenebaoui et al., 2024; Millan-Vargas et al., 2024). While this can entail efficiency gains, workloads can also increase due to unresolved citizen inquiries shifting to alternative channels or rebound effects from heightened service expectations (Hemesath & Tepe, 2024; Chen & Gasco-Hernandez, 2024). Additionally, the adoption of generative AI introduces new tasks, including system maintenance, data quality assurance, and model training, emphasizing the need for organizational readiness and continuous skill development (Kaun & Männiste, 2025). While chatbots improve access to simple, time-sensitive public information, they are less suited for complex or critical inquiries, where citizens often prefer human interaction (Følstad and Bjerkreim-Hanssen; 2023; Maragno et al., 2023; Ruiz and Reascos-Paredes, 2024). Errors in chatbot responses can create additional challenges, hence undermining public trust and potentially exacerbating social inequalities (Jo et al., 2025). Citizens also express high expectations regarding data security, transparency, and accountability in AI-driven public services (Bao et al., 2025). People's digital literacy and trust in these technologies play a central role in use, but are not distributed equally: younger, resourceful citizens exhibit greater confidence in chatbots, whereas vulnerable groups experience heightened barriers (Larsen & Følstad, 2024).

Taken together, our study identifies three key strategic challenges regarding chatbot implementation in the public sector: (1) enabling organizational restructuring in terms of rethinking divisions of labour, staff competencies, and the distribution of roles and departmental responsibilities, (2) preserving trust in the welfare state as digitalization reduces human interaction, and (3) ensuring digital inclusion and equitable access to public services. Hence, this review provides a consolidated, cross-disciplinary synthesis of recent empirical evidence on potentials and challenges regarding the implementation of chatbots in the public sector. By clarifying where chatbots demonstrate reliable value and where they generate new forms of complexity it informs policy discussions around the implementation of generative AI and furthers the understanding of its democratic consequences.

CDE06 AI, Democracy, and the Transformation of Political Communication

PP 0309 Will democratic communication remain human-produced? Generative and agentic AI in post-digital Europe

Sara Pane[1]

[1] University of Turin, Department of Cultures and Politics, Turin, Italy

This paper analyses the evolving relationship between public communication and democracy at the EU level through the lens of emerging socio-technical transformations driven by artificial intelligence, with particular focus on generative and agentic forms. It argues that the increasing institutional deployment of chatbots, conversational systems designed to perform communicative and informational tasks traditionally carried out by humans, thereby enhancing the perceived accessibility and responsiveness of public authorities, together with the accelerating interest in agentic AI and growing debates surrounding the agentic state, signals a structural shift in how governance is conceived, enacted and projected into the future. This shift is situated within a post-digital paradigm, in which "post-" denotes not the end of the digital era, but a new developmental phase characterised by intensified and qualitatively novel patterns of human–machine interaction (Pane, 2025). Within this paradigm, artificial sociality and quasi-otherness, enabled by AI-mediated interfaces, reshape communicative dynamics between institutions and citizens, reconfiguring expectations of participation, authority and legitimacy (Natale & Depounti, 2024). The paper contends that these developments necessitate a fundamental reconsideration of the communicative foundations of democracy and conceptualises generative and agentic AI along a continuum spanning AI as a tool to AI as a quasi-other capable of exercising delegated agency, prompting questions of empowerment, human over-shift, responsibility gaps and the trustworthiness of machine-mediated interventions in public life.

Empirically, the paper draws on a qualitative interview set (n = 10) involving experts in European democracy and public communication. The findings show that communicative practices, rather than technological capacity alone, mediate both the democratic risks and opportunities associated with the emergence of agentic AI systems. The interviews further illuminate how institutional chatbot deployment and the current experimentation with agentic AI are transforming the European public sphere, where AI-mediated interaction increasingly disrupts the Habermasian model of communicative rationality traditionally invoked as the normative foundation of democratic deliberation (Habermas, 1996). The analysis highlights tensions between artificial agency and human accountability, including concerns regarding over-reliance, opacity and shifting expectations of trust in hybrid human-AI communicative environments (Floridi, 2025). While these systems perform communicative tasks that resemble human action, they do not generate autonomous knowledge nor do they originate moral values, which marks a clear boundary between human agency and artificial output. These dynamics are interpreted as characteristic expressions of post-digitality, in which public communication becomes hybrid, contested and partially populated by artificial quasi-actors, creating both new democratic opportunities and new vulnerabilities for legitimacy, trust and the integrity of institutional authority.

CDE07 Platformed Democracies: Mediation, Participation, and the Struggle over Democratic Meaning

PP 0411 Democracy dies in dazzlement

Marwan Michel Kraidy[1]

[1] Northwestern University, Northwestern University in Qatar, Doha, Qatar

Against the mantra "democracy dies in darkness," this paper argues that in Western democracies with a rising far right, it is not darkness but a surfeit of light that threatens democracy. It is the excess of light brought by a bipolar public sphere, a cable news landscape starkly divided into a polarized duopoly, and histrionic, "horse-race" media coverage of public affairs. To elaborate this argument, this paper articulates Guy Debord with the post-colonial criticism of the Congolese Gabonese critic Joseph Tonda.

Tonda's notion of "postcolonial imperialism," centered on "dazzlement," offers new ways of understanding the crisis of democracy, because it enables a disassociation between "light" and "good," and between "fire" and "bad." It upends the Enlightenment's fetishization of light as enlightened rationality and banishment of fire as the retrograde domain of superstition and violence and offers a novel approach to the crisis of democracy, with Trump's US as case-study, torn apart by chauvinism and sexism.[1]

"Dazzlement" captures the nature of the threat to democracy. Debord theorized the becoming-image of all social relations under capitalism, opening *La société du spectacle* with the assertion that "the entire life" of modern societies "is turning into an immense accumulation of *spectacles*."[2] A system in which images mediate human relations, "spectacle is the affirmation of appearances and the affirmation of all … life, as mere appearance."[3]

A truly *global* phenomenon, spectacle comes in two types: in *concentrated* spectacle, political power is centralized, and the production and consumption of commodities is less developed than in *diffuse*spectacle, which perfuses advanced consumer societies. Autocracy spurs concentrated spectacle; capitalism spawns diffuse spectacular societies. Between the publication of *La Société du Spectacle* in 1967 and *Commentaires sur la Société du Spectacle* in 1988, Debord argues that "the concentrated and diffuse kinds of spectacular power had fused in "a third form … the *spectaculaire intégré* [integrated spectacular, or integrated spectacle] which tends to impose itself worldwide."[4]

Building on the above, Tonda's *dazzlement* helps us understand the crisis of democracy. It is the blinding light of the spectacle of US politics, where a parade of cartoonish political figures and issues blind us and overwhelm our perceptual capacities. Most emblematic is the figure of Donald Trump, a spectacular master image that disables effective public discourse by blinding our collective vision. This is the culmination of a variety of light metaphors, from "shock and awe" to "gaslighting," that have perfused contemporary discourse. My principal takeaway is that in Trump's United States, "democracy dies in dazzlement" is more suitable than "democracy dies in darkness." This paper explains the momentous ramifications of the politics of dazzlement to democratic life globally.

CDE07 Platformed Democracies: Mediation, Participation, and the Struggle over Democratic Meaning

PP 0412 Fact-checkers' theory of democracy: Fact-checking as democratic repair?

Johan Farkas[1], Mette Bengtsson[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Mis- and disinformation have become a major democratic concern, designated as the world's biggest short-term threat by the World Economic Forum (2025). A plethora of policy solutions have been implemented from anti-fake news laws to algorithmic detection (Tenove, 2020), often reinforcing top-down conceptions of what democracy is and ought to be (Farkas & Schou, 2023). The European Commission (n.d.) points to independent fact-checking organisations as "a crucial pillar" in efforts to strengthen European democracies, since "unchecked, malicious content spreads like a cancer and puts the health of our democracies at risk" (Borrell, 2024).

While policymakers point to fact-checking as a democratic solution to mis- and disinformation, little research has explored how fact-checkers themselves articulate the relationship between fact-checking and democracy. This study draws on 14 semi-structured interviews with European fact-checkers working in 13 countries, analyzed through three rounds of qualitative, thematic coding using the data analysis software NVivo. The study addresses the following research questions: (1) How do European fact-checkers articulate the relationship between fact-checking and democracy? (2) Which normative views on democracy do fact-checkers reproduce? (3) How do fact-checkers' views on democracy reinforce or challenge dominant narratives of fact-checking as democratic repair?

The paper finds that most European fact-checkers share a theory of democracy identified by Herbert Gans (2003) among journalists—one in which "democracy rests on, and can be maintained by, the political news they report" (p. 56). By presenting the world 'as it is', fact-checkers argue citizens become informed, which is what upholds democracy. Thus, fact-checking is equal to democratic repair, since democracy succumbs without knowledge-producers that adhere to strict objectivity standards. To uphold such standards, some organisations even forbid their employees to be members of a political party, as democratic participation is seen as a threat to their objectivity. However, not all fact-checkers reproduce this conception of democracy. Some—particularly those working under sustained authoritarian pressure (e.g., legal threats and coordinated harassment)—express deep skepticism about fact-checking's ability to strengthen participation and give voice to political alternatives.

These findings contribute to existing research showing that professional fact-checking constitutes "a highly diverse community united by a similar practice but employing it with different logics in mind" (Lauer, 2024, p. 179). At the same time, the results complicate one-sided narratives - often found in EU policy - that directly equate epistemic interventions with democratic repair.

CDE07 Platformed Democracies: Mediation, Participation, and the Struggle over Democratic Meaning

PP 0413 Democracy by design: The role of smartphone apps in young citizens' political opinion formation processes

Brian Douwenga[1], Tom Dobber[1], Bert Bakker[1], Felicia Loecherbach[1], Linda Bos[1]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Young citizens between the age of 16 and 24 spend an average of five hours a day on their smartphones. During this formative phase in their lives, their opinions on political issues are still in development and highly susceptible to external factors. It is therefore likely that the apps on their smartphones play a differential but substantial role in the political socialisation of young citizens, especially given the low-threshold access to information, expression, and discussion related to political issues granted by many of these apps (e.g. TikTok, WhatsApp, ChatGPT).

Scholarly inquiry into the processes through which young citizens shape their opinions on political matters via their smartphones has yet remained limited. Although some quantitative research has linked online activity to certain political opinions, examining how young citizens experience the role of smartphone apps in their personal opinion formation processes is essential to clarify when, why, and through which mechanisms smartphones shape the opinions of youth. Previous qualitative studies on this topic have often not focused on youth or smartphones specifically or have decreased in relevance in the light of a rapidly evolving media landscape. Above all, they have directed their attention to only a subset of platforms, activities, and content, but have not yet adopted a holistic approach that includes the whole variety of smartphone-based platforms, activities and content that may potentially shape young citizens' political opinions.

In this paper, therefore, I pose the following research question: "How do young citizens experience (differences in) the roles of smartphone apps in shaping their political opinions?" Gaining enhanced insight into this process is crucial in the

context of current EU- and national-level policy debates concerning the regulation of social media platforms and underage smartphone usage. This study informs these debates by shedding light on potentially problematic aspects of young citizens' smartphone-based opinion formation practices that undermine the quality of the public sphere – key to democratic functioning – and by developing a clearer picture of which app characteristics may most likely contribute to these harmful dynamics.

Adopting a grounded theory approach, I aim to formulate an answer to the research question by conducting semi-structured in-depth interviews with young adults between the age of 16 and 24, ensuring variety in age, gender, education, and region in the selection of participants. The interview guide will evolve throughout the interview process, which will come to an end once saturation has been reached. This data collection process is planned to take place in January and February 2026, after which I will analyze the data and expect to have a full-fledged paper ready by September 2026 at the time of the conference.

CDE07 Platformed Democracies: Mediation, Participation, and the Struggle over Democratic Meaning

PP 0414 Social media influencers as defenders of democracy

Nuppu Pelevina[1], Elisa Kannasto[2], Hanna Reinikainen[1], Essi Pöyry[1], Salla-Maaria Laaksonen[1]

[1] University of Helsinki, Social Sciences, Helsinki, Finland
[2] Seinäjoki University of Applied Sciences, Social Sciences, Seinäjoki, Finland

Academics and public discourse have expressed increased concern about the deteriorating state of democracy worldwide. Rising (right-wing) radicalism, populism, increasing (affective) polarization, spread of disinformation, and growing mistrust in democratic institutions and systems threaten even solid liberal Western democracies. While fragmented digital public spaces and the "third spaces" of social media (Bennet & Pfetsch, 2018) seem to function as catalysts of polarization, platform affordances may also be harnessed to facilitate democratic participation and increase resilience. In new media ecologies, new influential actors have emerged in the arena of societal discourse. Lifestyle social media influencers integrate consumerist content with societal and political topics (Author3 et al., 2025), and even radical ideas (Leidig, 2023). Influencers' political awakening highlights their potential in increasing their followers' interest in politics but also in sharing biased political content and influencer propaganda (Author1; Xu & Schneider, 2025).

In this article, we focus on lifestyle influencers, who also communicate political and societal topics to their followers who communicate political and societal topics to their followers. Social media platforms offer unprecedented opportunities for political engagement, but so far we know little about influencers' role(s) as democratizing or destabilizing forces/agents. To fill the gap in research on influencer politics, we examined Finnish political social media influencers' communication during the electoral period. Theoretically, we draw on democratic theory and three different democratic models: deliberative, participatory, and representative. Our research questions are: 1) How do social media influencers address political topics during elections? and 2) What roles do they take while addressing elections or political issues related to elections? To situate our findings in democratic political participation, we ask, 3) How do the identified roles reflect elements of different democratic models, deliberative, participatory, and representative?

We conducted a data-based, qualitative content analysis of 2,260 Instagram stories by 19 Finnish social media influencers who frequently engage in political discussions. Our data were collected one month before the 2023 Finnish parliamentary elections.

Our results indicate that influencers mostly addressed typical so-called lifestyle related topics (Suuronen et al., 2022): environment, gender equality, minority rights and, and did not fully follow partisan lines. Secondly, the data shows that influencers adopted various roles in electoral political discussions. These roles organize along two main dimensions: 1) presence of explicit political stancetaking and 2) encouragement of participation and deliberation. Based on these dimensions, we identified five roles that overlap and coexist in influencers' political content: *Endorser, Advocate, Interlocutor, Informative expert and Intimate inspirer.* Our analysis further suggests that components of different democratic models can be identified in influencers' political communication. The Endorser and Informative expert roles are closely linked to representative democracy, the Advocate aligns to participatory democracy and the Interlocutor reflects deliberative democracy. Finally, the Intimate inspirerer role emphasizes a personal, influencer-style political talk and incorporates elements of all three models. Based on our findings, influencers occupy a unique space among traditional actors of political communication: politicians, journalists, lobbyists, endorsers, advocates, activists, and opinion leaders.

CDE07 Platformed Democracies: Mediation, Participation, and the Struggle over Democratic Meaning

PP 0415 Distributing witnessing: Practicing connective democracy in platformed publics

Yena Kang[1]

[1] University of Massachusetts Amherst, Communication, Amherst, USA

Research on democratic communication has long emphasized deliberative ideals of rational discussion across difference. Yet a growing body of scholarship has shown that deliberative democracy often fails to account for the structural inequalities that shape who is heard, whose suffering is recognized, and which voices gain visibility in public life. Recent work on connective democracy responds to these critiques by foregrounding the relational, affective, and uneven conditions under which democratic communication unfolds.

Building on this scholarship, this paper conceptualizes witnessing as a distributive democratic practice through which marginalized publics negotiate visibility, memory, and ethical responsibility in platformed media environments. Rather than treating witnessing as a purely moral stance or an individual expression of empathy, I argue that witnessing operates through everyday acts of selection, circulation, and amplification that redistribute attention under conditions of unequal power. While deliberative models privilege rational discussion, this paper highlights how democratic engagement often begins with affective and visceral responses that unsettle, motivate, and at times disrupt deliberation. In this sense, witnessing constitutes a form of democratic engagement that operates alongside—and sometimes in tension with—deliberative ideals.

Empirically, the paper examines Black–Asian encounters in U.S. digital publics as a critical site for understanding the possibilities and limits of connective democracy. Drawing on digital ethnography, interviews, and multimodal discourse analysis, I analyze how Asian diasporic and Black creators on Instagram respond to racialized suffering across moments such as #StopAsianHate and #BlackLivesMatter. I ask how solidarity can coexist with rivalry, and how witnessing becomes a contested affective site in which recognition, pride, guilt, and fatigue circulate in unequal measure.

By foregrounding distribution-as-politics, I argue that democratic communication today is shaped less by what is said than by how suffering, memory, and voice are selectively circulated across platformed media environments. The analysis shows that connective practices can foster moments of cross-racial recognition and ethical listening, but they also expose tensions of competitive victimhood and uneven visibility. Rather than resolving conflict, connective democracy operates through imperfect and contested practices that allow democratic communication to persist amid disagreement, incivility, and structural inequality. In doing so, this paper contributes to understanding civic engagement in platformed publics by foregrounding distributive practices and moving beyond simplistic good/bad actor frames of democracy.

CDE08 The Digital State, Platform Power, and Political Autonomy

PP 0416 Decoding algorithmic suppression: How digital activists uncover and navigate platform censorship in Finland

Sanna Malinen[1]

[1] Tampere University, Communication Sciences Unit, Tampere, Finland

Social media has afforded political influencers and activists an unprecedented level of visibility, thereby enhancing their ability to amplify political messages. Recently, research has observed that popular platforms have shifted from fostering digital activism to intensifying algorithmic censorship of political content. When platforms exert their automated censorship practices globally, they have created new and unforeseen constraints on freedom of speech for activists in democratic societies. Building on social media's dual role as both a facilitator and a controller of public discourse, this ongoing study explores the current state of political censorship in an atypical context: a Nordic high-trust society. It identifies political topics that are considered sensitive to social media algorithms.

Digital activism is closely intertwined with platform affordances, which makes the success of political content creators increasingly dependent on the visibility granted by algorithms. Although privately owned social media platforms have the right to control their content, scholars have expressed concern that activism has become more vulnerable to platforms' political and commercial steering. Prior studies indicate that groups with marginalized identities are disproportionately suppressed by platforms, which in turn amplifies voices that are already overrepresented while further silencing marginalized communities, thereby deepening social inequities.

This ongoing study presents findings from 15 interviews with Finnish digital activists who reported having experienced political censorship on social media, particularly on Instagram, a popular site for activism. The most censorship-triggering topics mentioned are Palestine and LGBTQ+ rights.

The findings show that, like commercial content creators, digital activism is deeply intertwined with platform affordances and goals of optimizing visibility and avoiding censorship. While platforms marginalize activist content, activists themselves have adopted visual, influencer-like modes of communication facilitated particularly by Instagram and TikTok, leading to

a blurring of boundaries between platform-friendly and activist content. Activists must continuously invent new communication strategies to maintain their visibility and popularity, as AI tools quickly learn to identify political content.

This study reveals a fundamental value-based conflict between activists and platforms. Activists explain censorship by commercial values that drive moderation: serious political content does not match the platforms' preference for light, feel-good material. Digital activism operates at the intersection of commercial and political discourses, within an environment dominated by entertaining and consumerist lifestyle content, to which activists must strategically align their messages. Because non-normative and minority identities are more likely to be suppressed, content on queer rights is more heavily moderated than environmental activism. The findings underline the volatility inherent in globally operating, privately owned platforms and question the sustainability of digital activism that relies upon them. Platforms can continuously alter their policies without transparent communication, and such changes are closely tied to broader political shifts. There is a deep distrust towards platforms, which continues to be increasing by censorship. Despite the distrust, the activists currently lack realistic alternatives to platforms that are overwhelmingly dominant in terms of visibility and audience reach. Should censorship render participation on these platforms impossible, they would be compelled to revert to traditional forms of protest and more private modes of discussion.

CDE08 The Digital State, Platform Power, and Political Autonomy

PP 0417 Performing digital authoritarianism: Environmental conditioning and platformed authority

Dechun Zhang[1], Jun Liu[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Digital authoritarianism is commonly defined as the instrumental use of digital technologies by states to surveil, repress, and manipulate publics (Polyakova & Meserole, 2019; Pearson, 2024; Roberts & Oosterom, 2025), with empirical attention focused primarily on China and Russia (Lamensch, 2021; Shahbaz, 2018). By treating technology as neutral and authoritarianism as regime-bound, regime-centered framings confine authoritarianism to particular political systems and obscure similar forms of infrastructural and platform power in democratic societies (Couldry, 2012; Couldry & Mejias, 2019; Poell et al., 2019). Drawing on governmentality and political theory that conceptualize authoritarianism as emergent and enacted (Glasius, 2018; Dean, 2025), this study reconceptualizes digital authoritarianism as a patterned, performative process produced through iterative interactions among state discourse, platform architectures, and public engagement. Using China as a theoretically revealing case rather than an exception, it shows how digital power becomes legible through repeated performances across platformed environments (Zhang, forthcoming). Although digital infrastructures can generate authoritarian effects even without coercion and within democratic contexts (Feldstein, 2021; Yayboke & Brannen, 2020), dominant frameworks continue to presume pre-existing authoritarian intent. Extending research on soft authoritarianism (Zhang, 2025; forthcoming), this study reinterprets visibility governance (Brady, 2009), participatory persuasion (Repnikova & Fang, 2018), and affective alignment (Zhu & Fu, 2023) as performative processes through which legibility, authority, and emotional intelligibility are iteratively constituted within digitally structured environments.

To examine these dynamics empirically, we analyzed 82,034 Weibo posts referencing Japanese politician Sanae Takaichi during a period of geopolitical tension, employing topic modelling, temporal and semantic analysis, and MRQAP to compare how state actors and ordinary users construct political narratives. State actors produced fewer, tightly focused topics, whereas users generated more expansive and fragmented themes. Temporally, user-initiated narratives often appeared concurrently with—or earlier than—state-led ones, showing that narrative initiation is not monopolized by the state. Semantic network analysis revealed clustered and lexically constrained state discourse alongside dispersed and diverse user discourse; MRQAP detected no significant structural similarity between the two, indicating that users do not simply replicate state discursive architectures. Rather than demonstrating top-down diffusion, these patterns expose a fundamentally heterogeneous, polyvocal communicative environment in which state and public discourse operate with substantial autonomy.

These findings advance a reconceptualization of digital authoritarianism as environmental conditioning—the subtle calibration of plausibility, salience, and semantic possibility within platformed infrastructures. Authoritarian power emerges not through persuasion or mimicry but through contested performances of interpretive authority shaped by algorithms, platform design, visibility hierarchies, and discursive conventions. This reframing carries three implications: (1) authoritarianism should be understood as a performative dynamic rather than a regime attribute, and thus can materialize within democratic settings; (2) platforms function as generative sites where authority relations are continuously enacted and contested, as reflected in Weibo's polyvocal ecology; and (3) digital authoritarianism is inherently unstable and contingent, as demonstrated by the heterogeneity of user discourse, the temporal autonomy of narrative initiation, and the weak semantic alignment between state and public narratives.

CDE08 The Digital State, Platform Power, and Political Autonomy

PP 0418 Shifting grounds of the digital state: AI imaginaries and anticipatory governance.

Mait Kask[1], Maris Männiste[1], Andra Siibak[1]

[1] University of Tartu, Institute of Social Studies, Tartu, Estonia

As European societies confront rapid technological, political and institutional transformations, state–citizen relations increasingly unfold on shifting digital grounds. Artificial intelligence and datafication now shape how governments imagine desirable futures and reorganise welfare, administration and democratic communication (van Dijck, 2014; Amoore, 2020; Bareis & Katzenbach, 2021). This paper examines Estonia's emerging "personal state" as an empirical lens for understanding how AI-enabled anticipatory governance transforms the communicative foundations of democracy.

Drawing on sociotechnical imaginaries (Jasanoff & Kim, 2015), dataism (van Dijck, 2014) and critical discourse analysis (Fairclough, 2010), the study analyses a corpus of Estonian policy documents to examine how the future of the state is narrated, legitimised and stabilised. The corpus includes the national AI and Data White Paper for 2024–2030, the national AI Action Plan for 2024–2026, the Digital Society Development Plan, the Personal State concept paper, the Welfare Development Plan for 2023–2030, and the implementation overview of the Estonia 2035 long term national strategy. Policy discourse frames prediction, personalised intervention and automated decision-making as naturalised public values, embedding anticipatory logics within welfare administration (van Dijck, 2014; Bareis & Katzenbach, 2021).

Through these narratives, the state is reimagined as an entity that can, and should, anticipate citizens' needs before they act. Anticipatory governance thus relies on forms of prediction and inference that shift political decision-making into technical systems, recasting uncertainty and discretion as problems to be managed through computation rather than democratic deliberation (Amoore, 2020). Such visions construct a pathway toward efficiency and seamless governance while simultaneously redefining expectations of care, responsibility and democratic legitimacy.

Yet these imagined futures coexist with structural dependencies on global cloud providers and platform infrastructures, revealing tensions between aspirations for sovereign digital capability and the material realities of platformised governance (Van Dijck, Poell, & De Waal, 2018). These entanglements unsettle established democratic assumptions such as who exercises authority in automated systems, who is accountable for predictive interventions, and whose futures are prioritised or foreclosed through anticipatory welfare practices.

The paper argues that Estonia's personal state exemplifies anticipatory statecraft as a mode of governance that reframes welfare as an engineering problem solvable through continuous optimisation and data-driven inference. By foregrounding what is promised (efficiency, proactivity, personalised services) and what is silenced (discretion, inequality, labour, infrastructural vulnerability), these imaginaries actively shape the shifting grounds of democratic life (Kaun & Masso, 2025). In doing so, they transform not only administrative practice but also the communicative basis of democratic participation, contestation and public trust.

CDE08 The Digital State, Platform Power, and Political Autonomy

PP 0419 The voice of the state: Democratic implications of AI-generated text-to-speech communication in public e-governance

Iben Have[1]

[1] Aarhus University, Media and Journalism Studies, Aarhus N., Denmark

"[T]he way people interface with technology is in the midst of a paradigm shift from text input and output to voice input and output" (UNESCO 2019). This observation is the pivot of my forthcoming book *Reading with ears and writing with voices: The aural and oral turn in digital communication and media culture*, where I trace how born-written media like newspapers, books, letters, notes, e-mails, webpages, and text messages are presently experiencing a surprising popularity in digital audio versions, offering a convenient and effective way to engage with various texts in everyday life.

A significant driver in these changes is the fast development and implementation of text-to-speech (TTS) technology, accelerated by the EU Web Accessibility Act that came into effect across all EU member states on June 28, 2025, demanding high-quality TTS tools in various languages. This elicits critical questions related to voice design and perception: How are synthetic voices encoded and decoded, and what cultural or political consequences follow from these practices? What happens when some voices are privileged while others are excluded in AI-voicing? And finally, should voice design always strive for maximum human-likeness, or are certain texts and genres, for instance communication of legal rights, better served by being recognized as non-human robotic voices, with their distinctive aesthetics of machinic otherness?

This paper discusses these questions in relation to the TTS-solutions implemented by the Danish public authorities on the central self-service citizen portal Borger.dk. Denmark is a high-trust and digital-by-default welfare state. Trustworthy, accommodating, and smooth interaction on Borger.dk is therefore considered a democratic necessity when Danes are to fulfil their civic duties and, for example, apply for a new passport, social assistance, or other welfare services.

Currently, Borger.dk directs users to the TTS functions embedded in their own devices: In Danish, these voices are called Magnus and Sara in Apple environments and Christel and Jeppe in Microsoft environments. Consequently, the voice of Danish authorities is the voice of American Big Tech.

The paper will present preliminary results from data selected through the physical installation, Stemmeboxen (Eng: ballot box/voice box), placed in two Danish municipalities during spring 2026, inviting visitors to listen to TTS readings from Borger.dk and to rate their experience of the voices' credibility, courtesy, and intelligibility via a screen interface.

Drawing on sound-, voice-, and media theory, including the concept of listening publics (Lacey 2010) and Walter Ong's work on orality (1982), I develop the concept *synthetic orality* to discuss cognitive, cultural, and democratic implications of the ubiquitous synthetic voices in digital communication.

CDE08 The Digital State, Platform Power, and Political Autonomy

PP 0420 The promise and peril of generative AI for political autonomy in democratic societies

Michael V. Reiss[1]

[1] Leibniz Institute for Media Research - Hans-Bredow-Institut HBI, RP1, Hamburg, Germany

Since the release of generative artificial intelligence (GenAI) in 2022, global uptake has been rapid and transformative, with millions using such tools to retrieve, process, and interpret information, including political information (Chatterji et al., 2025; Newman et al., 2025). This diffusion has intensified debate about opportunities and risks, with growing concerns about human over-reliance and the erosion of autonomy. Similar to anecdotal car drivers blindly following navigation systems into lakes, over-reliance on GenAI has been linked to diminished learning, creativity, and critical thinking (Bastani et al., 2025).

Despite these discussions and empirical evidence that GenAI can surpass human persuasion in political debates (Bai et al., 2025), alongside high levels of trust placed in such systems (Candrian & Scherer, 2022), the implications of GenAI for citizens' political autonomy—the capacity to form and justify political opinions independently—remain underexplored.

This conceptual paper addresses that gap by developing a theoretical framework for political autonomy in the era of GenAI. Drawing on political theory, communication research, and philosophy of technology, it proposes a two-dimensional model and applies it to GenAI-mediated opinion formation. It argues that GenAI introduces an unprecedented form of epistemic dependence—interactive, adaptive, and personalized—which raises distinct challenges for democratic self-governance.

Human judgment has always relied on social and technological scaffolding. Work on cognitive offloading highlights that reliance on external systems can enhance reasoning but may compromise autonomy when it undermines independent judgment (Clark & Chalmers, 1998; Carter, 2020). In the political sphere, this tension is normatively charged: democratic ideals expect citizens to form judgments based on their own reason, rather than external authority (Kant, 1784).

Political autonomy is conceptualized along two dimensions. The internalist–procedural dimension focuses on individuals' reflective capacities such as critical self-assessment and the ability to justify political beliefs (Dworkin 1988; Westlund 2009). GenAI may undermine this autonomy if users accept its arguments uncritically or when it weakens independent reasoning. It can support autonomy by encouraging users to articulate reasons, engage with counterarguments, and refine their views through sustained dialogue.

The externalist–relational dimension concerns the quality and structural conditions of the informational environment that shape independent judgment (Oshana, 2020; Rössler, 2002). Enabling conditions include diversity of exposure (Loecherbach et al., 2020), source transparency, contextual explanations, and information accountability. Conversely, obscure provenance, factual errors and embedded biases (Augenstein et al., 2024, Motoki et al., 2024) in GenAI outputs complicate these conditions.

These two dimensions are mutually dependent: internal reflection relies on external informational conditions, while favorable informational environments lose meaning without internal responsiveness. Thus, political autonomy emerges by degrees at the intersection of cognitive agency and informational structure.

This paper advances a much-needed conceptual understanding of autonomy in digital democracies at a formative stage of technology adoption. By mapping the risks and opportunities of GenAI use, it offers a framework for understanding how technological mediation shapes citizen judgment. This conceptual framework will guide future empirical research and inform the design of informational environments that promote reflective engagement. Understanding autonomy is essential for fostering democratic resilience in an increasingly GenAI-mediated information environment.

CDE09 Platform Politics, Collective Action, and the Making of Political Publics

PP 0518 Non-maleficence without institutional gatekeeping? How ethical issues are addressed in empirical digital activism research

Paul Reilly[1], Suay Özkula[2]

[1] University of Glasgow, School of Social and Political Sciences, Glasgow, United Kingdom
[2] Paris Lodron Universität Salzburg, Center for ICT&S, Salzburg, Austria

While early studies played down ethical concerns about online research, there has been a shift towards more formal systems governing social media research over the past decade. Institutional regulatory structures like Research Ethics Boards have increasingly scrutinised these projects, with ethics forms becoming 'gatekeepers' for how universities organise research culture. There has been a concurrent growth in ethical guidelines for online research from organisations like the Association of Internet Researchers. Yet, there remain doubts as to how seriously ethics is treated in research, above all in studies employing data mining techniques. This is particularly salient for Digital Activism (DA) studies, where activists might be exposed to harm through their identification in publications. In response to this issue, our paper provides a critical discussion of how ethical issues are addressed in empirical DA research. We draw on data gathered from a systematic review of journal articles published between 2009 and 2024. In the first instance, mentions of research ethics were searched in protest literature more broadly (N= 264) and then in DA articles specifically (N = 59). Coding categories included how ethics were narrated (e.g., popular approaches or the mention of formal procedures) as well as what attributes characterised articles discussing research ethics, for example the platform(s) studied, method(s) of data collection and analysis, authors' institutional affiliations and their respective disciplines. We tested specifically whether empirical DA research included ethics statements i.e. outlining whether ethics approval had been obtained prior to the study beginning and what measures were taken to protect participants, and whether articles were more likely to address ethical issues if they drew on traditional rather than digital data sources. Results indicate that very few DA articles published during this period included ethics statements. Nevertheless, there was much evidence of non-maleficence in the corpus, including those studies using digital methods. These are often rendered opaque by the submission requirements of journals and the norms of certain disciplines.

PP 0519 AI activism: Artificial intelligence systems as tools and sites of contention

Francesca Belotti[1], Arianna Bussoletti[2], Riccardo Corsi[3], Antonio Opromolla[4]

[1] University of L'Aquila, Human Sciences, L'Aquila, Italy
[2] Sapienza University of Rome, Communication and Social Research, Rome, Italy
[3] Gran Sasso Science Institute, University of Pisa, L'Aquila / Pisa, Italy
[4] University of L'Aquila, Humanities, L'Aquila, Italy

This paper reports preliminary results from an exploratory research project that breaks new ground in the study of contentious political practices surrounding the use, development, and governance of artificial intelligence systems (AI), conceptualized here as "AI activism".

The analytical approach draws on a well-established body of literature on digital activism developed from ecological and praxeological perspectives (Shove et al., 2012; Trerè, 2019; Mattoni, 2020, among others), while also engaging with more recent scholarship on data activism (Beraldo & Milan, 2019; D'Ignazio & Klein, 2020; Ceccobelli & Mattoni, 2024, among others) and algorithmic resistance (Velkova & Kaun, 2021; Bonini et al., 2022; Bonini & Trerè, 2024, among others).

From a methodological standpoint, the study is situated within the interpretive research tradition (Morse, 1994) and adopts qualitative methods. Specifically, it is based on semi-structured interviews with activists and members of social movements, political collectives, NGOs, and other grassroots communities operating in diverse geographical settings and experimenting with AI systems for politically contentious purposes linked to social justice concerns.

The thematic analysis (Braun & Clarke, 2022; Guest et al., 2011) of the interviews reveals two broad and interrelated modes of AI activism: contentious politics *through* AI and contentious politics *over* AI.

The former captures practices in which AI technologies are strategically mobilized as instruments within wider socio-political struggles, as exemplified by *Data for Back Lives*, a "movement of scientists and activists working to make data a tool for social change instead of a weapon of political oppression." They build generative AI tools to go through public data and "pull out patterns" from repressive practices used by US law enforcement agencies that impact citizens' ability (especially people of color) to express their right to protest and congregate.

The latter frames AI systems themselves as arenas of political struggle, where conflicts emerge around governance arrangements, socio-technical design choices, ethical concerns, and claims to algorithmic rights, as illustrated by *Hermes*, for instance, who supports public administrations in the adoption and integration of AI into decision-making processes while addressing the risks associated with "surveillance and biometric recognition," such as privacy issues and deep fakes.

Taken together, these findings point to a mutually constitutive relationship between the two modalities of AI activism. They intersect and reinforce one another through dynamic feedback processes, revealing emerging alliances and persistent tensions between AI technologies and ongoing struggles for social justice.

Our analysis also introduces two labels we coin to describe distinct activist profiles, each with advanced competencies in computer science and digital design. "AI-Skilled Activists" refers to those who already possessed technical expertise and later redirected it toward long-standing political commitments, while "AI-Upskilling Activists" designates those who developed such skills over time, recognizing AI and digital infrastructures as crucial terrains of political contestation.

CDE09 Platform Politics, Collective Action, and the Making of Political Publics

PP 0520 Connected for change: Insights into the in-group communication of the German climate movement on Telegram

Tobias Schrimpf[1]

[1] University of Hohenheim, Communication Science, Stuttgart, Germany

Social movements are central to democratic life because they introduce, contest, and keep alive issues that may be neglected by institutional politics. One example is the climate movement, which plays a pivotal role in shaping public discourse around the ongoing climate crisis. While public protests do not usually translate directly into legislation, they can indirectly influence political decision-makers by articulating demands and narratives (Schürmann, 2024). To achieve this, in-group communication is crucial. Effective communication among activists via social media enhances information dissemination, facilitates protest organization, and fosters internal cohesion and a shared collective identity. Accordingly, sharing information, circulating identity-forming content, and promoting collective action represent central communicative functions within movements (Caren et al., 2020; Schlette et al., 2023). Coherent in-group coordination and communication is also a prerequisite for efficiently distributing messages among members. In networked communication systems, this can be modeled through the properties of small-world networks (Watts & Strogatz, 1998), which combine high clustering and short average path lengths and might be important for their coordination and mobilization efforts.

While previous research has analyzed various platforms, Telegram has recently attracted attention due to its emphasis on privacy and its versatile communication capabilities. Scholarly work on Telegram has so far focused predominantly on far-right, conspiracist, and other fringe actors, whereas its use by progressive social movements has received comparatively less attention. This study addresses this research gap by analyzing in-group communication within the German climate protest movement on Telegram. Specifically, it examines both message content and the underlying network of forwarded messages. The analysis is guided by three research questions:

RQ1: What role do (1) sharing information, (2) sharing identity, and (3) promoting action play in the in-group communication of the German climate movement on Telegram?

RQ2: What are the structural characteristics of the network of forwarded messages related to the German climate movement on Telegram?

RQ3: To what extent does the network of forwarded messages exhibit small-world characteristics?

The study employs a computational social science approach. Data were collected via the Telegram API using the Python library Telethon. Through snowball-sampling, I gathered a total of 277 public channels and groups and 464,699 messages from five prominent climate groups. For content analysis, a random sample of 109,997 messages were coded using the HALC pipeline for LLM content analysis proposed by Reich et al. (2025). The network of forwarded messages was modeled as a directed graph of channels and groups and analyzed using standard network measures.

In summary, the German climate movement maintains a robust communication structure on Telegram. FFF occupies a leading position within the movement. Communication within the climate movement strongly focuses on the three primary activities of sharing information, sharing identity, and promoting action, though thematic emphases differ between groups. While the network structure forms clusters in places, it integrates individual actors into a comprehensive overall communication network. Finally, my findings reveal pronounced small-world characteristics, indicating that information can circulate efficiently. These findings may help explain why the climate movement has remained an established player in German public discourse.

CDE09 Platform Politics, Collective Action, and the Making of Political Publics

PP 0521 Mapping China's capabilities in police cloud platforms to improve protections of vulnerable populations

Ausma Bernot[1]

[1] Griffith University, School of Criminology and Criminal Justice, Gold Coast, Australia

This project investigates the expansion of state surveillance in China through the Ministry of Public Security's (MPS) Police Cloud infrastructure, a nationwide system that integrates public security, surveillance, and digital tracking technologies. Platformisation of police work is an organisational process that allows for datasets and databases to cross-link and create networks of information retrieval and production that can improve police work by facilitating knowledge creation. Despite

its extensive adoption and significant implications for governance and social control, the operational functions and limitations of Police Cloud remain largely unknown. Designed to consolidate vast amounts of personal and behavioral data, Police Cloud enables authorities to monitor targeted populations, including ethnic minorities such as Uyghurs and Tibetans, as well as civil society actors. While officially justified under the pretext of enhancing law enforcement and public safety, evidence suggests that these systems have been deployed to track and control vulnerable groups, raising critical concerns about profiling, social discrimination, and further erosion of liberties.

This project addresses this knowledge gap by providing a detailed, province-level analysis of Police Cloud infrastructure and its implementation across China. Employing a mixed-methods approach, the study combines qualitative exploratory and quantitative descriptive techniques to examine a large dataset of public procurement documents (n = 1,054), triangulated with local newspaper articles and government reports. Through this analysis, the project maps the financial investments, technological capabilities, and institutional actors involved in constructing and maintaining Police Cloud systems. By uncovering patterns of procurement and identifying regional variations in surveillance practices, the research offers new insights into the mechanisms of digital authoritarianism and the role of technology in governance.

The findings contribute to academic debates on surveillance, human rights, and technology governance by illuminating how state-driven digital infrastructures operate in practice. This work not only advances academic understanding of China's security apparatus but also informs policy discussions on the global implications of technologically enabled social control.

CDE09 Platform Politics, Collective Action, and the Making of Political Publics

PP 0522 "Torrent is politics": Political participation of Ukrainian online pirates

Kateryna Boyko[1]

[1] Uppsala University, Department of Informatics and Media, Uppsala, Sweden

Peer-to-peer (P2P) file-sharing (when files can be downloaded from other computers directly through software called "torrent") has been the focus of many studies, often in the context of copyright and resistance to it. However, there is evidence that P2P file-sharing in certain contexts has much greater importance in encouraging civil activism, community building and identity formation than a narrow focus on copyright violation can show (Haigh 2007; Lindgren & Linde 2012; Mylonas 2012; Ashley 2015). One such context is Eastern Europe, where Ukraine has particularly demonstrated the social and political entanglements of P2P filesharing due to: ubiquity of piracy (e.g. Ukraine has been on the US government copyright infringement watch list since 1998), prolonged political and civic struggles between the Euro-Atlantic and pro-Russian vectors of development that are reflected in people's media consumption routines, and the 2022 Russian full-scale invasion of Ukraine serving as a turning point in nation-building as well as shifting society's attitudes towards the state.

Thus, this presentation focuses on external and internal arrangements of P2P file-sharing practices in Ukraine that facilitate political participation.

I approach P2P file-sharing and related practices from the perspective of the theory of practice architectures (Kemmis & Grootenboer 2008; Mahon et al. 2016), which, in particular, analyses how practices are shaped by external arrangements. While applying the concept of civic culture (Dahlgren 2000; 2003; 2005; 2009), the study explores the complex of factors that enables political participation within the online piracy area. Here, I draw on Dahlgren's (2009) perspective on participation as a collective action, which challenges power relations within the domain of the political.

In so doing, this research employs an ethnographic approach, exploring empirical material gathered from in-depth interviews with torrent users and online observations of one of the largest torrent trackers in Ukraine, conducted before and after the full-scale Russian invasion. The tracker offers exclusively Ukrainian language content (original or translated) and plays a central role in the accumulation of pirated movies and TV series dubbed into Ukrainian by unofficial studios.

The study's results show that external factors, such as the domination of the Russian content market and the contested position of the Ukrainian language in Ukraine (Kulyk 2011; Belaniuk 2017) contribute to the politicisation of pirate practices in the context of general decolonisation discussion in Ukraine amid Russia's war. The torrent community has developed a specific civic culture, based in particular on pragmatic-affective motivations, language identity, meritocratic trust, democratic values, and, paradoxically, loyalty to the state. They managed to coordinate and conduct multiple connective actions (Bennett & Segerberg 2012) that challenged the political status quo. Through conscious consumerist choices, grassroots advocacy, and acts of archival solidarity, users attempted to accumulate Ukrainian language content online and facilitate its expansion within the legal market. By creating informal structures – the informal distribution system for 'unofficial' dubbing – they aimed to fill the gap in the legal market using available means. Amid the discussion about the decline or transformation of civic culture, the study sheds light on unexpected mediated contexts where it can develop.

CDE10 Transforming Institutions and Digital Publics

PP 0523 The transformation of strategic communication in nonprofit organizations in Romania through digitalization: A case study of "Code for Romania"

Ileana Rotaru[1], Robert Nastasia[1], Trusca Claudia Ionela[1]

[1] West University of Timisoara- Romania, Faculty of Governance and Communication Sciences, Timisoara, Romania

Digitalization process profoundly transforms the manner in which strategic communication and civic mobilization are conducted within the contemporary public sphere. Although European policies, such as the Council of Europe's Digital Agenda (2022) and the Digital Decade Policy Programme 2030, strongly endorse digital transformation, a significant gap persists between these policies and their practical implementation at the micro-community level. This discrepancy is particularly evident in Romania, which ranks lowest among the European Union member states on the Digital Economy and Society Index (DESI, 2023), with a score of 47.5%. The present study investigates the effectiveness of civic technology tools in fostering transparency and public engagement within non-profit organizations. It aims to assess whether digital tools can genuinely bridge national strategies, including Romania's recovery and resilience plan (PNRR), with the daily operations of organizations. Employing a qualitative methodology, this research involves a systematic review of existing scientific literature alongside an analysis of relevant documents from 2020 to 2025. It encompasses key European and national strategic documents, as well as reports and digital outputs from Code for Romania, the country's leading civic technology non profit organization. This approach facilitates a comparison between top-down policy objectives and the actual practices of successful non-governmental organizations. Preliminary findings suggest that, although interest in digitalizing civil society is increasing, progress remains uneven. The results also indicate that civic technology organizations like Code for Romania serve as vital mediators, translating broad digital policies into practical tools that enhance transparency and support their implementation at the comunity level. However, beyond these digital elites, numerous non-governmental organizations face challenges in meeting European standards due to cultural disparities and infrastructure deficiencies. The study advances understanding of digital advocacy in contexts characterized by low digital adoption, emphasizing that effective integration of civic technology depends not only on technological advancement but also on strategic cultural shifts within organizations.

CDE10 Transforming Institutions and Digital Publics

PP 0524 When trust travels across institutions: How institutional credibility shapes perceived credibility of public broadcasting in Germany and the Czech Republic under conditions of polarization

Evelyn Kästner[1]

[1] Macromedia University of Applied Sciences, Professor of Marketing and Media Management, Munich, Germany

Public service media (PSM) are widely regarded as democratic trust institutions, yet their legitimacy is increasingly contested in contexts of polarization and declining confidence in political and societal institutions. Comparative research suggests that the credibility of PSM is closely embedded in broader structures of institutional trust, particularly in post-communist media systems with more fragile safeguards. This paper examines whether patterns observed in the Czech Republic—often discussed as a "stress-test scenario" for public broadcasting—also emerge in Germany, a more robust and institutionally entrenched PSM system. We focus on (1) how strongly PSM credibility is associated with the credibility of other major institutions and (2) whether these relationships are moderated by citizens' left–right political orientation.

Using parallel representative survey data from Germany (N = 2,036) and the Czech Republic (N = 2,094), we estimate country-specific multiple regression and interaction models predicting perceived credibility of PSM from credibility assessments of core institutions (government, parliament, parties, courts, universities/research, European Parliament), introducing political orientation as a moderator. Institutional credibility explains substantial variance in PSM credibility in both countries (Germany: adj. $R^2 \approx .54$; Czech Republic: adj. $R^2 \approx .49$), but the structure of these relationships differs.

In Germany, PSM credibility is most strongly associated with the credibility of universities and research institutions (Beta = .493) and, to a lesser degree, political parties (Beta = .185) and the European Parliament (Beta = .192), but not with credibility of the national government and parliament. This points to a comparatively detached anchoring of PSM legitimacy, linked to expertise and evidence-based public communication. Moderation analyses show that the association between credibility of science and credibility of PSM weakens markedly among more right-leaning respondents (Beta = –.420), indicating a polarization-related erosion of epistemic trust links. Surprisingly, no east–west differences are observed, despite PSM's later introduction and lower credibility in eastern Germany.

In the Czech Republic, by contrast, PSM credibility is more closely tied to political and state-proximal institutions—especially the national parliament (Beta = .281) and the European Parliament (Beta = .247), and to a lesser extent courts (Beta = .142) and science (Beta = .139)—indicating a more embedded, system-linked credibility configuration. Overall moderation is weaker, but political orientation significantly conditions the role of national parliament (Beta = –.241) and government credibility (Beta = .237), consistent with a more explicitly politicized perception of PSM as part of a contested institutional field.

Overall, the findings show that credibility of political and societal institutions forms a powerful foundation of PSM credibility. However, the architecture of credibility differs between a strongly institutionalized system (Germany) and a more fragile, politically exposed one (Czech Republic). Rather than a linear "future trajectory," the results point to two distinct credibility configurations: Germany exhibits similar dynamics in attenuated form, with polarization mainly weakening the link between credibility of science and credibility of public broadcasting among right-leaning respondents. The paper discusses the implications of these cross-national differences for understanding how PSM legitimacy is built—and how vulnerable it may become as polarization increases.

CDE10 Transforming Institutions and Digital Publics

PP 0525 The future is… military? How the German Bundeswehr normalizes military preparedness in the digital culture of everyday life

Sandra Kero[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

The study presented is a completed first part of a bigger project and investigates how the German Armed Forces (Bundeswehr) uses scenarios of possible futures in their social media communication to shape societal acceptance, to legitimize military strengthening, normalize its presence and mobilize recruits. In times of rising uncertainty, imagined futures – ranging from catastrophic scenarios to possible counter-futures – gain significance for societal actors, as they justify present crisis management practices, while mobilizing support for their approaches (Anderson, 2010). In this context, the digital transformation of public sphere amplifies the visibility of counter-publics and their alternative imaginaries of crisis and societal futures (Kaiser & Rauchfleisch, 2019; Primig, 2025). Both state and non-state actors now operate within the same communication environments and their respective means, competing for audiences as well as their interpretations of reality, knowledge, and possible futures.

Against heightened political tensions and the ongoing war in Europe, pressure on nation-state action and Western security policies has intensified, and the military has regained public attention as a key expression of state capacity. In Germany, the Bundeswehr has increasingly been positioned – and has actively positioned itself – as the central actor in preparing society for potential crisis scenarios, both in response to social collapse and in ensuring preparedness, while holding state legitimacy. Social media communication plays a key role in the Bundeswehr's legitimacy-building and in supporting recruitment (Stengel, 2021). Yet, while this normative interpretation has historically been met with polarized public opinions, digital media significantly increased both the opportunities for and the visibility of criticism challenging the state's narrative authority that frames the Bundeswehr as an "army of democracy".

Against this backdrop, the study examines the digital communicative construction of crisis-related future visions and their associated practices by the Bundeswehr. Particular attention is given to processes of identity formation and community-building within the frameworks of digital metapolitics (Maly, 2024) and banal militarism (Thomas & Virchow, 2015). Drawing on a qualitative content analysis of Instagram feed and story posts from the accounts "bundeswehr" and "bundeswehrexclusive" (11/2025–03/2026), this study addresses following questions: Which future visions and present-day actions are constructed, and how are they narratively and visually framed? How are military practices embedded in popular lifestyle aesthetics and emotional frameworks? What role does the conveyance of self-fulfilment and community play?

The results of the study show that the Bundeswehr presents its visions of the future and the corresponding necessary practices through different narrative, visual, and affective dimensions; portraying military life in a highly selective and banalized way. By emphasizing personalized storytelling, intimacy, and audience engagement, combined with modern, gamified aesthetics, the format resembles a pop-cultural, entertaining media product, presenting military as both an effortlessly ordinary and adventurous lifestyle choice. Rather than merely informing or recruiting, the Bundeswehr communicates in ways aligned with alternative online-communities, using culturally and emotionally coded messages to actively shape what is perceived as legitimate and desirable – both in the present and the future; for individuals and society.

CDE10 Transforming Institutions and Digital Publics

PP 0526 50 shades of poverty Representation of and information presentation for people affected by poverty and at risk of social exclusion. A case study on Austrian public service broadcasting

Andreas Schulz-Tomancok[1], Josef Seethaler[2]

[1] Austrian Academy of Sciences, CMC, Vienna, Austria
[2] Austrian Academy of Sciences, Institute for Comparative Media and Communication Research CMC, Vienna, Austria

In light of ongoing crises, including high inflation rates and government austerity measures, issues such as poverty and social exclusion have once again come to the forefront of social debate (Dambach & Schöneville, 2025). This is evident in Austria too, where almost one in five residents are affected by poverty or are at risk of social exclusion (Statistik Austria, 2025). Numerous studies suggest that inaccurate media portrayals of poverty can lead to apathy among those affected, as well as a rejection of certain media services (Lindtner & Nærland, 2024; Pernegger, 2025). One such service is the public service broadcaster ORF, which occupies a prominent position in the Austrian media landscape. Not only does it have its

own public value claim to be a medium for everyone, it is also legally obliged to do so (4(2) ORF Act). It also has high TV (34.2%) and radio shares (60%), as well as 1.36 million readers of the ORF.at network. In this regard, questions arise as to how the ORF reports on poverty (RQ1), and how people affected by poverty are provided with information? (RQ2).

Adopting a public value perspective (Moore, 1995), we conducted two focus groups (n = 13 and n = 3) and eight structured interviews with social work, education, social sciences, and communication sciences experts, as well as individuals affected by poverty in Austria, from March to May 2025. The transcripts and minutes of the discussions and interviews were subjected to thematic analysis using MAXQDA. We distinguish between journalistic and editorial/institutional accountability.

Our analyses illustrate that social experts and individuals affected by poverty agree that public service programmes (television, radio, teletext and online) currently primarily report about, rather than with, those affected by poverty.

One way of generating public value is to engage those affected as experts in their own living environments. For instance, they could act as community reporters or broadcasting hosts, or cooperate editorially with self-help groups and civil society initiatives. This could take the form of new participatory discussion formats in neighbourhood centres, for instance. Furthermore, editorial offices must become more inclusive, and organisational and political changes are necessary (Stegmann & Stark, 2024). This includes revising editorial guidelines and providing continuing education programmes in community competence for traditional journalists.

CDE10 Transforming Institutions and Digital Publics

PP 0527 Negotiating affordances, queering influencing: LGBTQIA+ Italian parent-influencers between activism and platform logics

Arianna Bussoletti[1]

[1] Sapienza University of Rome, Communication and Social Research, Roma, Italy

The contribution explores how Italian LGBTQIA+ parent-influencers negotiate with social media environments and embody an activist role as ambassadors of queer issues. It dialogues with the recent surge of contributions on activist-influencers and influencers' growing political involvement (see Murru et al. 2024), filling the important gap concerning LGBTQIA+ parent-influencers' relationship with digital environments.

Budding scholarship on activist influencers has pointed out the paradoxical nature of turning content-creation into political involvement (Banet-Weiser et al. 2020; Duffy et al. 2023; Murru et al. 2024; Scharff 2024), due to the increasing difficulty of distinguishing between political and commercial motivations when activism takes place in the neoliberal digital economy. Even when it comes to LGBTQIA+ influencers, figures who exhibit a clear potential to promote and facilitate public understanding of non-hegemonic narratives on LGBTQIA+ rights and oppression, the lens of homonormativity (Duggan 2002) can depoliticize gay cultures and anchor them to domesticity and consumption. This is especially significant when it comes to LGBTQIA+ parent-influencers, as in an effort to see their own identities and families recognized, they might be tempted to portray family and parenthood only in light of what is socially-acceptable, with limited potential to challenge the established status quo.

It is therefore paramount to focus on influencers' constant negotiation with affordances and platform logics to grasp the way in which different subjectivities interpret their political voice in a digital space that is not free from contradictions. However, little has been said about the intertwining between digital parenthood, activism, and LGBTQIA+ subjectivities, with the few existing contributions focusing on normalization and social acceptance of general users (Liliequist 2023), without taking into account public profiles.

This paper contributes to filling this gap by focusing on Italy, where LGBTQIA+ rights fall below Western European standards (ILGA 2024) and media's ambivalence in updating conservative notions of family and kinship fosters narratives that sustain exclusion. Consistent with the strand of studies in digital activism that focuses on individualized forms of activism (Dean 2023) and dialoguing with the recent interest on activist-influencers, the paper addresses the political involvement of

LGBTQIA+ parent-influencers and highlights how these subjectivities negotiate with affordances and the underlying social media logics.

Through qualitative content analysis and interviews to LGBTQIA+ parent-influencers on Instagram and TikTok, the contribution identifies and analyzes negotiations, idioms of practice and media ideologies, activism strategies, and communication styles of Italian LGBTQIA+ parent-influencers. Preliminary results highlight how Italian LGBTQIA+ parent-influencers contend with social expectations and integration and negotiate with affordances and the underlying social media logics. These creators' social media practices appear connotated by group-specific sense makings, allowing them to express (and act on) multiple ideologies regarding social media usage that are specific to being queer, a parent, and an influencer. This contribution thus allows for a nuanced analysis of the sense-giving processes that people from specific groups, such as the LGBTQIA+ community, assign to their political involvement on different media, expanding scholars' understanding of digital activism. In doing so, it also contributes to scholarship on activist-influencers and to the understudied field of LGBTQIA+ parent-influencers.

CDE11 Populist Communication and Anti-System Mobilization in Contemporary Democracies

PP 0625 Talking about democracy: Investigating young people's experiences and attitudes towards democracy and democratic citizenship

Gitte Stald[1]

[1] IT University, Digitalization- Democracy and Governance Section, Copenhagen, Denmark

This paper explores how scholars can engage with young citizens about their experiences and attitudes towards democracy and democratic citizenship. Its main objective is conceptual and methodological: to examine how research designs can enable young people to feel heard, included, and valued, while also generating empirical insights that can inform research and, consequently, evidence-based policymaking rooted in innovative ideas about what democracy and democratic citizenship may look like from the perspective of young citizens. Instead of viewing young citizens as objects of concern or deficits, the study aims to highlight their capacities and reflections.

Young people are increasingly described as disengaged from democratic processes and institutions (Morini & Runge, 2025; Zlobina et al, 2024). Existing research attributes this tendency to a complex interplay of factors, including declining trust in political institutions, information overload, fragmented and incoherent information, uncertainty and anxiety about global crises, and a perceived lack of democratic self-confidence (Mascheroni, 2017; Stald & Balle, 2023). While the situation in Nordic countries seems less severe compared to, for example, the United Kingdom or Southern Europe (Eurobarometer, 2024; Kitanova, 2019), concerns about youth disengagement remain. However, research (Cortesi et al, 2020; Sloam, 2025; Stald, 2023) also indicates that young citizens possess basic democratic knowledge, hold political opinions, and generally express commitment to democratic ideals.

The analysis is based on findings from a longitudinal study of youth, information, and democratic citizenship, and insights from a recent study. The methodological approach, analytical framework, and discussion are organised around a model comprising four interrelated approaches: recognition, respect, remembrance, and reflection.

Empirically, the paper draws on three interconnected sets of qualitative data collected ultimo 2024 as part of a study on young Danes' democratic approach. The study intentionally combines traditional methods, such as interviews, with formal assignments and experimental and creative approaches. It includes (1) in-depth interviews with 20 first-year high school students, (2) 75 mandatory school essays by first- and second-year high school students, and (3) 21 creative outputs in the form of rap lyrics and podcasts, collectively produced by the students. These materials provide a rich, multifaceted account of how Danish youth aged 16–19 reflect on democracy and their own roles as democratic citizens.

The findings demonstrate that the young informants possess foundational knowledge of democratic principles and an understanding of the roles, rights, and duties associated with democratic participation. They articulate nuanced attitudes towards the trustworthiness of democratic institutions and political representatives. Simultaneously, they describe experiences of not being taken seriously as democratic actors, which is linked to varying degrees of democratic self-doubt. Methodologically, the study underscores the importance of research approaches that validate young people's voices and create spaces for them to meaningfully express their knowledge, experiences, and perspectives on democratic life.

In conclusion, the paper argues that inclusive and creative methodological designs are crucial for advancing both scholarly understanding and democratic engagement among young citizens, as well as for innovative rethinking of normative narratives of democracy and democratic citizenship and for a resilient digital democracy (Fuchs, 2025).

CDE11 Populist Communication and Anti-System Mobilization in Contemporary Democracies

PP 0626 Communicating partial populisms: Conceptual boundaries and dispersed expressions of populist communication in Swedish parliamentary debates, 1950–2025

Valdemar Holt[1], Jonas Harvard[1]

[1] Mid Sweden University, Department of Communication- Quality Management and Information Systems, Sundsvall, Sweden

How have different forms of populist content been expressed over time and what do such patterns reveal about the conceptual boundaries of populism? To which extent do scattered populist expressions exist outside of established populist ideological positions, and at which point do they, in fact, amount to a complete populist positioning? In this article, we examine manifestations of populist communication in Swedish parliamentary debates between 1950 and 2025. This time period captures the development during different eras of democratic development, from post-war reconstruction to the transformations and challenges of an increasingly digitalised and polarized society. The framework of the study combines key definitional criteria of populism - people-centrism, anti-elitism, popular sovereignty and antagonism - alongside approximate string matching. In order to explore the spread of expressions in close similarity to explicit populist statements, the paper also examines related communicative output not wholly within the pre-defined categories. The analysis is based on identifying such expressions within a text-corpus of parliamentary debates including all political parties represented in the Swedish parliament. The paper conducts a quantitative analysis to identify variations in dispersed forms of populist expression within a comprehensive parliamentary text corpus consisting of all speeches in the Swedish Parliament during the period. By incorporating LLM-assisted topic modelling to detect themes beyond the deductive framework, the paper contributes to emerging strands of methodological innovation within large-scale text analysis. Moreover, a qualitative analysis of a subset of selected samples was also conducted in order to ensure conceptual validity. By building upon key categories of populism, the study contributes to reconsidering and contextualising populist frameworks within a longitudinal perspective. The empirical findings underpin a discussion of whether particular manifestations of populism, in moderate or dispersed forms, can be regarded as integral to democratic systems. In doing so, the study advances ongoing debates regarding the scope and conceptual criteria of populist communication.

CDE11 Populist Communication and Anti-System Mobilization in Contemporary Democracies

PP 0627 Anti-systemic movements: Communicative practices, media logics, and power

Julie Uldam[1], Christina Neumayer[2]

[1] Copenhagen Business School, Department of Management- Society and Communication, Frederiksberg, Denmark
[2] Copenhagen University, Department of Communication, Copenhagen, Denmark

In this research we argue that systemic critique can be mediated through radically different communicative arrangements and political ideologies. We develop our argument by contrasting how anti-globalisation movements on the far-right and the far-left use digital media to express discontent and mobilize support at two different points of time. Conceptually, we employ the concept of media practices (Couldry, 2012; Mattoni and Ceccobelli, 2024) to capture how movement actors' uses of digital media enact liberal and illiberal communication logics (Bennett and Uldam, 2024) and how they intersect with the different logics that underpin digital platforms and infrastructures (van Dijck and Poell, 2013). Revisiting the anti-globalisation movement of the late 1990s and early 2000s serves as a historically significant case of left-wing anti-systemic resistance which revolved around the consequences of globalisation. Their use of early digital media technologies, including web forums, independent media centres, email lists, highlighted a commitment to decentralized communication and bottom-up organising (Kavada, 2010; Uldam, 2010). Today, the right-wing anti-globalist movement leverages social media platforms to disseminate misinformation, challenge scientific consensus (e.g., through hashtags like #ClimateScam), and build networks around anti-immigrant, and nationalist narratives (Askanius, 2021). Strategies such as memetic warfare, cloaking (presenting radical content under seemingly neutral aesthetics), and astroturfing (fabricating grassroots support) illustrate how these actors use digital media, such as virality and algorithmic amplification, to gain visibility (Brock and Askanius, 2023; Farkas and Neumayer, 2018). On both ends of the political spectrum, anti-systemic movements protest what they see as the failures of globalisation, particularly in relation to job loss and economic inequality, although their visions for alternatives to economic and political systems diverge significantly. This research demonstrates that although anti-systemic movements on both the right and the left have used digital media to articulate criticism and to mobilise support, their practices differ at the intersections of political ideology, communicative practices, media logics, and power. The results contribute to our understanding of participation, accountability, and communicative power in contemporary democracies.

CDE11 Populist Communication and Anti-System Mobilization in Contemporary Democracies

PP 0628 Hijacking pride through connective action – Self-presentation, collective identity, and mobilization intentions in right-wing extremism

Lena Rogina[1], Hanna Rueß[1]

[1] University of Augsburg, Department for Media- Knowledge and Communication, Augsburg, Germany

Right-wing extremists continue to portray themselves as part of a counter-movement resisting against the existing system, through which they seek to disrupt democratic systems and structures (Birsl, 2018). The role of social media in particular has proven to allow right-wing extremists to come together and form up into communities of connective action that operate without any form of overarching organization or formally documented instructions and tasks (Bennett & Segerberg, 2012). Through this, they succeed in employing sophisticated tactics that enable them to communicate their anti-democratic beliefs in the digital sphere (Fielitz & Kahl, 2021). One example is the use of counter-movements to weaponize one's self-presentation as a victim, as seen in protests against the LGBTQIA+ community.

To deepen the understanding of these online spaces and their consequences for the democratic order, this study aims to examine how right-wing extremists shape their communication on X in terms of self-presentation (Martin et al., 2024), collective identity (Barron & Bollen, 2022, Coretti & Pica), and mobilization intentions (Birsl & Quent, 2025) intentions. These terms have been used vaguely in past research, not being properly defined or related to each other. The theoretical work in this paper addresses this issue by constructing a model that reveals the connection and chronological logic of these constructs within right-wing extremist online communication.

The case study that this research is going to analyze is "Stolzmonat". Being the literal German translation of pride month, "Stolzmonat" is a German right-wing extremist movement that originated on X in June of 2023 to form a counter-movement to the internationally known pride month (which celebrates pride of LGBTQIA+ communities) and express their own pride in being heterosexual Germans (Volk, 2025; Jasser, 2023). They post various and sometimes multimodal right-wing comments that vary greatly in tone and are often homophobic, racist, misogynistic and/or nationalistic. The queer hostile hashtag gained traction in Germany beyond June of 2023 and can be recognized as a form of right-wing connective action. #stolzmonat is a counter-protest hashtag utilized to hijack pride similar to counter-movements such as #AllLivesMatter (Gallagher et al., 2018). Through qualitative content analysis we analyze posts from X tagged with the hashtag #stolzmonat.

We analyze how right-wing extremist actors use this hashtag to instrumentalize gender and queer identities (Zentai, 2025) and ethnicity (Bronner, 2018), weaponize victimhood (Chouliaraki, 2024), rely on anti-elitism (Harsin, 2018) as well as stage crises (Moffit, 2014) and connect these media practices to the functionality of connective action and the communication intentions (self-presentation, collective identity, and mobilization).

By considering the underlying dynamic of disorganized internet communities that use refined tactics to effectively communicate their beliefs to potential new members by pursuing specific communication goals and employing right-wing populist tactics, it is possible to gain a clearer understanding of how right-wing extremism in Germany is deliberately attacking the foundations of democracy through communication on social networks, and to identify possible solutions to this highly relevant issue.

CDE12 Grassroots Communication, Citizenship, and Community Governance in Times of Change

PP 0629 Ground-up epistemologies of change: Community-driven technologies and the making of inclusive democratic futures among Dalit communities

Rahi Patra[1]

[1] University of St. Gallen, Institute for Media and Communications Management, St. Gallen, Switzerland

In the recent years, particularly during the Covid-19 pandemic, democratic life across the globe has become increasingly dependent on digital technologies, which has been positioned as default solutions for governance, participation and public service delivery. In India, digital technologies were extensively deployed to manage the pandemic, including vaccination registration, Covid-19 hotspots mapping, biometric verification, contact tracing (Das, 2020; Madan, 2021; Mathur, 2020). While framed neutral and efficient, these digital governance infrastructures reproduced long-standing structural inequalities, generating caste-based exclusions embedded within technological design and implementation (Deshpande, 2021; Madianou, 2020; Mondal & Karmakar, 2021; Rahman, 2020).

This paper situates these exclusions within broader caste-based technocratic regimes that have historically marginalized Dalit knowledge by assuming universal users, abstract data practices and top-down models of governance. Digital systems frequently presuppose a "standard" human subject (Milan, 2020) – urban, upper caste, digitally literate and socio-economically secure. As a result, Dalit communities and other marginalized populations were systematically rendered illegible within pandemic governance infrastructures, leading to exclusion from services ostensibly designed for public welfare. These dynamics expose how democratic participation and access are shaped not only by institutional arrangements but also by communicative and technological infrastructure.

Against this backdrop of epistemic exclusion, this paper advances a framework of ground-up epistemologies of change by examining grassroots, community-driven and co-created technological practices that contest such exclusions from within the margins. Building on scholarship that emphasizes situated, embodied and plural ways of knowing (Arora, 2024; Escobar, 2018; Haraway, 1988; Santos, 2016), the paper draws on Pink et al.'s (2016) concept of digital materialities to analyze how technologies emerge through relational, affective and material engagements between people, infrastructures and environments. This approach provides a methodological counterpoint to technocratic governance by foregrounding how democratic communication is enacted through everyday practices rather than abstract systems.

Based on ethnographic fieldwork (participant observation, 10 qualitative interviews) conducted over a period of two years in Delhi, India, this paper thus focuses on two organizations – Gram Vaani and Design Beku whose work models community-driven technological approaches. The paper explores how these organizations engage with Dalit communities and other marginalized groups to repurpose, redesign or reimagine technological tools as democratic infrastructures of collective agency, mutual care and epistemic justice.

The paper shows that technologies become meaningful not as standalone artefacts or technical fixes, but when embedded within community-led processes of learning, deliberation and shared political purpose. By foregrounding marginalized knowledge practices as legitimate and generative, these initiatives challenge dominant models of technological governance and demonstrate how communication functions as a constitutive practice through which democratic subjects, solidarities and futures are actively produced.

CDE12 Grassroots Communication, Citizenship, and Community Governance in Times of Change

PP 0630 The invisible rhizome: The characteristics, roles, and challenges of community media in Czechia

Karolina Simkova[1], Jeffrey Wimmer[2]

[1] Institute of Communication Studies and Journalism, Univerzita Karlova, Prague, Czech Republic
[2] University of Augsburg, imwk, Augsburg, Germany

This paper examines the characteristics, democratic roles, and structural challenges of community media in Czechia within a media system shaped by ownership concentration, declining trust in journalism, and ongoing digital transformation. While community media have attracted renewed scholarly and political attention as participatory, civil-society-based alternatives to commercial and public service media, their position in post-socialist media systems remains underexplored. The Czech Republic represents a particularly instructive case, as it lacks a formally recognised third media sector and a dedicated regulatory framework for community media.

The study is guided by a rhizomatic theoretical framework, drawing on Deleuze and Guattari's concept of the rhizome as further developed in community media scholarship. Rather than conceptualising community media as fixed organisational entities, the rhizomatic approach foregrounds relationality, heterogeneity, and contingency, allowing community media to be understood as embedded practices situated at the crossroads of civil society. This perspective also enables a critical analysis of the tensions between participatory ideals and material constraints.

Empirically, the paper draws on twelve semi-structured interviews with journalists and editors from Czech mainstream and community media, four interviews with representatives of national media authorities, and four focus groups with citizens (n = 38) – all carried out in 2024 and 2025 as part of an EU Horizon project. The data were analysed using a discursive-material framework and grounded theory-inspired coding procedures. This multi-perspective design captures how community media are perceived and evaluated by producers, regulators, and audiences.

The findings show that community media in Czechia are characterised by strong community-centred missions, participatory production practices, and a reliance on volunteer labour. They function as spaces of learning-by-doing, informal journalism training, and inclusive representation, particularly for marginalised groups such as ethnic minorities, migrants, and students. In democratic terms, community media act as discursive correctives to mainstream journalism, platforms for civic participation, local watchdogs, and laboratories for journalistic experimentation. At the same time, the study identifies persistent challenges that limit the realisation of this democratic potential. These include chronic financial precarity, regulatory exclusion from the dual public–commercial media system, limited visibility in platform-dominated attention economies, and the need to distinguish democratically oriented community media from disinformation-oriented "alternative" outlets.

The paper concludes by arguing that community media constitute a crucial, though fragile, component of the Czech media ecology. We are conceptualising this tension as an "invisible rhizome": while community media are deeply embedded in local communicative practices, their democratic contributions remain structurally marginalised and politically under-recognised.

Making the rhizome visible requires not only highlighting participation and innovation, but also providing sustained regulatory, financial, and institutional support to stabilise participatory media practices in times of democratic uncertainty.

CDE12 Grassroots Communication, Citizenship, and Community Governance in Times of Change

PP 0631 The governance of refugees between securitising and innovative practices: A case study on Ukrainian women refugees in Romania

Mălina Ciocea[1], Florenta Toader[1], Elena Negrea-Busuioc[1], Bianca Cheregi[1]

[1] National University of Political Studies and Public Administration, Communication and Public Relations, Bucharest, Romania

The 'new normal' (Krzyżanowski et al., 2023) of Ukrainian displacement in Europe has reactivated crisis imaginaries and societal anxieties around migration with direct implications for democratic legitimacy and accountability. The unexpected immediacy of the refugee as a symbolic presence has enabled a range of actors to mobilise migration crisis rhetoric as a narrative device (Dines, Montagna & Vacchelli, 2018), shaping political responses and legitimising particular modes of governance. In Romania, the media have been central in constructing the refugee crisis as a public problem, and at times as a legitimation crisis (Jakobson et al., 2023), feeding a rhetoric of emergency and securitisation which narrows the space of public deliberation and redefines who counts as a legitimate political subject. We approach these dynamics through the lens of multi-level governance (Bassoli & Campomori, 2024), understood as vertical relations between levels of government and horizontal relations between the state and civil society, including voluntary actors.

Against this background, Ukrainian women refugees have often been framed by policy-makers, NGOs and the media as victims deemed worthy of various forms of temporary protection. Yet refugees' lived experiences frequently resist victimhood and instead articulate forms of everyday democratic practice beyond formal institutions. We argue that two dimensions are central: (1) women navigate bureaucratic and family figurations of local and transnational character (Christ et al., 2021), where rights, obligations, and recognition are operationalised through everyday encounters with institutions and communities; and (2) many become primary decision-makers within their families, with this reconfigured agency shaping mobility, communicative and care practices, and transactional engagements with political actors. Through these negotiations, women recalibrate the terms of protection, responsibility, and belonging, producing alternative democratic imaginaries of participation and mutual accountability.

Empirically, we examine tensions between a public discourse still tributary to one-way integration philosophies and refugees' own accounts of integration as negotiated practice. We triangulate Romanian mainstream and independent media coverage (N = 153) across two key moments (the outbreak of the war and one year later) with semi-structured interviews with Ukrainian women refugees residing in Romania (March–May 2025). Using a temporally layered design, we trace how crisis imaginaries are constructed in Romanian media (2022–2023) and how these mediated governance frames are lived and renegotiated in refugees' longer-term integration trajectories (interviews, 2025). The media analysis highlights how citizen and volunteer-driven mobilisation can operate as both an apolitical response to immediate needs and as a critique of institutional shortcomings, thereby repoliticising humanitarian discourse in Romania. The interviews show integration as layered and unfinished, marked by "permanent temporariness", with agency grounded in caregiving, relational labour, and community solidarity amid persistent structural barriers. Overall, we show how refugee governance is negotiated between institutional actors and communities at the intersection of hegemonic crisis intervention and emergent, participatory, non-hierarchical practices of community governance and activism. In doing so, we position refugee reception as a site of democratic life on shifting grounds, where mediated imaginaries, civic infrastructures, and everyday negotiations of rights reconfigure participation and accountability beyond formal political arenas.

PP 0632 Volunteerism vs professionalism in community media: South African tensions and hybridity

Franz Kruger[1]

[1] NLA Høgskolen, Journalism, Kristiansand, Norway

Community media is widely conceptualised as an alternative to mainstream media, placing the power to communicate directly in the hands of communities whose members own, control and contribute to the outlet. The principle of voluntary work emerges as central in both scholarly and media development literature, contrasted with professionalism in mainstream, commercial media where production and therefore "voice" is in the hands of people paid to create media products for sale and profit. From a community media perspective, professionalism is a mechanism that distances media from their audiences. Media reforms that took place in South Africa during the transition from apartheid in the mid-1990s created a new legal and regulatory framework for community broadcast based on such ideals. Some 30 years after the sector was created, new research reveals complex attitudes to volunteerism and professionalism in South African community media. The research, consisting of interviews with practitioners, document analysis, observation and surveys, surfaces a number of themes: first, economic pressures on community media in marginalised communities – the main targets of

the post-apartheid drive to democratise the media – have created a hybrid model that is firmly commercial in orientation despite being non-profit in legal form. Direct government support is limited and community donations virtually unknown, leaving advertising income as the main source of revenue. Even government support comes mainly in the form of payment for airtime. Second, high unemployment in marginalised communities has driven an influx of volunteers, mostly young, who are motivated strongly by the hope of converting to a paid position, creating economic pressures on stations already struggling to survive. Third, community stations' ability to rely on voluntary work to reduce costs is therefore limited and managers find the involvement of volunteers burdensome, with pressures for payment, high churn and issues of reliability. Instead, many express a desire for professionalisation, understood to mean reliance on a fully paid, trained staff, and expect the state to foot the bill.

The research has implications on several levels. For South Africa, there is a need to reconsider the framework created for the sector and the assumptions on which it was based. More widely, the example of South Africa, marked by high levels of poverty and inequality, highlights the need to look more closely at the economic implications of media development in marginalised communities, including established donor and other expectations for sustainability. Fundamentally, the experience highlights difficulties with the ways in which normative assumptions about community-based media translate into resource-poor contexts of the Global South.

CDE12 Grassroots Communication, Citizenship, and Community Governance in Times of Change

PP 0633 Enacting the "active citizen": Materialities, technologies, and subjectivities of civic education in the Swedish youth-led climate movement

Saralie Sernhede[1]

[1] Södertörn University, Media and communication studies, Huddinge, Sweden

The question of what future citizens formal schooling is to foster has occupied the minds of educational actors for centuries. Following the notion of education as a citizen-making enterprise (Wan, 2014), the digital age has brought with it new questions of what it means to take part in democracy are arising, not least posing challenges in the civics classroom around controversial political topics (e.g. Andersson, 2016; Ojala, 2019). Set apart from legal conceptions of citizenship as tied to geographic belonging, passports, and other documentation, this article approaches the notion of the "active citizen" in digital democracy as an open and unstable ideal negotiated and enacted not only by educational policy makers, teachers, and adults in general, but by young people themselves. The article examines how the citizenship ideal of civic education is enacted beyond the constraints of formal schooling, focusing on the Swedish youth-led climate movement as a network of civic action, instruction, and subjectivity in the rapidly changing media landscape of the public sphere.

Theoretically, the article brings together Hannah Arendt's concept of action (1958), John Dewey's educational theories of experience and communication (1916), and Gert Biesta's (2022) notion of world-centered education and democratic subjectification. While Arendt and Dewey are often understood through their more abstract notions of speech, participation, and deliberation, this article foregrounds their shared emphasis on the materiality of the world as a condition for political and educational action. Civic education is thereby understood as an existential and relational process through which subjects arrive in a shared world by taking initiative, acting together with others, and enduring the unpredictable consequences of their actions. Importantly, this arrival is not only set against the consequences of other individuals and groups of civil society but are reliant on, as well as subject to, a constantly shifting material and not least technological world.

Empirically, the article draws on an ethnographic study of the Swedish youth-led climate movement, combining observation across the online-offline divide (Hine, 2008) and interviews with young activists. The article brings to light the ideals of citizenship that come to be when young people themselves navigate making their voices heard in a saturated, polarized, and at times hostile climate of public debate in a democratic society. This ideal citizen here sits in the tensions between context-specific traditional democratic values and the technologies of that democracy, knowledge as both scientifically established and processual, and a state of constant arrival through protest – enacted both through public civic action and experimental instruction in preparation for such action. The study at hand informs an understanding of civic education not as a means to an end – as the production of a certain type of ideal citizen – but as an inherent part in participating in society as unique subjects and as active citizens. Ultimately, it turns the educational question of what future citizens civic education is to foster for society on its head, asking instead what society it is that future citizens themselves actively partake in creating.

CDE13 Consolidating Digital Nationalism Studies: Infrastructures, Representations, Practices

PN 68 Enactment of Russian digital nationalism and geopolitics: Digital media practices on Telegram and VKontakte

Alexandra Brankova[1,2]

[1] Uppsala University, Department of Informatics and Media and IRES Uppsala University, Stockholm, Sweden
[2] Swedish Defence University, Swedish Defence University, Stockholm, Sweden

The paper investigates the enactment of Russian nationalism and geopolitics through digital media practices on non-Western social media platforms (Telegram and VKontakte) before and after the start of Russia's full-scale invasion of Ukraine. The pervasiveness of nationalism in digital media and the nation-based logic of technological infrastructure are focal points of academic discussions (Ahmad, 2022; Mihelj & Jiménez-Martínez, 2021; Rabinowitz, 2023; Skey, 2022). Political parties, their leaders, and influencers promote their ideologies and construct notions of the self and the internal or external enemy through digital media (Arnesson & Reinikainen, 2024; Mayerhöffer et al., 2024).However, less is known about how neo-authoritarian media systems, such as the Russian Federation—where the state has a hegemony over both discourse and digital infrastructure (Becker, 2004; Filimonov & Carpenter, 2021)—construct banal forms of nationalism and geopolitics through digital media practices and media intermediaries. Neo-authoritarian hybrid media systems involve media intermediaries facilitating nation-building, political influencing, discourse dissemination, and user engagement in addition to mechanisms for surveillance and restrictions. The study explores how Russian media owned by the state (RIA Novosti) or by entrepreneurs of influence (Tsargrad TV, RIA-FAN, and the League for Safe Internet) utilize the affordances of social media platforms to construct nationalism and promote managed activism, participatory surveillance, and pro-war mobilization of Russian audiences. Relying on theories of nationalism about the banal and discursive construction of the nation and geopolitical other (Billig, 1995; Calhoun, 1997; Wodak et al., 2009), a broader definition of digital practices as "an assemblage of actions involving tools associated with digital technologies" (Jones et al., 2015, p. 3) is adopted. Netnographic observations have been carried out between June 2021 and June 2023 on VK and Telegram channels associated with the above-listed media, and posts, images, and videos have been scraped and analyzed. The study reveals that the nation and geopolitics are constructed through representation and aesthetics, participatory practices through virtual and augmented reality applications, social media hashtag campaigns, and strategic communication through entertaining genres such as reels. Denunciation practices through user-led norms compliance in support of the ruling authorities and exclusion of opposition were identified. The start of the invasion transformed banal to hot nationalism, popularizing "Z" and "V" strategic campaigns, wartime support, and selective depiction of events. The findings demonstrate that banal and hot forms of nationalism are enacted in digital media as parts of a larger discourse about Russian internet sovereignty and opposition to Western platforms is promoted as wartime information security. This paper fits with the ECREA 2026 theme about "Shifting Grounds: Paths, Connections, and Futures" because it explores how geopolitical conflicts are manifested not only in terms of Internet governance but also in the application of digital media practices to construct identity and notions of the external or internal enemies. It advances theoretical understandings of how political phenomena such as nationalism and democratic backsliding are performed and enacted in digital media in addition to their discursive manifestations (DeCleen et al., 2025; Laruelle, 2025).

CDE13 Consolidating Digital Nationalism Studies: Infrastructures, Representations, Practices

PN 69 Hallucinating the nation: A comparative multi-modal analysis of genAI's visual regimes of representation

Delia Dumitrica[1], Maria Avraamidou[2]

[1] Erasmus University, Department of Media and Communication, Rotterdam, Netherlands
[2] Erasmus University Rotterdam, Department of Media and Communication, Rotterdam, Netherlands

The increased reliance upon genAI such as ChatGPT or Copilot to search and generate cultural content renews the urgency of understanding how such novel forms of mediation participate in ideological reproduction. While scholarship has started to examine race, class and gender biases in genAI output (Gengler, 2024), less attention has been devoted to the nation (Goode, 2021). This is even more important as far-right actors are already using genAI to develop exclusionary and gendered representations of the nation (Sengul et al. 2026). While significant, this line of research leaves aside potentially more banal and everyday representations of the nation by genAI. Consequently, we take an exploratory approach to examine genAI's tacit visual regimes of representing 'the nation'. Text-to-image genAIs work with training datasets where small elements of images have been textually labeled. Generating new images thus starts from culturally shared assumptions and taken-for-granted social categorizations (Sobey, 2025). Furthermore, genAI output is a sociotechnical product: not only are worldviews and biases embedded within training datasets, but the output blends a seemingly technological generation process with user input through prompts. Approaching genAIs as political, sociotechnical agents (Hurley, 2024), we ask: What types of markers do genAIs reify as national symbols? What imagined features of the nation are drawn upon and further perpetuated? And, what is the ideological role of the sociotechnical dimension of these representations? Against this backdrop, we examine 200–250 images generated by identical prompts across popular genAIs (e.g., ChatGPT, Stable Diffusion, Gemini, NightCafe, etc.) (Gengler, 2024; Hurley, 2024; Putland et al., 2025; Sobey, 2025). By combining prompts

in local languages to visualize historical accomplishments and national celebrations with requests to visualize families and landscapes, the dataset captures both explicit and banal representations of the nation. To compare different 'national' markers and features, we focus on two sets of neighboring Eastern European countries (set 1: Romania, Republic of Moldavia, and Hungary; set 2: Cyprus, Greece and Turkey). Characterized by the enduring popularity of ethnocultural forms of nationalism, interwoven histories leading to competing territorial claims, and shared cultural practices, these countries provide an ideal sample for comparisons. The AI generated images and accompanying textual explanations are qualitatively analyzed informed by multimodal discourse analysis (Machin & Mayr, 2023; Putland et al. 2025). Preliminary results reveal that architecture, landscape features, clothing, and cultural stereotypes mark everyday life as 'national'. In contrast, flags, history, scientific achievements, and folk traditions signify the nation. The cross-country and cross-genAI comparisons reveal the seemingly universal inter-changeability of the local contents, conveying the universality of the nation as a social category. The consistency of such results with visual regimes of the nation in Western digital culture (Dumitrica & Frijns, 2025) speak to the prevalence of discursive logics preferring "stylized and commodified images of nations, rather than realistic interpretations" (Kaneva, 2024, p. 68). Such ideological work, we argue, perpetuates post-national visions of nations as uncontested, beautified and depoliticized objects for aesthetic consumption.

CDE13 Consolidating Digital Nationalism Studies: Infrastructures, Representations, Practices

PN 70 Searching for discourse diversity: Social media and digital nationalism

Vihang Jumle[1], Vignesh Karthik[2]

[1] University of Bern, Institute of Communication and Media Studies, Bern, Switzerland
[2] Royal Netherlands Institute , Royal Netherlands Institute of Southeast Asian and Caribbean Studies, Leiden, Netherlands

This paper investigates the nature of digital nationalism on social media, examining how Twitter discourse operates around nationally significant political events. The study takes as its starting point an ongoing scholarly debate: while some researchers argue that social media makes nationalism more participatory and diverse through bottom-up engagement, others contend that discursive diversity remains circumscribed within certain boundaries. The authors use this tension as a framework to explore additional characteristics that define nationalistic discourse on social media. The paper conceptualises diversity along two dimensions: participatory diversity (who participates and how frequently) and discursive diversity (the range and features of ideas expressed). Understanding both is essential for assessing digital nationalism's social constructivist nature, enabling comparisons with offline nationalism and tracing how digitally projected ideas translate into popular nationalist sentiments through social media network effects. Two research questions guide the study: How numerically diverse is user participation on Twitter regarding nationally relevant political topics? What are the discursive features of these tweets? The study addresses its significance on two key fronts. First, case selection is difficult — researchers need topics that genuinely concern core features of nationhood (national identity, history, ethnicity) in contexts with high internet penetration and active social media engagement. Second, data collection from social media platforms has become increasingly restricted, making comprehensive, large-scale analysis difficult. To address these challenges, the study examines Twitter discourse surrounding the abrogation of Article 370 in India—legislation that revoked the special constitutional status of Jammu and Kashmir. This case directly engages fundamental questions of nationhood and identity. The authors situate their work within existing literature that presents contrasting evidence about social media's democratising potential. While some studies show social media enabling counter-frames against government narratives, others (particularly from Iran) demonstrate that platforms can be co-opted by elites to reinforce the status quo. Additionally, phenomena like bot activity, astroturfing, and tweet-storming complicate assessments of genuine participatory diversity. The paper's key findings reveal that Twitter discourse supporting the Article 370 abrogation was dominated by a relatively small number of influential users, suggesting limited participatory diversity. The authors also identify clear instrumentalisation of the platform for promoting nationalistic legislation. Most significantly, they introduce the concept of "tokenistic discourse"—user-generated nationalist content that lacks substantive depth and is overwhelmed by nationalist declamations rather than meaningful engagement with ideas. This finding adds a new dimension to understanding digital nationalist discourse beyond simply categorising it as "diverse." The authors conclude by redirecting digital nationalism studies toward new questions: Why do users engage in tokenistic discourses? What purposes do these serve? And how can researchers trace the causal process from online discourses to mass public opinion? The study contributes a context-specific analysis from India to help the discipline develop more nuanced, converging understandings of digital nationalism across different national contexts, while critically reassessing what "diverse" discourse truly means by distinguishing it from genuinely competing or divergent viewpoints.

CDE13 Consolidating Digital Nationalism Studies: Infrastructures, Representations, Practices

PN 71 Embracing the package deal: How foreign content creators engage with Chinese platforms

Qian Huang[1]

[1] Erasmus University Rotterdam, Centre for Media and Journalism Studies, Groningen, Netherlands

This paper investigates the complex engagement of foreign content creators with Chinese digital platforms, using Xiaohongshu (RedNote) as a timely and compelling case study. The study takes its cue from the unexpected migration of a substantial cohort of US-based TikTok users and some major content creators to Xiaohongshu in January 2025, during

a brief, though impactful, TikTok ban by the Trump administration. While the ban was short-lived and many users returned to TiktTok, a significant number of foreign creators chose to remain on Xiaohongshu, seeking to tap into the immense potential of the Chinese digital market. Content creators in general are already dictated by nested precarities (Duffy et al., 2021) and the regime of visibility (Jiménez-Martínez & Edwards, 2023). On top of that, foreign content creators operating on Chinese platforms face additional layers of challenges posed by Chinese platforms, politics, and audiences. This is exacerbated by the rising nationalism in digital China, ranging from the party-state's emphasis on digital sovereignty (Jiang, 2024) and cultural confidence, participatory censorships in fandom nationalism (Wang & Huang, 2026), and the increased awareness and public discourses of anti-racism and anti-imperialism (Zhang, 2024). It is crucial to unpack the intricate power dynamics and strategic negotiation between key stakeholders involved. Therefore, this research focuses on these foreign creators' daily production practices to understand their adaptive strategies. To do so, a thematic analysis of 20 semi-structured in-depth interviews with foreign content creators who have established a presence on Xiaohongshu is conducted. Preliminary findings suggest that these foreign content creators embrace relevant opportunities and challenges as the "package deal" of market entry. This includes navigating China-specific platform dynamics such as opaque content moderation policies, a complex matrix of social norms that govern acceptable content and interaction styles, and Chinese audiences' perceptions and interpretations of their (dis)respect of China and Chinese people. Therefore, while the Chinese party-state does not intervene directly in such foreign content creators' practices on Chinese platforms, its structural power prompts both the Chinese platforms and their users to engage with digital nationalism that nudge the creators to self-discipline. These findings offer vital perspectives on the geopolitical and cultural dimensions of global platform economies and digital labor.

CDE13 Consolidating Digital Nationalism Studies: Infrastructures, Representations, Practices

PN 72 Life in platform nations: Exploring citizen engagement with digital sovereignty in Brazil, Ukraine and the UK

Cesar Jimenez-Martinez[1], Sabina Mihelj[2]

[1] London School of Economics and Political Science, Department of Media and Communications, London, United Kingdom
[2] Loughborough University, Communication and Media Department, Loughborough, United Kingdom

Faced with the growing power of digital platforms, and driven by concerns over online harms, foreign election interference and privacy protection, governments world-wide are seeking to claw back control over digital technologies. Amidst these developments, the language of nations and nationalism is seeing a comeback, offering a tool for legitimating both authoritarian and democratic forms of state control over the digital world. As a result, the digital infrastructures we live in are becoming increasingly nationalized. Yet, while literature examining the rise of digital sovereignty from a top-down, policy and infrastructural perspectives has grown, little is known about how ordinary citizens react to an increasingly nationalized digital environment they live in. Our paper seeks to advance these debates both theoretically and empirically. Theoretically, it links debates on digital sovereignty with debates on digital and platform nationalism. Empirically, we draw on interviews and digital diaries with 30 participants from Ukraine, Brazil and the UK to examine how ordinary people experience the manifestations of digital sovereignty – ranging from geo-blocking to the proliferation of domestically owned digital platforms – in their everyday life. We address both discursive and routine dimensions, examining what people say about their national identity and the way it relates to their digital media use, as well as the way they use (and choose between) different digital platforms and devices. Our approach throws into sharp relief the tensions between the imagined placelessness of digital media promoted by the digital tech industry and embraced by many of our participants, and the increasingly nationalised reality of life in a world of platform nations. To put it differently, our study connects macro-level discussions on digital sovereignty and nationalism with the enactment and reproduction of national identities and routines on a micro-level. We emphasize that platform nations should be understood as lived environments rather than abstract architectures or symbolic representations, thus opening new paths to understanding how nationalism persists and is reconfigured through engagement with digital technologies.

CDE14 Media Dynamics, (Visual) Politics, and the Communication of Public Crises

PP 0843 Society's awareness of the foreign development aid in the context of wartime communication patterns: The case of Ukraine

Marta Puhach[1]

[1] University of the National Education Commission, Political Science and Administration, Kraków, Poland

The beginning of the Russian invasion of Ukraine in 2022 marked an all-time record in official development assistance (ODA) dispatched all over the world (USD 204 billion). According to OECD, the critical factors behind the surge in 2022 and post–2022 foreign aid numbers were: 1) hosting refugees within donor countries, 2) a jump in aid to Ukraine following Russia's full-scale invasion (OECD:2024). Over the course of the following years to date, Ukraine became the largest recipient of international aid ever for any single country in a single year. This marked the first time that a European country has held the leading position among aid recipients since the Marshall Plan after World War II, and brought a significant change

in OECD countries' citizen awareness of foreign aid and its role in sustaining democratic transformations in the context of war on the borders of the European Union. The paper demonstrates some of the leading tendencies.

The change in awareness of the need and aims of foreign aid that occurred after the beginning of the Russo-Ukrainian War happened in Ukrainian society, too, amidst the full-scale war. The recent representative survey (n = 1000) conducted in Ukraine in August 2025 showed that a total of 73.5% of Ukrainians express a high (44.9%) or moderate (28.6%) level of interest in *the topic of foreign aid from the EU and the U.S.* This level of interest is comparable to the interest in *the topic of negotiations about ending the war* (85.4%) or *the updates on the front line situation* (87.9%). The survey brings together the framework of news consumption in a time of war, war news fatigue, and awareness of and interest in a variety of topics relevant ot the country's current news consumption priorities, including foreign development aid as a necessity for a society and ongoing democratic transformations, not only the military function of the country.

The paper examines the society's awareness and the role of media in it, using the case of foreign development aid awareness in the context of war and the challenges the war brings to the news consumption patterns in Ukraine. In addition to the survey's results, the in-depth semi-structured interviews with the representatives of leading Ukrainian SCOs (n = 6) are provided to discuss the role of foreign development aid in the Ukrainian society and sustaining the country's reforms towards democratisation during the hardships of wartime and Ukraine's EU integration. Thus, the paper incorporates a mixed-method research design to look into the research question of the society's awareness of foreign aid in the context of wartime communication patterns in the Ukrainian society.

CDE14 Media Dynamics, (Visual) Politics, and the Communication of Public Crises

PP 0844 Cardboard evidence: Visual accountability in Bulgaria's 2025 anti-government protests

Iva Ivanova[1]

[1] Sofia University "St. Kliment Ohridski", Faculty of Journalism and Mass Communication, Sofia, Bulgaria

This paper examines protest signage as a vernacular medium of democratic accountability during Bulgaria's 2025 demonstrations against the draft state budget and the sitting government. Rather than treating placards as disposable slogans, the study approaches them as civic interfaces where citizens compress fiscal critique, constitutional language, and participation cues into portable visuals that circulate between the street and social media.

Three research questions guide the analysis: (1) Which frames dominate the signs (tax justice and redistribution; anti-corruption and stewardship; civil liberties and rule of law; European anchoring and sovereignty)? (2) To what extent do signs incorporate "design-for-trust" features- on-sign evidence such as numbers, article/paragraph references, dates and reading stages, and QR/URL links- and how are these staged to sustain credibility under polarization? (3) What calls-to-action (CTAs) appear, and how often are they procedural (naming channels, committees, deadlines) rather than attitude-only appeals?

A purposive corpus of publicly shared photographs and livestream captures from multiple protest days in 2025 is assembled and de-duplicated. Each sign is coded as a visual artifact with a structured rubric: frame(s); design-for-trust components (legal badge, versioning, QR/URL, authorship, procedural context); CTA type and specificity; affect register (indignant, ironic, playful); language (Bulgarian/English); and materiality (handmade versus professionally printed). The analytic strategy combines descriptive patterns with qualitative multimodal vignettes that reconstruct the micro-composition of "message - evidence- action," and traces basic platform spillovers when images are reposted with captions and hashtags.

Preliminary patterns indicate three contributions. First, democratic accounting by design: many signs embed numbers, line items, or receipt/ledger metaphors and pair them with small, checkable anchors (a committee name, an article reference), producing screenshot-resistant claims. Second, procedurality as mobilization: beyond expressive dissent, a notable subset of signs specifies institutional coordinates (committee, reading stage, consultation window) that migrate into social captions, increasing the likelihood that attention routes toward eligible participation (comments, submissions, attendance). Third, humor as shield and solvent: irony, puns, and meme intertext reduce confrontation costs while puncturing official narratives; their persuasive bite strengthens when tethered to compact facts.

For the Communication and Democracy field, the contribution is a portable coding rubric that operationalizes credibility as an artifact-level property and links it to concrete participation pathways. The talk closes with implications for documenting and designing verifiable signs (for CSOs, journalists, and archives), ethical notes on image use, and suggestions for comparative extension across Central and Eastern European budget cycles.

CDE14 Media Dynamics, (Visual) Politics, and the Communication of Public Crises

PP 0845 Where topics take off: Tracing temporal impulse dynamics in cross-platform crisis communication

Jana Johanna Klapproth[1], Saïd Unger[1], Thorsten Quandt[1]

[1] University of Muenster, Department of Communication, Muenster, Germany

Global crises produce volatile information environments in which breaking news, uncertainty, and misleading content circulate across news media and multiple social media platforms. Journalistic crisis coverage is crucial for providing reliable orientation, yet audiences increasingly combine sources across platforms, often encountering fragmented and

asynchronous topic trajectories. Social media discussions can supply timely eyewitness information but also introduce "frame breakers" that challenge journalistic routines and potentially affect reporting quality. While research on intermedia agenda setting highlights mutual influences between outlets, it remains unclear how topic dynamics between news media and distinct platform ecosystems unfold over time across different crisis types, and whether topic diffusion is primarily driven by journalistic gatekeepers or by platform-specific publics.

This study offers a content-driven, temporal approach to tracing cross-platform topic diffusion by reconstructing topic paths and estimating directional dependencies between platforms. A key contribution is the comparative design across multiple crises that differ in temporal structure: we analyze both slow-burning crises (economic crisis, climate crisis, refugee crisis) and fast-burning crises (the war in Ukraine, the conflict in the Middle East). This allows us to assess whether cross-platform information flows follow crisis-transcending patterns or whether topic dynamics systematically vary between gradual, long-duration crises and rapidly escalating conflict events.

For each crisis, we collected German-language data from news media and the platforms Instagram, Mastodon, Reddit, Telegram, and X between August 1 and October 9, 2024. Data were gathered using crisis-specific keyword lists (Instagram, Mastodon, X), curated subreddit lists (Reddit), and selected channel lists (Telegram). After merging platform datasets per crisis, we first extracted thematic structures with transformer-based topic modeling (BERTopic) and conducted a qualitative validation of the 20 most prevalent topics per case. We then constructed platform-level time series of topic prevalence and modeled temporal dependencies with multivariate time-series analysis. Directional influence between platforms was assessed using Granger causality tests, and impulse–response functions were used to estimate the magnitude and persistence of topic impulses as they propagate across platforms. This approach enables us to identify when a platform tends to lead, follow, amplify, or remain insulated from a topic's trajectory.

Across crises, we identify four recurrent temporal patterns of cross-platform topic dynamics: (1) followed paths, where topics originate on one platform and appear later elsewhere with a lag; (2) escalating foreign sparks, where escalation on one platform is triggered by impulses emerging on another; (3) parallel paths, characterized by synchronized trajectories across platforms; and (4) single-path escalation, where topics remain largely platform-specific. Comparing slow- and fast-burning crises indicates that rapidly escalating events more often produce sharp impulse cascades and quicker cross-platform jumps, whereas slow-burning crises exhibit longer, more persistent topic cycles and stronger platform segmentation.

Overall, the study advances a comparative, multi-crisis perspective on cross-platform agenda dynamics and provides a typology of temporal topic diffusion patterns. Practically, the findings underscore the need for cross-platform monitoring in crisis reporting to detect early escalations, distinguish synchronized diffusion from organic uptake, and prevent speculative framings from stabilizing unchecked.

CDE14 Media Dynamics, (Visual) Politics, and the Communication of Public Crises

PP 0846 How media repertoires affect climate literacy. Information diversity and the epistemic function of deliberative systems

Niklas Berger[1], Cornelius Puschmann[1], Patrick Zerrer[1], Paul Pressmann[1]

[1] Universität Bremen, ZeMKI- Zentrum für Medien-- Kommunikations- und Informationsforschung, Bremen, Germany

Deliberative democracy depends on informed publics capable of engaging with complex information through discourse and public reasoning (Bächtiger et al., 2018). Climate change exemplifies this challenge, as it requires citizens to navigate pluralistic media environments where legacy outlets, professional influencers, interest organizations, and alternative sources coexist on social platforms (Blomberg et al., 2021; Dikmen, 2020; Hautea et al., 2021; Marquardt & Bäckstrand, 2022). Yet it remains underexplored how different patterns of media consumption relate to climate literacy and thus to citizens' capacity for meaningful deliberative participation.

This paper connects deliberative systems theory with media repertoire research to examine how self-assessed media use patterns relate to differentiated forms of climate knowledge. Following the systemic turn in deliberative theory (Mansbridge, 1999; Mansbridge et al., 2012), we conceptualize news media repertoires at the individual level and their relation to the media ensemble at the societal level as serving the epistemic function of deliberative systems, which is to enable fact-informed preference formation based on logic and consideration of diverse perspectives (Hasebrink & Hepp, 2017). We ask: How do media repertoires relate to objective climate knowledge across different domains (causes, consequences, political responses) (Hoppe et al., 2018; Taddicken & Reif, 2016)? What is the relationship between media use patterns and subjective climate information assessments? Which configurations of media sources and news curation practices support climate literacy to improve deliberation?

We analyze survey data from a large-scale research project (N = 1,038), combining objective knowledge tests covering 16 items across three climate domains with subjective information assessments and detailed media repertoire measures spanning eight source types (TV 69%, radio 66%, web/social/conversations 60% each, print 35%, AI 23%, podcasts 20%). We also examine news curation practices (duty to keep informed, news avoidance, news finds me) as potential moderators. Experience sampling method data across twelve waves provides longitudinal context for media use and topic prioritization patterns.

This research contributes empirically grounded insights into how media diversity shapes the epistemic quality of deliberative systems in climate politics. By examining the interplay between media repertoires, news curation practices, and differentiated knowledge outcomes, the paper advances theoretical understanding of deliberative capacity building while offering practical implications for climate communication strategies aimed at supporting informed public discourse.

CDE15 Contested Speech, State Authority, and Resistance in Digital Publics

PP 0952 Instrumentalised confusion: How façade democracy envisions freedom of speech and censorship. The case of Russia

Tatiana Chervyakova[1]

[1] Lusófona University, CICANT, Lisbon, Portugal

In the aftermath of the Cold War and the impending dissolution of the Soviet Union, political regimes have increasingly displayed characteristics of ambiguity and hybridity. Fukuyama (1989) pronounced the triumph of Western liberal democracy in the ideological struggle; however, many non-democratic regimes present themselves as democratic by adhering to formal principles, which aids their survival in an open international environment and market conditions (Guriev & Treisman, 2020). Hybrid regimes blend democratic institutions with a "facade" of democratic practices to legitimise their procedures (Schedler, 2002). As a result, the meanings and performances of freedom of speech and censorship vary significantly in façade democracies compared to genuine democracies. In democracies, leadership changes systematically, whereas in hybrid regimes, leaders can implement long-term strategies. This dynamic complicates explicit censorship, as regimes face high transactional costs (Corduneanu-Huci & Hamilton, 2022) and the risk of public backlash, prompting a shift over time toward more covert methods of censorship (Gehlbach & Sonin, 2014; Little, 2017; Shadmehr & Bernhardt, 2015; Roberts, 2018).

This paper argues that politically empowered actors in façade democracies do not entirely reject the values of liberal democracies, such as freedom of speech. Rather, they interpret and utilise these concepts as reactive measures to both internal and external pressures. By examining contemporary Russian discourse—particularly through the lens of Russian authorities and state media—I illustrate how "freedom of speech" and "censorship" are (de)constructed and various interpretations are curated for instrumental purposes.

The Russian Federation exemplifies a façade democracy characterised by undeclared, de facto censorship. In this context, authorities employ various tactics based on the source of perceived threats: external or internal. They accuse European countries and the USA of hypocrisy regarding censorship (e.g., blocking RT in Europe), deny allegations of suppressing free speech by invoking the rule of law (TASS, 2021), and justify censorship in a "war state" while criminalising the term "war" (Article 207.3 of the Criminal Code). These contradictory narratives serve as tools for non-democratic regimes, reshaping the concepts of "freedom of speech" and "censorship" to further their internal and external agendas.

To investigate the fluidity of these concepts, I employ critical discourse analysis, analysing interviews, public statements, and state-financed media articles. In a volatile political context, "censorship" and "freedom of speech" may lose their significance, becoming mere rhetorical constructs. This phenomenon contributes to the degradation of democratic institutions, undermining the rule of law and clear values, as illustrated in the Russian case study.

I also introduce the notion of proxy censorship, which is pertinent in façade democracies. This type of censorship is often concealed behind a façade that mimics democratic practices, lending credibility to pseudo-democratic processes (Schedler, 2002). Adopting Darnton's (2014) narrower definition of censorship, I contend that the ambiguity and "conceptual stretching" of contemporary censorship obscure essential elements necessary for a comprehensive examination of the phenomenon in these regimes, leading to misinterpretations of freedom of speech and expression.

CDE15 Contested Speech, State Authority, and Resistance in Digital Publics

PP 0953 Feeling safe, feeling heard: Exploring customizable moderation and its effects on online discourse quality

Anna Maria Planitzer[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Social media platforms have long been seen as potential infrastructures for inclusive and democratic public discourse. However, rising misinformation and online norm-violations have challenged this promise, as users perceive and respond to harmful content differently (e.g., Cinelli et al., 2021; Strippel et al., 2023; Bormann, 2022). This diversity of norms creates a central tension for platform governance: how to mitigate harm without overstepping legal boundaries or restricting freedom of expression. Traditional top-down moderation approaches often struggle to balance these goals, particularly for "borderline" or legally permissible yet harmful content.

To address this challenge, in part, platforms are increasingly exploring user-self-configured, customizable moderation approaches. Features such as toggles and filters allow users to selectively limit exposure to content they find harmful, giving them more control over their online experience (Jhaver & Zhang, 2023). While prior studies have explored users' preferences for such systems, little is known about how they actually use these tools in practice and whether this usage

influences important core objectives in content moderation, such as perceived safety or feelings of empowerment to participate in and be open to varying opinions in online discussions.

The work-in-progress examines these questions using a planned pre-registered, controlled online experiment simulating a social media environment. Participants will be randomly assigned to a customizable moderation condition, in which they actively configure content filters via toggles, or a fixed moderation condition, in which moderation rules are standardized. The experiment will measure actual behavior in adjusting moderation settings, as well as participants' perceptions of safety and empowerment. Empowerment is conceptualized along two dimensions: the comfortability to speak up in discussions and the open-mindedness to others' perspectives, both of which are central to fostering constructive online deliberation. Data will be collected from a representative sample of Austrian adults, attention checks and exclusion criteria will ensure data quality. All procedures follow Open Science principles, including IRB approval, pre-registration, manipulation checks, and validated measures of the dependent variables.

This work-in-progress aims to advance prior research by moving beyond stated preferences to examine whether user-configurable moderation produces tangible behavioral and perceptual effects. By systematically investigating how users interact with customizable moderation features and how these interactions shape both their perceptions of moderation and the quality of online discourse, the study seeks to foster healthier democratic online spaces where participatory mechanisms support constructive dialogue while mitigating harm in today's increasingly platformized society.

CDE15 Contested Speech, State Authority, and Resistance in Digital Publics

PP 0954 Resistance as a narrative: Far-right alternative media storytelling and the co-constructed myth of resistance

Hanna Rueß[1], Susanne Kinnebrock[1], Christian Schwarzenegger[2]

[1] University of Augsburg, Department for Media- Knowledge and Communication, Augsburg, Germany
[2] University of Bremen, Centre for Media- Communication & Information Research, Bremen, Germany

Resistance as a narrative: Far-right alternative media storytelling and the co-constructed myth of resistance

Far-right actors frequently portray themselves as victims of oppressive elites and portray their actions as resistance against an oppressive system. While this self-identification has been researched as a common theme in far-right and conspiracy-related groups (Zehring & Domahidi, 2023), it has not yet been researched as a *co-constructed story* based on a variety of different contributions by far-right actors. This paper argues that if resistance is presented in the form of a narrative, it is even more convincing: It assigns roles (i.e., protagonist and antagonist), establishes moral meaning, and allows far-right actors to draw on myths of heroic resistance. Understanding resistance as a narrative reveals how far-right actors mobilize powerful plots such as the hero´s journey and (national) myths of resistance against authoritarian regimes, thereby appropriating narrative techniques comparable with those analyzed in literature in the context of anti-colonial resistance (Harlow, 1986).

To get a better understanding of far-right communication strategies, we analyze them as *narratives* (unit of analysis) and distinguish them from co-constructed *myths*. Narratives are defined as representations of a causally connected sequence of events (Abbott, 2020; Prince, 1982) and are generally characterized by thematic closure, a narrative structure (including tension-building composition, protagonist role, antagonist role), and narrative stylistic devices (amongst others, Bal, 2017). In contrast, we use the term myth to refer to socially and culturally deeply rooted narratives whose content is widely known and agreed upon (Flood, 2002).

We analyzed 25 articles from far-right alternative news media sites and 791 comments on the platform X. Using qualitative content analysis (Schreier, 2012), we identified how media actors and regular users assign narrative roles, establish plot structures, and draw on mythic repertoires. This allows us to examine how resistance is narratively constructed and then amplified.

The case study focuses on the arrest of German far-right YouTuber Shlomo Finkelstein in August 2023 for incitement to hatred and illustrates a fully developed resistance narrative with a heroic arc. Articles in far-right alternative media assign clear roles with Finkelstein as a persecuted protagonist and the state as an unjust antagonist. The prosecution, imprisonment, and alleged harassment in prison are meant to demonstrate the hero's moral steadfastness. The early release from prison provides a positive resolution and moral lesson about staying true to one's cause and solidarity within the far-right community. Remarkably, user comments amplify and expand this media narrative, situating it within established mythic repertoires: they draw explicit parallels to past totalitarian regimes and compare Finkelstein to well-known resistance figures. This co-construction elevates an individual's struggle into a broader moral struggle.

The case study shows how episodic events are transformed into a resistance narrative and how users amplify these stories by linking them to an established historical myth. Resistance thus shifts from a situational claim to a mythic principle. It serves as an identity resource and mobilizing device within the far-right, and thereby becomes part of democratic backsliding.

CDE15 Contested Speech, State Authority, and Resistance in Digital Publics

PP 0955 Debating antisemitism and political criticism during the Israel–Gaza war: Online news coverage, political narratives, and Jewish experiences in Turkey

Melis Oneren-Ozbek[1]

[1] Bahcesehir University, New Media, Istanbul, Turkey

This study examines how political and media discourse surrounding the Israel–Gaza war (2023–2024) circulates across the public sphere in Turkey and how these narratives are experienced and interpreted by Jewish communities in everyday public encounters. Focusing on the war coverage of two ideologically distinct online newspapers, the study analyses how political elite discourse shapes media framing and how these framings resonate beyond formal political communication. Rather than assuming a direct causal relationship between elite discourse and antisemitism, the analysis foregrounds the disjuncture between media–political narratives and their street-level interpretations.

The theoretical framework engages critically with contemporary debates on the conceptual boundaries of antisemitism, drawing on the IHRA Working Definition, the Jerusalem Declaration on Antisemitism (JDA), and the Nexus Project, alongside scholarship on "new antisemitism" (Cotler, 2002; Wistrich, 1990; Lerman, 2022). While these approaches diverge in their treatment of Israel-related speech, they converge on the importance of contextual interpretation and the distinction between political criticism of Israel and the targeting of Jewish individuals or communities. Building on this literature, the study conceptualizes antisemitism as a relational and context-dependent phenomenon shaped by the interaction between globally circulating war discourses and nationally specific political, historical, and media dynamics in Turkey (Aviv, 2017; Bali, 2013, 2021; Nefes, 2015; Öneren-Özbek, 2024). This perspective enables an analysis that accounts for both global patterns and locally embedded meanings without reducing the phenomenon to either level alone.

Methodologically, the study combines Critical Discourse Analysis of 1,319 news stories with in-depth interviews conducted with Turkish Jewish opinion leaders. This research design places media and political discourse in conversation with minority perspectives, allowing textual findings to be examined alongside lived experiences. The media analysis shows that political and media discourse largely remains within the register of criticism of Israeli policies and avoids explicit references to Turkey's Jewish population. However, interview findings reveal a marked divergence between media discourse and everyday experience. Participants highlight how ambiguous and repetitive frames—particularly regarding Zionism and the generalization of Jews—blur the boundaries between political critique and antisemitic targeting in daily interactions. Derogatory "Zionist" tropes in mainstream discourse thus unintentionally marginalize local Jews, increasing their vulnerability to street-level hostility.

By analyzing how political and media discourses circulate into street-level interactions during times of crisis such as the Israel–Gaza war, the study conceptualizes antisemitism not only as a media issue but as a democratic one. In polarization-prone public spheres, politically charged discourses are more likely to be reinterpreted through identity-based distinctions, producing uneven risks for minority communities. A core contribution of the study lies in documenting the lived experience of Turkey's Jews, marked by a condition of "conditional belonging" in which safety and recognition become contingent on regional developments. Interviewees articulate a range of coping and survival strategies—including strategic silence, cautious visibility, selective engagement with state institutions, and emerging forms of digital resistance—highlighting the fragility of democratic belonging under conditions of conflict.

CDE15 Contested Speech, State Authority, and Resistance in Digital Publics

PP 0956 Auditing state authority: YouTube cop-baiting as dangerous media

Michał Bukowski[1]

[1] Jagiellonian University in Krakow, Faculty of Management and Social Communication, Kraków, Poland

The paper explores the phenomenon of sousveillance, defined as the practice whereby ordinary citizens observe and record public spaces as a countermeasure to institutional surveillance. While the maintenance of public order is formally entrusted to state institutions such as the police, this allocation creates a structural asymmetry of power. Sousveillance partially disrupts this imbalance by enabling citizens to hold authorities publicly accountable—a capacity central to democratic theory. A prominent modality of sousveillance is cop-baiting, which involves deliberately staged police–citizen encounters, typically organised around photographing and recording public spaces to expose discrepancies between the law's formal provisions and its practical enforcement.

Empirically, the article examines such encounters as documented by "auditors," YouTube content creators who specialise in staging interactions with law enforcement. Analysis of multiple episodes reveals recurrent failures of situational control by police officers, often resulting in unjustified escalation of conflict and various forms of misconduct. The study also considers official police responses to these recordings and selected judicial rulings addressing the cases.

The phenomenon is interpreted through Immanuel Wallerstein's world-systems perspective, particularly his thesis on "taming the dangerous classes." This concept refers to the state's management of social groups whose collective action could destabilise the world-system's foundational dynamic: the endless accumulation of capital. Such management combines coercion and concession, aiming not to eliminate conflict but to contain it within politically and economically tolerable bounds. Crucially, this process has an epistemic dimension, realised through ideologies that shape how social reality is interpreted and contested, persuading the population to remain relatively patient (Wallerstein 2000).

From this perspective, sousveillance practices—and the media forms through which they circulate—pose a challenge to these epistemic mechanisms of governance. By exposing recurrent gaps between legal norms and their enforcement, auditors' recordings undermine interpretive frameworks that sustain institutional legitimacy. To conceptualise this dynamic, the article introduces the notion of dangerous media: media practices that destabilise the epistemic and discursive boundaries within which state authority is rendered intelligible and legitimate. Unlike oppositional media, their disruptive potential does not primarily derive from ideological content but from documenting routine institutional contradictions.

Auditors' YouTube channels exemplify dangerous media. Their recordings, durable and universally accessible, enable translocal and intersubjectively verifiable critique of policing practices, amplifying long-standing countercultural diagnoses of law enforcement. The article concludes by considering future trajectories: while some theorists view dangerous media as democratically empowering, a more pessimistic outlook anticipates intensified censorship and subtle epistemic coercion aimed at reasserting control over these disruptive practices.

CDE16 Digital Publics, Protest, and Political Participation

PP 1051 A digital revolution wouldn't be a bad idea

Des Freedman[1]

[1] Goldsmiths- University of London, MCCS, London, United Kingdom

Throughout history, theorists have regularly turned to the language of *revolution* in order to process enormous and rapid processes of technological change. Just as we earlier had the Gutenberg revolution, the Industrial Revolution, the transistor revolution and the PC revolution, we are apparently in the throes of a biotech revolution, a quantum 3D printing revolution, a nanotechnology revolution and of course, an AI revolution. Thanks to an interconnected series of developments – including blockchain, robotics, quantum computing and increased processing power – the digital has, it seems, been particularly vigorous in fostering a series of 'revolutions' in all areas of social, economic and political life.

This ongoing conceptualization of a 'digital revolution' raises a whole number of questions: about winners and losers, strategy and tactics, the environmental cost and social impact. Indeed, the consequences of the 'digital revolution' are often seen in terms of negative developments for democracy – in the shape of an increase in disinformation and political polarisation – rather than the positive externalities one might expect from a radical transformation of the status quo. But it also begs another set of questions: what constitutes a revolution and what distinguishes revolutions from other descriptions of change and transformation? What might be the difference between quantitative and qualitative shifts, and between progressive and exponential forms of change, when it comes to the impact of the digital on society?

To speak of a wholehearted 'digital revolution' would suggest that we are in thrall to a new 'informational' mode of production generating social relations that are distinct from those that preceded it. The paper, therefore, considers the extent to which the digital has facilitated the transfer of power not within elite groups but to other social groups who have remained largely marginalised and disempowered. It addresses the question of whether power has shifted meaningfully from control of resources and decision-making by a tiny minority or whether residual relations of power remain intact, indeed strengthened, albeit facing novel challenges (such as those we anticipate from GenAI).

This paper is based on research from my new book on *Capitalism and the Media*. Drawing on the work of Marx, Schumpeter and Raymond Williams (as well as contemporary writers on AI), it explores the relationship between capitalism and technological innovation. It further analyses the language and claims made about the 'digital revolution' and suggests that they are all too often prone to a form of technological determinism that misrepresents technological innovation as an inevitable and relatively depoliticised process. It critiques this essentialised understanding of the digital and instead reflects on what a more robust sense of revolution would look like for contemporary democratic societies.

CDE16 Digital Publics, Protest, and Political Participation

PP 1052 From TikTok to the streets and back: Connecting online and offline #8M feminist protest

Laura Cervi[1]

[1] Universitat Autonoma de Barcelona, Journalism, bellaterra- barcelona, Spain

Contemporary protest increasingly unfolds across interconnected online and offline arenas, where personalized, platform-mediated participation expands repertoires of contention by linking individualized expression to collective visibility and circulation beyond formal organizations and fixed collective identities. Within this context of digital transformation and reconfigured participatory pathways, this paper examines how platform-based practices intersect with street-level protest through an analysis of the global hashtag #8M on TikTok.

Traditionally associated with demonstrations for International Women's Day across diverse national contexts, the hashtag #8M functions as a key visibility device for feminist mobilization. On TikTok, at the time of data collection, the hashtag had generated more than four billion views, indicating its centrality within the platform's political and cultural ecosystem. Drawing on Askanius' typology of video activism, the study adopts a three-step qualitative research design attentive to TikTok's affordances and multimodal meaning-making. The analysis is based on a hashtag-based dataset of 2,000 #8M TikToks collected around International Women's Day, from which a purposive sample of 400 highly visible videos was selected for in-depth analysis. Using multimodal discourse analysis, the study examines how visual, audio, textual, and performative modes articulate protest meanings and strategies of visibility.

Findings show that #8M tiktoks operate as connective interfaces between street protest and platform participation, enabling both proximate and remote forms of engagement while facilitating transnational connections among feminist activists and audiences. Alongside videos documenting demonstrations or highlighting specific claims, users appropriate platform-native trends such as #getreadywithme and #makeupwithme, posting videos that document their preparation to attend protests. These videos provide practical guidance—ranging from how to draw feminist symbols to advice on safety and how to avoid police violence—while translating protest preparation into a highly shareable, algorithmically legible format that sustains visibility and collective identification.

At the same time, other creators deploy preparation-oriented videos as an alternative mode of participation when attending demonstrations is not feasible. Particularly among younger users facing constraints related to age, distance, safety, or parental control, these videos function as a means of expressing political presence and solidarity from a distance. In several cases, creators explicitly stage readiness for protest despite knowing they will not participate offline, embedding their performances within shared protest repertoires.

Theoretically, these findings challenge reductive critiques of slacktivism by demonstrating how platform-mediated participation can constitute meaningful democratic engagement when embedded in collective visibility, recognizable repertoires of contention, and transnational networks. By foregrounding the interplay between connective action, platform affordances, and protest visibility, the paper advances understanding of how contemporary feminist activism is negotiated across media environments within evolving democratic practices.

CDE16 Digital Publics, Protest, and Political Participation

PP 1053 Becoming citizens by design: Digital identification systems and the politics of access

Maud Rebergen[1], Rik Smit[1], Marcel Broersma[1]

[1] University of Groningen, Research Centre for Media and Journalism Studies, Groningen, Netherlands

This paper analyzes how digital identification systems become sites of political struggle over inclusion in digital societies. As public service delivery is increasingly mediated through digital technologies, digital identification systems have become critical gateways to welfare, healthcare, education, and democratic participation in societies worldwide. Drawing on the case of DigiD, the Dutch digital identification system, this paper examines how its technological and cultural affordances shape citizens' experiences of access and reconfigure citizenship as a practical, instrumental relationship with the state.

The Dutch case highlights how digital identification systems produce new mechanisms of exclusion and contestation around access. In the Netherlands, digital identification is positioned not merely as a technical solution but as a cornerstone of a new governance model rooted in automation, reduced bureaucracy and individual agency. Yet despite high levels of digital literacy and internet coverage, a substantial number of people struggle to access and navigate online government services. Approximately 4.5 million of the country's 17.5 million residents experience difficulties finding information about digital government services and are unable to use online public services effectively (Hoevenagel & Joossen, 2022). In particular, the use of DigiD generates exclusionary effects, potentially leading citizens to exclusion and deprivation of public services, rights and benefits.

To better understand how citizens experience access in such digitally mediated states, this study draws on approximately 400 hours of field observations conducted during consultation hours at public libraries and community centers, as well as during digital skills courses offered in public libraries. These observations were carried out in both urban and rural

contexts across geographically distinct regions of the country. In addition, the study is based on 32 semi-structured interviews with citizens who experience difficulties accessing public services online. This ethnographic data is complemented by a systematic walkthrough of the DigiD system (Light et al., 2018), examining its interface design, registration procedures, authentication mechanisms, credential management, and account termination processes.

This paper mobilizes Foucauldian concepts of governmentality (Foucault, 1991) and responsibilization (Juhila et al., 2017), together with STS insights into affordances (Gibson, 2015), to examine how digital identification systems govern access and reconfigure citizenship in practice. We argue that DigiD does not merely verify users' identities but actively produces distinctions between legitimate and illegitimate users by embedding normative assumptions about competence, autonomy, and responsible citizenship into its design. These assumptions redistribute access to rights and services, turning digital identification into a site exclusion. The paper contributes by demonstrating how digital identification systems function as infrastructural politics, reshaping citizenship and inclusion through everyday encounters with digital government.

CDE16 Digital Publics, Protest, and Political Participation

PP 1054 Protest against media as an instrument of media accountability

Igor Išpanović[1], Čedomir Markov[1]

[1] University of Belgrade, Institute for Philosophy and Social Theory, Belgrade, Serbia

In 2025, Serbian public service broadcaster RTS was blockaded for two weeks by demonstrators demanding fair coverage of student protests. A year earlier, demonstrations erupted in Hungary with calls for the "state propaganda factory" to be dismantled. Similar protests emerged in several European countries, including Italy, Poland, Greece, and Georgia, most commonly targeting public service media over perceived journalistic transgressions and a lack of professional autonomy. Amid widespread institutional and legitimacy crises, traditional (self-)regulatory mechanisms in journalism are increasingly perceived as ineffective, fueling citizens' dissatisfaction with media and mobilizing protest against professional and ethical breaches. While there is a substantial body of literature examining how media cover political protests, far less is known about what happens when the media itself becomes the target of protest. This contribution explores the potential of protest behavior to serve as a media accountability mechanism. The analysis begins with desk research documenting cases of protests against media organizations in Europe between 2008 and 2025. This timeframe captures key events and processes that have shaped contemporary legitimacy crises in journalism and democracy, including the global financial crisis, the rise of social media and artificial intelligence, democratic backsliding, and the proliferation of fake news discourse alongside the normalization of anti-media rhetoric. Across cases, we examine protest initiators, motives, targeted media types, protest duration and repertoires, as well as institutional and public responses. Theoretically, the paper draws on scholarship on political participation, social movements, and media accountability to conceptualize protest behavior as a distinct media accountability instrument in relation to both institutional (e.g., press councils and ombudspersons) and non-institutional forms (e.g., media boycotts and news comments). Finally, we examine selected cases in greater depth to illustrate how citizens mobilize to defend public interest journalism, while also showing how similar protest practices can be co-opted by populist actors to intensify anti-media rhetoric and exert undue pressure on news organizations. While we acknowledge that protest may entail democratic corrective, disruptive, and strategic potentials, we focus on its capacity to articulate accountability claims directed at media. The paper concludes by outlining a research agenda for studying protest-driven media accountability across different political and media systems.

CDE16 Digital Publics, Protest, and Political Participation

PP 1055 Build-a-Barron: The collective construction of political Persona. A case study of fan audience perceptions of Barron Trump

Alicia Navarro Hernández[1], Ike Picone[1]

[1] Vrije Universiteit Brussel, IMEC/SMIT- Vrije Universiteit Brussel, Brussels, Belgium

In an increasingly politically polarized world veering towards social media, the phenomenon of fandom in politics has garnered significant attention due to eroding boundaries between popular and political culture and a turn to "democratainment" (Van Zoonen, 2005), which have brought the proliferation of so-called "celebrity politicians". Research into political fandom has examined the phenomenon both in terms of "fan-based citizenship" (Hinck, 2019), or organized media

fandoms turning to civic action; as well as politicized fans (Dean, 2017), who show support for politicians by engaging in transformative participatory fandom practices (Jenkins, 1992) such as fanfiction, fan-produced stories that draw from the source "canon" text. Reactionary politics supporters particularly engage in these to construct far-right conspiracy theories like QAnon (Reindhart, 2022).

However, politicized fandom's impact on politicians' public personas remains less explored. To address this gap, this study examines discussions of Barron Trump, youngest son of US president Donald Trump, on the MAGA fan forum *The Donald*. Barron presents a boundary case, as despite little public information that could constitute fandom "canon" being available on him he has nonetheless garnered a following that hails him as the next president. By asking the question "How does political fandom happen when the core canon is extremely limited?," this paper employs qualitative content analysis to follow the process of real person fanfiction (RPF) construction, exploring the extent to which users' perceptions of Barron are grounded on the limited canon available and how fandom supplements the canon to create an office-worthy political persona.

Findings indicate that political fandom can exist regardless of scarce canon information available. Limited canon is circumvented by fans transplanting canon from Barron's environment (primarily his family and the MAGA movement) onto him complemented with comparisons to pop culture characters. Fan audiences do not necessarily need a politician's character traits to be openly displayed or stated in information produced by their team or media coverage. Rather, they are effectively capable of constructing their dream politician's persona almost autonomously, supplementing it with canon sourced elsewhere and their own constructions. This renders factual information on the politician subordinate to that which confirms the persona being built, potentially making fandom a gateway to disinformation and conspiracy theories. Barron's case also shows that some of the unverified traits that fans project onto their idol can have worrisome implications, such as legitimizing inheritance to transfer political power, which exacerbate some of the negative impacts on political violence and public trust that have already been associated with polarized politics.

CDE17 Platform Polarization, Algorithmic Publics, and Political Expression

PP 1150 Less mobilizing than polarizing: Populist appeals of top candidates and audience responses on TikTok during the 2025 German federal election campaign

Claudia Thoms[1], Julia Niemann-Lenz[2], Lara Hausy[1], Cindy Kielkopf[1]

[1] University of Hohenheim, Institute of Communication Science, Stuttgart, Germany
[2] German Centre for Higher Education Research and Science Studies DZHW, Research Infrastructure and Methods, Hannover, Germany

In the 2025 German federal election, young voters aged 18–24 showed strong support for populist parties. The Left and the AfD ranked first and second in this age group, receiving 25% and 21% of the vote (infratest dimap, 2025). This development has fueled concerns about political polarization, particularly in light of the strong presence of these parties on TikTok, which has become a central source of political information for young people (Böhmer et al., 2025). In this context, social media platform logics and populist communication strategies intersect. Platform algorithms tend to favor emotional, polarizing, and problem-centered content, which is more likely to generate interaction and reach (Klinger et al., 2023). Research further suggests that young users are disproportionately exposed to negative content, which may foster pessimistic worldviews and dissatisfaction with society (Kaye & Johnson, 2024; Sharma et al., 2022). Such dissatisfaction is associated with increased support for populist parties (Giebler et al., 2021).

Populist communication reinforces these dynamics by emphasizing crisis narratives, dramatization, and pessimistic visions of the future, often combined with blame attribution to elites or outgroups (Brubaker, 2017; Hameleers et al., 2017). Alongside pessimistic, future-oriented problem portrayals, recent research has highlighted nostalgia as an additional emotional component of populist appeals. Populist actors idealize a supposedly better past through nostalgia and use it as a reference point to restore lost stability or popular sovereignty (Frischlich et al., 2023; Steenvoorden & Harteveld, 2018; van Prooijen et al., 2022). Pessimism and nostalgia can thus be understood as complementary emotional resources within populist communication.

Against this backdrop, this study investigates how top candidates in Germany used TikTok during the 2025 federal election campaign and examines how pessimistic and nostalgic appeals, in combination with populist communication, relate to audience responses on social media. Rather than assuming that populism alone drives engagement, we explore how different communicative elements interact with platform dynamics and audience responses.

We draw on a quantitative content analysis of all 770 TikTok videos posted by the seven top candidates of all major parties, from the dissolution of the governing coalition until election day. Videos were coded for populist communication,

future-oriented pessimistic portrayals of societal problems, and nostalgic references. These content characteristics were linked to engagement indicators (likes, comments, shares) and to the emotional tone of user comments, assessed using RoBERTa-based sentiment analysis and LIWC measures. All analyses control for exposure and candidate-level differences using multilevel models.

Results show substantial variation between candidates in their use of populist, pessimistic, and nostalgic appeals. However, these differences translate only weakly into engagement. Nostalgic communication is consistently associated with higher levels of commenting, whereas populist and pessimistic communication do not function as independent drivers of engagement volume. Instead, populist communication is strongly associated with more negative emotional reactions in user comments.

Overall, the findings challenge the assumption that populist communication constitutes a universal engagement strategy on TikTok, suggesting that it is less mobilizing than polarizing and that platform dynamics and existing audience structures are key in shaping political engagement.

CDE17 Platform Polarization, Algorithmic Publics, and Political Expression

PP 1151 Shifting democratic grounds: Folk theories of algorithmic news selection on social media among young abstainers

Laura Iannelli[1]

[1] University of Sassari, Department of Economics and Business, Sassari, Italy

Research on democracy and digital media has largely focused on online participatory cultures and renewed forms of political activism, while scant scholarly attention has been paid to the media practices of citizens who do not participate in democratic life (Andersen et al., 2021; Woodstock, 2014). Yet non-participation represents one of the most significant threats to the quality of democracy. It is a complex phenomenon, as it can take traditional forms—such as abstention from voting—without necessarily indicating political disinterest or weak civic engagement. The limited body of research on the relationship between non-participation and digital media complicates efforts to counter this growing threat.

This study addresses this gap by examining the informational experiences of young Italians who were potential first-time voters in the 2022 Italian general elections but chose not to vote. Given that young people's encounters with political information are increasingly shaped by social media algorithms, the study focuses on their experiences of algorithmic news selection, drawing on the concept of "folk theories" (Eslami et al., 2016).

Folk theories are understood as cultural resources through which individuals make sense of how media operate and shape their engagement with digital information environments (Nielsen, 2016; Siles et al., 2020; Toff & Nielsen, 2018; Ytre-Arne & Moe, 2020). Studies of folk theories about digital algorithms remain limited and tend to focus on highly educated populations in high digital literacy contexts, overlooking citizens at the margins of political participation.

Focusing on Italy – a country with low digital literacy levels (European Commission, 2024) – this study aims to (1) identify the folk theories articulated by abstaining youth regarding algorithmic news curation on social media; (2) explore the contexts in which these folk theories are formed (civic cultures and reasons for abstention); (3) examine whether these young citizens develop strategies to resist or reinforce algorithmic news selection.

Eighteen qualitative interviews were conducted in May 2023 using a variation sampling strategy to account for sociodemographic differences.

An inductive and iterative analysis identified three main folk theories: "Practical but limiting algorithms", seen as useful yet restrictive of users' perspectives; "Predatory algorithms", perceived as attention-maximizing mechanisms; and "Functional algorithms", viewed as effective tools for delivering relevant information.

While participants showed widespread awareness of algorithmic personalization, differences emerged between "critical" and "detached" abstainers. Both groups expressed skepticism toward algorithmic news environments, potentially reinforcing political disengagement, but with distinct emphases. Critical youth—politically interested but disillusioned—frame algorithms as predatory and question platform asymmetries, while detached youth—whose abstention reflects broader civic disengagement—emphasize the impoverishment of the information experience. Rebuilding trust therefore requires differentiated strategies that consider these distinct folk theories and the contexts of non-participation in which they emerge. Finally, unlike findings from high digital literacy contexts, these theories appear to generate digital resignation rather than resistance.

These findings contribute to research on non-participation and shifting information environments, while offering insights for policymakers and educators. Folk theories can inform platform transparency policies and support digital literacy initiatives aimed at fostering critical engagement with algorithmic systems rather than resignation.

CDE17 Platform Polarization, Algorithmic Publics, and Political Expression

PP 1152 Seeing red – disruptive right-wing publics and polarisation in TikTok-comments

Esko Nieminen[1], Pekka Isotalus[1]

[1] Tampere University, Communication Sciences, Tampere, Finland

TikTok is currently one of the most topical social media platforms in modern democracies due to its ability to reach large, young audiences and the concerns over outside influences and the algorithmic nature of feeds. In Finland, the parliamentary elections of 2023 caused a major surge for the platform. At the same time, polarisation is also a trending subject in European social media and society, with TikTok being discussed as one of the drivers of this division. This study investigates whether TikTok comments reveal polarisation through the formation of disruptive right-wing publics alongside publics acting against disruptions during election campaigns. The theoretical framework of the study is based on existing work on right-wing counterpublics (for example Reijven et al. 2020, Toepfl & Piwoni 2015), with the added sensibility of utilising the concept of disruptive publics instead of counterpublics due to their importance to marginalised groups (Jackson & Kreiss 2023).

The dataset of the study consists of 58 TikTok videos from the five Finnish parliamentary parties that were present on TikTok before the 2023 parliamentary elections, along with the 3813 comments received by these videos. The comments are analysed through a framework designed to uncover right-wing discursive patterns, with the goal of identifying disruptive right-wing publics that form in the comment sections of TikTok videos. Disruptive publics are formed through calls for reformation, counter-positioning or identifying with a disruptive public. This study also seeks to uncover the concise language used by commenters and thus identify what constitutes different blocs through vocabulary choices.

The results indicate that a large disruptive public consisting mainly of right-wing commenters was present on TikTok. This public opposed other affiliations mainly by self-identifying with a disruptive public, even though other forms of disruptive commentary were also utilised. The language used by these publics was clearly tilted towards a confrontational position, thus polarising the comment sections. The study also revealed that there did not seem to be a singular right-wing disruptive public, but rather one that was driven by the nationalistic Finns Party, as evidenced by the language present on other right-wing parties' comment sections. On a broader scale the results indicate that disruptive publics have effects on both polarisation and discussion quality on TikTok, and that comment-based discussions are relevant spaces of identity work on a video-first platform.

COH01 Broadcasting: Public and Colonial Histories

PP 0750 Creating national soundscapes under colonial rule: Broadcasting in African languages in the Portuguese empire

Nelson Costa Ribeiro[1]

[1] Catholic University of Portugal, Faculty of Human Sciences, Lisboa, Portugal

This paper discusses how the first programmes broadcast in African languages in Mozambique and Angola brought an end to more than two decades of all-white radio in the Portuguese Empire in Africa. First aired in the late 1950s on private radio clubs, such programmes altered the colonial broadcasting *status quo* by allowing indigenous languages, music and oral traditions to be listened to on the airwaves. For this to be possible the radio clubs hired black announcers and producers who mastered the local languages that until then had been labeled as uncivilized by the colonial regime and therefore unworthy of being spoken on the microphones.

The programmes aired in African languages were received with high enthusiasm by the black population, especially in the capitals of Maputo and Luanda, where radio sets were more widely available in clubs and coffee shops. It was in these collective spaces that people would gather to listen and even to dance to the music aired in the broadcasts. As the paper will discuss, the success achieved by the programmes in Ronga (Mozambique) and Umbundu (Angola) was soon captured by the colonial regime and transformed into a tool of colonial control. Not only did the Portuguese authorities use such broadcasts as a symbol of how they were supposedly embracing the indigenous cultures of the African population, but they also initiated their own programmes in these same languages as an attempt to silence the voices of those who demanded the independence of the colonial territories.

Based on archival research conducted in Lisbon, Luanda, and Maputo, and on oral interviews with former radio producers and announcers, the presentation will argue that the programmes first aired in the mother tongues of the black populations in the Portuguese Empire were marked by ambivalence: while they allowed for a preview of Mozambican and Angolan soundscapes, they also served the colonial agenda by promoting Portuguese language and culture along with the regime's propaganda. The historiographic research that will be presented will be discussed through the framework of entangled media histories (Cronqvist & Hilgert, 2017) as it will be argued that the case of broadcasting in the Portuguese Empire can only be understood when considering that radio programmes were part of an assemblage of different media used both by the Portuguese regime and the independence movements during the 1950s and 1960s. Ultimately, the paper will question to what extent the broadcasts became a battlefield between those who aimed to use them to promote and those who aimed to counter the creation of African national soundscapes.

COH01 Broadcasting: Public and Colonial Histories

PP 0751 The denial of shame or acknowledging without avowing: An interpretation of the shifting positions of those responsible for the censorship and destruction by burning of a TV series

Serkan Savk[1], A. Özgür Gürsoy[2]

[1] Izmir University of Economics, Cinema and Digital Media, Izmir, Turkey
[2] Izmir University of Economics, New Media and Communication, Izmir, Turkey

The adaptation of Kemal Tahir's (1910–1973) *Tired Warrior* novel (hereafter *TW*) to a mini-series by the Turkish Radio and Television Corporation (TRT), its subsequent destruction by burning in 1983, and its eventual broadcast a decade later through a copy preserved from that burning, together constitute one of the most striking and revealing episodes in recent Turkish history.

The filming of *TW* began in late 1979 and took two years to complete. During production, the September 12, 1980 military coup took place, and the country was subsequently ruled for three years by a junta composed of senior officers of the Turkish Armed Forces. From the very beginning, the *TW* project became a subject of controversy both within TRT and in the national press. These debates intensified during the post-production phase, which continued under the military junta. Although *TW* had become increasingly contentious, post-production was somehow completed in May 1983. Nevertheless, the series was neither broadcast nor was any air date announced. A few months later, Macit Akman, the TRT Director General appointed by the junta government, told a journalist that *TW was destroyed by burning*. This statement triggered a long-standing controversy that continued well into the mid-1990s over who had ordered the burning of *TW* and why.

The debates surrounding the alleged "objectionable" nature of *TW* revolved around two main issues. The first set of objections concerned Kemal Tahir's worldview and his interpretation of Ottoman-Turkish history. The second set of objections related to how certain historical figures and events from the period between 1918 and 1920 were represented in *the novel and the series*. Despite all the controversies, the true reasons behind the destruction of *TW*, and the identities of those responsible, have remained unclear.

This paper proposes a conceptual framework for reading this process as a long, strangely *self-exculpatory* conversation that enables us to illuminate the shifting positions of the people responsible for the censorship and destruction of a cultural artefact. The historical resources including official statements, media coverage, memoirs, and interviews show a recurrent

pattern: the very actors who later admit that destroying a film is "unacceptable" simultaneously disown or dilute their own implication by appealing to institutional chains of command, conjunctural pressures, or the presumed self-evidence of the national interest. We call this pattern *acknowledging without avowing*: a mode of retrospective speech in which the wrong is named, yet shame, agency, and reparative responsibility are displaced.

For interpreting this entangled chain of hierarchy, responsibility and later denial, we build on Theodor Adorno's reflections on "coming to terms with the past" (Adorno 1998) and the speech-act theory (Austin 1962; Searle 1969). We argue that such utterances perform precisely the opposite of what they seem to promise: instead of binding actors to the past, they de-particularize the act and distribute it across a faceless apparatus—exactly what happened here, where responsibility expands from TRT bureaucrats to the junta leadership until it becomes almost abstract.

COH01 Broadcasting: Public and Colonial Histories

PP 0752 Institutional shifts and media convergence: Latvian radio's path into unified public media

Marita Zitmane[1], Vita Zelče[1]

[1] University of Latvia, Department of Communication and Information, Riga, Latvia

In 2025, Latvian Radio marked its 100th anniversary—an emblematic moment that simultaneously signified the end of its existence as an independent public media institution. In the same year, Latvian Radio was legally integrated into a newly established unified public service media organisation, Latvian Public Media, alongside Latvian Television and digital platforms. This paper examines the historical and institutional significance of this transition, situating it within the long and complex trajectory of Latvian Radio's development from its founding in 1925 to its incorporation into a convergent public media structure.

Drawing on an empirical communication history approach, the study focuses on the final phase of institutional transformation between 2009 and 2025, while contextualising this period within Latvian Radio's century-long history. The analysis is based on archival documents, media policy texts, institutional reports, public debates, and selected oral history materials collected within the research project *Latvian Radio 100*. The *Latvian Radio 100* project represents a major scholarly collaboration between the University of Latvia and Latvian Public Media (LSM), led by Professor Vita Zelče and an interdisciplinary research team. As part of the centenary commemorations of Latvian Radio. The project produced a comprehensive history of Latvian Radio throughout its existence. This project makes a significant contribution to the study of Latvia's media history by offering an empirically grounded and widely accessible account of one of the country's most enduring public communication institutions.

Theoretically, the paper engages with media history scholarship on institutional continuity and change, including cyclical models of media development, to explore how historical legacies shape contemporary media transformations. The study employs a mixed historical methodology combining extensive archival research, analysis of periodical press and institutional documents, oral history interviews, and selected sociological surveys on media use and audience practices. This multi-source approach enables a contextualised reconstruction of Latvian Radio's institutional, political, and cultural development, as well as its changing relationship with audiences across different historical periods.

The findings highlight how the unification process was marked by shifting political, technological, and geopolitical conditions, as well as by internal professional tensions. Particular attention is paid to the symbolic and practical implications of institutional dissolution, including staff resistance, emotional attachments to the historic Radio House in Riga, and concerns over editorial autonomy within a larger organisational structure. The paper also addresses the closure of Latvian Radio 4, the Russian-language service, as a critical moment in the transformation process, reflecting broader debates on language, security, and public service media responsibilities in a changing geopolitical environment.

By examining the centenary of Latvian Radio as a moment of rupture rather than celebration alone, this study contributes to communication history by demonstrating how public media institutions negotiate continuity, memory, and legitimacy at times of structural change. More broadly, it responds to the ECC 2026 theme *Shifting Grounds* by showing how historical institutions are reconfigured through choices, connections, and contested futures in contemporary public service media systems.

COH01 Broadcasting: Public and Colonial Histories

PP 0753 COMMEM-CON: Analysing Dutch Commemorative Configurations Through Public News Broadcasting (1925–Present)

Pieter Van den Heede[1], Berber Hagedoorn[2]

[1] Erasmus University Rotterdam, History Department, Rotterdam, Netherlands
[2] University of Groningen, Research Centre Media and Journalism Studies CMJS, Groningen, Netherlands

Which events do societies publicly commemorate and why? This question has been central to the field of memory studies since the 1980s. What the available scholarship on the topic has shown is that public commemorations, on the (trans)national level and beyond, are fundamentally contested and subject to major shifts over time, in terms of what is

commemorated, how, and why. Assmann (1997) identified scholarship in this area as mnemohistory, i.e., the study of how public remembrance has evolved from past to present (Tamm, 2013).

While mnemohistory has become a prolific tradition in memory studies, most available studies provide historical analyses of specific case studies (see for example analyses of Dutch National Remembrance Day: Raaijmakers, 2018). What is lacking are broader studies that take a distant reading-approach as starting point, to provide wider overviews of how specific local, (trans)national and other, commemorative configurations have evolved over time. Studying how Dutch commemorative discourse has evolved via public news broadcasting since the emergence of the latter provides a promising starting point for such an approach.

In this paper, we present the preliminary findings of the CLARIAH fellowship project 'COMMEM-CON: Analysing Dutch Commemorative Configurations Through Public News Broadcasting (1925-Present)'. This project explores how distant reading methods, and digital text mining in particular, can be used to study mnemohistory. The main empirical question is how commemorative discourse in Dutch public news broadcasting has evolved since its early beginnings (for radio around 1925 and television around 1956). The study combines the study of historical culture and natural language processing (NLP) to analyse which people, events, and entities have been commemorated through Dutch public news broadcasting. The research uses the CLARIAH Media Suite to analyse a large corpus of radio and television news bulletins.

In this paper, we present the preliminary results of two key analyses: a Named Entity Recognition (NER) analysis to identify commemorated entities, and a Topic Modelling (TM) analysis to find main themes in public commemoration. We visualize the results using commemorative maps to show geographical patterns and mnemonic density graphs to display changes over time. This research aims to provide an innovative way of studying how public remembrance has evolved in Dutch media through the use of digital humanities methods.

COH01 Broadcasting: Public and Colonial Histories

PP 0754 Tracing the evolution of discourse on the purposes of television archives of estonian public broadcasting

Hanna Šein-Meier[1]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

Although television has been criticized for its ephemerality, it is its focus on the here and now that makes it so valuable as a memory medium. It records everyday life, leaving behind an invaluable collection of artefacts in its audiovisual archives. These in turn play an important role in the reproduction of cultural memory. Using television archives to make judgements about the culture and society in the past must, however, be approached with caution, as archives are never neutral collections. Technical and economic reasons, issues of archival appraisal and even chance and personal relationships can influence what has been preserved.

Although some of those topics have been studied before, the evolution of television archives remains largely unexplored in Estonia and other countries with similar histories in Eastern Europe. In addition, while a lot of the international literature focuses on looking back at the past from the present, this paper proposes an additional approach - using Foucauldian discourse analyses of institutional management documents from the past seven decades and qualitative interviews with current and former employees of the organisation. Document analysis helps to understand how the discourse on the purposes of television archives has changed over time and what conditions have influenced this evolution. Interviews are used for further contextualisation and explanation through lived experiences.

The paper shows that while today the archives of Estonian Public Broadcasting are often seen as a public good, their roles have historically varied from a production storage to a guardian of cultural heritage and to a source of profit. The changes in the discourse reflect the regulations, technological developments, shifts in the organisation and society on a wider scale. The results give a unique perspective into understanding how archiving television has changed over time and how these historical circumstances may have conditioned the shaping of cultural memory later and specifically in the present.

COH02 Shifting Grounds of Media History: Technologies, Texts, and Practices

PP 0859 Artificial intelligence at the gates. A semi-systematic literature review of how AI can (or cannot) shift the grounds of media history

Deborah Barcella[1], Riccardo Ferrigato[2]

[1] USI Università della Svizzera italiana, Institute of Media and Journalism, Lugano, Switzerland
[2] USI Università della Svizzera italiana, Faculty of Communication- culture and society, Lugano, Switzerland

Over the past few years, artificial intelligence (AI) has experienced increasing adoption in education and academic research. In historical research, its introduction has been discussed not only in terms of technical support for research activities but also for the way it intersects with long-standing debates about historical methods, including source selection, interpretation, contextualization, and the epistemic status of historical knowledge (Sternfeld, 2023). Historiography has repeatedly emphasized that historical facts and sources are not neutral but produced through methodological decisions, acts of selection, and interpretive frameworks. Reflections on the digital turn further suggest that an increasing dependence on computational methods may obscure these choices by turning them into technical tasks and data-driven operations (Raines, 2025). At the same time, as historical analysis relies heavily on language, imagery, narrative construction, and interpretive judgment, studies stress that AI-based methods cannot be straightforwardly transferred from other disciplines and must be understood as analytical tools of human-machine collaboration in which interpretive responsibility remains with the historian (Yao, 2025). This tension, however, is often marginal in AI-driven historical research, including media history, despite the growing urgency to define conditions for its meaningful integration.

As a contribution to this ongoing discussion this article explores, through a semi-systematic literature review (Snyder, 2019), how AI has been conceptualized and used in historical research across adjacent fields. Drawing on a structured and transparent search strategy, the review synthesizes a heterogeneous body of literature composed by articles in humanities and social sciences published from 2022 to 2025. This corpus is analyzed through thematic analysis, combining deductive and inductive approaches (Braun & Clarke, 2006), focusing on conceptualizations of AI, the types of sources and of AI tools used, the phases of the research interested, and whether methodological and epistemological issues are explicitly discussed.

Preliminary findings indicate recurring patterns. Definitions of AI are often implicit or inconsistent, and the sources analyzed with AI are predominantly textual, with visual and audiovisual materials only marginally addressed despite their methodological significance for media history. Moreover, in historical research, AI mainly been used as workflow infrastructure to enhance analysis or provide research support, with interpretive authority remaining explicitly human. Nevertheless, fundamental historical tasks like source selection, categorization, and pattern detection are often embedded in modeling and preprocessing choices and not always recognized as critical decisions to be taken consciously by historians. Although transparency and ethical issues are sometimes considered, ongoing engagement with source criticism, context, and gaps remains unevenly limited. Generally, there seems to be a lack of in-depth and much-needed reflection on the methodological and epistemological consequences of using AI tools in historical research.

In conclusion, this paper shows that the growing use of AI in historical research has not been accompanied by an equally robust methodological reflection and reveals recurring patterns that remain obscured in single-field studies. Finally, the article articulates an agenda aimed at supporting media historians in the critical use of AI, offering guidance, not best practices, for addressing these gaps and for integrating AI into media-historical research.

COH02 Shifting Grounds of Media History: Technologies, Texts, and Practices

PP 0860 Embodied historiographies of absence: Walking, listening, and play in postcolonial Lisbon

Rui Antunes[1]

[1] Universidade Lusófona, CICANT, Lisbon, Portugal

This paper examines walking, listening, and playful participation as methodological tools for communication history through two Lisbon-based works: *Immemorial*, a performative audio-walk narrating suppressed colonial histories, and *Memorial*, a pervasive game engaging with the delayed construction of an official slavery memorial. Rather than treating these works as cultural artefacts, they are approached as innovative situated historiographic methods that mobilize embodied movement, locative media, and audience participation to interrogate historical continuities in mediated remembrance and public silence.

Lisbon is positioned as a palimpsestic communicative space where urban infrastructures function as conduits of imperial power and contested meaning. From maritime trade networks to contemporary heritage tourism, the city's communicative ground has shifted while reproducing patterns of selective visibility and silence. *Immemorial* and *Memorial* disrupt these inherited paths by reactivating embodied listening and playful participation as historiographic strategies. Both works foreground absence and fragmentation as historically grounded conditions of Portuguese public memory.

Drawing on Pierre Nora's concept of *lieux de mémoire*, the paper argues that Portugal's memory of slavery is structured less by commemoration than by dispersal and absence. In a postcolonial urban context, memory emerges through fractured,

unstable sites shaped by colonial amnesia. *Immemorial* temporarily reactivates these latent sites, producing contingent *lieux de mémoire* through performative activation of sound and movement. Walking functions as an archival practice that counters official historical narratives by privileging situated, ephemeral forms of mediation.

In *Immemorial*, historical knowledge emerges through spatial coincidence and sensory alignment rather than chronological mastery, producing ruptures that unsettle dominant imperial imaginaries embedded in the city. In line with Benjamin's critique of historicism, this approach frames walking as a mode of historical reception that interrupts linear narratives of progress and national exceptionalism, privileging experiential encounter over teleological continuity.

Paul Ricoeur's theory of memory, forgetting, and narrative responsibility is useful to analyse *Memorial*. The indefinite postponement of Lisbon's slavery memorial is interpreted as institutional forgetting enacted through bureaucratic discourse and temporal deferral. By translating this condition into a playable structure, *Memorial* exposes how postcolonial memory acknowledges historical violence while indefinitely delaying reparative action. Participation becomes a way of navigating "difficult memory," revealing how responsibility is negotiated and deferred in public communication.

Methodologically, the paper treats walking paths, interruptions, and absences as archival materials for cross-temporal analysis of post-imperial memory politics, and contemporary locative media. By reframing walking, listening, and play as historically embedded modes of mediation, we highlight a new historiographic approach in communication history and contribute to postcolonial debates on power and participation. Embedding contemporary locative media within enduring communicative infrastructures, the paper shows how experimental practices unsettle dominant narratives of progress while revealing persistent patterns of mediated absence and institutional forgetting across time. Ultimately, such practices operate as historiographic tools that challenge historical exceptionalism. Attending to paths, connections, and participatory futures enables a critical understanding of how urbanism and media have historically helped shaping the grounds on which public memory and responsibility are negotiated.

COH02 Shifting Grounds of Media History: Technologies, Texts, and Practices

PP 0861 On the historiography of text-image relations: A long-term view

Espen Ytreberg[1]

[1] University of Oslo, Department of Media and Communication, 0317 Oslo, Norway

The relationship between text and image is a longstanding discussion in the Humanities. At several historical junctures it has been renewed as a result of media developments. The first media revolution of the 19th century brought reproducibility into the equation, and the medium of photography made it possible to put a variety of visual media together on the pages of a book. In the 1960s, challenges to existing cultural divides brought a still wider range of images from high and low culture together. Then from the 1990s came the second media revolution where digitalisation promised to unite all media with limitless freedom, where book pages became Web pages and all media could mingle on them.

In short, a history of placing images and text together exists that is a history of media technologies, as well as a cultural, social and political history. There is also, or at least there should be, a historiography of text/image relations, since intellectuals, historian, media historians and rhetoricians have long discussed the possibilities and pitfalls of communication that combines text and image.

This presentation starts off by discussing two main ways of understanding the long-term developments of text-image combinations. One emphasises change: it sees the tradition of institutionalised disciplines in the Humanities like history and philosophy as placing their prestige and epistemological hopes squarely with text-based media. This is then thought to have changed gradually from the 1960s, and particularly with the interdisciplinary «visual turn» from the turn of the millennium. Disciplinary expressions of this turn include visual communication and visual history, to some extent also media history.

A critique of this line of historiographic thinking is then made, arguing that it represents a variety of presentism, and that the discipline of history contains a number of significant counterexampes. Image-based discussions on book pages in fact existed already in the 19th century, and adventurous experimentations with text-image combinations at least from the early 20th. On this basis, an argument is made that intellectually ambitious image-text combination has been a constant, more than a variable, from the 19th century into the age of electronic media, and also into the digital era, where fundamental text-image relations have been repeated, more than transformed.

Throughout the presentation, illustrative examples are drawn on from historical and media-historical works. Three seminal cases of ambitious and reflexive text-image combination are particularly highlighted: Aby Warburg's photography-based, early 20th century *Mnemosyne Atlas*, John Berger's *Ways of Seeing* television and book project from the early 1970s, Roland Barthes' reflections on photography from the same period, and a major digital humanities Web resource from the early 2000s, *Feral Atlas*.

COH02 Shifting Grounds of Media History: Technologies, Texts, and Practices

PP 0862 Critical pieces of the functionalist puzzle: How women researchers can shift our field's historical grounds

Esperanza Herrero[1], Leonarda García Jiménez[1], Peter Simonson[2]

[1] Universidad de Murcia, Departamento de Comunicación, Murcia, Spain
[2] University of Colorado Boulder, Department of Communication, Boulder, USA

The history of communication studies has frequently relied on overly simplistic narratives to explain the field's development. As a result, we have often reinforced disciplinary centers and peripheries, as well as a limited set of canonical figures both in our teaching and scholarly research (Pooley & Park, 2013). In turn, our traditional historiography has transformed what was once a diverse, heterogeneous, and plural field into a narrow, singular, and monolithic disciplinary imaginary (Park & Pooley, 2008). We argue that this highly fragmented history has hindered longstanding calls for a more dialogical and reflexive field of communication research (e.g., Waisbord, 2019 & 2025).

Within these dominant historical narratives, Lazarsfeld's Bureau of Applied Social Research (BASR) at Columbia University has been positioned as a pivotal turning point in the field's history and as the primary citational authority to represent its embraced functionalist American origins (Pooley & Park, 2013). At the same time, other contemporaneous schools —most notably the critical Frankfurt School— were framed by early historians as Columbia's ideal counterpoint, thereby establishing a foundational dialectic that supplied the epistemic tension necessary for consolidating the identity of a young field. This oppositional framing persisted, despite existing evidence of intellectual exchange across paradigms (Robinson, 2010). Subsequent scholarship has reinforced this dichotomy, turning it into a rhetorical device that obscures the field's longstanding diversity and multi-paradigmatic character.

We argue that recovering marginalized figures in the field's history—particularly women scholars—can help us uncover dismissed aspects of its intellectual development, including early interactions between different paradigms, scholars, and institutions.

The main objective of this study is to identify early points of interaction between functionalist and critical approaches in communication research by examining the work of women scholars. To this end, we employ a critical-hermeneutic archival research methodology across 7 archives in Europe and North America. Our analysis draws on 354 documents (2304 pages), including grey literature, correspondence, and personal materials associated with scholars associated to both the BASR and the Frankfurt School.

Our findings identify a group of 5 women scholars at Columbia's BASR whose work was informed by early critical perspectives on communication and the media during the 1940s and 1950s. These scholars include Katherine Wolf (1904–1954), Marie Jahoda (1907–2001), Herta Herzog (1910–2010), Marjorie Fiske (1914–1992), and Hazel Gaudet (1908–1975). Adopting a socio-epistemic approach, we focus on: (1) recovering these women's figures for the broader history of the field; (2) critically examining the eclectic and critical work they produced within the BASR; and (3) analyzing how they articulated early interpersonal and intellectual networks linking functionalist and critical scholars.

In conclusion, we propose a more nuanced reading of early interactions between functionalist and critical thought, arguing that women scholars played a significant role in shaping the field's history. We also draw attention to the still largely unexplored early transatlantic intellectual interconnections in communication research across the Columbia and Frankfurt Schools. Ultimately, historical evidence of early paradigmatic diversity underscores the need for more complex and plural approaches to communicative phenomena moving forward.

COH02 Shifting Grounds of Media History: Technologies, Texts, and Practices

PP 0863 There is no "real time": The long history of the dream of instantaneous communication

Jerome Bourdon[1]

[1] Université Paris Panthéon Assas, CARISM. Interdisciplinary Center for Media Research and Analysis, Paris, France

In my presentation I will discuss the notion of 'real time' in interpersonal communication. In other words, I will talk about the idea of a near-instantaneous exchange of information between people, made possible by technology. I will make both a historical and a theoretical point.

Beginning with the historical perspective, I will show that the aspiration for immediate communication through technology began with the first epistolary systems in ancient empires (Radner, 2014), and a recurring metaphor emerged: letters (or messengers) were depicted as winged creatures or carried by such beings, including birds, winged humans, angels and dragons. The concept of such winged letters was far more prevalent than the actual use of pigeon post. In the Renaissance, with the creation of postal systems open to the public, the postal system (our 'snail mail' today) became the incarnation of speed. Several phrases emerged at this time in European languages, such as the French 'en poste' and the English

'posthaste' (Behringer, 2006). This was paralleled by the rise of clock time, which allowed a precise measurement of delay, a yardstick for the appreciation of increased speed of transmission. The telegraph, a major technological and discursive turning point, was said to herald the 'annihilation of space' and/or the 'death of distance'. These themes have been repeated ever since with regard to various technologies, such as the telephone, wireless telegraphy and radio, and most recently the internet (Cairncross, 2001).

From a theoretical point of view, I will argue that the phrase 'real time' is less about technological capacity than about an unfulfillable promise. Technology repeatedly fails (from ancient letters to the internet), and waiting is a constant feature (see, for example, Alexander, 2017). Furthermore, the desire for immediacy can be linked to an ideal of communication as fusion (Peters, 1999), which is hindered by the reality of separate bodies.

In this regard, the history of technology cannot be considered in isolation from the history of religion and spiritual traditions, which have attempted to overcome this reality. These efforts paralleled those of technology. For example, research on telepathy (then a new term) flourished at the end of the 19th century.

Thus, what makes our present time unique is less the fullfilment of the dream than the extreme tension between this dream and our inability to achieve instantaneity despite our much-hyped "advanced" technology.

COH03 Infrastructures, Networks, and Archives

PP 0965 Sensible archives? Capturing experience and affect in born-digital archives

Emmanuelle Bermes[1], Christian Schwarzenegger[2]

[1] Ecole nationale des chartes, Centre Jean-Mabillon, Paris, France
[2] University of Bremen, Lab Media Change and Long-Term Transformation Processes, Bremen, Germany

The digital culture of the late 20th century until the early 2000's, including practices such as blogging and gaming, is now fully recognized as part of our cultural history. It has contributed to shaping our modern digital world, where digital interfaces and artificial intelligence have become day-to-day tools. Most of today's adult European citizens have grown up with video games and the early Web, building their digital skills as new communication channels started to emerge. To help communication historians analyse and understand these evolutions, cultural institutions such as national libraries have built born-digital archives in order to preserve web pages, video games and online videos.

When setting ourselves to studying these archives with an historical perspective, we discover an often underacknowledged issue: we are lacking a major element that is hardly captured in the sources, namely experience. Digital material is highly dynamic and interactive and its use often implies communication activities and online relationships in addition to documentary content. Born-digital archives embed conversational aspects – through comments, backchannels, reciprocal links, virtual environments, etc. – and emotional aspects related to their social nature. Documenting the experience of these conversations and associated emotions – how the experience was felt and what it meant at the time – is key if we want to understand how they fit in the broader landscape of social and cultural changes across the past 40 years.

Beyond traditional ways of documenting experience (through secondary sources such as oral archives, newspapers and magazines, social networks…), we are experimenting with new ways to collect evidence of the emotional and conversational nature and impact of blogging and gaming practices and how to adequately incorporate them in digital archives.

In our research on digital gaming archives, we focus on participatory and ephemeral practices within games and among gamers, foregrounding social interaction, emotional engagement, and networks of communities and practices around (retro) gaming. In particular, we examine how retro gaming communities actively reflect on emotional genuity and the original feel of play as a way of securing what they perceive as authentic gaming experiences. Through citizen science and co-creation formats, we document how these communities articulate emotional impact, cultural significance, and gaming memories, and how such experiential markers can become relevant for archival descriptions.

Within the SkyTaste project, we use art-based research to develop a sensible approach to web archives, building on methods such as situated research, metaphoric mapping, and empathetic exploration. "Sensible" can be understood as a twofold approach: one that acknowledges the sensitive nature of emotional and intimate archived material, and one that uses the senses (sight, hearing, touch) as a way to create a direct connection with the archive, not mediated by reflection or analysis. Sensible approaches raise new historical questions or help hypothesis emerge for future research. They lead us to having

a different perspective on the archive, acknowledging different viewpoints or pointing us to yet unseen details. Finally, they can open pathways for new archiving initiatives and for the dissemination of research results towards a wider audience.

COH03 Infrastructures, Networks, and Archives

PP 0966 Networking and supercomputing centres: The case of CINECA in redefining human-technical networks in a pre-Internet era

Lara Marziali[1]

[1] Politecnico di Milano, Design, Milano, Italy

The aim of my presentation is to historicize supercomputing centres as sites of experimentation for networking environments, focusing on the 1980s. I will use the term "network" both in the technical (connectivity) aspect than the human (relational) one. The purpose is to underscore how, within the specificities of supercomputing centres, technological developments in data networks and communications shaped and were shaped by human networks (the communities crossing those centres).

Supercomputing lies at the heart of simulation sciences (Edwards, 2013), but supercomputing centres are nowadays also important sites for the ecosystem of generative AI as well (see the *Cartography of generative AI* project: https://cartography-of-generative-ai.net/). Furthermore, supercomputing centres' importance in fostering what's the Internet today has been underlined by Abbate (1999) and Weber (2019). Data networks are central within supercomputer centres, because supercomputers produce a large amount of data, but it is produced within a central point that needs to be connected to other research institutions. In solving one issue – computational power – scientists and computer scientists had also to tackle the other: how to transmit the data generated by that computational power. Supercomputing centres, moreover, had to find solutions between machines that relied on different hardware and software architectures (Edwards 2013; Gugerli and Wichum 202).

The connectivity problems, however, can also shed light on which relational networks were part of supercomputing centres: where and what to connect. Based on my ongoing PhD research on the history of CINECA, one of the main supercomputing centres in Italy, I will retrace CINECA's attempt in creating a connection system within the centre and the institutions surrounding it, before the Internet era. CINECA's effort in building its network then can be defined in two ways:

- The technical network: the need to wire and connect all the machines within the centre, when everyone of those machines had different operating systems
- The human network: the need to dialogue with all the different scientific communities that used CINECA's machines.

Historicizing supercomputing centres, then, means understanding how supercomputing gathered specific networks of interests tied to objects and infrastructures, as conceptualized by Gießmann (2024). It will also serve as a specific case study for the struggles of a pre-Internet era, starting from specific institutional needs (such as CINECA's). Within communication histories, supercomputers can be an interesting site of analysis and, possibly, a specific media: one that make possible scientific and big data processing.

COH03 Infrastructures, Networks, and Archives

PP 0967 The siren-radio media ensemble and the emerging protocols of Swedish preparedness communication 1930–1960

Marie Cronqvist[1], Emil Stjernholm[2]

[1] Linköping University, Department of Culture and Society, Linköping, Sweden
[2] Lund University, Department of Communication, Lund, Sweden

This paper examines the emergence of sound-based preparedness communication in Sweden between the 1930s and the early Cold War, placing emphasis on the siren and public service radio as interlinked media technologies. Rather than approaching media preparedness as a set of messages or prominent campaigns, the paper explores the sonic alarm system as a historically contextualized infrastructure composed of technological challenges and negotiated social protocols. As Lisa Gitelman (2006) argues, a cultural-historical perspective on media history warrants emphasis on the transforming social, cultural, and material conditions that have shaped communication over time. From this perspective, it follows that researchers should be sensitive to the dynamics of media as a combination of technology and social protocol, the latter signifying the values, norms, uses and practices surrounding media technologies. In addition, the paper makes use of the concepts of logistical media (Peters 2015; Hockenberry, Starosielski & Zieger 2021) and communication maintenance (Edgerton 2007; Balbi & Leggero 2025), both addressing the way media organize and arrange things and people. Thereby,

attention is directed in equal terms to the upkeep of this particular communication infrastructure, and the cultural habits and mentalities associated with it.

Empirically, the paper combines two strands of historical analysis. The first examines the siren as a new sonic medium of urban civil protection in the age of air warfare, tracing how its meaning was negotiated through testing routines, instructional campaigns, and debates in the press. The second strand analyzes the role of the Swedish public service broadcaster, Sveriges Radio, in translating the alarm into authoritative information. Drawing on archival material from the public service broadcaster and the Swedish psychological defence, we show how radio was positioned as a trusted medium to which citizens were instructed to turn to once the siren sounded. Focusing on the period 1930 to 1960, the paper situates this siren-radio media ensemble (Ytreberg 2014) within broader transformations of Swedish preparedness culture and total defence thinking, highlighting the emergence and consolidation of an organized, systematic approach to media preparedness in an age of total war.

COH03 Infrastructures, Networks, and Archives

PP 0968 From ruins to networks: NATO, telecommunications, and military integration in the early 1950s

Mandy Tröger[1]

[1] Universität Tübingen, Institut für Medienwissenschaft, Tübingen, Germany

This paper offers a historically grounded examination of NATO's role in shaping communications infrastructures, with particular emphasis on the Alliance's formative period in the early 1950s. While NATO has been widely studied as a military and political institution, its influence on national and transnational telecommunications has remained largely overlooked. Drawing on archival research, the paper argues that communications were not merely a technical support function but a foundational element of NATO's operational capacity and a significant driver of postwar infrastructural reconstruction in Western Europe.

In the immediate aftermath of World War II, Europe's communications networks were severely damaged, underinvested, and fragmented. Telephone penetration was low, long-distance calls unreliable, and waiting lists extensive across major NATO member states such as the United Kingdom, France, and West Germany. Against this backdrop, NATO's creation in 1949 coincided with a broader US-led strategy to consolidate Western Europe politically, economically, and militarily. Alongside the Marshall Plan and other initiatives of Cold War containment, NATO emerged as a mechanism to integrate Western European defense under US leadership. Effective telecommunications were indispensable to this project, as alliance strategy depended on the rapid coordination of forces, intelligence sharing, and command-and-control across national borders.

During the early 1950s, NATO identified two urgent communications priorities: the construction of a reliable "signals communications infrastructure" and the coordination of that infrastructure across heterogeneous national systems. Beginning in 1950, the Alliance launched a rapidly expanding program of communications projects, increasing from several dozen annually to hundreds by the mid-1950s. These initiatives included landlines, radio relay circuits, and early radio networks distributed across allied territories from Northern Europe to the Mediterranean. Importantly, NATO did not build a fully separate system; instead, it planned communications that would interoperate with national military networks and, crucially, with civilian telecommunications infrastructures.

This dual-use approach meant that NATO communications projects simultaneously served military objectives and peacetime European communications. By the mid-1950s, NATO projects were expected to add tens of thousands of kilometers of new lines and circuits to existing civilian networks, representing a substantial contribution to Europe's postwar recovery.

Nevertheless, the early NATO communications buildout was neither smooth nor unified. Disagreements among member states (over issues such as cost-sharing, West German rearmament, and regional conflicts) shaped the pace and form of development. National planning priorities, technological incompatibilities, and institutional rivalries often complicated efforts to achieve interoperability. Despite NATO's growing influence over member states' defense policies, comprehensive integration of communications systems remained elusive.

Overall, this paper demonstrates that NATO's early communications efforts were central to both alliance military readiness and the reconstruction of European telecommunications. In the early 1950s, NATO functioned not only as a security alliance but also as a powerful infrastructural actor, embedding Cold War strategic imperatives into the technical foundations

of Europe's emerging communications systems – foundations whose influence continues to shape military and civilian networks today.

COH03 Infrastructures, Networks, and Archives

PP 0969 The other history of submarine telegraphy. The shift toward maintenance and repair through the history of Telcon (1864–1914)

Riccardo Ferrigato[1]

[1] Università della Svizzera Italiana, Institute of Media and Journalism, Lugano, Switzerland

From the second half of the 19th century, national and international telegraph networks were connected to form the first global telecommunications network, largely thanks to submarine and suboceanic cables. A significant body of literature (see Winseck and Pike, 2007; Wenzlhuemer, 2013; Müller, 2016) has examined the construction and management of this infrastructure, particularly in terms of its use as a political tool by European nations, especially the British Empire, in projecting their influence towards colonial domains. It has also been studied as an economic enterprise, primarily funded by private capital and companies. Drawing on primary archival sources, this paper aims to enrich current historical research by highlighting the essential actions and strategies that kept the network operational in the medium and long-term, emphasizing their integral role in the economic policy of submarine telegraphy.

As with terrestrial telegraphy, maintaining and repairing the submarine infrastructure represented a significant cost for telegraph companies. Moreover, these companies had to deal with complex operations, which were often carried out in the open ocean, in many cases with little success. The network was fragile and, in the event of a breakdown, it could take weeks for the cable to be repaired, when repair was possible. These aspects are considered secondary in telegraphy historiography, yet the story of the Telegraph Construction and Maintenance Company (Telcon), addressed by this paper, demonstrates their primary importance and how they could be decisive. In 2026, the 160th anniversary of the first transatlantic cable laid precisely by the Telcon will mark the beginning of a new era of communication. However, that cable was fragile and failed six years after being installed, never to be repaired. Regardless of the outcomes of submarine telegraphy discussed in the literature, it is necessary to focus on the activities that made them durable, so effective.

"The timelines of technological history are based on dates of invention and innovation" (Edgerton, 2006). However, the growing interest in maintenance and repair across different disciplines over the last two decades could provide the impetus for a necessary counter-narrative. This article provides this kind of historiographical analysis, focusing on the most significant company in the sector of construction and repair for submarine telegraphy. Thanks to research carried on in three different archives and numerous primary sources, it recounts the main stages of Telcon's history from 1864 to 1914, drawing an alternative timeline of submarine telegraphy focused on maintenance and repair. It demonstrates how Telcon ensured the reliability of its network managing changes and continuities by taking technical and organizational measures to address the material constraints of the infrastructure, thereby operating a kind of essential yet generally overlooked "material politics" (Law and Mol, 2009).

COH04 Actors, Pacifists and Creators: Histories of Maintenance, Norms and Memories

PP 1065 Hidden paths to the public sphere: Women's routes into journalism in pre-1914 Poland as a resource for contemporary media studies

Elżbieta Pawlak-Hejno[1]

[1] Maria Curie-Sklodowska University, Faculty of Political Science and Journalism, Lublin, Poland

Hidden paths to the public sphere: women's routes into journalism in pre-1914 Poland as a resource for contemporary media studies

The turn of the nineteenth and twentieth centuries marked a period of profound transformation in European media systems, characterised by expanding publics, the gradual professionalisation of journalism, and shifting boundaries of participation in the public sphere. These processes, however, did not unfold uniformly across Europe. In the Polish case, the absence of statehood and the experience of political partition created a distinct political and communicative environment that fundamentally shaped women's access to journalism and the public sphere.

This paper argues that the trajectories of Polish women journalists before 1914 exemplify "shifting grounds" in European communication history and constitute an important, yet largely overlooked, resource for contemporary media and journalism studies. Under conditions of political oppression, censorship, and intensified cultural and educational activism, women's entry into journalism in the Polish territories followed paths that differed significantly from those observed in sovereign states. Rather than emerging through institutionalised professional channels, women's journalistic practices were frequently embedded in broader social, educational, and national projects.

Focusing on pre-1914 Poland as a European case study, the paper examines how women entered the media sphere through informal and non-linear routes. Literary activity, translation, pedagogical work, and social engagement often served as gateways to journalistic authorship and public visibility. These pathways shaped distinctive strategies of legitimacy, authorship,

and participation in the press, challenging dominant narratives of journalistic professionalisation grounded in male-centred and institution-driven models.

Methodologically, the study adopts a herstorical approach within communication history, drawing on qualitative analysis of press materials and selected case studies of Polish women journalists, including Bronisława Neufeldówna, Natalia Jastrzębska, and Eugenia Żmijewska. By reconstructing their professional trajectories, thematic choices, and communicative strategies, the paper reveals "hidden paths" to the public sphere that have largely faded from canonical historiographies of journalism. These cases illuminate how women negotiated structural constraints while simultaneously contributing to the development of public discourse.

Beyond its historical contribution, the paper emphasises the contemporary relevance of herstory in communication and journalism studies. Revisiting forgotten women journalists exposes enduring mechanisms of exclusion in the production of media history and challenges established narratives of journalistic professionalisation. At the same time, the study highlights herstory as an increasingly relevant thematic and narrative resource within contemporary journalism and media culture, where historical perspectives—particularly those centred on women's experiences—are gaining renewed visibility and resonance. By integrating herstorical approaches into communication history, the paper contributes to more inclusive frameworks for understanding media pasts and strengthens the dialogue between historical research and present-day journalistic practice.

COH04 Actors, Pacifists and Creators: Histories of Maintenance, Norms and Memories

PP 1066 Mass media and communicative norms: A bottom-up perspective of long-term trends (1840–1990)

Melani Schröter[1], Theo Jung[2], Pia Schmueser[2]

[1] University of Reading, Language and Cultures, Reading, United Kingdom
[2] Martin Luther Universität Halle-Wittenberg, Institut für Geschichte, Halle, Germany

Before the rise of 'social media', mass media were often criticised as creating a socially fragmented public of passive consumers. But how did people themselves react to these new technologies? How did their understandings of the uses and significance of different types of communication change against the background of the new affordances and challenges presented by mass media? Based on an analysis of more than 200 British and German diaries written by ordinary people between 1840 and 1990, we investigate how evolving mass media influenced people's perceptions of the value and relevance of communication in their everyday lives. Within our three-year research project "Between Voice and Silence: Communicative Norms in Diaries 1840–1990", we developed a coding system to systematically analyse diarists' metacommunicative comments on both their everyday communicative encounters as well as on their own practice of diary writing. To operationalise our large time span, we selected diaries written during the 1840s, 1880s, 1920s, 1950s, and 1980s. By capturing how diarists at these respective points in time framed, phrased and used communicative opportunities and constraints, we analyse the ideas and norms of communication that underpin their metacommunicative comments. Investigating how these ideas and norms of communication changed over time, we show how such changes were underpinned by broader developments within our time span such as democratisation, individualisation, and mediatisation. For the purposes of this talk, we focus on how the increasing presence and proliferation of mass media between 1840 and 1990 informed diarists' perceptions of the opportunities and constraints of various modes of communication. We also consider possible influences on their own practice of diary writing and diarists' comments on mass media communication. In doing so, we engage with scholarship on the social history of media (e.g., Boddy 2004; Briggs/Burke 2009; Gitelmann 2006; Führer/Ross 2006, Moran 2014) as well as on changing ideas and norms of communication (e.g., Peters 1999, Verheyen 2010, Schröter 2011).

COH04 Actors, Pacifists and Creators: Histories of Maintenance, Norms and Memories

PP 1067 The polyphony of PostOst family memory on TikTok and Instagram

Christine Lohmeier[1], Sophie Hepach[1]

[1] University of Salzburg, Communication Studies, Salzburg, Austria

In recent years, users with (post-)Soviet and Eastern European family histories have increasingly shared personal stories on social media platforms. These platforms have become prominent spaces in which experiences of migration, belonging, and cultural identity are negotiated through personal narratives embedded in platform-specific genres. These practices lower barriers to participation and provide accessible entry points into complex historical issues.

In the proposed presentation, we aim to explore and structure different types of PostOst mnemonic content. PostOst refers to people with (post-)Soviet or Eastern European family histories living in Germany or other Western European countries (Boychenko, 2022; Schulz, 2022). Using the concept of the "polyphony of memory" (Schwarzenegger and Lohmeier, 2020), we argue that digital media open up spaces in which marginalized groups can participate in memory negotiations and contribute to a more critical and potentially more democratic engagement with the past. At the same time, such openness raises questions of responsibility and legitimacy, and the abundance of unfiltered voices can foster fragmentation, polarization, and the distortion of historical facts.

Our research addresses two guiding questions: First, how is family memory articulated and made visible by members of the PostOst community on social media?, Second, how do PostOst content creators draw on genres and formats characteristic of TikTok and Instagram in presenting these memories. Family memory is central in this context because it constitutes the most accessible and universally available form of remembrance. Unlike institutionalized or expert-driven memory practices, it is something that everyone possesses as an entry and connecting point between collective and personal memory.

Drawing on a qualitative and inductive design, the study analyzes mnemonic content on TikTok and Instagram from a German-speaking PostOst community. Posts were selected using theoretical sampling based on relevant hashtags and keywords (e.g., #postost, #russlanddeutsche, #balkanchildhood). Applying Kuckartz's typology approach (2016), different types of mnemonic content were systematically identified and described.

Preliminary results indicate a wide range of content, extending from the traditional presentation and exploration of an original family photo to Get-ready-with-me videos that integrate elements of family history into everyday practices. Mnemonic practices appear to be shaped both by platform logics and platform-specific trends.

An illustrative example is the "We Are Clean" trend, revolving around a narrative of success. Migrants share old family photographs from their countries of origin, followed by images of the now adult child achieving success in Germany, such as obtaining a university degree. The audio phrase "We are clean" in the background of the videos symbolizes that the parents' struggles have paid off. Numerous similar videos circulate with this sound bite. While some creators primarily aim to entertain or provide only superficial information, others engage deeply with historical contexts. A further preliminary observation suggests that certain posts can also legitimize alternative narratives that risk oversimplifying social realities or fostering division.

By typologizing PostOst mnemonic content on social media, this presentation contributes to research on the polyphony of memory and advances understanding of how platformized memory practices reshape migration-related remembrance beyond institutional frameworks, providing a foundation for future research.

COH04 Actors, Pacifists and Creators: Histories of Maintenance, Norms and Memories

PP 1068 Media practices of contradicting in light of continuity and change: Feminist-pacifist interventions in World War I and the Cold War

Susanne Kinnebrock[1]

[1] University of Augsburg, Department of Media- Knowledge and Communication, Augsburg, Germany

Media practices of contradicting in light of continuity and change: Feminist-pacifist interventions in World War I and the Cold War

This submission addresses the question to which extent historical conditions form media practices of contradicting (concept by Thomas et al., 2024; Lünenborg et al., 2025). In order to capture in a context-sensitive way both change and continuity in articulating dissent, the project examines the women's peace movement in Germany and its interventions under two different historical conditions—World War I and the Cold War.

The development of media practices of contradicting get analyzed taking the International Women's League for Peace and Freedom (WILPF) as an example. The League was formed in 1915, in the midst of World War I, by middle-class suffragists who met at the International Women's Peace Congress in The Hague. There, not only an immediate and unconditional ceasefire was advocated, but also a groundbreaking concept for modern international law developed (Baetens, 2010; Bianchi, 2014). These early pacifist interventions are compared to those in the Cold War, when WILPF members, together

with women of various political parties, protested against the rearmament of the Federal Republic of Germany in the early 1950s (Meyer, 1989; Leyrer, 2025; Song, 2025).

Although these two feminist-pacifist interventions took place in different political systems (monarchy vs. democracy) and in the midst of different states of war (hot vs. cold war), some commonalities can be identified:

First, Media practices of contradicting were directed against dominant positions in public discourse, additionally, they took place under conditions of social and discursive inequality (by articulating themselves publicly and addressing the 'male' domain of war and peace, the female pacifists left the narrow sphere open to them as women at that time). Furthermore, feminist-pacifist interventions in both periods resulted in similar silencing processes. It was publicly discredited as 'unpatriotic' (World War I) or 'communist' (Cold War), and large parts of the German public distanced themselves from these feminist-pacifist interventions, which were ultimately banned from the public sphere altogether with the help of censorship and activity bans (Kramer, 2010; Meyer, 1989; Wilmers, 2008). It is significant here that silencing was enforced not only with the help of the martial law in an authoritarian monarchy, but also in the democratic state of the Federal Republic of Germany, when the (rather bourgeoise) Munich WILPF group was declared an anti-constitutional organization by the Bavarian Ministry of the Interior, banned completely from 1955 to 1957 and then placed under police surveillance until 1967 (Dieckmann, 1995).

Selected pacifist interventions with subsequent processes of silencing from both periods will be compared to identify lines of continuity on the one hand and time-specific features of media practices of contradicting on the other. The analysis is based on newsletters of the feminist-pacifist movement, press clippings, files of the military administration during World War I and the Bavarian Ministry of the Interior in the 1950s, papers of the WILPF, and ego documents from key protagonists of the women's peace movement, which were subjected to hermeneutic analysis.

COH04 Actors, Pacifists and Creators: Histories of Maintenance, Norms and Memories

PP 1069 Nothing new under the sun: Arguments and denial techniques in anti-vaccination rhetoric since Edward Jenner (1749–1823)

Hernâni Zão Oliveira[1], Helena Lima[2]

[1] University of Évora, Citcem, Évora, Portugal
[2] University of Porto, Faculty of Arts and Humanities, Porto, Portugal

This article examines the historical persistence of vaccine denial by analysing the arguments, rhetorical strategies, and communication infrastructures mobilised against vaccination since Edward Jenner's introduction of the smallpox vaccine. Situated within a broader research project aimed at mapping transnational networks of scientific dissemination and counter-knowledge, the study foregrounds the role of media systems in shaping scientific authority, public trust, and resistance to public health interventions.

As contextual background, this article analyses a ten-year corpus of pro-vaccination newspaper publications that actively promoted the circulation of vaccine-related scientific knowledge across Europe and the Atlantic world. This includes the *Jornal de Coimbra* between 1812 and 1820, which systematically republished scientific reports and correspondence produced by Jenner's collaborators in London and disseminated them throughout the Kingdom of Portugal and its Atlantic territories, including Bahia, Brazil, during the period of the French invasions. This corpus illustrates the existence of early transnational communication infrastructures designed to stabilise scientific authority, legitimise vaccination as a public health practice, and embed medical innovation within institutional and political frameworks. This network is further exemplified by a clipping from the *Gazeta de Madrid* preserved in Edward Jenner's personal papers, highlighting the deliberate circulation of vaccine-related knowledge across linguistic and national borders.

The core of this article, however, consists of an in-depth qualitative content analysis of *The Vaccination Inquirer and Health Review* during the period from 1879 to 1902. Published as the official journal of the London Society for the Abolition of Compulsory Vaccination and later of the National Anti-Vaccination League, *The Vaccination Inquirer* functioned as a central organisational and discursive hub of the anti-vaccination movement. Its relatively stable editorial organisation combined leading editorials, thematic articles, extensive readers' correspondence, reports on meetings and parliamentary actions, international news summaries, and supplementary materials such as statistical tables, legal case reports, and press extracts. This structure enabled the systematic production, circulation, and legitimisation of counter-knowledge across Britain and North America.

A substantial proportion of each issue was dedicated to letters from readers and activists, including parents, clergy, local organisers, and occasionally medical practitioners, who shared personal experiences, moral objections, and practical advice related to resistance against compulsory vaccination. These letters were analysed both as rhetorical artefacts that privileged anecdotal testimony and emotional appeal, and as network mechanisms that connected dispersed actors and transformed individual grievances into a shared oppositional narrative.

Methodologically, the study combines an inductive qualitative content analysis with a deductive analytical procedure based on the FLICC matrix developed by Cook et al. (2020). Editorials, articles, correspondence, and reports were systematically coded to identify recurring themes, argumentative structures, and narrative patterns, and subsequently analysed according

to the five core techniques of science denial identified in the FLICC framework: Fake experts, Logical fallacies, Impossible expectations, Cherry-picking, and Conspiracy theories.

By reconstructing the organisational logic and denialist repertoire of early anti-vaccination journalism, the article contributes to current debates on media, power, and public trust, highlighting the enduring role of communication systems in shaping the social negotiation of scientific knowledge and public health legitimacy.

COH05 Journalistic Practices Through Time: Challenges and Change

PP 1166 Back again? Journalistic role perception of editors in Austrian party media

Eva Asboth[1], Andreas Schulz-Tomancok[1], Christian Oggolder[1]

[1] Austrian Academy of Sciences, Institute for Comparative Media and Communication Studies CMC, Vienna, Austria

Party media have a long history in Austria. Following the diversification of the media landscape and economic pressures, they lost relevance and fell into financial distress in the 1960s and 1970s. By the 1990s, only a few party newspapers remained, having evolved into niche products. However, the rise of digital communication platforms and the low-cost distribution of content enabled a resurgence in the 2010s, increasing both the number of party channels and their reach and relevance within the media system.

Our research aims to examine this phenomenon of rapidly spreading portals from a comparative perspective over time. Based on the current state of research on party newspapers and audiovisual media, both from the past and the present, we know very little about the characteristics of party media journalists, their socio-demographics, motivations, and attitudes. Therefore, our research questions are the following:

- How do journalists of party media understand their journalistic role?
- How has this role changed since the heyday?
- Which target groups were addressed then and now?
- What function do these types of media have in society?

Our investigation focuses on the social democratic *Arbeiter-Zeitung AZ* (Workers' Newspaper). Founded in 1889, it developed into a widely circulated and influential publication. However, due to economic reasons, it had to cease publication exactly 100 years after its founding. We also examine *KONTRAST.at*, launched by the parliamentary club of the Social Democratic Party (SPÖ) in 2016, as well as the party's YouTube channel *SPÖ-TV*, launched in 2025.

In our research, we will first conduct narrative interviews with former AZ journalists until theoretical saturation is reached. Based on the results of the grounded theory analysis, we will then conduct guideline-based interviews with current employees of the digital party media. Our aim is to identify the structures within the editorial office and the extent to which party ideology conflicts with journalistic quality standards (Melischek & Seethaler, 2019, p. 18). Despite 'efforts to produce decent journalism' (Interview 1), 'party discipline' prevailed within the editorial office. We will pay particular attention to the different departments, the journalists' backgrounds, and the 'generations' of journalists. The material will be analysed using MAXQDA. In addition to theories on understanding the role of journalism, the results are reflected upon in relation to the two different methodological research approaches.

Through this project, we aim to contribute to journalism research, address gaps in the existing literature on party media and provide a foundation for further comparative analyses with conservative and right-wing populist party media.

COH05 Journalistic Practices Through Time: Challenges and Change

PP 1167 Journalistic experience and political practice: Wilhelm Liebknecht and the entanglement of journalism and politics in nineteenth-century Germany

Niklas Venema[1]

[1] Leipzig University, Institute of Communication and Media Studies, Leipzig, Germany

In the nineteenth century, journalism and politics were closely intertwined in many Western European countries. In Germany, however, such overlaps rarely extended to the highest levels of either the press or politics. Wilhelm Liebknecht (1826–1900) constitutes a notable exception. As a founding figure, long-term leader, and parliamentarian of the German Social Democratic Party (SPD), and simultaneously an active journalist and editor for leading liberal newspapers and socialist

party organs, Liebknecht occupied a hybrid position that challenges modern distinctions between journalism and politics. Unlike many contemporary politicians, he not only witnessed the transformation of the media landscape in the nineteenth century but also developed a keen awareness of the growing relevance of a mass-circulated press.

While previous scholarship has primarily examined Liebknecht's journalistic activity within the political history of the labour movement (e.g., Schröder, 2013), this paper situates his work within the field of historical research on mediatisation. The paper contributes to research on politicians' media biographies and the mutual influence of political and media logics (Birkner & Krämer, 2016) as well as to studies on the emergence of "publicity politicians" (Van Waarden, 2025, p. 2) in the context of the rise of the mass press. Against this backdrop, the paper asks how Liebknecht's experiences as a journalist shaped his political ideas and practices and how, conversely, political struggle informed his understanding of journalism. Based on a systematic analysis of a variety of published and unpublished sources — including memoirs, programme articles, party conference minutes, party manifestos, correspondence, and archival documents — the paper advances four interconnected arguments.

First, Liebknecht's commitment to freedom of the press was rooted in his early political and journalistic activities during the revolutions of 1848/49 and was reinforced by sustained experiences of state repression, making press freedom a central demand of Social Democratic media policy under his leadership. Second, he strategically cultivated public visibility, treating parliamentary sessions and court proceedings as mediated stages for political communication. Third, Liebknecht conceptualised the party press as a core political instrument, serving as founder and editor-in-chief of his party's central organs and repeatedly framing the party press as a "weapon" in struggles against political opponents. Finally, influenced by his background as a teacher, he understood journalism as a means of political education.

Overall, the paper demonstrates how nineteenth-century configurations of journalism and politics prefigured later forms of mediated political communication. By historicising strategic media use within a period of close entanglement between journalism and politics and expanding mass communication, the study illuminates long-standing tensions between journalism and political power that remain relevant today.

COH05 Journalistic Practices Through Time: Challenges and Change

PP 1168 Conflict resolution in the media: United Nations decision number 181 on the Palestinian territories as reported in the portuguese press

Inês Fernandes[1]

[1] Catholic University of Portugal, Faculty of Human Sciences, LISBOA, Portugal

On the 29th of November 1947, the United Nations approved resolution number 181. Known as the decision to partition the Palestinian territory into two states, Arabic and Jew, with a special regime for Jerusalem, the resolution was to be implemented with the end of the British mandate over the territory (1948). Although the aim was to bring stability to the region, and a solution for the European Jews seeking safety, the outcome of the plan ended up representing the beginning of the Arab Israeli war. Under these circumstances the territory became a point of conflict that still prevails until this day, making it one of the longest conflicts of the last century, representing a consequence of the Second World War.

At that time, Portugal was living under the Estado Novo regime, led by Salazar. Known for its autocratic leaders, censorship, propaganda and repression, the regime tried to build "an alternative reality" on an overall "patriotic press" (Ribeiro 2017), determining what was newsworthy (Ribeiro 2015) and creating a journalistic ecosystem assembled as an echo-chamber of the regime's values. Simultaneously, the regime was acknowledged by its position during the Second World War, shifting form "geometric neutrality" to "collaborative neutrality" (Rosas 1998) in compliance with its political affiliations and alliances. Largely due to it's neutrality, Portugal had the right to be a member of the UN from the outset, in 1946. However, it was the countries relations with Germany during the conflict that were used as reasoning for constant vetoes for admission, specially from the soviets. It was only in 1955 that the country was to become a member of the UN, much to the joy of Salazar, until that moment quite cautions of Portuguese international collaborations, expecting recognition for its colonial cause. A subject that ended up, actually, becoming a topic of clear tension and distancing from the international counterparts.

Against this background, this research departs from the question: how did the Portuguese printed media covered the situation of Palestine in 1947 under the influence of censorship and during the negotiations for admission to the United Nations? The investigation aims to understand how the Portuguese printed press of that time covered not only the publication of the resolution but also the ongoing conflict throughout the year having in mind the Portuguese international situation. Drawing on comparative content analysis, this research takes all the news regarding the topic in 1947 as corpus of analysis, along

with the censorship archives of the publications. For that, the research is focused on the two main newspapers of that time, *O Século* and *Diário de Notícias*, and the two most important local newspapers, *Diário de Lisboa* and *Primeiro de Janeiro*.

With the Palestinian conflict with no end in sight, the Portuguese contemporary press is filled with news on the topic, but at a time of an autocratic regime and with the countries international position at stake, how was the topic portrayed is the aim of this research, creating a bridge between past, present and future of conflicts in the media.

COH05 Journalistic Practices Through Time: Challenges and Change

PP 1169 Visible, respectable and cheerful: Thelma Berlack Boozer's "Woman of the Week" column in the 1941 New York Amsterdam News

Henrik Ornebring[1]

[1] Karlstad University, Department of Geography- Media and Communication, Karlstad, Sweden

This paper presents an analysis of Thelma Berlack Boozer's "Woman of the Week" column in the US Black newspaper *New York Amsterdam News*. During the autumn of 1941, Berlack Boozer wrote 32 "Woman of the Week" columns, each one presenting and interviewing an accomplished Black woman active in Harlem and/or the wider New York area. Berlack Boozer was at the time a very well-known Black woman journalist. She was assistant managing editor of the *New York Amsterdam News* as well as editor of the women's page and a prolific columnist.

Based on the theories and concepts of Patricia Hill Collins, this study positions the "Woman of the Week" column as an instance of Black women's intellectual work. The column was a site of expressing, negotiating, reframing and developing Black feminist views and standpoints during the early part of the so-called "long civil rights movement". As Jacquelyn Dowd Hall, Belinda Robnett and others have pointed out, the early (1920s-1950s) civil rights movement was deeply grounded in the gender mores of the time, and issues of gender equity were largely ignored in the movement even though "women's issues" (to use the terminology of the times) were not. Previous research on Black women and the civil rights movement has focused more on either on the earlier (1890–1920) Progressive era or the 1960s heyday of the civil rights movement, leaving the interstitial 1920s-1950s era understudied. The study thus contributes both to the history of women in the Black press, and to the history of Black women's thought during the "long civil rights movement" of the 1920s-1950s.

In that time, Black women's intellectual activity was still strongly influenced by what Evelyn Brooks Higginbotham has called "the politics of respectability", a tradition broadly based on Evangelical Christianity that promoted individual moral strictness and manners aimed at achieving "Black uplift". However, the period also saw a slow but gradual rise in the number of Black women professionals – in nursing, teaching, business, social work, public administration, the arts (and journalism!), and so on. This and other developments, notably the rise of Black and cross-racial union activism, contributed both to the reshaping of "the politics of respectability", and to the emergence of more radical Black women's thought – the latter embodied by for example Claudia Jones, Vicki Garvin and indeed Thelma Berlack Boozer's co-worker at the *New York Amsterdam News*, Marvel Cooke.

This study shows how Berlack Boozer's "Woman of the Week" column was a vehicle for this transformation of Black feminist thought. The column was mostly anchored in the "politics of respectability" of an earlier era but also expanded the scope of respectability, for example by advocating for Black women's participation in higher education (including at white universities, challenging racist barriers to entry), as well as occasionally flirting with more radical ideas. Above all, Berlack Boozer's column rendered the ongoing intellectual work by Black women *visible* by providing a dedicated space for celebrating professional/intellectual success in one of the major Black newspapers of the day.

COH05 Journalistic Practices Through Time: Challenges and Change

PP 1170 The commercial roots of body shaming in Victorian newspaper skincare columns and advertisement pages

Diana Garrisi[1]

[1] Cardiff University, School of Journalism- Media- and Culture, Cardiff, United Kingdom

This interdisciplinary study illustrates how skincare columns and advertisements published in Victorian British newspapers reinforced notions of shame, exclusion, and punishment associated with facial disfigurement and skin disorders. Disfigurement and skin disorders can be defined as changes in appearance caused by congenital or acquired medical conditions. In medieval times, those with disfigurements were treated as an out-group and morally condemned (Skinner, 2017). During 20th-century wartime Britain, disfigurement was framed as a loss of identity and humanity (Biernoff, 2011).

In nineteenth-century Britain, there was a mutually constitutive relationship between dermatology, the study of skin, and the formal evolution of newspapers. Media coverage of wounded skin assumed a central rhetorical position in debates pertaining to class and social acceptability (Garrisi, 2024). Amidst Britain's sanitation movement, flawless skin emerged as a symbolic canvas embodying a visual moral ideal (te Hennepe, 2014). Skincare products were among the most prominently marketed in the industry, and, as Richards (1990, p. 205) put it, the body had become "the prevailing icon of commodity culture".

Disfigurement, through the lens of disability, can be analysed as a verbal construction rather than a bodily defect (Garland-Thomson, 1998). In fact, a rhetorical and visual analysis of a selection of key studies drawn from newspapers searched through keywords via the Gale Cengage digital archives (1880–1900), shows that skin conditions and disfigurements were depicted through thematic polarities sustained by a set of linguistic devices including antithesis, synecdoche, metaphors, and enumeration. Adverts for products targeting skin disorders such as acne, psoriasis, eczema, and other skin conditions, were built around notions of judgement, shame, and punishment through a binary logic embedded in dichotomies such as, inside skin/outside skin, sick/healthy, whole/broken, symmetrical/asymmetrical. As a result, facial conditions were discursively constructed as inherently problematic, both physically and morally, in order to endorse commercial products that would supposedly cure such conditions.

The use of rhetorical devices, value judgements, and graphic visual imagery contributed to constructing disfigurement as an ideologically loaded concept that benefited the booming skincare industry of the time. In doing so, they laid the groundwork for stigmatising media representations of body diversity, patterns so pervasive that they remain evident in the ways modern mass media promotes skin ideals today. This study highlights the significance of communication history in tracing the commercially-driven roots of contemporary phenomena such as body shaming and media stereotypes targeting physical differences.

CLP01 The Promise and Limits of Digital Services Act Implementation

PP 0015 Systemic risks in very large online marketplace platforms: An investigation under the digital services act

Giada Marino[1], Nicola Righetti[1]

[1] University of Urbino Carlo Bo, Department of Communication- Humanities and International Studies, Urbino, Italy

The Digital Services Act (DSA) extends regulatory oversight beyond social media to online marketplaces, requiring Very Large Online Platforms (VLOPs) to identify, assess, and mitigate systemic risks arising from the design and use of their services. This presentation draws on experience from an ongoing project funded by and conducted in collaboration with the European Commission's Joint Research Centre on algorithmic transparency to examine such risks across five major marketplaces—Amazon, Facebook Marketplace, Temu, SHEIN, and AliExpress—with a focus on fraudulent practices and harms affecting minors. By combining computational and qualitative analyses of marketplace content with ethnographic monitoring of DSA data access practices currently implemented by the analyzed platforms, the project aims to support DSA enforcement with empirically grounded evidence for risk assessment and oversight.

From a DSA perspective, systemic risks in online marketplaces threaten consumer protection and the integrity of the digital single market. Product safety risks are particularly acute for minors. Unsafe goods, such as toys lacking the legally required CE marking, are linked to documented injury risks in the EU (Eurofins, 2023). Electronic cigarettes represent an emerging concern: despite EU bans on sales to minors, weak age-verification allows access, while product presentation and packaging increase youth appeal (Modesto-Lowe & Alvarado, 2017). Inappropriate advertising, including sexualized imagery used to market products to children, raises concerns under consumer protection law and the DSA's provisions on protecting minors (BBC News, 2023).

These risks are amplified by platform affordances that shape information visibility and consumer trust. In particular, manipulated and coordinated reviews generated through astroturfing practices distort reputation systems and mislead users. Such practices mirror inauthentic behaviors documented on social media and raise questions about platforms' compliance with DSA obligations related to systemic risk mitigation and the prevention of deceptive practices (Fan et al., 2025).

Empirically, the project focuses on Italian marketplaces across the five platforms and targets high-risk product categories—electronic cigarettes, toys, cosmetics, and children's clothing—identified as priorities for regulatory scrutiny. Data collection covers product listings, seller characteristics, customer reviews, and moderation-related signals over a 12-month period. Additionally, the project systematically assesses platform-specific data access conditions relevant to DSA-compliant research.

This presentation documents data access negotiations, technical constraints, and data quality issues across the five marketplaces, which directly affect the feasibility of independent systemic risk assessment, as envisioned by the DSA. Preliminary findings show the existence of substantial variation characterizing researcher accessibility: Aliexpress, Temu, and SHEIN provide API-based research portals with product and seller data access, while Amazon rely on transparency reports and scraping permissions. Facebook Marketplace data is included into the Meta Content Library, providing both the User Interface and API. The ease and speed of access also vary, as does the type of data provided.

By linking empirical risks to enforcement-relevant data access conditions, the project offers new insights for researchers, regulators, and policymakers, advancing understanding of how systemic risks in online marketplaces can be identified and addressed within the DSA framework.

CLP01 The Promise and Limits of Digital Services Act Implementation

PP 0016 Discussing platform governance in the Czech Republic: Discourse networks behind delayed DSA implementation

Hana Moravcová[1], Markéta Klásková[1], Petra Koudelková[1], Soňa Schneiderová[1], Tereza Ježková[1], Tereza Klabíková Rábová[1]

[1] Faculty of Social Sciences- Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

Two years after the Digital Services Act (DSA) became fully applicable, its national implementation still varies across EU member states. Differences persist also in how the DSA is publicly framed and contested (Mattioli, 2025). As of 2026, the Czech Republic remains among the few member states that have not aligned national legislation with the DSA, despite repeated calls to act ahead of the October 2025 parliamentary elections. In May 2025, the European Commission also identified the Czech Republic as one of five member states failing to designate a Digital Services Coordinator and adopt national penalty rules (European Commission, 2025). This case study illustrates how local discourse coalitions (Duygan et al. 2018) shape DSA enforcement, highlighting dynamics that are often invisible from the EU perspective, as emphasized by Börzel (2010).

Building on a recent qualitative analysis of discourses and narratives in the DSA debate in the Czech Republic (Klabíková Rábová, Schneiderová, 2026), we follow up with quantitative Discourse Network Analysis (DNA). We systematically code parliamentary debates, traditional media (print, radio, television), and online news coverage from 2023–2025. Using the Discourse Network Analyzer (Leifeld, 2017) and R-based processing, we model actor coalitions based on shared frames,

repeated co-occurrences, and sustained alignment, identifying discourse clusters, polarized coalitions, and brokers operating across arenas (Leifeld, 2020; Černý & Ocelík, 2020). To capture issue spillovers in communication policy debates, we also track keywords related to adjacent regulatory frameworks, including the DMA, AI Act, and ChatControl.

Preliminary findings point to pronounced polarization. While some coalitions frame the DSA as a necessary instrument for digital sovereignty and platform accountability (Falkner et al., 2024), others emphasize risks to privacy, freedom of expression, and national autonomy (Atzori, 2024). Within parts of the network, we observe frames resonating with established Russian disinformation narratives portraying EU digital regulation as censorship and loss of sovereignty (Tyushka, 2022). Discursive brokers play a key role in diffusing these frames, shaping pressures on regulators and complicating public communication of the law.

First, it demonstrates how public debate often obscures the DSA's legal baseline–particularly its direct applicability and the division of competences—undermining regulatory clarity and reframing EU law as politically optional rather than directly applicable and enforceable at the EU level. Second, it examines whether and how EU-level actors engage in public legitimation, both explanatory and deliberative, when EU digital policies are domestically contested. Third, it analyzes the communicative strategies of an "unempowered" national regulatory authority (ČTÚ) operating under institutional ambiguity, focusing on how it frames its role, authority, and expectations toward platforms, media, and the public.

The Czech case suggests that delayed adaptation of EU platform governance is not merely a procedural failure, but a communicative one. Effective implementation of communication law increasingly depends on understanding national discourse dynamics, their entanglement with hybrid information threats, and the role of strategic public communication in fostering regulatory legitimacy, trust, and compliance (Macnamara, 2025; De Wilde & Rauh, 2019).

CLP01 The Promise and Limits of Digital Services Act Implementation

PP 0017 AI-powered Google search,news media and democracy: How far can the DSA protect Epistemic Rights?

Alice Baroni[1]

[1] University of East Anglia, School of Politics- Philosophy and Area Studies, Norwich, United Kingdom

The integration of artificial intelligence (AI) technologies into Google Search is radically changing digital information environments and, consequently, how citizens access, consume and impart information. The implementation of 'AI Overviews' in May 2024, which display an authoritative summary of information and response to users' queries, was followed by a substantial decline in traffic metrics by news outlets in the US. Despite Google's claims that click volume remains stable, with an increase in 'high-quality clicks' (Reid, 2025), different studies and reports indicate otherwise (Chapekis and Lieb, 2025; Elebi, 2025). More recently, Google rolled out what it claims to be its most advanced AI search model. AI Mode is powered by Gemini 2.5 and has multimodal and agentic capabilities to address users' questions in a "simple and intuitive way" (Google Search, 2025). These developments not only put an additional strain on the news media, whose economic crisis has been widely documented (e. g. Newman, 2024), but also have the potential to negatively affect citizens' access to a plurality of information on digital information environments.

Democratic decay and disillusionment with democracies, combined with a decline in political and civil liberties, have become global phenomena. A substantial decline in media freedom and freedom of expression is also a global trend (Economist Intelligence Unit (EIU), 2024). This is alarming, because citizens "who engage with news tend to be more knowledgeable about public affairs, more resilient to misinformation, more active in politics, and more connected with their communities than peers who do not" (Nielsen, 2024). Alongside education systems, public institutions and authorities, regulatory bodies, among others, the news media is a crucial epistemic authority in democratic societies. It plays a crucial role in safeguarding a factual basis that maintains a "shared reality" among citizens, who should make informed decisions about issues that concern their lives (Rekker and Harteveld, 2024).

Nieminen (2024) elaborates on the concept of epistemic rights to make a claim of epistemic equality by arguing that it is imperative to increase people's knowledge to save democracy. He understands epistemic rights in association with the requirement for people to have equality in decision-making in a democratic society. This requirement implies citizens' equal access to credible and truthful information in order to make informed decisions that bring benefits not only to themselves, but to society as a whole (Nieminen, 2024: 11). The EU's Digital Services Act (DSA) regulates very large online platforms (VLOPs) and search engines (VLSEs). Hence, the DSA's designated services (e.g., Google Search) must comply with the regulation and develop risk assessments concerning systemic risks, aiming to safeguard European values and fundamental rights, spamming from human dignity to freedom of expression and the pluralism of the media or civil discourse and electoral processes.

Aiming to contribute to current discussions on epistemic rights, news media and democracy this article asks: **What are the implications of the integration of AI technologies into Google Search for epistemic rights? How far is the EU's Digital Services Act able to protect epistemic rights in very large online platforms and search engines?**

CLP01 The Promise and Limits of Digital Services Act Implementation

PP 0018 Governing under uncertainty: Simulating risks and interventions in platform governance

Max Van Drunen[1], Natali Helberger[1], Aytalina Kulichkina[2], Annie Waldherr[2]

[1] University of Amsterdam, Department of Information Law, Amsterdam, Netherlands
[2] University of Vienna, Department of Communication, Vienna, Austria

What if Meta cut off access to news in the EU? What if regulators forced it to moderate hate speech more quickly? Regulators and academics thinking about how to regulate social media platforms are confronted with many such hypotheticals. Answering them is highly challenging. While the Digital Services Act (DSA) has significantly expanded formal rights of access to platform data, gaining access to sensitive platform data in practice is likely to remain difficult. Moreover, the DSA does not allow researchers to test changes to platform systems, such as different moderation rules or recommender designs. As a result, platform governance remains constrained by uncertainty about how alternative platform configurations might function.

Agent-based modelling (ABM) has emerged as a response to such uncertainty in other policy areas, ranging from transport to democracy. By simulating the behaviour of autonomous agents (such as individuals or media organisations) within an environment (such as a platform), ABM can help reveal unpredictable patterns that emerge in complex systems through interactions between different actors. In theory, this technique holds significant potential for platform governance. Reflecting this, an emerging body of research uses ABM to study social media platforms, including dynamics such as polarisation and the effects of regulatory interventions.

There is, however, a large gap between theory and using ABM to inform platform governance in practice. It is unclear how ABM would fit into the DSA's existing risk assessment system, and existing literature on its use in other contexts emphasizes a wide array of risks relevant to the platform context (such as inaccurate or biased output). Therefore, this article asks the following question:

How could simulation techniques such as ABM support platform governance, and what conditions need to be in place before regulators can rely on evidence they produce?

The paper addresses this question in two main ways. First, it develops a conceptual framework for understanding the role and risks of simulations in platform governance. Drawing on literature on agent-based modelling in policymaking, anticipatory governance, and risk assessment under the DSA, it argues that ABM can support platform governance in three distinct ways: (1) by helping regulators identify unforeseen risks and explore the trade-offs and side-effects of potential interventions; (2) by lowering the costs of platform research, enabling researchers to explore a wider range of regulatory options before testing them with real users; and (3) by supporting communication and learning through concrete scenarios that make underlying assumptions explicit.

Second, the paper reports findings from 15 interviews with policymakers and regulators on the role of simulations in platform governance. While existing literature often emphasizes the promise of ABM for policymaking, empirical insight into regulators' perspectives remains scarce. The paper therefore examines regulators' views on the potential and risks of using ABM in platform governance, as well as the safeguards they consider necessary to ensure its responsible use. Interviewees were selected based on their involvement in platform regulation or experience with using simulations, and were drafted from EU (EC, JRC, ECAT) and national (Irish, Romanian, Dutch DSCs) authorities.

CLP01 The Promise and Limits of Digital Services Act Implementation

PP 0019 Auditing LLM Election Answers Under the Digital Services Act (DSA): Methodologies for assessing systemic risk for generative AI systems under the DSA

Marie-Therese Sekwenz[1], Rita Hermann-Gsenger[2]

[1] TU Delft, Institute of Technology- Policy and Management, Delft, Netherlands
[2] Weizenbaum Institute, Normsetzung und Entscheidungsverfahren, Berlin, Germany

Large language models (LLMs), like Gemini, Deepseek, or ChatGPT, increasingly function as "search-like" intermediaries for political information, including questions about election results. In 2026, the European Commission might qualify ChatGPT as one of the first generative Artificial Intelligence (AI) models that underfalls EU regulation as a very large search engine. In that case OpenAI must assess systemic-risk concerns aligned with the Digital Services Act (DSA), including foreseeable negative effects on civic discourse and electoral processes (Art. 34(1)(d) DSA) which may emerge when users receive misleading procedural or political information in authoritative sounding 'advice', and when mitigation measures (e.g., guardrails, hedging, labelling, or recommendations to consult official sources) are absent, inconsistent, or difficult to interpret. This paper operationalizes the systemic risk of negative effects on civic discourse and the electoral process as auditable output in LLM question-answer interactions for the European parliamentary election 2024, focusing on (i) factual reliability and (ii) guardrail occurrence as a risk mitigation measure.

Therefore we ask: How can the DSA's systemic risk of negative effects on civic discourse and electoral processes (Art. 34(1)(d) DSA) be operationalized and measured in generative AI systems (in the case of LLM election Q&A)?

We begin with a hand-annotated corpus of 200 election-related prompts and LLM responses, coded for authenticity (accuracy/incorrectness) and guardrail adherence. To enable scalable auditing, we implement a Python-based synthesis pipeline that expands each prompt into an augmented corpus containing both engineered falsehoods and engineered truths. For each seed prompt, the pipeline generates ten intentionally false answers via an explicit instruction to "make sure to not give the right answer," and ten "good" answers by paraphrasing a correct answer ("keep it the same, but slightly different"), in both cases enforcing a strict numbered-list output format and instructing the model not to return the question text. We show that this design choice, combined with the generator model, creates systematic validity challenges for systemic-risk measurement as a systemic risk evaluation method that takes systemic risk assessment methodologies under the Delegated Regulation of conducting systemic risk assessments and independent audits into account.

The paper contributes (1) a DSA-informed audit design for election-related systemic risks in LLM-mediated information environments and (2) evidence-based guidance on the validity and measurement effects of synthetic data generation, showing that generator choice and prompt constraints materially shape what "electoral-process risk" becomes observable at scale. (3) We provide recommendations for auditing generative AI systems under the DSA.

CLP02 AI Governance

PP 0122 Regulating AI-generated deepfakes: A comparative study of legal frameworks and public perceptions in Japan and The Netherlands

Sophie Morosoli[1], Teresa Weikmann[1], Stanislaw Piasecki[2]

[1] University of Amsterdam, Communication Science, Amsterdam, Netherlands
[2] Hitotsubashi University, Graduate School of Law, Tokyo, Japan

Deepfakes employ artificial intelligence to make it look like an event took place that never happened. They threaten political stability, social cohesion and individual security. They can be weaponized to manipulate public opinion, discredit political opponents or spread false narratives. As such, they constitute a dangerous form of visual disinformation and cause ethical concerns. Addressing these risks requires legal frameworks that not only deter misuse but also align with public expectations to maintain trust in institutions. Governments worldwide are trying to regulate deepfakes, but legal approaches vary across cultures and political systems. We argue that the acceptance of these regulations depends on whether they resonate with public perceptions. If legal measures fail to align with citizens' concerns and competencies, they may be ineffective in curbing the impact of deepfakes. Yet, we know little about how deepfakes are dealt with in different contexts, even though comparative research is crucial in informing and improving policy making for such a global threat. To fill this gap, this article examines legal regulations of deepfakes and public perceptions thereof in Japan and the Netherlands. These countries were selected due to their contrasting legal frameworks and attitudes toward artificial intelligence, which is the technology underlying deepfakes. This research is both comparative and interdisciplinary in nature, combining communication science and legal studies. How are deepfake regulations developed and perceived among Japanese and Dutch citizens?

The article consists of two components. First, a legal analysis was conducted. The analysis revealed that the two countries tackle the regulation of deepfakes very differently. The EU (incl. the Netherlands) follows an ex-ante approach, where enforcement often remains reactive, the objective is clearly prevention of disinformation. Japan uses an ex-post approach, victims must complain, courts or regulators must act, and relief comes after the deepfake has circulated online. Second, based on this legal analysis, existing legal frameworks are examined in order to evaluate how well they align with citizens' competencies and expectations regarding deepfakes via representative surveys in Japan and the Netherlands. We will measure the following key variables: *risk assessment* of deepfakes; *self-perceived competence and third-person effect* connected to the ability to recognize deepfakes; *deepfake literacy and AI skills*; assessing the *acceptance of deepfakes* in different contexts (e.g., in arts vs. politics); *attitudes toward legal approaches.*

This article aims to uncover cross-country differences in both the legal analysis and empirical research, linked to cultural differences, ethical approaches and political systems. Based on this, concrete suggestions are proposed for policymakers grounded in the insights from the respective countries. These suggestions are informed by learning from each other on a legal level, but also on an individual level. By examining Japan and the Netherlands, we offer policy recommendations for each country inspired by insights from the contrasting country, thus contributing to stronger societies. The article's objective is to help navigate the global societal and regulatory challenge of deepfakes.

CLP02 AI Governance

PP 0123 Voluntary algorithmic censorship: A comparative institutional analysis of sensitive prompt responses in DeepSeek, ChatGPT, and Mistral

Kun He[1]

[1] University of Groningen, Center for Language and Cognition CLCG, Groningen, Netherlands

Large Language Models (LLMs) increasingly function as central infrastructures of digital communication, mediating access to knowledge, shaping public discourse, and structuring economic opportunities. While prior research has focused on the risks of harmful or illegal outputs, comparatively little is known about how LLMs themselves govern content through

embedded moderation mechanisms, or how these mechanisms vary across institutional, commercial, and linguistic contexts. This paper addresses that gap by offering a comparative empirical analysis of content moderation practices in three leading LLMs developed under distinct geopolitical regimes: ChatGPT (United States), DeepSeek (China), and Mistral (European Union).

Drawing on an original dataset of 551 sensitive prompts collected from publicly reported refusal cases on social media platforms, we systematically test model responses across free and paid tiers and across English and Chinese language contexts. Using a risk-based classification framework inspired by regulatory approaches in AI governance, we analyze refusal patterns, partial responses, warning strategies, and stylistic differences in moderation. Our findings reveal three core dynamics.

First, moderation practices closely reflect institutional and regulatory environments rather than neutral technical standards. DeepSeek exhibits pronounced sensitivity to political and historical content, particularly topics associated with state legitimacy and collective memory, while ChatGPT prioritizes technical security, system integrity, and behavioral manipulation risks. Mistral adopts a distinctive pedagogical refusal style, frequently contextualizing restrictions with explanations, reflecting European regulatory emphases on transparency and user rights.

Second, commercialization produces systematic stratification in information access. Paid GPT-4o responds to a substantial share of prompts that are categorically refused by free ChatGPT, often without warnings or disclaimers. This creates what we term *subscription-based information asymmetry*, where access to sensitive knowledge becomes contingent on users' ability to pay, despite identical safety justifications. Such differentiation cannot be explained by legal compliance alone and instead points to voluntary moderation decisions shaped by commercial incentives.

Third, moderation is applied unevenly across languages. All three models demonstrate significant asymmetries between English and Chinese, with certain sensitive prompts becoming more accessible when queried in one language rather than another. These multilingual discrepancies suggest language-specific alignment pipelines and culturally contingent risk assumptions, raising concerns about linguistic discrimination and unequal participation in global digital publics.

We conceptualize these dynamics as **voluntary algorithmic censorship**: content restrictions that extend beyond formal legal requirements and are shaped by institutional priorities, market strategies, and cultural assumptions. To assess governance implications, we examine whether the European Union's Digital Services Act (DSA) offers a viable regulatory framework for addressing these practices. We argue that the DSA's transparency obligations, systemic risk assessments, and accountability mechanisms could meaningfully constrain opaque and discriminatory moderation practices if adapted to LLM-specific architectures.

Overall, this study demonstrates that LLM moderation is neither universal nor neutral but systematically patterned by power, profit, and place. As LLMs become foundational infrastructures of knowledge production, their voluntary censorship practices raise urgent questions for competition, equality, and democratic governance.

CLP02 AI Governance

PP 0124 Governing AI in European public communication

Colin Porlezza[1], Laura Amigo[1], Tobias Eberwein[2], Marten Juurik[3], Marko Milosavljević[4], Mari-Liisa Parder[3], Marie Rathmann[2], Krisztina Rozgonyi[2]

[1] Università della Svizzera italiana, Institute of Media and Journalism IMeG, Lugano, Switzerland
[2] Austrian Academy of Sciences, Institute for Comparative Media and Communication Studies CMC, Vienna, Austria
[3] University of Tartu, Institute of Philosophy and Semiotics, Tartu, Estonia
[4] University of Ljubljana, Department of Communication, Ljubljana, Slovenia

The current hybrid media ecosystem (Chadwick, 2017) has led to the emergence of numerous actors beyond news media that shape information flows within democratic societies. In this evolving media ecosystem, artificial intelligence (AI) plays an increasingly central role, as media and other public communication actors rely progressively on AI systems to (autonomously) produce information and communicate with people (Jungherr & Schroeder, 2023). However, while AI technologies can support participatory, dialogic and pluralistic communication processes, e.g. through news recommenders, they also risk reinforcing destructive communication patterns such as hate speech or disinformation that, in turn, may lead to polarization, eroding levels of institutional trust, and increased legitimacy issues in democracies (Bennett & Livingston, 2018).

Drawing on a governance (Dafoe, 2018) as well as a media accountability approach (Eberwein et al., 2019), this paper wants to shed light on whether and to what extent different actors in Europe (including news media, public institutions and civil society groups) seek to ensure a responsible use of AI in public communication. It seeks to answer the following research questions:

1. What AI-related themes and risks and values are addressed?
2. What forms of governance and accountability mechanisms are promoted?
3. How do approaches differ between national and supranational stakeholders?

The paper presents findings from a two-step empirical study conducted within a Horizon Europe project involving eight European countries. The first step involved a comprehensive collection of documents (n = 435) (codes, charters and

guidelines) concerning ethical standards in public communication. The second step employed computer-assisted inductive thematic analysis (Braun & Clarke, 2012) to identify key themes and cross-national patterns.

The findings show that AI-related concerns are addressed across three stages of the AI lifecycle: development and operation, legitimation for AI use, and AI deployment. However, ethical considerations remain fragmented and are often only superficially integrated. Although common principles such as transparency, accountability, fairness, privacy, and human oversight occur across national and supranational documents, their operationalization remains limited. Lastly, results show that while national guidelines are commonly tailored to everyday applications, supranational documents emphasize normative frameworks grounded on fundamental rights, aiming at harmonizing standards across member states. By highlighting emerging institutional responses to the challenges of AI deployment, our study contributes to current debates on digital democracy, tech governance, and the accountability of AI in shaping public communication in times of disruptive technological changes that affect democracy.

CLP02 AI Governance

PP 0125 Controversies and challenges in GenAI content moderation: Shifting rules in the emergence of a new governance regime

Christian Katzenbach[1], Kim Lisa Ermler[1], Runge Luisa[1]

[1] University of Bremen, ZeMKI, Bremen Deutschland, Germany

The challenges of content moderation are shifting from social media to generative AI (GenAI). To what extent should companies seek to curb the spread of hate speech and misinformation on their platforms, and what are the consequences if they fail to do so? How can the development of emerging technologies and services be aligned with public interest, and how is public interest identified? The rapid uptake and deep integration of GenAI services into our personal and professional lives exacerbates these challenges of private rule-setting rather than relieving them. The advanced forms of automation and data processing embedded in the complex digital infrastructures that enable GenAI services, such as ChatGPT, make it difficult to understand the politics of GenAI outputs.

Alongside the rise of GenAI, there has also been an increase in controversies surrounding the challenges of content moderation. Providers are criticised for spreading misinformation in election contexts, enabling blatant copyright infringement and the appropriation of artists' creative work, and failing to take responsibility or intervene when users with mental health issues endanger or even end their lives after conversations with chatbots.

This paper addresses the development of GenAI governance by companies as an emergent process that is currently unfolding. Building on insights from social media governance, we can understand how tech companies' governance of GenAI interactions emerges over time in response to public and political pressure. Such an approach requires a longitudinal study of evolving GenAI discourse and the changing rulesets for and by GenAI providers.

Alongside this conceptual perspective, the paper presents the initial findings of an empirical study building on a mixed-methods analysis of media reporting on GenAI, product policies and guidelines, and corporate communication on product websites and corporate newsrooms for the time period (2021–2025). The results indicate that, (1) in normative controversies on GenAI, misinformation, mental health and creative practices constitute key themes of contestation. These tensions are already beginning (2) to manifest in product policies and guidelines. For example, providers reaffirm the need to respect creators, their work, and their intellectual property, and to prevent imitation of the work of individual living artists. They defer liability for infringements to users. In their corporate communication (3), companies present their services as powerful tools that enable a wide range of activities and carefully balance normative tensions regarding liability for dangerous and contested forms of usage.

Overall, these results are indicative of a negotiation process regarding norm setting between private companies, public debates and regulation, which strongly resembles debates on the responsibility and power of social media platforms. Studying these questions of platform governance from social media to GenAI is becoming ever more critical. The current confluence of high political polarization, rapid technological developments and foundational planetary transformations challenges the cohesion of contemporary societies. Tech companies, developing platforms and GenAI tools, play a substantial role in these

dynamics by (re)organizing public discourse, thereby affecting societal norms, and policy-making processes, not necessarily for the better of democracy and human well-being.

CLP02 AI Governance

PP 0126 Regulating artificial intelligence in authoritarian contexts: Russia's "ethics" approach to becoming an AI power

Anna Ryzhova[1]

[1] University of Passau, Chair of Political Communication with a Focus on Eastern Europe and the Post-Soviet Region, Passau, Germany

In 2022, two events have significantly transformed the dynamics of worldwide digital cooperation: Russia's war on Ukraine and Open AI's introduction of ChatGPT and the rapid following development of generative large language models (LLMs) (Fui-Hoon et al., 2023). Russia's unprecedented attack on Ukraine has formed a new international relations dynamic, within which big tech companies took the role, previously taken by the states, i.e. "taking sides" in political conflict and imposing a digital blockade on Russia (Aviv & Ferri, 2023), leading to Russia much more actively, than before, striving to achieve "digital autonomy" from global technology providers and develop its own technology (Aviv & Ferri, 2023). At the same time, Russia's president, Vladimir Putin, has repeatedly underlined, that Russia's ambition is to become a world leader in creating AI technologies, as well as in Russian LLMs and AI products being adopted worldwide (e.g. Putin, 2024). As Smuha (2021) convincingly argues, the race to AI triggers the race to AI regulation, as the established AI regulatory regime can establish legal certainty for stakeholders involved, and ensure the trust in the technology, while simultaneously facilitating its uptake, hence advancing the country's competitive position as an AI market player worldwide (Smuha 2021, P.59). However, the question remains – what kind of *leader* Russia strives to become, how is it ingrained in official regulatory documents and how has it changed after 2022, in the light of the sanctions, imposed on Russia in the aftermath Russia's invasion of Ukraine in 2022 (Nadebaidze 2025, P.134)?

AI systems are always a part of a broader socio-technical environment, and their trustworthiness requires trustworthiness of all actors and processes involved. Existing research on Russia's AI strategy has examined how Russia's AI narrative is reflected in official's statements and in Russia's state-sponsored media (Nadibaidze, 2024; 2025), described Russia's regulatory regime and bodies (e.g. Chan et al., 2024, Papyshev & Yarime 2024; Szakonyi et al., 2024), the role of Russia's state-owned firms in Russia's AI strategy (Petrella et al., 2021). However, existing articles on the Russia's regularoty regime (e.g. Chan et al., 2024, Papyshev & Yarime 2024; Szakonyi et al., 2024) only discuss the hard regulations and the official bodies that regulate the AI in Russia, while Petrella et al. (2021) look at the connections of the companies, involved in regulating AI in Russia, with the government, as well as the Russia's official narrative, discussed by Nadibaidze (2024; 2025) is based on statements and media reports, not on official documents. This contribution, in contrast with existing literature, analyses the hard regulation frameworks, that exsist in Russia, but also the "soft" regulations, which are as of 2025 prevalent in the Russian AI landscape and answers the following research question.

What are the major regulations, that govern the development of the AI in Russia as of 2025, and how have these regulations transformed after 2022? How does Russia present itself in these documents, what are the narratives of Russia as AI player, described in these documents?

CLP04 Power and Influence in Media and Communications Policy Processe

PP 0339 The agency of industry elites in media policy processes

Helle Sjøvaag[1], Mary-Lynn Young[2], Alfred Hermida[2], Raul Ferrer-Conill[3], Thorsten Quandt[4]

[1] University of Stavanger, Department of Media and Social Sciences, Stavanger, Norway

[4] Department of Communication, The University of Münster, Münster, Germany

In this paper we ask how agency is expressed by journalism elites in media policy-making processes. We operationalise the policy process as consisting of formal and informal dynamics where formal dynamics include a seat at the table where deliberation and decision making happens, and informal dynamics encompass problem definition, coalition building, bargaining, and lobbying.

To access what agency is, we apply the life-course approach, an interview method designed to focus on retrospective oral histories, personal narratives, and the unique experiences and contributions of the individual. Agency is furthermore operationalised through Strategic Action Field theory, an institutional approach that focuses on social skills, alliance-building, and informal networks in attaining strategic goals. Structure is operationalised through media systems properties and the formal and informal process of policymaking during the 30 years of digital transition in journalism in Canada, Germany, Norway, and Spain.

To get around the problem of strategic discourse in media policy research, we talk exclusively with retired industry professionals (n = 31). As the universe of retired CEOs is small, our sample reflects the limited availability, as well as the homogeneity, of elite actors. Our sample consists of 31 informants, 28 of which are male and three of which are female,

nine from Canada, eight from Germany, eight from Norway, and six from Spain. Represented in the sample are former CEOs, publishers, managers, directors, editors, regulators and union/association/federation leaders.

Interviews are analysed using thematic analysis, where the agency theme is analysed in light of Strategic Action Field theory. We find that elites act strategically at formal and informal levels, using their position, social skills, and professional resources to attain their goals, in line with core assumptions in the theoretical framework. However, our analysis also shows that while social skills are important in building policy influence, position within the strategic action field matters more in forming narratives, setting the agenda, and accessing policymaking processes, highlighting the role of institutional arrangements in media systems.

To that end, informants give media policy varying degrees of importance to their professional lives – more so in Canada and Norway than in Germany and Spain – reflecting the fact that the relative reach of media policy also matters for how agency is mobilised to engender influence. The contribution of this study is thus to bring nuance to the theory of Strategic Action Fields in how these are positioned in relation to other fields, particularly the state.

CLP04 Power and Influence in Media and Communications Policy Processe

PP 0340 Journalistic access to information as a policy process

Francisco Goncalves[1], Fernando Paulino[2], Danilo Rothberg[3]

[1] Brasilia University, Faculty of Communication, Brasilia, Brazil
[2] Brasilia University UnB, Faculty of Commucation, Brasilia, Brazil
[3] Sao Paulo State University Unesp, Communication Postgraduate Program, Bauru, Brazil

Freedom of information (FOI) laws have become a cornerstone of democratic governance, formally guaranteeing citizens and journalists the right to access public information. However, comparative research has shown that the effectiveness of these legal frameworks varies significantly across countries and institutional settings. This paper examines how journalists secure access to information within FOI regimes, conceptualizing access not merely as a legal entitlement but as a transnational policy process shaped by law, administrative practices, and communicative interaction.

The study adopts a mixed-methods research design grounded in documentary analysis, large-scale quantitative data, qualitative content analysis, and semi-structured interviews. Its empirical foundation combines original data with comparative evidence drawn from FOI systems in Scotland, Canada, Brazil, Mexico, and other national contexts discussed in the literature and analyzed throughout the research. While Brazil offers the most comprehensive empirical dataset in our analysis, this study systematically draws on comparative findings from Canada and Scotland—both prominent in international FOI research—as well as from Mexico and other national contexts. This approach reveals shared patterns and structural differences in the governance and practice of access to information.

The theoretical framework draws on classical and contemporary reflections on publicity, secrecy, and democratic accountability (Bentham, 2011; Kant, 2008; Arendt, 2018; Bobbio, 2015), as well as on policy-oriented approaches to transparency and information governance (Ackerman & Sandoval-Ballesteros, 2006; Michener & Bersch, 2013; Gomes, Amorim & Almada, 2018). In our study, FOI laws are analyzed as instruments of public communication and public action (Lascoumes & Le Galès, 2012), whose implementation depends on organizational cultures, administrative discretion, and risk management practices within the state.

Across the cases examined, the findings indicate that journalists' requests are frequently treated as politically sensitive, particularly in policy areas related to national security, foreign affairs, and economic governance. In Scotland and Canada, previous studies highlight tensions between formal transparency standards and administrative caution. Research on Mexico and Brazil reveals how historical legacies of secrecy and uneven institutional capacity shape access outcomes. In every context, journalists gain access not by default through legal provisions but by drawing on professional expertise, crafting strategic requests, demonstrating persistence, and leveraging their understanding of bureaucratic processes.

By comparing multiple FOI regimes, the paper suggests that journalistic access to information is consistently mediated by informal policy practices operating alongside formal legal norms. This comparative perspective challenges compliance-based evaluations of FOI systems and instead advances a process-oriented understanding of access to information. The study contributes to Communication Law and Policy debates by offering a transferable analytical framework for examining how transparency laws function in practice across democratic systems, with implications for FOI reform, regulatory oversight, and the protection of journalism as a democratic institution.

CLP04 Power and Influence in Media and Communications Policy Processe

PP 0341 Governing the governors: Tech industry influence on AI policy

Lee Raudsepp[1], Andra Siibak[1]

[1] University of Tartu, Faculty of Social Sciences- Institute of Social Studies, Tartu, Estonia

This presentation analyses the strategic methods through which technology companies have systematically co-opted artificial intelligence policymaking processes in both the European Union and the United States.

Our research draws upon political economy scholarship, governance studies, and regulatory theory, integrating qualitative analysis of policy documents, media coverage, and materials secured through freedom of information mechanisms in Estonia. The investigation traces AI policy development across the Atlantic from 2019 to 2025, revealing a multi-layered influence architecture.

Rather than operating as neutral stakeholders in regulatory development, big tech functions as architects of the very frameworks designed to govern their activities. The current wave of AI legislation, including the EU AI Act and emerging US regulatory initiatives, has been fundamentally shaped by industry intervention, raising critical questions about the legitimacy and effectiveness of democratic governance in the platform economy. Whilst traditional industries have long engaged in regulatory manipulation, technology companies have pioneered novel tactics specifically calibrated for the AI domain: embedding personnel within government agencies through revolving doors, financing ostensibly independent academic research, and positioning themselves as indispensable partners in regulatory experimentation and policy co-design.

Examining contested regulatory areas, including algorithmic accountability, privacy safeguards, platform content governance, and safety protocols, our analysis exposes how corporate actors engineer deliberate weaknesses into regulatory frameworks. These vulnerabilities consistently favour market expansion over citizen protection. Our analysis reveals a consistent pattern: rather than reacting defensively to regulatory proposals, technology companies strategically anticipate, weaken, and obstruct any policy measures that could threaten their monopolistic positions. This represents corporate power operating not merely as influence, but as governance itself.

We conceptualise this dynamic as AI regulatory capture, a phenomenon qualitatively different from classical regulatory capture due to three distinctive features: the esoteric technical knowledge required to understand AI systems, the unprecedented velocity of technological change, and the profound imbalance in expertise between under-resourced public institutions and well-funded private actors. Our presentation advocates for institutional reforms that can sustain democratic, accountable AI policymaking resistant to corporate colonisation, whilst preserving space for innovation genuinely aligned with collective welfare.

CLP04 Power and Influence in Media and Communications Policy Processe

PP 0342 A critical policy analysis of Denmark's "tech diplomat"

Abigail Simmerman[1]

[1] Penn State University, Bellisario College of Communications, State College- PA, USA

In 2017, Denmark became the first country to appoint a "Tech Ambassador" to represent the country's technological interests. The Ambassador's primary goal was to "encourage investment into Denmark from the [US] West Coast tech companies, and [promote] Danish exports to Silicon Valley startups," as well as sharing Danish culture with tech giants (Stokel-Walker, 2017). From then, as of 2025, over 70 consulates and embassies operate in Silicon Valley (Buckup & Canazza, 2023). Many of these consulates represent other European nations. This sudden proliferation of tech diplomats is part of the growing trend of "tech diplomacy." Tech diplomacy is the practice of diplomacy between a nation and a private technology company (or sector) rather than between two nations, or "strategically engaging with [private] technological stakeholders for diplomatic objectives" (Mashiah, 2023: p. 1). The practice of tech diplomacy through the appointment of the first Tech Ambassador makes clear the power of the tech industry, to where nations must negotiate with corporations as if they were governments.

This paper fills a critical gap in scholarship on the burgeoning practice of tech diplomacy by offering a critical analysis of strategic plans of the Danish tech Ambassador – the first of its kind – from 2021–2025. Through document analysis (Karpinnen & Moe, 2019) of the published strategies of the Danish Tech Ambassador over the past four years, the paper's aim is to reveal and unpack the complex motivations of tech diplomacy. To ground its findings, this paper relies on the tenets of critical political economy. Critical political economy (CPE) at its core is the study of power relations, focusing on the critique of market fundamentalism and the failures of the principles of liberalism (Mosco, 2009). CPE aims to propose democratized solutions to the problems presented by liberal policy.

Findings reveal a contradiction within Danish tech diplomacy policy. Indeed, while the Danish Tech Ambassador purports their mission to be one of democratization, in line with the socialist democratic principles of the nation, and through the promotion of European regulatory frameworks, the plans of the Tech Ambassador reiterate a continued focus on increasing Europe's economic position as an industry power in the technology sector. This reveals the liberal agenda of the Danish Tech Ambassador and provides a frame of analysis for tech diplomats appointed throughout Europe, contributing an important and novel analysis in communication law and policy.

CLP04 Power and Influence in Media and Communications Policy Processe

PP 0343 Media policy and platform regulations in transition: Disinformation regulatory frameworks and governance logics in Egypt

Maysa Amer[1]

[1] Free University of Berlin, Institute for Media and Communication Studies- Department of Political and Social Science, Berlin, Germany

The acceleration of the dissemination of misinformation and disinformation has severe implications for both democratic and non-democratic societies. Although digital platforms and social media platforms have facilitated global communication, expression of viewpoints, and activism in the MENA region, they have also become channels for misinformation, disinformation, and political manipulation worldwide. While there is extensive and rigorous attention to platform regulations and government responses to misinformation, disinformation, and online deception in democracies, authoritarian regimes, including countries in the MENA region, remain underrepresented.

This study examines media policy and platform regulations in Egypt as a case study, with particular emphasis on disinformation regulations and their governance logics. Drawing on power and governance theoretical frameworks, the study aims at 1) exploring platform governance logics and regulations modes in Egypt for disinformation and misinformation, 2) understanding the power dynamics of governance actors and stakeholders, and 3) identifying implications of current policies and regulations and proposing policy alternatives for countering misinformation and disinformation.

This study employs triangulation of qualitative methods, including text and document analysis of laws and policies pertaining to digital and social media platforms, with a focus on disinformation and misinformation, and qualitative in-depth interviews with key stakeholders, including policymakers, experts, officials, politicians, platforms, industry, and media practitioners, reflecting laws and regulations governing disinformation and their implications. Drawing on primary qualitative data, this paper presents a conceptual framework that enriches the literature on platform governance and regulation in non-Western contexts. We deepen our understanding of governance modes across regions worldwide and broaden the lens for comparative perspectives. In addition, it deepens our understanding of which actors shape the power of platform governance and online content regulation within such contextual frameworks, which content is deemed controversial and classified as disinformation, and with what mechanisms it is governed. The findings show a fragmented regulatory lanscape, and typology of three modes of disinformation governance: selective-enforcement, collaborative governance, and disputed policy and online content governance. The study suggests a multi-stakeholder approach model, including civil society actors and independent oversight.

CLP05 Re-Thinking and Reforming Communications Policy Making

PP 0455 The long and winding road: Developing dialogic bottom-up policy recommendations for the polarised and disinformed societies

Marko Milosavljevič[1], Krisztina Rozgonyi[2], Melita Poler[1], Marie Rathmann[2], Romana Biljak Gerjevič[1], Tobias Eberwein[2]

[1] University of Ljubljana- Faculty of Social Sciences, Department of Communication, Ljubljana, Slovenia
[2] Austrian Academy of Sciences ÖAW, Institute for Comparative Media and Communication Studies CMC, Vienna, Austria

Digital communication has generally been associated with the idea of a new and booming participatory culture (Jenkins, 2006). However, this shift has been reflected only to a limited extent in policy shaping. This paper proposes research- and evidence-based policy recommendations for digital media communication, stemming from a bottom-up participatory approach that could enrich the democratic potential within the development of communication law and policies.

The theoretical approach builds on dialogic communication theory (Couldry, 2010; Carpentier, 2011), which conceptualises public communication as a relational and reciprocal process in which actors jointly construct meaning and negotiate responsibilities, rather than participating through one-directional consultation. Within policymaking, dialogic approaches have been shown to strengthen legitimacy and accountability (Fung, 2015; Kerr, 2024).

The paper is based on an application-oriented perspective on policy analysis, aimed at achieving specific objectives, and adopts a normative analytical stance to evaluate policy alternatives and prescribe action (Dunn, 2018), including the formulation of policy recommendations.

The paper applies the research and results of the project DIACOMET, conducted over the past 2 years across eight European countries (Austria, Estonia, Finland, Hungary, Lithuania, the Netherlands, Slovenia, and Switzerland). The policy recommendations are developed through four major research strands: (1) an analysis of 429 ethical codes and normative communication guidelines; (2) a multi-stage Delphi study with experts; (3) the implementation of the Q-sorting method with diverse audiences; and (4) 87 focus groups involving more than 500 participants across professional, generational, and minority groups. The methodological design enabled an empirically grounded bottom-up contribution to communication policy by integrating the perspectives of groups that are commonly absent from formal consultations.

The analysis identified four key areas for policy recommendations: disinformation and foreign interference; polarisation and radicalisation; the impact of artificial intelligence (AI) and new technologies on democracy; and data privacy, security, and surveillance.

The DIACOMET findings highlight a shared concern regarding the increasing vulnerability of public communication environments, shaped by commercial, technological, and political pressures. These pressures undermine the conditions for trustworthy, inclusive, and accountable public discourse, rendering societies more susceptible to misinformation, polarisation, and manipulation. Restoring trust and integrity, based on the principles of dialogic communication, therefore requires more than isolated interventions; it demands systemic accountability, transparent digital infrastructures, and communication practices grounded in dialogue rather than confrontation.

The paper emphasises how participatory and dialogic approaches can address persistent disconnections between formal regulatory processes and everyday communicative practices. It advances normative questions of legitimacy, accountability, and inclusion by grounding them in empirical civic experiences, rather than relying solely on institutional or technological expertise, and illustrates how civic accountability mechanisms may operate across self- and co-regulatory, and statutory frameworks, complementing recent EU regulatory framework such as the Digital Services Act, the European Media Freedom Act, and the Artificial Intelligence Act.

As the DIACOMET project is ongoing, the policy recommendations are currently being developed as a temporary milestone, and the final version will be submitted to the European Commission in May and then available to be presented and discussed at the conference.

CLP05 Re-Thinking and Reforming Communications Policy Making

PP 0456 Telecommunications policy: The case for empathy

Christopher Ali[1]

[1] Penn State University, Bellisario College of Communications, State College, USA

Recent years have seen a turn to the study of empathy in critical studies of public policy. Studies show empathy can help amplify minority perspectives on policy issues and diversify what counts as evidence in the policymaking process. Further afield, empathy contributes to a deliberative democracy, underscoring conversation, understanding, and compassion. In studies of communication policy, however, concern for empathy has not been a priority. In media policy, that which refers to content and production, empathy may be thought to be included in public interest standards, public service media organizations, and in sensitivity to cultural differences, tastes, and domestic production. Telecommunications policy, in contrast, is cold and impersonal: wires, frequencies, and orbits. Such seeming impersonality has led to a telecommunications policy ecosystem that has entirely abstracted human beings and human experiences. This, in turn, has allowed telecommunications policy to operate entirely in service of private telecommunications providers, actively harming communities by driving up prices and interrupting universal service goals. Debates around Europe's proposed Digital Networks Act exemplify this disruption. Communities lose when battles are between network operators and when only the voices of the regulated count as policy evidence. To correct this dehumanized architecture, this paper envisions a telecommunications policy environment that is human, people-centered, and empathetic.

Underscored by literature on empathy and deliberation in public policy, this paper draws on ethnographic-based fieldwork (participant observation and interviews) in the United States with un- and under-connected communities. Specifically, the paper draws on examples from the city of Pittsburgh, Pennsylvania (an urban city of approximately 300,000 people), that developed a mobile Cyberbus; the Hoopa Valley Indian Tribe in Northern California (a rural, Indigenous community of approximately 3,000 people), which created its own wireless network; and the State of Vermont (a small rural state of approximately, 650,000 people), which created a policy architecture that invites community participation. Connecting these examples and communities, the argument is made for the inclusion of empathy within telecommunications policy.

Drawing on these American examples, this paper urges regulators and policymakers globally to adopt four empathy-based telecommunications recommendations: meaningful engagement from communities in policymaking actions; a focus on access to infrastructure rather than infrastructure availability; a commitment to affordable universal service; and the inclusion of public interest mandates akin to those found in broadcasting for internet service providers. While the research is based in the United States, the lessons from this research are global as the domination of telecommunications policy by private industry is a universal rather than a local problem. This paper contributes to the ECREA Communication Law & Policy Division's call for abstracts regarding policies for communication infrastructure.

CLP05 Re-Thinking and Reforming Communications Policy Making

PP 0457 The many faces of the user in Internet governance: A typology of user roles

Florian Saurwein[1], Jasmin Dall'Agnola[1], Natascha Just[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Over the past two decades internet governance has undergone a profound transformation, giving rise to hybrid governance arrangements that now encompass national and international statutory regulation, platform-supported self- and co-regulation, civil society initiatives, and, increasingly, active user participation. In the EU, the latter is reflected in the Digital Services Act, which has introduced obligations that strengthen user rights by enabling them to notify illegal content, receive explanations for content moderation to enhance transparency, and challenge such decisions through dispute procedures. In this evolving regulatory landscape, users are no longer passive recipients of services or mere subjects of protection but increasingly active participants and bearer of legal rights and responsibilities, agents of empowerment, and even co-governors.

Although early scholarship linked users to broader processes of transformed statehood in the context of convergence, for example by noting a shift from centralized state protection to decentralized user self-protection, analyses of platform governance still rarely place the role of users at their core. Existing research often focuses on governance by states, companies, and NGOs. When user agency is recognized, for example in discussions of participatory governance or participatory accountability, analyses tend to address specific forms of user involvement in regulation rather than providing a comprehensive account of the multifaceted roles users now play in digital platform governance. Such a narrow focus overlooks how recent (self-)regulatory reforms are redefining the role of users within governance arrangements.

To address this gap, we developed a differentiated typology of user roles in internet governance. Drawing on qualitative, iterative analysis of regulatory frameworks, academic literature and governance instruments from 32 platforms, we identified the roles that users assume when state and platform governance instruments are deployed in practice. The typology ranges from users as vulnerable individuals in need of protection, to those whose beliefs and behaviours are subject to steering, to rule-breakers requiring discipline, to legal subjects endowed with rights, to informed actors supported in building knowledge and digital literacy, to autonomous decision-makers exercising choice, and finally to co-governors actively shaping governance arrangements.

The typology provides a lens for analysing how users are positioned and addressed through governance instruments such as prohibitions, nudges, notification systems, news-feed configurations, and account suspensions, for identifying the roles they ultimately assume. With this, we move beyond the state-industry binary and the narrow view of users as content producers and consumers and we offer a framework for understanding how users are positioned within evolving platform governance, and how they are protected, empowered, and held to account. This, in turn, offers a conceptual and methodological basis for analyses of user roles across policy fields, to examine whether current reforms privilege certain user roles (e.g., protection) over others (e.g., empowerment), and to explore whether broader shifts toward more active or passive conceptualizations of user agency are emerging. We demonstrate the analytical value of the typology by applying it to the field of content moderation, showing how it enables systematic analysis of user positioning within a central domain of contemporary platform governance.

CLP05 Re-Thinking and Reforming Communications Policy Making

PP 0458 Fostering unicorns: Institutional optimism in the EU digital agenda

Rebecca Scharlach[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

Innovation is a central yet ambiguous goal in the European Union's digital agenda. Within the AI Act, innovation is positioned as both an economic imperative and a normative good, associated with safeguarding fundamental rights. Innovation is also closely connected to techno-optimism, the belief that technological innovation is inherently beneficial and economically necessary (Nye, 2007). Contemporary techno-optimism is strongly shaped by Silicon Valley's "Californian Ideology" (Barbrook & Cameron, 1996). In this regard, scholars have shown how cyberlibertarian ideals conceal deregulatory, anti-democratic ideologies rooted in neoliberal markets and right-wing political thought (e.g., Golumbia, 2024; Massanari, 2024). Much of the existing scholarship has examined these dynamics within the US context, but little is known about how these ideologies shape European governance frameworks. Addressing this gap, I focus on current developments in the EU digital agenda. I ask: *how is innovation understood, mobilized, and justified within the EU digital acquis?*

Empirically, the paper draws on ten interviews with EU policy experts involved in drafting and negotiating the AI Act, as well as related digital legislation such as the GDPR, DSA and DMA. Following previous studies in platform governance research (e.g., Gorwa, 2024), I explore whose visions of innovation shape legislative priorities amid recent geopolitical shifts, and how narratives of innovation shape regulatory choices, enforcement practices, and attributions of responsibility for the effects of technological advancements.

Preliminary findings reveal three forms of innovation: First, innovation is understood in terms of scale and economic growth, aligning closely with American techno-optimist ideals. Interviewees emphasized that innovation is frequently equated with enabling firms to grow and compete internationally. Second, innovation functions as an empty signifier: a vague, largely symbolic term inserted into policy discourse for normative resonance rather than a clear definition or measurable regulatory objective. Third, innovation operates as a political tool to justify specific regulatory choices and practices, including how the European Commission enforces the AI Act. This becomes particularly visible under external pressure from the US government in 2025. Interviewees consistently described an acceleration of influence from the US government and Big Tech companies on EU digital policymaking, especially over the past year, and expressed concern about growing pressure to deregulate in the name of innovation. Some interviewees characterized this pressure as "blackmailing."

Despite these concerns, interviewees agreed that Europe's value-driven regulatory approach can and should persist. I conceptualize this stance as institutional optimism: a belief in regulatory institutions' capacity to harness technological change while safeguarding democratic values. Institutional optimism does not stand in opposition to techno-optimism, but reflects the conviction that institutional intervention is necessary to realize the benefits of technological innovation while mitigating potential harms. At the same time, this optimism is marked by ambivalence, shaped as much by awareness of current geopolitical constraints as by confidence in the EU's digital agenda. In other words, the current tech governance discourse is shaped as much by concern as it is by conviction.

CLP05 Re-Thinking and Reforming Communications Policy Making

PP 0459 Multistakeholder discourses in the BBC's 2027 Charter renewal period: Mapping a debate over the future of public service media in the UK and beyond

Peter Lunt[1], Tim Neff[2]

[1] University of Leicester, Arts- Media and Communication, London, United Kingdom
[2] University of Leicester, Arts- Media and Communication, Leicester, United Kingdom

Public media systems around the world, including those in the UK, are facing sustained efforts to erode their core public service missions. The 2027 renewal of the BBC Charter and accompanying agreement with the Department for Culture, Media & Sport opens a window for intense public consultation, discussion and debate concerning the public value of the BBC, its purposes and continuing relevance, its accountabilities and governance and its funding model. This is a crucial process with significant consequences for the mediated social, cultural, and news environment in the UK, and it also serves as a test of the quality of deliberation and public engagement in shaping a major cultural institution. The debate has already begun as various stakeholders outline their initial positions and members of the public participate in processes of public engagement and deliberation. In this paper we will summarize the range of participants, processes of consultation and public engagement and reactions to the deliberative process of Charter renewal. Our core research questions concern the extent to which the debate about the future of the BBC as a leading public broadcaster represents a pluralistic process engaging diverse participants and views or a process that is captured by hegemonic stakeholders' views, potentially to the detriment of public engagement in the process shaping the BBC and, ultimately, broader civic engagement in vital public affairs. We will present critical analysis of early public discussion, debate and contention and the provision of approaches to public engagement and commentary on the public value of the BBC and its role in social, cultural and political life. We will map participants in the early stages of the debate, including political institutions, NGOs, advocacy groups, and the media, and examine attempts at public engagement through consultation or research with a focus on arguments regarding the public interest in the work of the BBC. Through these analyses we aim to contribute to academic studies on the role of the BBC and public service media more generally, the quality of deliberation surrounding the Charter renewal process, and the characteristics of public understanding and engagement in this pivotal moment in public life. We anticipate that legacy issues from previous Charter renewal processes will remain salient in the present, open policy window, such as the role and purpose of the BBC, its funding model, issues of governance, and the representation of diverse views, opinions and communities. We also anticipate and will analyse early examples of discourses on emergent technological and social concerns, including the digitalisation and fragmentation of media markets, rise of generative artificial intelligence (genAI) and proliferation of misinformation (Cañedo et al., 2022; Chivers and Allan, 2024; Gibbons, 2017; Sehl, Fletcher, and Picard, 2020), will have a significant impact on these debates, contentions and, ultimately, the future of the BBC.

- Cañedo, A., Rodriguez-Castro, M., and López-Cepeda, A.M. (2022). "Distilling the Value of Public Service Media: Towards a Tenable Conceptualisation in the European Framework.", European Journal of Communication, vol. 37, no. 6, pp. 586–605.

CLP06 Contemporary debates for Public Service Media governance and remits in Europe

PN 47 The future of public service media in the context of broadcast decline: the case of the UK

Catherine Johnson[1]

[1] University of Leeds, School of Media and Communication, Leeds, United Kingdom

Over 99% of UK households have free access to broadcast TV – included regulated public service media (PSM) providing trusted news and high-quality programmes that support democracy and culture. Yet, broadcasting is in structural decline, as audiences increasingly watch via internet-delivered television (IPTV), presenting significant challenges to social cohesion and the future of public service media (PSM). Those that are older, disabled and/or on lower incomes risk being left behind because they cannot afford, or lack the skills to use, broadband and IPTV (Vernon et al, 2024). Meanwhile, the lack of regulation for IPTV threatens the viability of PSM, which supports the UK's creative economy and democracy. This paper takes the case of the UK as a starting point for examining the impact of broadcast decline on policy debates about the future of PSM. It examines two parallel policy debates in the UK: the future of TV distribution and BBC Charter renewal. In 2025, the UK Department of Culture, Media and Sport convened a year-long Stakeholder Forum consisting of representatives from across infrastructure, technology, broadcasting and civil society to review the future of Digital Terrestrial Television (DTT) and will publish its recommendations in 2026. The BBC have publicly pushed for DTT switch-off in the mid-2030s, arguing that the costs of maintaining dual distribution via broadcast and internet-delivered television are becoming unsustainable. The paper will analyse the policy debates and documents stemming from this process with a particular focus on the ways in which arguments related to the future of PSM are mobilised by competing stakeholders. It will then examine the extent to which questions of the long term (post-2034) future of DTT emerge in the debates and responses to the government's Green Paper on BBC Charter which is open for consultation from December 2025 to March 2026. Both policy debates demand long-term thinking, given that current DTT licences in the UK run until 2034 and that the next BBC Charter period will likely run until at least 2038. The UK case offers a useful opportunity to examine the extent to which multistakeholderism (Van den Bulck and Raats, 2022) limits the ability for policymakers to tackle longer term structural shifts in the media ecology and asks what this might mean for the ability of policymakers to address the challenges facing PSM today. Given that debates about the future of DTT are playing out in other contexts, such as France, Sweden and Finland, this paper aims to offer a useful starting point for analysing the structural decline of broadcasting and its impact on PSM policymaking.

CLP06 Contemporary debates for Public Service Media governance and remits in Europe

PN 48 The illusion of independence: Depoliticization, hybrid funding, and dual capture in flemish public service media governance

Hilde Van den Bulck[1], Tim Raats[2]

[1] Drexel University, Department of Communication , Philadelphia, USA
[2] Vrije Universiteit Brussel, imec-SMIT-VUB, Brussels, Belgium

Across Europe, public service media (PSM) governance has increasingly relied on depoliticizing instruments such as management contracts, performance indicators, and multistakeholder, evidence-based policymaking procedures. Emerging from broader shifts in public management and multi-level governance, these mechanisms are intended to secure arm's-length independence from political interference while enhancing transparency, accountability and regulatory legitimacy. Yet persistent controversies around remit, funding and market impact raise questions about whether such governance arrangements effectively insulate PSM from political and commercial pressures or, instead, reconfigure them. This paper examines this paradox through an in-depth analysis of the most recent renewal of the management contract of Flemish public broadcaster VRT. Building on prior research on "mature" multistakeholderism and evidence-based policymaking in European PSM governance, we advance the notion of "an illusion of independence" to capture how formal governance arrangements can perform regulatory autonomy while enabling continued and, in some respects, intensified forms of capture. Empirically, the study combines analysis of the policy cycle leading up to the management contract renewal with a critical analysis of the contract itself and surrounding policy documents. The analysis examines how independence is structured and constrained across successive stages of the process, including commissioned research and stakeholder consultations, advisory council input, parliamentary hearings, ministerial negotiations and final government approval. Particular attention is paid to contractual language that defers key decisions to political authorities, introduces conditionality ("to be finalized by government") or embeds discretionary oversight that sits uneasily with the logic of arm's-length governance. Rather than insulating decision-making from politics, these arrangements allow political authorities to retain discretionary control at key moments of the policy process. The findings demonstrate how hybrid funding arrangements contribute to a dual form of capture. While the ceiling on commercial revenues for VRT has been reached, commercial income has not reduced political dependence. Instead, it has provided additional leverage for private media actors through "level playing field" claims rooted in competition frameworks and has intensified pressures on PSM to engage in market-oriented collaborations. These dynamics resonate with broader critiques of evidence-based policymaking and multistakeholderism which caution against overestimating data neutrality and instrumental rationality while underplaying power asymmetries and path dependencies. We argue that depoliticizing governance instruments do not fail merely due to imperfect implementation. Rather, they

operate within a policy environment where political authorities retain decisive discretion and core principles of regulatory independence, including clear separation of roles, predictable commitments, stable funding horizons and respect for contractual autonomy, are only partially upheld. While focused on the Flemish case, the paper speaks to wider European debates on regulatory (in)dependence, PSM governance, and the limits of contemporary communication policy under conditions of fiscal pressure and competitive media markets.

CLP06 Contemporary debates for Public Service Media governance and remits in Europe

PN 49 Public service media impartiality under political scrutiny: Analysis of questions and interpellations on VRT news reporting in the Flemish Parliament

Michael Pakvis[1]

[1] Vrije Universiteit Brussel, imec-SMIT-VUB, Brussels, Belgium

Impartiality has historically underpinned Public Service Media (PSM) news reporting. By adhering to impartiality, PSM aim to provide high-quality trustworthy journalism by presenting news through a diversity of views and actors present in society according to their due weight and by providing sufficient contextualisation (Sambrook & Cushion, 2024). Discussions on impartiality have increased gradually in the last two decades, with scholars observing an increase in criticism and accusations of bias, false balance and 'wokeness' (Pakvis et al., 2025). In 2025 criticisms of PSM operationalisations of impartiality were further exacerbated due to an edited speech by Donald Trump in a BBC documentary deemed to have mislead audiences, culminating in the resignations of BBC director general Tim Davie and CEO of News Deborah Turness. Against this backdrop, our study analyses policy discussions on impartiality through the lens of parliamentary questions. In many PSM systems, the parliament is not only involved in multistakeholder discussions on charter renewals but also fulfils a specific monitoring assignment (Campos-Freire et al., 2021; Jakubowicz, 2011; Van den Bulck & Raats, 2022). This is the case in Flanders, where the Flemish parliament, as the authority responsible for cultural competences, oversees the execution of VRT's public service contract, with parliamentarians being able to address the Minister of Media on matters related to VRT (Van den Bulck & Donders, 2014). Furthermore, the case is salient given the relevance of multistakeholder processes in Flemish PSM policy (Van den Bulck & Raats, 2022), the centrality of impartiality for the public broadcaster and its yearly oversight (VRT & Flemish Government, 2020; 2025). The article analyses how politicians discuss VRT's impartiality in the Flemish parliament. Our dataset consists of 111 parliamentary questions and interpellations explicitly referring to VRT's impartiality in news reporting and interrelated values (e.g. objectivity, independence, neutrality) between 2014 and 2025, taking place during the current and two previous Flemish governments. We analyse questions and ensuing exchanges by means of a thematic analysis (Herzog et al., 2019) investigating (i) patterns across time, political parties and representatives regarding impartiality, (ii) which aspects of VRT's remit and performance are problematised, and (iii) how other politicians and the media minister respond to critical interventions. This design allows us to identify who speaks most about VRT, how the broadcaster is attacked and defended, and which specific values and expectations parties attach to VRT's information remit. Preliminary analysis of documents indicates that concerns ranged from government influence on specific programmes hampering impartiality to the perceived neutrality of VRT's news and current affairs coverage. The radical-right party Vlaams Belang positions itself as the most vocal parliamentary critic of VRT's impartiality, questioning its standards for high quality by addressing news reporting as well as internal functioning of the public broadcaster. By revealing how different political actors discuss the value of impartiality in relation to VRT, the paper contributes to debates on PSM legitimacy and accountability, and to research on how political discussion and symbolism shape the development of public service media remit and operations.

CLP06 Contemporary debates for Public Service Media governance and remits in Europe

PN 50 Polish Television (TVP) in the Age of Platforms

Michal Glowacki[1], Filip Świtkowski[1]

[1] University of Warsaw, University of Warsaw, Warsaw, Poland

For many years, public service media (PSM) in Poland have been subjected to increasing political pressure and market marginalisation. Imprecise systemic regulations have enabled political parties to gain functional control over PSMs, turning them into instruments of government propaganda and media capture rather than tools for the exchange of knowledge, culture, and literacy, or for public deliberation. Consequently, PSMs have lost credibility and have been affected by a chilling effect stemming from internal structural adaptations. This continues to pose a challenge following the 2023 political transition, which led to the liquidation of Polish Radio (Polskie Radio – PR) and Polish Television (Telewizja Polska – TVP), and has, in turn, had a profound impact on subsequent waves of societal-cultural polarisation. This paper draws on data and qualitative analysis from "Public Service Media in the Age of Platforms" (PSM-AP), an international CHANSE-funded research project conducted between 2022 and 2025. Research into legal frameworks and qualitative studies conducted in five countries — Belgium, Denmark, Poland, Italy, and the United Kingdom — reveals differing speeds and levels of digital strategy implementation, as well as varying capacities to distinguish themselves from global platforms. For TVP, one of the case studies, this concerns both the extent of progress in implementing personalised and curated content exposure and the dynamics of organisational, cultural, mindset-related, and intergenerational change. This study summarises the three-year

work of the Polish PSM-AP research team at the University of Warsaw. In-depth interviews (N = 8) were conducted with TVP employees in the spring of 2024. Comparative analysis within the PSM-AP framework identifies Telewizja Polska (TVP) as representing a traditional linear-evolution model, consistent with Fordist legacies and a "Television-First" strategy and mindset. The qualitative data highlight hierarchical and rigid management structures and persistent information silos, including communication barriers between production and distribution units, as well as the burdens of public procurement procedures, paperwork, and bureaucracy. Moreover, TVP's development in the platform era has occurred amid intense politicisation and the appropriation of Polish public media by political actors. This has contributed to defensive attitudes among employees, particularly in the post-election period, when staffing changes frequently reflect party affiliation. As a result, the brand's negative reputation within a highly polarised media environment illuminates the critical steps required for organisational renewal. This, in turn, offers potential value for strengthening public service media advocacy and informing scholarly responses to the urgent organisational adaptation required of PSM.

CLP06 Contemporary debates for Public Service Media governance and remits in Europe

PP 1096 Diverging digital futures: A comparative analysis of approaches to public service platforms in UK and German media policy

Helen Jay[1], Dominik Speck[2]

[1] University of Westminster, Westminster School of Media and Communication, London, United Kingdom
[2] TU Dortmund University, Institute of Journalism, Dortmund, Germany

Amid rising concerns about the influence of social media, misinformation and algorithmic systems on the European public sphere, the last decade has seen policymakers seek to update the regulatory framework governing public service media (PSM) for a digital age. However, despite their media systems facing similar challenges- technological disruption, economic pressures and political influence - European nation states have taken diverging policy approaches. This paper provides a comparative analysis of why and how policymakers in the UK and Germany have differed in their conceptualisations of public service media's role in a digital ecosystem since 2015. By analysing the divergent policy paths taken by the UK and Germany, this paper explores how different conceptions of public service media shape possible digital futures in Europe, aligning with the conference theme of *Shifting Grounds: Paths, Connections, and Futures.*

In the UK, reforms for public service media (such as the 2024 Media Act) have focused primarily on extending the audio-visual remit of PSM by securing smart-TV prominence and modernising distribution frameworks. Policy debates remained largely focused on the broadcast logic of content distribution, with limited attention to the broader potential of PSM as facilitators of civic participation or as convenors of digital public spaces. In contrast, Germany has gradually advanced a more expansive vision of PSM's digital role. Drawing from initiatives such as ZDF's participation in NewPublic's Public Spaces Incubator, which focuses on the development of online spaces for deliberation, and proposals for a European public service platform, German policymakers have adapted a conceptualization of PSM as foundational to a wider public digital ecosystem. A change to the Interstate Media Treaty enacted at the end of 2025 has broadened the public remit to encompass interactive, deliberative and participatory elements. The stated goal is to enable PSM organizations to provide "public open spaces" online, moving beyond a mere content distribution logic.

Using primary analysis of policy and regulatory statements and PSM strategy documents, this paper examines these contrasting conceptions to assess how the UK and Germany have imagined PSM's role in supporting a healthier digital environment. Analysing the policy discourse, organizational strategies of PSM, geopolitical dynamics and the emergence of legal and regulatory provisions, the paper traces how the policy debates in the two countries yielded these different results.

Against the backdrop of intensifying European debates on digital sovereignty, and as the UK prepares the BBC's next ten-year Charter, this paper examines public service media's potential as a core component of digital public infrastructure, while recognising its political, legal, financial, technological, and cultural constraints. By contextualising the choices pursued by policymakers, we reveal possibilities for alternative digital futures in Europe.

CLP07 Exercising Media Privilege, Protecting Media Freedom

PP 0680 Epistemic news plurality: A case for conditional regulation – A comparative analysis of France and Poland

Beata Klimkiewicz[1], Inna Lyubareva[2], Romain Billot[3], Morgane Le Guyader[1], Monika Szafrańska[4], Vanevska Katarzyna[4]

[1] Jagiellonian University, Institute of Journalism- Media and Social Communication, Krakow, Poland
[2] Institut Mines-Telecom / IMT Atlantique, Interdisciplinary Department of Social Sciences- Laboratory: LEGO – Laboratory of Economics and Management Western France EA2652, Plouzané, France
[3] Institut Mines-Telecom / IMT Atlantique, Data Science Department- Lab: UMR CNRS 6285 Lab-STICC, Plouzané, France
[4] Jagiellonian University, Institute of Journalism- Media and Social Communication, Kraków, Poland

This paper develops a conceptual framework for analysing epistemic news plurality in contemporary, platform-driven hybrid news ecosystems. In these environments, professional news media no longer occupy a dominant position but compete for public attention with a wide range of "new epistemic authorities", including news influencers, commercial content creators, politicians, celebrities, ordinary users and an increasing volume of AI-generated content. In contexts of communicative

abundance—often characterised by misinformative, manipulative or trivial content—we argue that sustaining viable spaces for public deliberation has become a central democratic challenge.

Epistemic news plurality refers to the capacity of the media system to sustain public deliberation grounded in cognitive and normative standards, including information quality, source credibility and production transparency. While the epistemic public sphere is inherently heterogeneous, news media continue to play a distinctive role in linking professional standards and accountability with citizens' epistemic rights and democratic aspirations.

Building on established distinctions between Public Service Media (PSM), commercial news providers and the non-profit news sector, the paper proposes a set of criteria that are critical for sustaining epistemic news plurality under current conditions. These criteria are developed through a theoretical analysis and refined through empirical observations from France and Poland. They include professional standards, editorial independence, transparency (ownership, financial and production-related), representation of diversity, audience reach and visibility, participatory affordances, and the capacity for original, in-house news production. The analysis shows that these criteria take different institutional and practical forms across media sectors and national contexts.

Empirically, the paper draws on data collected within the MeDeMAP project to map the current state of epistemic news plurality in France and Poland. We assess how different news media providers meet the proposed criteria and examine the extent to which existing regulatory and policy instruments contribute to improving—or, in some cases, undermining—epistemic news plurality. These include national media pluralism regulation, the implementation of the European Media Freedom Act (EMFA), regulatory approaches to systemic information risks, and self- and co-regulatory mechanisms.

Our findings indicate that epistemic news plurality does not emerge automatically from media diversity alone, but depends on the interaction of specific structural, economic and regulatory conditions. On this basis, the paper advances recommendations for a conditional approach to epistemic news plurality regulation, in which public support, regulatory privileges or platform-related obligations are linked to demonstrable epistemic contributions by news providers.

CLP07 Exercising Media Privilege, Protecting Media Freedom

PP 0681 Constructing a privilege doctrine: Theorising and systematising journalism privileges in the European legal framework

Melinda Rucz[1]

[1] University of Amsterdam, Institute for Information Law IViR, Amsterdam, Netherlands

Media privileges have become increasingly prominent in media policy debates in Europe and are hailed as the new frontier for strengthening the resilience of news media and the quality and plurality of public debate. However, regulatory interventions that aim to bring journalism privileges to life in the online context, such as the EMFA's content moderation privilege or visibility privileges, have exposed significant tensions in respect of the equality of speech and the legitimacy of preferential protection.

This paper seeks to bring analytical clarity into this contested field by untangling the main contours, theoretical foundations and legal sources of the privileged protection of public interest journalism in Europe. It argues that the doctrine of privileged protection of journalism is grounded in a democracy-centred account of the free speech principle that not only permits but presupposes a hierarchical approach to free speech protection. According to a multi-tier free speech principle, different levels of protection are awarded to speech on the basis of their proximity to the free speech core, understood as the principle's central democratic function. As public interest journalism routinely engages in expressions that are instrumental to realizing this ultimate democratic purpose, its privileged protection is justified within such a framework.

If the underlying rationale for the privilege doctrine lies in the multi-tier free speech theory, this shapes how journalism privileges need to be conceptualised, circumscribed and applied. In particular, the paper develops three key parameters of the privilege doctrine, derived from such theoretial grounding: the privileged protection of public interest journalism is necessarily *instrumental*, *conditional* and *societal*, in contrast to the inherent, automatic and individual nature of the protection of ordinary speech.

Such privileged protection of public interest journalism is not only theoretically coherent but also has strong foundations in various areas of European law. The paper identifies three broad European privilege regimes: (1) constitutionally protected rights that afford journalism broader speech rights (compared to ordinary speech) or provide specific freedoms of which journalism is the primary beneficiary, (2) carveouts for journalism in different types of legislation that limit some aspects of communication or present risks of interference or censorship, (3) entitlements to journalism in various areas of law and policy where ordinarily applicable rules would not provide sufficiently supportive conditions for journalism. Through analysing these privilege regimes, the paper demonstrates that the privileged protection of public interest journalism is a shape-shifting and heterogeneous doctrine that has always evolved in response to the changing needs of a viable media ecosystem, while retaining its unified purpose and underlying democratic justifications. The normative framework developed in this paper, thus, offers a blueprint for repurposing the privilege doctrine for the digital society in a theoretically coherent and democratically grounded manner.

CLP07 Exercising Media Privilege, Protecting Media Freedom

PP 0682 Investigating media services' experience with preventing systemic risks to media freedom and pluralism from very large platforms

Sally Broughton Micova[1]

[1] University of East Anglia, School of Politics- Philosophy- Language and Communication Studies, Norwich, United Kingdom

Back in 2018 Helberger et al. referred to platform governance as a problem of many hands and called for arrangements for *cooperative responsibility* in which governments set parameters and users of all kinds are empowered to participate. The EU's 2022 Digital Services Act (DSA), arguably, sets out such an arrangement by establishing due diligence requirements for platforms and mandates transparency, flagging and redress mechanisms to empower users to engage in the prevention of harm (Wilman, 2024; Husovec, 2024). The cooperative responsibility arrangement implied by the DSA's innovative "systemic risk" management obligations on very large online platforms (VLOPs) and search engines is complex. It covers not only the circulation of illegal or harmful content, but also user behaviour and harm stemming from the service's own functionalities and design to individuals and society in very broad risk areas. As Broughton Micova and Calef (2023) pointed out, the expectations for platforms, users and various institutions relevant to the systemic risk areas, are not clear. It is in the mitigation of risks of "negative effects" for the exercise of fundamental rights "including freedom and pluralism of the media" (DSA Article 34) where this lack of clarity is particularly problematic due to the delicate balances involved.

This paper argues that the 2024 European Media Freedom Act (EMFA) has introduced some clarity in expectations by setting out how cooperative responsibility should work to address some harm from VLOP gatekeeping between media and audiences. The EMFA obliges VLOPs to provide mechanisms that allow media services to declare themselves as such, give media services advance warning and a chance to respond before their content is actioned, and prioritise their complaints (Article 18). It also sets out quality criteria for the media services and requires them be made public. VLOPs must provide tools and the media services must use them in good faith, while others monitor which media is getting this special treatment.

This paper will present findings from an investigation into how this is working and what it indicates is necessary for operationalising cooperative responsibility. After elaborating the allocation of responsibilities indicated in the EMFA and DSA, it will share the results of a survey of media service providers in Austria on their use of and experience with the declaration mechanisms provided by the VLOPs, and their experience with content moderation and redress. It will contribute new data on implementation of this regulatory mechanism where the EMFA and DSA interact to mitigate harm to media freedom and pluralism. Advancing debates about responsibility in platform governance, it raises questions about the roles of information disparities, distinctions among users (e.g. media service providers, platform users/audiences), and the potential for collaboration.

CLP08 Governance of Data and Privacy

PP 0778 Re-infrastructuring the digital cultural economy: EU data governance and the institutional turn of WEB3

Indrek Ibrus[1], Madis Järvekülg[1], Ulrike Rohn[1]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

Debates on Web3 and blockchain in media and communication research have largely oscillated between technological utopianism and critical rejection. In the cultural and creative industries, these debates intensified after the speculative boom of crypto assets and NFTs exposed renewed opacity, inequality, and governance failures. In Europe, however, this crisis coincided with a distinctive policy moment. The emergence of the Data Governance Act (DGA), the European Blockchain Services Infrastructure (EBSI), and related data-sovereignty and platform-governance initiatives created a regulatory environment in which decentralisation was no longer framed as a challenge to governance, but as a potential instrument of it. This paper, based on a book the authors are currently writing, starts from the observation that decentralisation did not fail because it was too radical, but because it was insufficiently institutionalised. The central question is therefore how decentralised technologies are reconfigured when they encounter European communication law, cultural policy, and public-value traditions.

The paper draws on a plural theory of value that distinguishes four interacting imaginaries – price, labour, institutional coordination, and public good – and treats digital infrastructures as the sites where these imaginaries first enter dialogue, then stabilise, and are governed. Combining institutional and evolutionary political economy, infrastructure studies,

and public-value theory, blockchain is conceptualised not as a market technology but as a governance infrastructure. Decentralisation is approached as a design variable shaped by regulation, standards, and institutional context rather than as an ideology of disintermediation. This leads to the core analytical concept of *re-infrastructuring*: a process through which technological promises are translated into institutional arrangements via interoperability frameworks, metadata standards, legal compliance mechanisms, and practices of maintenance and care. Legitimacy is produced not by removing intermediaries, but by redesigning mediation.

Empirically, the paper is based on a series of qualitative research projects across European audiovisual and cultural sectors. The material includes comparative case studies of decentralised media and rights-data initiatives; interviews with entrepreneurs, engineers, policymakers, and cultural institutions; and participatory observation within EU-funded research and innovation consortia. The cases examined include peer-to-peer media experiments, public-service copyright registries aligned with national digital-government systems, and interoperable licence-ledger solutions connecting producers, collecting societies, and public broadcasters. Rather than treating these as isolated innovations, the paper analyses them as emerging institutional forms: data intermediaries, shared registries, and standards-based coordination layers.

The paper makes three contributions to communication law and policy research. First, it provides empirically grounded insight into the concrete institutions and infrastructures emerging at the intersection of Web3 and European regulation. Second, it shows that Europe's creative industries function as laboratories of institutional learning, where decentralisation is translated into public-value-oriented infrastructures rather than disruptive markets. Third, it advances a normative but non-utopian account of digital governance: decentralisation acquires legitimacy only when it learns from the institutions it initially sought to escape. By reframing Web3 as re-infrastructuring rather than disruption, the paper offers a grounded perspective on how European communication policy can shape digital futures around coordination, trust, and democratic public value.

CLP08 Governance of Data and Privacy

PP 0779 Privacy as a collective problem: Evidence from a representative survey experiment on privacy externalities

Alena Birrer[1], Natascha Just[1]

[1] University of Zurich, Department of Communication and Media Research IKMZ, Zurich, Switzerland

Privacy is one of the central challenges in digital societies characterized by pervasive data generation, collection, and processing. Public, regulatory, and scholarly discussions of privacy have largely focused on how individuals can protect their personal information, typically framing privacy as an individual right, thereby obscuring the collective nature of privacy and the unintended effects of data disclosure on others who are not directly involved in the data transaction. Such unintended effects, referred to as "privacy externalities" (Acquisti, 2010; de Brouwer, 2020; MacCarthy, 2011), arise when the data practices of individuals, companies, or governments inadvertently compromise the privacy of uninvolved third parties. Recognizing these dynamics highlights the increasingly interdependent and collective nature of privacy and raises three key questions: (1) how aware people are of privacy externalities, (2) who should be held responsible, and (3) who should internalize their costs.

To address these questions, we conducted a representative online survey of 1,210 internet users aged 16 and above in [*blinded for review*] with an integrated 3 × 2 × 3 × 3 mixed-design vignette experiment. Awareness of privacy externalities was measured using nine true-or-false statements covering different forms of privacy externalities. In addition, a semantic differential scale with nine opposing adjective pairs (e.g., individual–collective) assessed whether respondents viewed the protection of privacy primarily as an individual or a societal issue. Responsibility attribution and support for internalizing privacy externalities were examined through vignettes depicting three different contexts in which a data-sharing act negatively affected an uninvolved third party (within-subjects factor). Between-subjects factors included personal gain from data sharing (two levels), informed consent (three levels), and severity of consequences (three levels), yielding 54 unique scenarios. Participants were stratified by age and randomly assigned to one of 18 experimental conditions, each comprising three vignettes with the same factorial combination. After each vignette, respondents evaluated the degree of responsibility attributed to the involved actors and indicated their support for four types of mitigation measures (information provision, protective actions, self-restraint, and liability) framed as obligations for themselves, the general public, companies, and the government.

The results show that awareness of privacy externalities is generally low. Responsibility judgments are strongly context-dependent and shaped by cues such as perceived controllability, the level of informed consent, and whether the data-sharing individual personally benefited. Respondents express broad support for internalizing the costs of privacy externalities, particularly for companies with data-driven business models, which are expected to provide clearer information, implement effective safeguards, and refrain from practices likely to generate externalities. Willingness to adjust one's own data-sharing behavior is lower overall but increases with the perceived severity of the externality and among individuals with more socially oriented values.

CLP08 Governance of Data and Privacy

PP 0780 Social media platforms as informal networked data ecosystems: An expert review of Kenya's data protection regime

Sally Boyani[1]

[1] Digital Platforms Ecosystem Research Group- University of Passau, Science Communication, Passau, Germany

In Kenya, social media platforms function as central hubs for commerce, enabling transactions between consumers, small and medium enterprises, mobile money services, and delivery riders. Personal data generated during these transactions circulates across multiple actors who operate largely unregistered and weakly governed, producing an informal networked data ecosystem. This paper examines: How does the Kenya Data Protection Act regulate data flows in Kenya's informal social media commerce? What enforcement gaps emerge when data controllers remain unregistered and unidentifiable? How do institutional limitations affect enforcement in decentralised data flows? No comprehensive study has explored how data protection frameworks modelled for formal economies function when applied to informal networked ecosystems. This study fills this gap. Drawing on theories of regulatory transplantation and state legibility, this study examines how GDPR-inspired frameworks encounter visibility challenges when applied to informal networked ecosystems. Based on semi-structured interviews with thirty-five experts including data protection officers, regulators, legal practitioners, technologists, and consumer rights advocates. Early findings show fundamental incommensurability between the regulatory framework and the ecosystem it attempts to govern, manifesting through three interconnected gaps. Registration requirements based on revenue and employee counts exempt informal actors processing personal and sensitive data. Enforcement depends on consumer complaints from an "enlightened minority" while most perceive data collection as inherent to platforms. In networked transactions, where social media platforms connect consumers and SMEs who share data with delivery riders, regulators cannot trace flows beyond initial controllers. These structural gaps compound institutional constraints. The Office of the Data Protection Commissioner operates with limited staff, urban-only presence, and no prosecutorial powers, resulting in unpaid fines and enforcement limited to individual cases surfaced through complaints while most informal actors remain ungoverned. This study contributes theoretical understanding of how transplanted data protection frameworks fail to achieve regulatory visibility in informal data economies that differ from the formal economies they were designed to govern.

data protection, Kenya, social media commerce, informal economy, regulatory enforcement, platform governance, regulatory transplantation, state legibility

CLP08 Governance of Data and Privacy

PP 0781 Negotiating transparency and privacy under digital regulation: Evidence from mandatory IP location disclosure on a Chinese social media platform

Huan Lai[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Digital transparency measures have become an increasingly prominent instrument of communication regulation, often justified as means to enhance accountability, curb misinformation, and stabilize online discourse. Such measures are part of broader shifts toward platform-centred digital governance, where regulatory goals are increasingly implemented through interface-level design and disclosure requirements. Yet far less is known about how such measures operate in practice once they are translated into mandatory platform rules, nor about how users experience and respond to the forms of visibility these interventions produce in everyday platform use. This study examines how social media users navigate transparency, privacy, and participation in response to mandatory IP location disclosure, a regulatory intervention that requires platforms to display coarse-grained geographic labels (e.g., province- or country-level) alongside user-generated content.

Empirically, the study focuses on Zhihu, a major Chinese question-and-answer platform characterized by relatively in-depth and deliberative public discussion. Drawing on web-scraped data comprising 373 policy-related questions and 16,552 user responses posted after the implementation of IP location disclosure, the study adopts a mixed computational approach. User sentiment is analyzed using a fine-tuned BERT-based classification model, while user engagement is operationalized through a composite metric capturing activity, visibility, and social recognition on the platform. In addition, BERT-based topic modeling is employed to identify dominant themes structuring public discourse around the policy.

The findings show that overall sentiment toward IP location disclosure is predominantly neutral to mildly negative, indicating ambivalence rather than outright rejection. User discussions repeatedly foreground concerns about privacy erosion, digital surveillance, and the amplification of regional identities and stereotypes, suggesting that IP location disclosure is experienced as a socially consequential form of enforced visibility rather than a purely technical feature. Importantly, responses to the policy vary systematically across levels of user engagement. Highly engaged users demonstrate greater capacity to articulate polarized and nuanced positions, actively reflecting on perceived trade-offs between regulatory transparency, accountability, and personal risk. By contrast, less engaged users are more likely to express skepticism, resignation, or disengagement, pointing to uneven capacities and willingness to participate under conditions of mandatory disclosure.

By linking regulatory intervention, platform-level implementation, and differentiated user responses, this study contributes to research on platform governance and the regulatory dimensions of communication, offering a globally relevant case of digital policy implementation and its societal consequences. It demonstrates how transparency policies may generate unintended participatory consequences, reinforcing inequalities in voice and visibility rather than uniformly fostering accountability. Beyond the Chinese context, the findings offer insights into broader debates on how digital regulation reshapes participation, rights, and public expression in platform-mediated communication environments.

CLP08 Governance of Data and Privacy

PP 0782 Audiovisual policy and governance in the European Union: The 'Spain Audiovisual Hub' initiative as a case of member state implementation

Carmina Crusafon[1]

[1] Universitat Autonoma de Barcelona, Journalism & Communication Studies, Bellaterra, Spain

Recent years have witnessed an intensified transformation of the European audiovisual media landscape, driven by platformisation, technological change, and growing geopolitical pressures (Chalaby, 2025). The adoption of major regulatory instruments—such as the revised Audiovisual Media Services Directive (AVMSD) and the European Media Freedom Act (EMFA)—reflects a renewed European commitment to safeguarding media plurality, regulatory independence, and democratic values in an increasingly digital and platform-dominated environment (Ranaivoson, Raats & Broughton-Micova, 2023). Alongside these regulatory developments, the European Union has mobilised unprecedented financial resources through the post-COVID Recovery and Resilience Facility, opening new avenues for media policy intervention based on public investment and industrial support.

Within this context, Spain constitutes a particularly distinctive case. As one of the main beneficiaries of EU recovery funds, it stands out for having allocated a substantial share of these resources to the audiovisual sector. The 'Spain Audiovisual Hub' is a Government of Spain initiative (2021–2025), which aims to position the country as an international hub for audiovisual production, investment, and business. The initiative represents a singular national interpretation of European audiovisual policy priorities, as it foregrounds the industrial dimension of media policy at a time when EU-level initiatives have emphasized digital regulation, platform accountability, and media freedom (Vlassis, 2023). This makes the Spanish case particularly suitable for examining how national policy choices can complement, reinterpret, or rebalance broader European audiovisual objectives.

This paper analyses the 'Spain Audiovisual Hub' as a national media policy case study, examining how European audiovisual policy objectives are translated into concrete regulatory, institutional, and financial instruments at the Member State level. The theoretical framework is grounded in the conceptualisation of audiovisual policy as a dynamic balance between regulatory intervention, market dynamics, and public interest objectives. It also engages with research on audiovisual industries and diversity in the digital era (Albornoz & García Leiva, 2019). In addition, the analysis draws on scholarship addressing platform policies and competition in European media markets, which highlights the growing interdependence between audiovisual regulation, platform governance, and public interest considerations (Evens, Donders & Afilipoaie, 2020). This perspective is particularly relevant for assessing the 'Spain Audiovisual Hub', as the initiative operates at the intersection of audiovisual production, global platforms, and national market incentives, raising questions about the long-term implications of industrial support in platform-centred ecosystems.

Methodologically, the study adopts a qualitative case-study approach (Broughton-Micova, 2019) based on the systematic analysis of EU and national policy documents, regulatory texts, institutional reports, and publicly available budgetary data related to the Hub. These materials are examined to assess policy rationales, governance arrangements, and regulatory alignment, with particular interest in the interaction between audiovisual regulation, platform dynamics, and public investment strategies.

The analysis focuses on three dimensions: coherence with EU audiovisual frameworks, institutional coordination of industrial and policy objectives, and implications for media plurality and cultural diversity. It concludes that the Spanish case offers valuable insights into how a Member State can develop policy singularities within a shared European media policy framework. It also provides a reference for comparative analysis across the EU internal market.

CLP09 Comparative Approaches to Address Platform Practices

PP 0886 Handling offensive content on social media: Determinants of reporting behavior and cross-country differences in satisfaction with reporting mechanisms across the EU

Steliyana Doseva[1], Danilo Harles[2], Hannah Schmid-Petri[3]

[1] Bavarian Research Institute for Digital Transformation, Research, Munich, Germany
[2] Bavarian Research Institute for Digital Transformation, Think Tank, Munich, Germany
[3] University of Passau, Chair of Science Communication, Passau, Germany

Social media platforms accelerate the spread of opinions to wide audiences and thereby amplify not only positive but also hostile forms of communication. While the EU's Digital Services Act (DSA) obliges platforms to address unlawful offensive content, its effectiveness largely depends on users' ability to report such content. Since reporting mechanisms are often complex and require substantial digital literacy (Festl, 2021), and levels of digital literacy vary considerably across EU member states (Eurostat, 2021), the impact of the DSA is likely to differ across countries.

Thus, it remains unclear how effective the introduced law will be in practice across different national contexts. Against this background, our first research question asks, which factors (digital literacy, social media usage and repeated exposure to offensive content) influence reporting behavior in an EU cross-country comparison (RQ1).

Furthermore, prior experiences of personally affected users with existing platform reporting procedures may provide important insights into the practical applicability of regulatory measures such as the DSA. Accordingly, the second research question examines, reporting users' satisfaction with platform reporting mechanisms in a cross-country comparison (RQ2).

We address these issues through a secondary analysis of online survey data from five EU member states – Austria, France, Finland, Italy, and Spain ($N = 6753$) – representing diverse usage profiles (Gomes & Dias, 2025), conducted between November 2022 and January 2023. The analysis focuses on respondents who reported being personally insulted at least once ($N = 1173$). Digital literacy was measured using a self-assessment instrument developed by the European Commission's Joint Research Centre; for the purposes of this study, we focus on 11 items related to privacy and security in digital environments such as social media. Social media usage was measured in a 7-point Likert scale, the exposure to offensive content was measured binary, differentiating between respondents who had been insulted once and those who had experienced insults multiple times. Reporting behavior was measured binary differentiating between respondents who had reported offensive content on the platform at least once and those who had never done so. Satisfaction with the reporting procedures on the platform was measured using a 4-point scale (1 = very satisfied, 4 = not at all satisfied). To answer the first research question, we conducted binary logistic regressions for each country, controlling for gender, age and education. Prior to running the regressions, we ensured that no multicollinearity was present.

The findings reveal substantial cross-national differences in reporting offensive content. Reporting behavior is generally higher in Southern European countries and is primarily associated with digital literacy, although the relevant predictors vary by country. Satisfaction with reporting mechanisms also differs across countries but remains moderate overall, indicating that while reporting procedures function to some extent, their improvement could enhance reporting rates across Europe.

At the conference, we will discuss conceptual and applied implications of these findings.

CLP09 Comparative Approaches to Address Platform Practices

PP 0887 Effects of age verification legislation in US-states on the consumption of online-pornography by under 18s: An interrupted time-series analysis using behavioural data

Neil Thurman[1], Yu Xu[2], Sabine Hoffmann[3], Robin Schüttpelz[3]

[1] LMU Munich, Department of Media and Communcation, Munich, Germany
[2] Northwestern University, Medill School of Journalism- Media- Integrated Marketing Communications, Evanston, USA
[3] LMU Munich, Department of Statistics, Munich, Germany

In the 1990s, attempts in the US to criminalize the publication of 'indecent', 'offensive', or 'harmful' internet content that could be accessed by minors were struck down on free-speech grounds. Since those failed federal Acts, the availability of online pornography has increased, prompting, since 2023, a wave of legislation by individual US-states. By the end of 2025, 26 states—from Alabama to Wyoming—had legislation in force that required commercial websites containing at least 33.3% pornographic content to use age verification (AV) methods to ensure users were at least 18 years old.

Existing studies (Lang et al. 2025, Spencer 2025, Guo and Peng 2025) have attempted to investigate the effects of such legislation by analysing changes—at the state level—in the volume of Google searches for terms such as "Pornhub" and "Xvideos". Although the studies found changes in search patterns, they could not distinguish between searches by under 18s and those 18+. Furthermore, Googling the name of a pornographic website does not necessarily mean the searcher will subsequently visit it. Conversely, not all visits are via search and there are thousands of other pornographic websites.

To overcome these limitations, our study uses behavioural data from a large (N = 100,000+) online panel of US internet users who agreed to have their internet consumption tracked via software installed on their desktop computers. Because the demographics of the panel members are known, we could distinguish between under-18s and adults and between

those living in states with and without age verification legislation (AVL). Furthermore, when recording panelists' internet consumption, the tracking software assigns usage to panelists according to the locations of their home desktops—even if they are using a VPN to spoof their location.

Using 49 months' of data, our study is a quasi-experiment using an interrupted time series design. To assess the efficacy of AVL, we analyse pre- and post-intervention trends in the consumption of hundreds of commercial pornographic websites by 13–17-year-olds using a variety of measures. These include the proportion of adolescents visiting such sites (% reach) as well as metrics (such visit frequency and the numbers of minutes and pages per visit) that move beyond exposure to capture the level of attention being paid.

To control for threats to validity, we compare trends in the behaviour of users living in states with AVL with the behaviour of users living in states without. As recommended by Shadish et al. (2002), to further control for validity threats, we also compare the consumption of pornographic websites with the consumption of other websites not effected by AVL.

This study is, we believe, the first to analyse the effects of age verification legislation in US-states on the consumption of online-pornography using direct measurement (rather than a proxy variable) and also the first to investigate the effects on the behaviour of the age group AVL is designed to regulate.

CLP09 Comparative Approaches to Address Platform Practices

PP 0888 New challenges, traditional policy values? Nordic-Baltic policy and regulatory approaches to algorithmic content recommendation systems

Guna Spurava[1], Arjen van Dalen[2]

[1] University of Southern Denmark, Digital Democracy Centre, Odense, Denmark
[2] University of Southern Denmark, Centre for Journalism, Odense, Denmark

Algorithmic content recommendation (ACR) systems are central to the business logic of global online platforms, shaping how information is selected, filtered, and personalized (Stray et al., 2024). These systems pose novel political, societal, and economic challenges (Helberger, 2019; van Dijck et al., 2019), raising acute regulatory dilemmas in Nordic and Baltic small states, where historically strong public interest media policies must respond to algorithmic systems developed and controlled by global, market-oriented platforms. This study examines *which public interest values guide media policy and regulatory responses to ACR in Nordic and Baltic countries*. Examining these values is essential for clarifying how Nordic and Baltic communication policy adapt to the new challenges posed by ACR. Building on Van Cuilenburg and McQuail's (2003) notion of shifting communications policy paradigms (understood as changing balance of political, social, and economic values that define the public interest) and literature on algorithmic governance and platform regulation (e.g., Helberger et al., 2018; Napoli, 2015; Trappel et al. 2023), the study investigates how Nordic–Baltic regulators navigate tensions between traditional media policy values on the one hand and the challenges created by algorithmic content recommendation systems on the other.

The study is based on semi-structured interviews with 14 media regulators and communication policy makers from five Nordic countries (Denmark, Finland, Iceland, Norway and Sweden) and three Baltic countries (Estonia, Latvia and Lithuania), conducted from April 2025 to June 2025. Analytically, we distinguish between political welfare, social welfare and economic welfare as categories of general public interest objectives (Van Cuilenburg and McQuail, 2003). We identify which values under these categories are invoked when the interviewees identify risks created by ACR and when they propose responses. Finally, we analyze how these values reflect or diverge from Nordic–Baltic media policy traditions (Kõuts-Klemm et al., 2022; Syvertsen et al., 2014) and characteristics of small states' media policy (Balčytienė, 2009; Puppis, 2009).

Under *political welfare*, values of media pluralism, and accountability were emphasized and often contrasted with freedom of expression. These values were mainly invoked to ensure that individuals are exposed to diverse and accurate news content through ACR, rather than guaranteeing the availability of diverse content and different channels. The *social welfare* values inclusion, trust, and protection of vulnerable audiences were also prominent. *Economic welfare* values, in particular market fairness, competition, and limiting platform dominance were secondary to political and social objectives.

The prioritization of the quality and diversity of information as experienced by individual users, rather than merely guaranteeing access or structural plurality suggests that Nordic–Baltic policymakers are adapting long-standing media policy commitments to address the personalized news consumption due to ACR. The relatively low emphasis on economic welfare values is notable, given the small-state context. Together, these findings indicate that traditional policy values remain central but are being reinterpreted in practice to navigate the new challenges posed by algorithmic content recommendation systems.

CLP09 Comparative Approaches to Address Platform Practices

PP 0889 Capturing the grey zones: The regulation of the cultural production of Danish influencers

Bjarki Valtysson[1], Sara Kepinska Meleschko[1]

[1] University of Copenhagen, Department of Arts and Cultural Studies, Copenhagen, Denmark

Influencers are specific content creators. They primarily work and construct ecosystems via digital platforms such as Twitch, Instagram, TikTok, Snapchat, X and YouTube. They are interested in reach, impact and contact with other platform users to construct and sustain their "brand"; and they wish to appear authentic to their audiences (Abidin 2015; Duffy 2020; Bishop 2025). Being an influencer is also a profession in the sense that influencers generate income; by engaging in partnerships with platforms and their ad programmes; by promoting products in their content production; by making commercial sponsorships with companies; and by channelling their influencer persona to other contexts, such as reality shows, in productions with established media companies and PSBs, by making and selling their own products, etc. Influencers are therefore not only invested in the ecosystem of platforms but also construct an ecosystem around their cultural productions and persona, which includes companies, brands, media organisations, influencer agencies and platforms (Hudders et al. 2021; Hund 2023).

In terms of governance, influencers are regulated *by* platforms, for instance in managing audience relationships and visibility (Baym 2018; Cotter 2019), content moderation (Gillespie 2018; Gorwa et al. 2020) and the platforms' business models (van Doorn 2017). However, the platforms that influencers use are also subject to regulation and governance (DeNardis & Hackl 2015; Gorwa 2024; Flew 2021), manifested in the EU with regulatory frameworks such as the AVMS directive, the DSA, the DMA, the GDPR and the AI act. These supranational frameworks are implemented in different nation states, which adds to this complex nexus between influencers, platforms and national contexts. The context of this paper is the Nordic digital welfare state (Andreassen et al. 2021; Kaun & Löfgren 2024; Valtysson & Jørgensen 2025), more specifically, Denmark and Danish influencers.

In regulatory terms, the complexity between platform regulation, the influencer as a cultural producer and national contexts creates grey zones (van Dijck et al. 2018; Poell et al. 2022) that cut across the different policy fields (digital markets, digital services, privacy and data protection, audiovisual content, AI), the platforms' policies, community guidelines and terms of service, and national regulation. The aim of this paper is to inspect the regulatory challenges of placing and responding to the content creation of popular Danish influencers, thereby inspecting further how the regulatory grey zones manifest in the content production of prominent Danish influencers. We will use the popular influencers Jas and Mika, as critical case study (Flyvbjerg 2006) and conduct a qualitative content analysis (Mayring 2000; Hsieh & Shannon 2005) of their platform ecosystem over three months. Jas and Mika produce content primarily aimed at children and youth and by analysing their larger platform ecosystem, it is our aim to use their content productions to exemplify regulatory grey zones, which are prevalent in the protective framework surrounding minors. We thus aim to critically engage with current platform regulation, and how EU regulatory frameworks are implemented in a Danish context.

CLP09 Comparative Approaches to Address Platform Practices

PP 0890 The very large online platforms and very large online search engines fail to fulfill their transparency obligations for advertising repositories under Article 39 of the EU Digital Service Act

Xiaoyao Ren[1], Leon Y. Xiao[1], Ching Yiu Lo[1], Yuchen Huang[1], Xiaoyu Xiong[1]

[1] City University of Hong Kong, School of Creative Media, Hong Kong, China

Article 39 of EU Digital Service Act (DSA) mandates designated Very Large Online Platforms (VLOPs) and Very Large Online Search Engines (VLOSEs) to provide and maintain public advertising repositories. These repositories are intended to facilitate the monitoring of ad content and granular delivery metadata. The regulation requirements for these repositories can be categorized into four layers: functional requirements (public availability, searchability, multi-criteria filters and API); ad detail disclosures (content, product/brand, subject matter, advertisers and payers, and display period); target and delivery (targeting criteria, exclusions, impressions and reach); and documentation of non-compliant ad processing.

This study examines the implementation of these regulations by empirically auditing repositories using the keyword "Brawl Stars" (or its parent company Supercell Oy where applicable), a widely promoted video game in the EU, supplemented by additional case-specific queries.

Preliminary results show that 17 of the 25 designated VLOPs and VLOSEs established a publicly accessible and searchable advertising repository. These services generally performed well on baseline functional requirements, meeting most of the DSA's minimum expectations. However, about half of them failed to disclose the ad payer, and platforms such as Apple App Store and Booking.com display ambiguity in defining and revealing the "advertiser", thereby undermining clear attribution.

Compliance is weakest regarding the target and delivery data. For 11 of the 17 active repositories, platforms listed only parameter names rather than criteria or values used for targeting and exclusions. Impressions were categorized into predefined buckets across 11 repositories, providing only vague numerical ranges that render quantitative monitoring

ineffective. Furthermore, although more than half of the repositories provided the reach data disaggregated by countries or regions, only 2 of them provided additional reach numbers based on the target criteria required by Article 39.

In terms of the illegal or non-compliant ads, 13 platforms removed such ads without disclosure. Among the remainder, only Temu correctly provided both the removal reasons and the procedural details, while Apple App Store provided a removed ads library without specific reasons. AliExpress and Snapchat provided disclosures identical to active ads, failing to meet the DSA's transparency standards.

Additionally, although the DSA is an EU obligation, the platforms and search engines often extend to global markets, showing records for countries and regions like the UK, Singapore and Taiwan (China). This study offers practical insights for platforms and search engines to improve the design of advertising repositories and provides reference for regulators and other stakeholders responsible for monitoring DSA compliance.

CLP10 Media Ownership and Pluralistic Markets

PP 0992 Media ownership structures of news-related VLOP accounts in the EU: Differences in transparency between traditional media and content creators

Magdalena Holzapfel[1]

[1] University of Salzburg, Communication Studies, Salzburg, Austria

The use of digital platforms for news keeps growing. Especially *Very Large Online Platforms* (VLOPs) change how people find and access content and attain information, influencing the news industry and journalistic practices as a whole (Mazzoli & Tambini, 2020). This has led to debates on how to safeguard access and the promotion of public interest content on those platforms. A possible dimension of this could be increasing transparency in ownership structures of these accounts, just as the current EU media policy EMFA is pursuing regarding traditional media, as such transparency supports democratic systems by fostering accountability (Craufurd Smith et al., 2021).

Media ownership and its structures have already been examined from various perspectives, primarly focusing on how they are shaped by different kinds of ultimate owners and decision-makers (Sjøvaag & Ohlsson, 2019). However, for this it is essential that ownership structures are known. With digital platforms, which are used by traditional media and news content creators alike, these established kinds of structures are possibly challenged, as it might be unclear who is behind online accounts to which historically evolved media laws and standards do not necessarily apply. Not only does this call for an investigation into the transparency of the ownership structures of VLOP accounts in general, it also creates the need of examining possible differences between accounts directly linked to traditional media and those that are not – something this paper seeks to address.

This paper conducts such an analysis based on the 2025 scores of risk assessments of transparency in media ownership by the Euromedia Ownership Monitor (EurOMo). Relevant indicators are transparency of *direct* and *beneficial owners*, naming of all *natural-person shareholders* and transparency of *legal ownership form* (Euromedia Ownership Monitor, 2025). For each indicator, the monitor has scored the single outlets of its sample, which are opinion-shaping news producers across sectors (print, broadcast, website and VLOP account). 188 VLOP accounts are included, 148 related to traditional media and 40 to content creators.

Results show that transparency regarding VLOP accounts in general is high in most EU countries. This is particularly true for direct owners and legal ownership forms. Transparency tends to be lower for natural persons and beneficial owners. Differences between the transparency of structures for VLOP accounts of traditional media and those of content creators are minimal. In cases where there are significant differences, they tend to relate to individual countries. The findings are crucial for further discussions as they provide valuable insights into the current status of accounts playing a media-like role, especially since the EMFA has introduced higher transparency requirements for the first time.

CLP10 Media Ownership and Pluralistic Markets

PP 0993 Between legal demands and messy data: Building exhaustive media ownership chains with triangulation and uncertainty in the Euromedia Ownership Monitor

Tales Tomaz[1], Mariia Aleksevych[1], Magdalena Holzapfel[1], Josef Trappel[1]

[1] University of Salzburg, Communication Studies, Salzburg, Austria

European media ownership transparency is increasingly framed as a governance tool to safeguard pluralism, deter undue influence, and enable accountability (Craufurd Smith, Klimkiewicz, & Ostling, 2021 ; Tomaz, 2024). Yet, despite strengthened EU-level expectations – from the Anti Money-Laundering Directive framework (AMLD) to disclosure duties introduced by the European Media Freedom Act (EMFA) – establishing who owns and controls media outlets in practice remains methodologically difficult, especially in cross-border cases. This presentation reflects on challenges emerging from the data collection of the Euromedia Ownership Monitor (EurOMo), a research infrastructure designed to provide granular information on EU media ownership relations and other stakeholders in relevant control functions.

EurOMo adopts an exhaustive chain approach: starting from an outlet's legally responsible publisher (often identifiable via imprint or privacy-policy disclosures), it reconstructs successive layers of legal shareholdings until the beneficial owner, understood as the natural person(s) with ultimate control. In addition to shareholders, EurOMo tracks senior managing officials, persons with editorial responsibility, board members and chairs (notably for entities without clear shareholders), and well-documented forms of influence (e.g., parties, churches, interest groups). Data are triangulated across heterogeneous, publicly-available sources: outlet self-disclosures; annual reports and corporate communications; national business and beneficial ownership registries mandated under the AMLD; commercial corporate databases; and investigative journalism and official public documents. Collected information is structured in a relational format aligned with the Beneficial Ownership Data Standard (BODS).

From this workflow, EurOMo surfaces a set of recurring methodological challenges, and this paper focuses on five of them. First, registry fragmentation and uneven implementation across Member States produces incomplete, divergent, and difficult-to-compare records, turning cross-border verification into manual work (e.g., Czech Media Invest). Second, opaque legal forms, such as foundations and trusts, often lack clear ownership and provide limited insight into decision-making power (e.g., Moser Holding in AT); some jurisdictions list legal entities as board members rather than natural persons (e.g., NL). Third, trade-offs between precision and clarity arise when exhaustive mapping leads to overwhelming complexity, risking loss of the 'big picture' of control and complicating the construction of coherent media groups (e.g., Bolloré group in FR). Fourth, investment funds pose categorisation problems: they can be seen as both legal entities and assets; in addition, they may hold recursive stakes, creating circular ownership patterns and obscuring actual ownership and influence (e.g., Blackrock and Vanguard). Finally, relational influence can be decisive even in EU countries and documenting networks of relations or informal affiliations remains challenging even with mature standards such as BODS; systematic formalisation requires stretching current schemas, threatening standardisation.

The presentation concludes with implications for aligning AMLD/EMFA transparency ambitions with verifiable, interoperable ownership data, and with design principles for documenting uncertainty while preserving analytical clarity about control.

CLP10 Media Ownership and Pluralistic Markets

PP 0994 What is behind Spanish newsrooms? Mapping the ownership and transparency gaps in a concentrated and financialized media landscape

Xavier Ramon[1], Eloi Camps-Durban[1], Laura Pérez-Altable[1], Ruth Rodríguez-Martínez[1], Marcel Mauri-Rios[1]

[1] Universitat Pompeu Fabra, Communication, Barcelona, Spain

In the current scenario, characterized by dwindling levels of citizens' trust in journalism and the growing impact of news avoidance, concerns about media accountability (Kreutler et al., 2024) are all the greater. Aligning with institutional demands for transparency (EMFA, 2024; European Commission, 2020), citizens would like "fuller disclosure of sources, and better transparency over funding and conflicts of interest" (Newman et al., 2025, p. 26). In addition to explaining editorial practices, disseminating information about media ownership structures and financial results (Trappel, 2024) is increasingly considered an important step towards bolstering democratic participation (Craufurd Smith et al., 2021) and "safeguarding and promoting media pluralism" (Tomaz, 2024, p. 509).

This paper contributes to the ongoing debates on media transparency by presenting the findings of research conducted by the Euromedia Ownership Monitor (EurOMo) project team on the Spanish context between 2022 and 2025. The study has been guided by the following questions: What are the predominant ownership structures and control relations in the most important news outlets in Spain? (RQ1); What is the level of transparency exhibited by their websites? (RQ2). A cross-section of Spanish outlets (N = 24), including most consumed television channels, radio stations, print and online newspapers and social media news accounts was selected for the analysis. Following the EurOMo methodological approach (Tomaz, 2024), data was collected from public sources, including companies' websites and reports, press releases and ownership registers such as the National Securities Market Commission (CNMV) and the National Markets and Competition Commission (CNMC). A relational database comprising of 54 categories was employed to register data from all persons in the ownership chain, all the entities with direct or indirect shareholding in the sampled outlets and all ownership relations.

Consistent with previous research (Artero-Muñoz et al., 2021; Parrilla-Guix et al., 2025), the analysis reveals a concentrated and increasingly financialized media ecosystem characterized by limited transparency. In institutional terms, ownership is predominantly corporate (RQ1). 13 of the 24 outlets exhibit complex or very complex ownership structures, defined as more than two layers between the publisher and the ultimate beneficiaries. Ownership is also highly internationalized: 64 of 130 legal owners (49.2%) are based outside Spain. The financial nature of owners is salient, as more than half of legal owners are financial actors (notably trusts, banks, asset-management funds) or companies in insurance and real estate businesses. Transparency is very limited, particularly regarding financing and ultimate beneficial ownership: only public broadcasters (RTVE and 3Cat) and eldiario.es provide this information in full (RQ2). Insights into newsroom composition diverge between organisations. Financial statements of owning entities are not widespread across the sample while information on subsidies and revenue from public advertising is unavailable in most cases. Findings reveal a clear mismatch between growing institutional demands for transparency and the persistent opacity of ownership and financing structures in the Spanish media system.

While acknowledging limitations and potential areas for future inquiry, the analysis can help inform media representatives and policymakers and stimulate the discussion on the challenges and opportunities for strengthening media accountability in Europe and beyond.

CLP10 Media Ownership and Pluralistic Markets

PP 0995 Access denied: Paywalls, information inequality, and the economics of quality journalism

Iva Nenadic[1], Romana John[2]

[1] University of Dubrovnik and European University Institute, Faculty of Media and Public Relations, Dubrovnik, Croatia
[2] University of Dubrovnik, Faculty of Media and Public Relations, Dubrovnik, Croatia

The very mechanism that promises to safeguard journalism's future also undermines its accessibility, fragmenting the public into informational haves and have-nots. In this paper, we examine the paradox of paywalls through an interdisciplinary lens, with a view toward proactive media policy and governance capable of mitigating the risks of digital informational inequalities, particularly those rooted in economic and educational inequalities and contributing to generational divides. Although paywalls are a legitimate revenue stream for commercial online media, they cannot be regarded as neutral tools of financial sustainability; rather, they should be understood as institutional mechanisms with far-reaching implications for democracy and social cohesion. This is especially relevant in today's media environment, where an abundance of free online content exists, but its accuracy and quality are increasingly questionable. When citizens are exposed to vastly different levels of information- some accessing rigorous reporting, while others rely on freely available but often unreliable online alternatives- the shared foundation on which democratic deliberation depends begins to erode.

From a media studies perspective, journalism's normative function lies in its contribution to democratic deliberation (Christians et al., 2009; Stromback, 2005). The democratic theory of journalism holds that citizens require access to trustworthy and diverse information to make collective decisions, hold power to account, and participate effectively in public life (Geiss, 2023). Paywalls pose a challenge to this ideal by enclosing what is normatively a public good within commercial logics of scarcity (UNESCO, 2022). From an economics perspective, information goods differ from physical commodities. They are costly to produce but cheap to distribute, which makes them prone to under provision in purely market-based systems (Stigler, 1961; Varian, 1995). Paywalls reintroduce scarcity where none naturally exists, creating asymmetries between those who can pay for quality news and those who cannot. Bringing these perspectives together allows us to examine how structural market dynamics and normative democratic expectations collide in the digital news ecosystem.

The contribution of this paper is threefold. First, it situates paywalls within the broader literature on digital inequalities (DiMaggio et al., 2004; Robinson et al., 2015; Imran, 2022), showing how access to journalism is not only a question of consumer behaviour but also a matter of structural distribution. Second, it engages with empirical evidence on media economics and audience studies, highlighting striking differences across countries and socio-economic groups in willingness to pay for news. Third, the paper offers a conceptual synthesis by bridging normative theories of journalism with the economics of information, thus contributing to interdisciplinary debates at the intersection of communication studies, political science, and economics. In doing so, it reframes paywalls not as isolated market instruments but as systemic forces that shape today's information spaces and individuals news diets, both foundational for democracy. Against this background,

the paper concludes by proposing new avenues for media policy that are more attuned to contemporary realities and that build on a system of subsidies, public service media, and media literacy initiatives to address the growing digital divides.

Keywords

paywall; paywall paradox; informational inequalities; media economics; media policy

CLP10 Media Ownership and Pluralistic Markets

PP 0996 A bouquet of ideas for the way forward? State support for (private) media in Germany

Daniel Gräßer[1]

[1] Freie Universität Berlin, Institut für Publizistik- und Kommunikationswissenschaft, Beriln, Germany

The circumstances for media organizations concerned with the provision of public service journalism remain dire, the challenges plentiful. German news publishers continue to face decreasing advertising revenues. While spending for digital advertising increases, news publishers don't benefit.

This affects publishers on local and hyperlocal levels with limited potential and total audiences even more, while their contribution to public sphere and participation, and thus democracy, remains fundamental. Consequently, discussions about alternative modes of financing public interest journalism through media subsidies gain traction.

This project's research agenda is to identify media subsidy programs implemented by state and state adjacent actors in Germany. State actors refer to governmental bodies, i.e. ministries or state chancelleries, state adjacent actors refer to public-law institutions, i.e. non-governmental bodies assigned with specific tasks by law such as the Media Authorities of the German states.

Media subsidies are a well-established media policy tool since at least the 1960s in a substantial number of European countries. Subsidies come in direct and indirect forms, allocated generally or specifically to beneficiaries. For the longest time, Germany employs a rather hesitant approach to media policy and more specifically media subsidies for private media.

Based on the horrific historic experiences and designed by the Allies in the post-war setting, Germany's media policy is governed by its individual states rather than the federal government both for majority the Public Service Media and private media. In accordance with the challenges outlined in the introduction (e.g. declining circulation, reallocation of advertising funds), the project focuses on private media rather than PSM who face a different set of challenges.

By means of document analysis of written laws, statutes, respective institution's websites and press releases, media subsidy programs on the federal and state level are systematically identified. This paints a fully comprehensive picture of currently implemented media subsidies in Germany – an overview that is missing in literature so far.

Prior research into media subsidies primarily comes in comparative cross-country designs describing subsidies programs for particular media types, i.e. press, radio, TV or online. Alternatively, research focuses not on particular media but subsidization of managerial and organizational dimensions such as 'innovation'.

Results show that the federal government continues its traditional hesitant stance, as can be seen in several subsidy programs being discussed but never implemented (e.g. canceled initiative for the funding of printed press delivery in 2021, canceled initiative for non-profit journalism 2024). On the state level, all 14 state media authorities run initiatives for non-commercial citizen broadcasting. However, very few of them have dedicated subsidy programs for local journalism, e.g. Media Authority Berlin Brandenburg assigns funds provided through the state budget of Brandenburg.

This research project builds a comprehensive foundation of insights into German media subsidy programs on all levels of state across all media types, accounting for decades of convergence. Thus, it provides researchers and policy makers alike a starting point for discussion and conceptualization of further support programs.

CLP11 Public Media and Public Interest Media Policy

PP 1094 Between remit and restrictions: Regulating public service media's online services

Sabrina Heiland[1], Manuel Puppis[1]

[1] University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

In light of convergence, scholars have been discussing the need for developing public service broadcasting (PSB) into public service media (PSM) for more than 20 years. It is argued that for reaching their audience and serving the public interest, PSM organizations cannot be limited to providing linear broadcasting only (Bardoel & Lowe, 2007; Donders, 2021). By now, PSM not only offer on-demand streaming services that increasingly rely on algorithmic personalization (Sørensen & Hutchinson, 2018; Van den Bulck & Moe, 2018) but also operate online news sites. More recently, moving beyond the production and dissemination of public interest content, PSM's role in providing "public open spaces" is attracting growing attention (Dobusch, 2018). Yet the changing role of PSM in a digitalized society is contested, leading to heated media policy debates across Europe (Puppis & Ali, 2023). Private media companies heavily criticize PSM's online offer, claiming a crowding-out of their own services despite a lack of empirical evidence (Sehl et al., 2020). Moreover, both populist and neoliberal parties call for restrictions of PSM's remit (Holtz-Bacha, 2021). As various PSM organizations from the BBC to the

SRG prepare for their license renewal, policy-makers and PSM organizations rely on comparative research for evidence for drafting future regulation.

However, the few comparative studies looking into the remit of and restrictions for PSM's online services were conducted several years ago (Schweizer & Puppis, 2018; Thomass et al., 2015; Van den Bulck et al., 2018). Significant changes are likely to have occurred in the meantime. To gain a better understanding of what PSM organizations are obligated to do and prevented from doing online, this study thus compares the regulation in twelve European media systems, namely Austria, the Flemish and French communities of Belgium, Denmark, Germany, France, Ireland, Italy, Norway, Sweden, Switzerland and the United Kingdom. This case selection allows for comparing media systems featuring different sizes (Puppis, 2009) and political traditions (Hallin & Mancini, 2012). To examine the similarities and differences in PSM regulation, a qualitative content analysis of documents was conducted (Bowen, 2009; Mayring, 2022). The analysis included documents such as broadcasting acts, service contracts, and licenses which were analyzed with respect to regulations concerning the provision of online content, digital innovations, the use of AI and algorithmic systems, as well as requirements for accountability and dialogue with society.

Results show that, although online content is part of the remit in the analyzed media systems, what PSM can offer is usually restricted to protect private media. Additionally, PSM organizations are rarely obligated to exploit digital opportunities and innovative digital public service concepts are approached with caution. This stands in stark contrast to scholarly debates that call for bold visions for the future of PSM by taking on new dialogue functions and creating a counterweight to commercially-driven platforms.

CLP11 Public Media and Public Interest Media Policy

PP 1095 Does a free subscription make all the difference? An evaluation of media subsidies aimed at young adults in Switzerland

Manuel Puppis[1], Stefano Pedrazzi[1], Seraina Tarnutzer[1], Sina Blassnig[1]

[1] University of Fribourg, Communication and Media Research DCM, Fribourg, Switzerland

News media across Europe are struggling to generate sufficient revenues. Not only are users and advertising increasingly shifting to search engines and platforms (Curran, 2010), but users' willingness-to-pay for online journalism is rather limited as well (Newman et al., 2025). This is particularly evident among younger audiences, who often perceive limited value in paid digital news (Borchgrevink-Brækhus & Moe, 2023). The rise of agentic AI and of the so-called zero-click internet can be expected to intensify the financial ailment of the news industry even more (Sjøvaag, 2024). As a consequence, media companies and policymakers alike are (re-)discovering media subsidies as one way to mitigate journalism's funding crisis (e.g., Trappel, 2018). Policymakers also consider options for dealing with young audiences' decreasing news use, as the latter is closely related to political knowledge and political participation (de Vreese & Boomgarden, 2006).

However, research looking into the effects of media subsidies is rare. The few existing studies show that subsidies can ensure greater plurality by keeping more publications in the market (Gustafson et al., 2009; Haas, 2012; Ots, 2013; Sjøvaag & Pedersen, 2018). Yet effects on individual citizens remain mostly unexplored. This study thus aims at evaluating a particular support measure for the media industry in Switzerland, namely a free digital newspaper subscription offered to young people who reach the age of majority. It raises the questions of whether redeeming the free subscription is related to news use, media literacy, and civic engagement as well as of how the measure is assessed by media companies. Switzerland's federal set-up allows for comparing between cantons that implemented a particular measure (Fribourg, Geneva) and similar cantons that did not (Basel-City, Neuchâtel). The study follows a mixed-methods design consisting of a two-wave standardized survey of 12,500 young people aged 17–20 in the four cantons, focus groups with young people that redeemed the offer for the free subscription (Fribourg and Geneva), as well as expert interviews with managers of the participating media companies. The questionnaire covered news interest and use, attitudes toward journalism, media literacy (self-assessment (Vraga et al., 2015) and test (Fivaz & Schwarz, 2022)), political effectiveness (Gil de Zúñiga et al., 2017) as well as formal and informal political participation (Koller, 2017), whereas the focus groups allowed participants to expand on motivations to redeem the free subscription as well as its use and value.

Survey results show that young people with access to professional journalism show greater interest in news, use news more frequently, trust journalism more, and have slightly higher media literacy skills. They also report greater political interest, self-efficacy, and participation. Results from the focus groups largely confirm that young adults that redeem the free offer value journalism for orientation and for following political developments. At the same time, media companies welcome the measure in principle: However, to have an effect beyond media literacy and civic engagement, media companies would prefer a free subscription for people in their mid-twenties who might have a higher willingness to renew the subscription after the free trial ends.

CLP11 Public Media and Public Interest Media Policy

PP 1097 Public service broadcasters and national moral economies: Intergroup fighting and compromises

Hannu Nieminen[1]

[1] University of Helsinki, Faculty of Sociel Sciences, Helsinki, Finland

Public service broadcasters and national moral economies: Intergroup fighting and compromises

The present predicament of European public service media can be approached through the lens of competing interest coalitions. The central concept here is that of the moral economy: Competition between different interest coalitions takes place against the background of the prevailing moral economy of society. Based on E. P. Thompson's writings, moral economy is the totality of commonly shared social norms and values that form the basis of the social order. Key institutions that sustain and reproduce the moral economy in modern societies are the media system, the education system, scientific institutions, cultural establishments, the Church, governmental bodies, public services (social security, healthcare, police, and military) and others.

Public service media enjoy a special role in European national moral economies. In many countries, they play a central part in the processes of nation-building and in shaping and even controlling the political and cultural public spheres. However, as public institutions, the media have been a site of contestation and compromise between the main national interest coalitions. In this paper, the history and present of Yle – the Finnish public broadcaster – is used as a test case to scrutinise its role for the national moral economy of Finland. Initially, three influential interest coalitions are identified: the ideological-political coalition, led by political parties; the moral-ethical coalition, comprising the spiritual and intellectual values; and commercial interests, which are most clearly identifiable among other interests. Throughout the Yle history, the negotiations and compromises between these coalitions have shaped the role of the company in the larger framework of national moral economy.

Applying the framework of interest coalitions, we can provisionally distinguish five phases in the Yle's history: the national-conservative period (from the 1920s to the mid-1960s); the short liberal-pluralistic period (from the late-1960s to the early 1970s); the period of parliamentary-regulated consensus (from the 1970s to 1993), the technology-driven period (from the early 1990s to the 2020s); and the fight for the company's survival (in the 2020s).

The analysis is based on historical documents on Yle as well as on the research of Finnish social, political, and cultural history.

CLP11 Public Media and Public Interest Media Policy

PP 1098 Sustainability of streaming everywhere and nowhere: The EU's blind spot in the governance of video-on-demand platforms

Antonios Vlassis[1], Pauline Bissot[1], Solenn Houard[1]

[1] University of Liege, Political Science, Liege, Belgium

This paper investigates the policy challenges faced by the European Union in creating a consistent governance framework for the sustainability of video-on-demand (VoD) platforms. While these platforms have become central components of the European audiovisual media landscape (Koulesz, 2017) their growing environmental footprint, stemming from production, data centres, and end-user consumption, remains largely overlooked in European policy debates (Efoui-Hess, 2019 ; Marks et al. 2021).At the EU level, multiple regulatory instruments touch upon environmental and digital concerns, including the Green Deal, the Corporate Sustainability Reporting Directive and Creative Europe (Munch, 2025). While these initiatives establish general sustainability expectations, none specifically target the VoD sector, and they do not adequately integrate audiovisual and digital dimensions (Psychogiopoulou, 2016; Gassman & Gouttefarde, 2021). Consequently, there is no dedicated EU-level framework for regulating the ecological impact of streaming, leaving a significant governance gap in a sector that is increasingly transnational in nature (Munch, 2025).Drawing on a comparative cross-national mapping conducted within the Horizon Europe project StreamSCAPES, the paper examines regulatory measures, greening initiatives, and governance practices in nine European and associated countries (AT, BE, DK, FR, NL, MK, PL, RO, SE), and situates them within wider EU-level frameworks such as the Audiovisual Media Services Directive, the Digital Services Act, and the European Green Deal. The analysis is based on a mixed-methods approach combining desk research, institutional reports, academic sources, and semi-structured interviews with policy experts and lawmakers. Based on an assessment of the VoD value chain and a multi-level inventory of policy interventions, the findings reveal that there are distinct logics leading to divergent obligations, incentives, and environmental requirements for platforms. These differences are reinforced by varying interpretations of sustainability in the audiovisual sector, ranging from carbon-accounting requirements to green production incentives or the complete absence of environmental measures (Stephens et al. 2021; Sorensen & Noonan, 2022).The paper argues that this fragmented landscape is not primarily the result of political resistance from Member States, but rather a structural effect of the EU's limited competences in the cultural and audiovisual domains. National measures, while innovative in certain cases, remain isolated and fail to produce a coherent European policy. Ultimately, this paper contends that a dedicated European approach to VoD sustainability is normatively relevant. By integrating environmental concerns

across audiovisual and digital policies, the EU could enhance policy coherence, promote best practices, and guide industry behaviour, thereby aligning the sector with broader climate objectives. In the absence of such a framework, sustainability in VoD remains "everywhere and nowhere": recognised as important but addressed inconsistently, leaving a significant sector structurally under-governed. The paper contributes to debates on multi-level governance, the limits of EU competences, and the normative imperative for European coordination in digital and audiovisual media policy.

DMM01 Technologies of Migration Control

PP 0431 AI Rationales: Imagining and integrating artificial intelligence for migration governance in London and New York

Myria Georgiou[1], Philipp Seuferling[2], Radha Hegde[3], Maggie Jack[4]

[1] London School of Economics, Media and Communications, London, United Kingdom
[2] University of Glasgow, School of Critical Studies, Glasgow, United Kingdom
[3] New York University, Media- Culture and Communication, New York- NY, USA
[4] New York University, Tandon School of Engineering, New York- NY, USA

Migration and its governance are increasingly caught up in the promises and deployments of new AI technologies. While increasing attention is paid to how nation states deploy AI-driven technologies for border control, in this paper we examine the scale of the city – in particular of the global cities London and New York as spaces and contexts where AI is woven into migration governance.

The technologies of the border have expanded well beyond the outer borders of nation-states and have become increasingly integrated in the management of all elements of urban life – from schooling, to access to health and housing for migrants being monitored and governed through accumulation of data and predictive AI technologies. Thus, cities are now turning into "inner borders" (Chouliaraki and Georgiou, 2022), with migrant lives being subjected to decisions made based on data collected anywhere in the world. Scholarship has shown how global cities might be key sites for the realisation, even experimentation of technologies of the border (Molnar, 2020), but also how they are complex sites of migration (Georgiou, 2024). This raises important questions of how new technological systems are inserted into the structures of migration in the city and reshape the lives of those affected by technologized borders.

We draw on fieldwork consisting of elite interviews with stakeholders in London and New York conducted in 2025 and 2026. In both cities, we engage with three key constituencies involved in migration policy and its technological implementation: technologists, policy makers, lawyers. Our interview data with these groups offers transnationally comparative insights into how stakeholders: i.) design and build the technological systems (technologists), (ii.) decide about and devise political strategies, practices and frameworks for migration and urban governance (policy makers), and (iii.) handle, practice and are confronted with legal structures, policies and technologies of migration governance (lawyers).

On this empirical basis, the paper offers critical comparative analysis of the rationalisation and enactment of AI into urban structures of migration governance in situated contexts of the global city. The analytical focus on the city-level allows us to query the tensions in immigration policy and control between the nation and the city. While national migration politics is centred around deterrence, surveillance and deportation ("Hostile Environment" in the UK, "Stay out and Leave Now" in the US), the level of cities often stand in opposition to the performance of harsh border spectacles: being self-declared sanctuaries, and being the lived environment of migrant cultures, where the everyday encounter with the border and its technologies is situated. In our cases this is not least highlighted by the administrations of London (Sadiq Khan) and New York (Zohran Mamdani) whose politics draw global attention.

Ultimately, our paper offers analysis of socio-technical enactments, discourses and practices of AI in migration on the ground. As global cities tend to be at the forefronts of both experimentations as well as of alternatives and resistance, this paper ultimately provides critical insights into practices and counter-practices of migration in times of AI.

DMM01 Technologies of Migration Control

PP 0432 Media (AI) and Migration Practices of Ukrainians in Exile

Nataliia Murashko[1]

[1] Södertorn Högskola, Media and Communication, Stockholm, Ukraine

The research focuses on how displaced Ukrainians in Sweden, especially women, live with AI-based tools in their everyday lives after migration. Since the full-scale invasion in 2022, many daily tasks for Ukrainians abroad are now carried out through digital systems and interfaces in unfamiliar languages. Translation apps, chatbots and recommendation algorithms are used to correspond with schools, understand social security letters, search for housing, follow the news and keep in touch with family and friends. These tools can make life easier and open doors, but they also create new forms of friction, misunderstanding and emotional strain.

I focus on women because they often bear the primary responsibility for care, communication and administration in the household. The project asks how they rely on AI-based tools to negotiate belonging, legal status and work, and what happens to their voice and sense of self in the process. What is lost, and what is made possible, when a message to a school, an employer or an authority is mediated through machine-generated language? How do these tools affect how women feel seen, heard and recognised in Swedish society?

Methodologically, the project combines several qualitative approaches. Semi-structured interviews and short diaries capture concrete situations where AI is used in everyday life, from quick translations on the phone to more extended prompting and rewriting. Community observations in places where Ukrainians live and meet help to show how knowledge

about AI tools circulates informally, for example when women teach each other strategies and compare results. A small multilingual audit of selected AI systems is used to see how responses differ depending on the language, and how this shapes trust, accuracy and tone.

Overall, the project asks how AI-supported tools shape everyday experiences of adaptation, agency and identity for displaced Ukrainians in Sweden, and what this means for designing more inclusive technologies and support systems in the future.

DMM01 Technologies of Migration Control

PP 0433 Detention as a technological waiting institution

Miriana Cascone[1]

[1] Södertörn University, Media and Communication Sudies, Stockholm, Sweden

This article explores how detained migrants, media technologies and techniques of enclosure are entangled in detention centres for migrants who are waiting to be deported. The paper investigates the experience of indefinite detention, and the role and meanings of media technologies, present but also absent such as the smartphones, within this experience of detained waiting. Drawing on the Swedish detention context, this study is based on ethnographic interviews conducted with detained and formerly detained migrants between 2022 and 2024 and will be presented through the use of ethnographic vignettes. Detention centers are not prisons. Yet, the fieldwork has shown that limited and controlled access to media technologies, together with other restrictions, are perceived by migrants as punitive measures that hinder their connection and participation in outside daily life. This study examines the detention of migrants as a socio-technical system that, through present – and absent – technologies, produces a regime of waiting, surveillance and deportability. Here, influenced by Goffman's concept of Total Institution (1961), I propose the concept of waiting institution as a framework for understanding detention, where waiting is the dimension that defines the experience, its role, and purpose in relation to power and control but also, the means through which the system functions and acts. I argue that this institutionalization of waiting is constructed, maintained and fed not only by regulations and laws, but also by both the media technologies available to migrants as well as those used on them to manage life inside the centres. It contributes to breaking down the perception of simultaneity and temporal coincidence between inside and outside, increasing the perception of isolation and exclusion. Finally, findings show that migrants, aware of such obstacles, manage to find and implement a number of strategies to appropriate that technology in a different way and respond to such incarceration practices.

DMM02 Post-War Mediations and Belonging

PP 0537 Possible, precarious and fragmented: Narrating return in post-Assad Syria

Yazan Badran[1]

[1] Vrije Universiteit Brussel, Department of Communication Sciences, Brussel, Belgium

The collapse of the al-Assad regime on 8 December 2024 has opened up the prospect of return for millions of exiled Syrians. However, insights from migration studies show that returns are neither linear processes nor do they bear binary outcomes. The prospect of return rather than being perceived as a simple journey from one place to another instead reveals a gamut of possibilities and trajectories from the provisional, temporary and cyclical returns to those of permanent re-settlement in the original "home". Indeed, the transformation of the condition of exile does not represent an unproblematic transition into its supposed resolution, "return" – but rather opens up a space of contestation about the meanings of both return and exile. Narrating the "return from exile" thus inevitably serves to frame that return as a socially and politically meaningful act and embeds within that act different ideological positions and emotional and political investments and aspirations.

This paper investigates how the notion of return has been narrated by Syrian exile media and writers during a critical six-month window (December 2024–May 2025) immediately following the collapse of the regime. During this period many previously-exiled writers, journalists and activists – not to mention the broader community of displaced Syrians – were able to visit the country for the first time in many years and produced a rich corpus documenting and reflecting on these early returns. Through a qualitative thematic discourse analysis of journalistic and first-person narratives on the question of return ($n = 45$) the chapter asks how the individual and collective experiences of return were framed in these accounts? And how were they embedded and contextualised within the political, economic and socio-cultural context of Syria in the immediate aftermath of the al-Assad regime?

Our preliminary analysis shows that return was not narrated as a singular event, but as a process that is at once *possible*, *precarious* and *fragmented*. Return as a genuine *possibility* is made legible through the ubiquitous description of desecrated symbols, in the crossings of the border-threshold into the country, revisiting homes, reinhabiting memories and routines, and reclaiming one's voice in the public space. This possibility of return, however, is at the same time complicated by material obstacles and destabilised by political uncertainty. In particular, these Syrian narratives highlight the *precarity* and *fragmentedness* of return as a function of the unevenness of the post-conflict and exile landscapes and how they operate differentially on individuals and groups in relation to class, gender, ethnicity, locality and political affiliation. Finally, our paper highlights how such narratives also work to project normative visions of Syria's future by creating a discursive

space where the meaning of return is negotiated and re-interpreted as a proxy for broader questions about the political future of the country.

DMM02 Post-War Mediations and Belonging

PP 0538 Statelessness and digital belonging in Greece: Integration strategies through story sharing by Palestinian refugees

Triantafyllos Gkaragkanis[1]

[1] Babeș-Bolyai University, College of Political- Administrative and Communication Sciences FSPAC, Cluj, Romania

This research project aspires to shed light on legal statelessness and digital belonging by addressing the integration complexities for Palestinian migrants in Athens, Greece. On the one hand, social media is perceived as a mechanism for building and sustaining *social belonging*. On the other hand, for individuals deprived of recognized state identity, it can be challenging to navigate themselves in the digital sphere. Therefore, this research aims to highlight how statelessness can shape the discursive strategies and information-seeking behaviors of Palestinian refugees while they maneuver through the obstacles encountered in bureaucratic affairs both on Greek and European level.

As for the theoretical background, the research project draws upon the concept of "*right to have rights*" (Arendt, 1951) and "*digital imaginaries*" (Appadurai, 1996) and explores how refugees share their personal stories and frame their identities while their legal status remains unclear. Thanks to this human-centered approach, the focus on digital literacy shifts from a purely utilitarian view on the ways statelessness can be seen as a "*digital burden*". The latter can assist in comprehending the visibility patterns to avoid surveillance and the methods operationalized to increase their sense of social belonging, a core factor in their integration (Georgiou, 2018).

From a methodological standpoint, SketchEngine is utilized for corpus analysis purposes. Also, this software is used to track down recurring patterns in refugee story-sharing practices, including information resilience against hateful online content and construction of support networks to overcome state-centric barriers. The corpus is built with qualitative data from focus groups that were organized in Athens, Greece (November 2025). More precisely, participants of Palestinian origin spoke about their social media practices and shared how they embrace their journey for integration in the new social environment.

At this stage, preliminary findings demonstrate that statelessness triggers a "*fragmented digital identity*". In particular, focus groups participants attempt to find a balance between social media activism (story sharing to gain symbolic capital) and high digital caution (safe path for their integration). These results unveil the complexity of integration as a non-linear process; it acts as a space of continuous negotiation where social media can be both a site of potential legal vulnerability and a key to develop the sense of social belonging. By focusing on the unique anthropological and communicative angle of the Palestinian experience in Athens, this paper contributes to broader debates in migration studies (Chouliaraki & Georgiou, 2019; Leurs, 2023) about how the digital agency of marginalised communities is being expressed through the European public sphere.

DMM02 Post-War Mediations and Belonging

PP 0539 Afghanistan diaspora's advocacy efforts: Digital practices, intergroup relations, and solidarity

A. Wahid Mehran[1]

[1] University of Lugano USI - Università della Svizzera italiana, Institute of Communication and Public Policy ICPP, Lugano, Switzerland

A series of political disruptions have affected Afghanistan and its diaspora community in the past four decades with the Taliban takeover being the most recent upheaval. As the Taliban regime is nearing the fifth anniversary of its rule, severe restrictions on women's education, media freedom and exclusionary policies are challenged and debated not only inside the country, but notably, also in the diaspora online and offline.

Digital engagements enable political dissidents to participate in essential debates over their homeland which often shape offline solidarity, collective action and activism (Ansar & Maitra, 2024; Ponzanesi, 2020; Zeng & Fang, 2025). While this highlights the unifying potential of digital diaspora, other scholars point to tensions, internal othering, and fractures exacerbated by the digital media affordances (Conversi, 2012; Mahmod, 2019; Minchilli, 2021). Hence, online platforms enable both cohesion and fragmentation, establishing a dialectic and paradox of digital solidarity. How does this dialectic play out

in the context of Afghanistan's diaspora is not clear. Divisions shape offline intergroup relations within Afghanistan's diaspora (Fischer, 2017; Rytter & Nielsen, 2020). However, no attention has been paid to how digital media use in the diaspora shapes and is carried into the real world among members of this diaspora.

Building on critical diaspora studies, I understand diaspora as power-sensitive and contextually grounded (Candidatu et al., 2019; Witteborn, 2019) and inseparable from materiality (Candidatu et al., 2019). Social media such as Instagram became a major platform for informing the diaspora users of the Taliban abuses and discussions about exclusionary policies employed by the regime back home. Focusing on a non-western context and using a mixture of interviews and digital ethnography, this project will address diaspora intergroup relations and online to offline continuation of practices, and activism vis-à-vi the Taliban by answering the following research questions: How Afghanistan diaspora's digital media use shapes and is carried into the material world (and the other way around)? Do online spaces unify or divide members of this diaspora and does online interactions of advocacy and activism extend into offline collaboration, solidarity and mobilization against the repressive regime back home? And finally, how does the Taliban's hindering advocacy efforts, affect and shape Afghanistan diaspora's intergroup relations?

DMM02 Post-War Mediations and Belonging

PP 0540 Home vs. Abroad: How media exposure and perceptions of life shape emigration aspirations during the preparation phase of visa liberalization in Kosovo

Blerta Blakaj[1], Hajo Boomgaarden[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Kosovo, the youngest country in Europe and a society in transition, faces a paradox: while forced emigration has characterized Kosovo's trajectory up to state-building and remains prominent in the collective memory due to rapid transformations, emigration rates today remain high despite ongoing development and transformation. However, this is not a characteristic unique to Kosovo. In fact, middle-income countries undergoing transformation predominantly observe higher levels of emigration along the global trajectory. De Haas (2019) refers to this phenomenon as the development-driven emigration paradox, in which emigration aspirations increase alongside development and state progress during transition. These countries are often also characterized by structural mobility barriers, including visa regimes. As a result, many individuals emigrate to destinations they have never previously visited, and their expectations are frequently disappointed upon arrival (Schapendonk & Van Moppes, 2007; Siviş et al., 2024).

From a communication perspective, this situation raises questions about how development is communicated and perceived in transitional societies. Do citizens perceive long-term development as real progress in their country, or does the information they consume instead emphasize the distance between current conditions and perceived opportunities elsewhere? How do media exposure and perceptions of life influence aspirations to stay or to leave, particularly during periods in which changes in mobility policies are anticipated, such as visa liberalization?

Existing studies on media and emigration have focused primarily on portrayals of destination countries, showing that exposure to images of prosperity abroad increases emigration aspirations (Wood & King, 2013; Mai, 2011; Ennaji, 2012). However, migration decision-making is inherently comparative. Emigration aspirations emerge from evaluations of life "there" in relation to life "here" (de Haas, 2021). These aspirations are shaped not only by imagined opportunities abroad but also by perceived limitations in the country of origin, where perceptions often carry greater weight than objective socioeconomic conditions (De Haas, 2011). News media, political influencers, and platform-specific logics generate narratives that individuals use to evaluate life at home and abroad, making it important to examine these sources in relation to both contexts.

Accordingly, this study examines the development-driven emigration paradox through a communication-based approach during a period of anticipated change in mobility policies. Focusing on Kosovo's pre-visa liberalization phase, the study draws on two-wave panel data collected between July and December 2023 (N = 505) to test whether exposure to news and political influencer content, as well as the perceived tone of information, shapes perceptions of life at home and abroad and thus influences emigration aspirations.

The findings suggest that emigration aspirations intensify during periods of anticipated mobility, when life evaluations are shaped by media exposure. Exposure to social media influencers is associated with more negative evaluations of life in Kosovo, whereas exposure to television and social media influencer content is associated with more positive evaluations of life in the EU. In both contexts, perceived news tone emerges as a key predictor of life perceptions. Consequently, more negative evaluations of life at home, combined with more positive evaluations of life abroad, are associated with higher emigration aspirations.

DMM03 Narratives and Belonging of Ukrainian Refuge

PP 0644 Hospitality as a mediated encounter: The experiences of British hosts with Ukrainian refugees

Yael Gordon[1]

[1] The London School of Economics and Political Science, Media and Communication, London, United Kingdom

The Russian invasion of Ukraine in 2022 generated one of Europe's largest refugee movements since the Second World War. In the United Kingdom, the Homes for Ukraine sponsorship scheme invited private citizens to house and support Ukrainians, shifting responsibility for refugee reception into domestic spaces. This study examines how British hosts imagined and practiced hospitality toward Ukrainian refugees, conceptualising these encounters as forms of 'mediated hospitality' shaped by media portrayals, digital communication, and everyday cohabitation. The theoretical framework brings together Derrida's (2000) ethics of hospitality, Silverstone's (2013) notion of media hospitality, and Nikunen's (2019) concept of media solidarities. It understands hospitality as simultaneously imagined through news coverage that constructs Ukrainians as "like us", mediated through digital platforms where hosts and guests first meet, and practiced in the home through daily routines and shared spaces. The study asks: how do media narratives shape hosts' moral imagination of Ukrainian refugees? How do initial digital encounters mediate trust and expectations? And how is mediated compassion translated into lived ethics in the household?

Methodologically, the project draws on 20 semi-structured online interviews with British hosts who participated in Homes for Ukraine between 2022 and 2024. Participants were recruited via Facebook groups dedicated to matching Ukrainians seeking accommodation with potential sponsors, mirroring the digital infrastructures through which hosting was organised. Interviews explored motivations to host, perceptions of media coverage, experiences of early online contact, and the negotiation of domestic space, intimacy, and boundaries. Transcripts were analysed using qualitative content analysis with inductive and theoretically informed coding. Findings show that hosting emerged at the intersection of state-led schemes, mediated narratives and deeply personal moral dispositions. Institutional factors-visa rules, financial compensation, and bureaucratic responsibilities-shaped the perceived feasibility and risks of hosting but rarely served as primary motivations. Media and political narratives that framed Ukrainians as European, white, family-oriented and morally worthy underpinned a sense of selective humanitarian obligation and reduced social distance, even as hosts remained aware of cultural differences. Affective motivations, grounded in participants' biographies and ethical self-understandings, were crucial in turning mediated sympathy into concrete acts of hospitality. Digital pre-arrival encounters on Facebook softened the boundary between stranger and guest, reframing anxieties away from racialised fears of refugees toward more generic concerns about online trust and safety. The paper argues that these mediated beginnings and emotionally charged domestic practices can soften-but not erase-the structural asymmetries inherent in hospitality. Cohabitation generated relationships often described as familial or companionate and involved reciprocal learning that challenged simple giver-receiver models. Yet hosts retained control over household space, rules, and access to resources, and hospitality remained conditional. By foregrounding the role of media in shaping moral imaginaries and enabling citizen-led hosting, the paper contributes to debates on hospitality, digital diaspora, and the racial politics of refuge, showing how mediated hospitality becomes practiced hospitality within contemporary regimes of selective solidarity.

DMM03 Narratives and Belonging of Ukrainian Refuge

PP 0645 Competing war narratives: Ukrainian diaspora digital activism in Italy

Anastasiia Simashova[1]

[1] Kamianets-Podilskyi Ivan Ohiienko National University, Educational and Scientific Institute of Ukrainian Philology and Journalism, Kamyanets-Podilskyi, Ukraine

The Ukrainian diaspora has played a crucial role during the Russian war against Ukraine. Acting as a bridge between Ukraine and global audiences, diaspora communities contribute to humanitarian support, international advocacy, and the preservation of cultural identity. Previous research shows that the Ukrainian diaspora became more politically active after the Euromaidan protests of 2014, redefining its identity and engagement in response to Russia's military aggression (Kozachenko, 2018; Korzh, Kovalchuk, & Marshall, 2022).

At the same time, media representations of armed conflict are of vital importance for migrant communities, whose "virtual communities" are shaped by and contribute to ongoing media narratives (Keles & Janroj Yilmaz, 2015). In this context, Russian foreign influence operations aimed at manipulating public opinion, shifting political agendas, polarizing democratic societies pose significant challenges (Martin, Shapiro, & Nedashkovskaya, 2019). While diaspora members actively participate in public discourse surrounding the Russo-Ukrainian war, their role in countering disinformation remains underexplored (Maathuis, Ridder, & Stuurman, 2023).

We still know little about the reaction of diasporas when they become witnesses to physical military aggression against their homeland and engage in the hybrid warfare environment of their host country.

This study examines the digital activism of the Ukrainian diaspora in Italy, focusing on their activities to disseminate trustworthy information about Ukraine and the ongoing Russo-Ukrainian war as a response to Russian influence operations.

The research highlights their motivations and the possible impact of their efforts in countering misinformation and Russian propaganda narratives. The study addresses the following question: do Ukrainian immigrants spread information solely to advocate for Ukraine's cause and reinforce a sense of belonging, or is this activity also a reaction to the "clash of narratives" that has characterized the Italian information space since the start of the war?

For this purpose, semi-structured interviews were conducted with 20 content creators, representatives of the Ukrainian diaspora in Italy, on social networks such as Facebook, Instagram, and TikTok, in order to identify the motivations, strategies, and perceived outcomes that determine their information activities. In addition, their social media activity was analyzed to identify the most engaging strategies.

Preliminary findings suggest that personal stories of Ukrainian immigrants in Italy are a less common strategy than countering Russian propaganda war narratives. Their informational activism is connected to their sense of belonging (particularly the presence of family members or relatives in Ukraine during the war) but the higher their level of integration into the host country (current profession, language proficiency, etc.), the more likely they are to spread anti-propaganda content (videos, text posts) targeted at Italian-language users.

Beyond investigating this specific case of diaspora mobilization, the study underscores the role of diasporas in the digital information space of host countries and in empowering democratic communities during times of crisis.

PP 0746 Studying disconnection: Refugee women, digital withdrawal, and the online/offline continuum

Amber Bartlett[1], Noemi Mena Montes[1], Koen Leurs[2]

[1] Radboud University, Centre for Language Studies, Nijmegen, Netherlands
[2] Utrecht University, Department of Media and Cultural Studies, Utrecht, Netherlands

This article examines the disconnection practices of refugee women living in the Netherlands, challenging dominant assumptions that equate digital use with agency and empowerment. Scholarship on digital inclusion has largely privileged connectivity, framing digital non-use as a marker of exclusion, lack of digital skills, or passivity (Scheerder et al., 2017; Leung, 2020). Such assumptions disproportionately affect refugee women, who are frequently represented as digitally disengaged and lacking agency. This bias is further reinforced by media-centric and online-oriented approaches to digital methods which foreground participation and visibility and makes invisible disconnection.

Drawing on qualitative fieldwork and 20 in-depth interviews with refugee women in the Netherlands, this study builds on the disconnection turn (Fast 2021; Chib et al 2021; Cascone and Bonini 2024) to investigate the tactics of disconnection employed by refugee women during resettlement. The findings identify four forms of tactical disconnection work that allow women to selectively manage visibility and risk across digital platforms. Contrary to prevailing narratives that interpret limited online presence as evidence of digital exclusion or lack of competence, this article argues that digital invisibility can constitute a deliberate, agentic response to hostile and precarious conditions.

The article further contends that such situated forms of agency cannot be adequately captured through digital methods alone. It therefore advocates an online/offline continuum approach to digital ethnography that attends both digitally mediated and embodied practices. By reframing disconnection as meaningful and tactical, this study contributes to critical shifts in digital literacy scholarship away from technopositivist accounts of technology as inherently empowering, towards growing acknowledgement of the impact of post-digital capitalism on precarious users' daily life (Fast 2021).

PP 0747 Daigou trading as cross cultural practice, entrepreneurship and gendered social practice

Peter Lunt[1]

[1] University of Leicester, Arts- Media and Communication, London, United Kingdom

Daigou are Chinese individuals who live, work or study abroad and act as informal traders, buying goods from around the world and selling them to clients in China. Their activities are grounded in navigating the distances between Western and Chinese consumer culture and in managing their identity in the West in relation to their clients in China as a practical accomplishment. In this talk we will present an analysis of daigou as a social and cultural practice, recognising its evolution over the phases of economic reform in China, transitions in global supply chains and cultural flows, changing regimes of economic policy, governance and regulation and shifts in consumer culture (Xu, 2025). Daigou takes various forms, from gift giving, carrying goods across borders, sending goods to friends and relations to more organised, professionalised daigou traders. We interpret daigou as a cultural practice drawing on a variety of perspectives in social and cultural theory to reflect on the meaning and practice of daigou as providing a view from below of the social and cultural effects of China's rapid process of economic reform and associated transitions in global cultural flows and shifting ideology, governance and consumer culture.

We show how social and digital media are critical to daigou, enabling them to attract potential clients, market their products and services, establish relationships and form groups and networks of clients. Daigou network capital uses various strategies across multiple platforms and apps, including WeChat, Xiaohongshu, Taobao, Douyin (Tiktok), Zhihu, Weibo and Instagram. Through these online resources daigou advertise their goods and services, share their experience with other daigou, search for potential clients and offer personalised services and recommendations. Daigou are disproportionally women migrants, students and spouses who make use of their everyday competencies and capabilities in provisioning goods, understanding consumer needs, projecting authenticity and sustaining relationships with their clients. They use their bodies, interactional skills and emotions to present goods and manage their relationships with clients, focusing on care, taste and trust (Pugh, 2024), through which they seek to overcome the distance between their clients and the products they desire, connect disparate cultural expectations across borders and infusing transactions with the qualities of cosmopolitan credibility and emotional labour (Hochschild, 1983). In their navigation of this dispersed social and cultural environment daigou act as flexible citizens (Ong, 1999) through a practice characterised by messiness and friction (Tsing, 2005), in the context of the contradictions inherent in China's economic reform and global positioning (Saich, 2015).

PP 0748 Voicing queer diasporas through critical podcasting

Fatma Ozen[1]

[1] York University, Cinema and Media Studies, Toronto, Canada

This paper examines how queer Middle Eastern migrants negotiate belonging, visibility, identity, and community building through alternative streaming platforms, using critical podcasting as both a methodology and a public-facing output (McMain et al., 2025). Situated within the ECREA Diaspora, Migration and the Media section, the paper responds to calls to explore how streaming platforms are reshaping transnational connections, identity formations, and everyday media practices for queer migrants navigating multiple regimes of surveillance and marginalization.

Drawing on queer diaspora theories (Gopinath, 2005), media, and platform studies, the paper conceptualizes "queer diasporic spectatorship" as a relational practice that unfolds across interfaces, curated catalogues, and the wider digital ecosystems in which viewers encounter and discuss content. Methodologically, it mobilizes a ten-episode podcast series that brings into conversation three groups: founders of human-curated queer streaming platforms, queer migrants from Middle Eastern backgrounds who use these platforms in their everyday lives, and media scholars reflecting on digital infrastructures, inequalities, and curation models. Treating podcast episodes as semi-structured interviews and sites of co-created knowledge, the research combines digital ethnography and content analysis to foreground how participants articulate tensions between visibility and exposure, curation and market logics, and private viewing and networked community.

The paper argues that podcast-based engagement is uniquely suited to research on migration and media because it renders audible the accents, hesitations, and emotions that structure diasporic media encounters, while also circulating these voices beyond the academy as an accessible, vernacular archive. By centering queer migrants' encounters with alternative platforms, the research illuminates how non-mainstream distribution models can function as fragile yet vital infrastructures

for transnational connection, affective world-making, and counter-public formation under conditions of rising border control and hostility toward migrants.

DMM04 Feminist, Queer And Gender Perspectives

PP 0749 Between homes and screens: Post-migration digital media practices and negotiation of gender among young Chinese migrant women

Ruiyao Wang[1]

[1] Cornell University, Communication, Ithaca, USA

Transnational migrants increasingly rely on digital media for information-seeking, decision-making, and identity negotiation across both pre- and post-migration stages. Building on the theory of mediatized migrants (Hepp et al., 2013), this study examines post-migration digital media practices among young Chinese migrant women in the United States, focusing on the interplay between gender negotiation and everyday engagement with digital platforms.

The study is situated within two key complexities. First, it challenges the assumption that migration entails a linear transition from "home" to "host" media environments. Instead, migrants experience an (a)synchrony between migration and media accessibility: continued access to homeland platforms, alongside early and uneven engagement with host-society media, produces overlapping and sometimes conflicting media ecologies. Second, gender is understood as a socially constructed and discursively shaped process that is imagined, perceived, and lived differently across home and host societies. While existing scholarship on Chinese migrant women has rarely examined this process in depth, this study explicitly rejects a linear logic that frames Chinese and U.S. femininities as moving from conservative to liberal, or from traditional to modern.

This study-in-progress draws on semi-structured interviews with young Chinese migrant women residing in the United States, supplemented by a think-aloud method. Preliminary findings suggest that migrant women's platform engagements reveal a blurred boundary between interpersonal and mass communication: being influenced by media, influencing others, and actively creating, circulating, and maintaining gendered cultural meanings occur simultaneously within platformed environments. Gender negotiation unfolds through a platform logic in which algorithmically shaped media environments not only provide discursive resources for imagining womanhood in both home and host societies, but also function as spaces where young migrant women seek affirmation, alignment, and validation of their negotiated gender roles and identities.

Notably, young Chinese migrant women often occupy a liminal position in gender negotiation. Rather than fully aligning with gender norms from either home or host societies, participants reflect critically on both, selectively drawing from multiple cultural repertoires. Their diasporic experiences create a space in which gender beliefs are negotiated through the interplay of personal values, transnational cultural references, and platform-specific norms and popularity metrics that shape visibility and legitimacy.

Theoretically, this study advances the theory of mediatized migrants by proposing an intra-actional approach (Barad, 2007) to media and migrants' gender negotiation. Rather than treating media as external forces acting upon gender, or gender as a stable lens shaping media use, this approach conceptualizes them as co-constitutive processes. Media use thus becomes not merely a site where gender negotiation occurs, but the very form through which gender negotiation is enacted.

DMM05 News Representation Reporting on Migration

PP 0856 Fragmented traces of racism in the news – A framework for measuring large-scale patterns

Rainer Freudenthaler[1], Philipp Müller[1], Katharina Ludwig[1]

[1] University of Mannheim, Institute for Media and Communication Studies, Mannheim, Germany

In this paper, we introduce a novel framework for measuring traces of racial stereotyping and overt racism as well as anti-racist portrayals in large-scale news corpora. We start with a multidimensional definition of racism as a multi-level social phenomenon and then discuss the extent to which existing media content research measures these individual dimensions. We conclude that empirical communication scholarship often considers the various sub-dimensions of the racist ideology in

isolation, neglecting their ideational relationship and the concept of racism as their overarching umbrella. In doing so, the research landscape mirrors the fragmented occurrence of these various traces of racism in public discourse. At the same time, however, it ignores the epistemological value of seeing them in relation. To fill this gap, we present a framework for the joint measurement of the different subdimensions of racism in news discourse within and across racialized groups and media outlets. It captures and combines socio-structural dimensions (which social positions are different racialized groups portrayed in?), core ideological components (are groups presented as encroaching on privileges of the dominant group, are they portrayed as morally inferior or less competent, are there traces of othering, homogenization and essentialization?), the boundaries groups are differentiated by (are they differentiated using cultural or racial terms and are there underlying similarities along racial lines?), and threat and benefit portrayals.

We argue that with recent advances in computational methods, it is possible to apply this multidimensional framework over large text corpora to show divergent patterns of reporting for different racialized groups – allowing a differentiation of patterns of overtly racist messaging, "mere" stereotyping, moderating portrayals, and anti-racist portrayals of different groups. This allows for comparisons between groups, as well as across corpora of a variety of news outlets within the same period, as well as time series over different periods. With such a multidimensional measurement tool, we argue that research can trace causal mechanisms that explain the differing portrayals of racialized groups – for example, the role perceived cultural distance as well as intergroup contact play in enabling stereotyping and othering, or strategic focus on specific racial outgroups by right-wing media, as well as anti-racist responses within left-wing media; or the way the perceived social status informs group stereotypes concerning moral status and competency. We discuss how such a birds-eye-view on fragmented expressions of (anti-)racist ideology can complement and enrich existing qualitative and quantitative research and enable us to show ways for journalists and politicians to participate in reducing racial inequalities.

DMM05 News Representation Reporting on Migration

PP 0857 A relational framework for digital news (non-)use: Examining diasporic groups' dilemma of news engagement under information overload, negative news exposure, and disinformation spread during crises

Mohammad Javad Imani Khoshkhoo[1], Noemi Mena Montes[2], Arul Chib[1]

[1] Erasmus University Rotterdam, International Institute of Social Studies, The Hague, Netherlands
[2] Radboud University, Department of Language and Communication, Nijmegen, Netherlands

News engagement frameworks have emerged as alternatives to consumption/avoidance models by emphasizing users' active interaction with news. However, existing scholarship continues to privilege news use over news nonuse, tending to overlook (non-)use as a spectrum through which users agentically oscillate. Moreover, media-centric approaches often obscure how digital news (non-)use is shaped by relational dynamics in everyday life. Addressing these gaps, this study adopts a relational perspective and extends the news (non-)use model developed by Chib et al. (2021) through examining its applicability to digital news engagement in a very peculiar context: Ukrainian diasporic communities navigating the dilemmic circumstance of maintaining transnational ties during war through digital media and pursuing integration in host societies. The communities constitute a compelling case for examining how use and nonuse practices are fluidly enacted by such groups highly dependent on digital media. As digital news has become a socially embedded experience- interwoven with everyday activities through the ubiquity, personalization, and participatory affordances of digital technologies- the relational framework of (non-)use offers a robust lens for understanding news engagement as entangled within networks of relational factors. Moreover, while existing research has largely focused on ordinary users' news experiences, this framework allows for the examination of news (non-)use among marginalized users, such as diasporic groups.

Based on in-depth interviews with 22 Ukrainian diasporic individuals in the Netherlands, the study employed an iterative qualitative analysis. The relational codes were organized into five themes: users' relationships with others, the self, digital technologies, news sources, and news content. Consequently, after using Atlas.ti 24 for structuring the codes, Gephi 0.10 was utilized to carry out a novel co-occurrence analysis and mapping the codes' networks.

The findings demonstrate that nonuse strategies were associated with users' aversion to negative news and disinformation (user-content relation), their distrust of Russian outlets, Ukrainian official news, and informal social media channels (user-source relation), as well as their aversion to certain social media platforms (user-tech relation). These dynamics foster active nonuse strategies- including self-control, non-adoption, blocking, and departure- as means of self-preservation (user-self relation). At the same time, strong connections to their homeland and their personal ties compel continued engagement with war-related news, often mediated through trusted relational gatekeepers such as family members. Nonetheless, users' relationships with others can lead to digital disguise, particularly when it comes to their disagreements with their personal connections or the risk of Russian surveillance. Faced with this tension, exercising relative and hybrid forms of nonuse, including selective disengagement and self-control, enabled a restricted and situational news engagement.

Overall, the study highlights the relationally contingent and agentic nature of news (non-)use in diasporic settings under conditions of war, distrust, and information disorder, and advances relationality as a critical lens for understanding contemporary news engagement. The study recommends using methods beyond qualitative approaches to investigate digital news (non-)use on a broader scale. It also calls for exploring how distrust, disinformation exposure, and negative

news environments push users toward generative AI for news engagement- and how this shift may, in turn, reinforce their distrust.

DMM05 News Representation Reporting on Migration

PP 0858 Platform-mediated news role negotiation and diasporic belonging among Cuban migrants in Spain

Victor Santiago Padilla[1]

[1] Universitat Pompeu Fabra, Communication, Barcelona, Spain

This paper examines how first-generation Cuban migrants in Spain engage with Cuban news media (both state-controlled outlets and alternatives to the state) and how they negotiate journalistic role expectations under transnational conditions marked by political polarization, restricted media pluralism, and digital platformization. Moving beyond Western-centric models that conceptualize integration as a linear absorption into a host-country media sphere, the study foregrounds the specificity of the Cuban news ecology and the political and affective stakes migrants attach to competing sources of information. The Cuban case complicates common assumptions about media, mobility, and belonging by showing how cross-border informational ties persist and are reworked in diaspora.

The paper asks how journalistic roles are reinterpreted when news travels beyond territorial and institutional boundaries through platformized routes of discovery, sharing, and discussion. Here, "platform-mediated" refers to the socio-technical arrangements through which migrants encounter, evaluate, and circulate news, encompassing practices such as interpersonal forwarding, group-based circulation, channel subscriptions, and feed-driven exposure, all of which are shaped by visibility rules, recommender logics, and moderation practices. Conceptually, the study combines audience research and diaspora studies with journalism role theory to analyze how migrants attribute, contest, and reprioritize functions such as informing, legitimizing, contesting, and providing civic orientation across different Cuban outlets, and how these attributions intersect with everyday negotiations of identity and belonging in Spain.

Empirically, the study draws on 20 in-depth semi-structured interviews with Cuban migrants living in Barcelona and Madrid, recruited through convenience and snowball sampling to capture variation in gender, age, and length of residence. Interviews explored participants' news repertoires, credibility criteria, experiences of platform-based circulation (including group dynamics and feed exposure), interpretations of journalistic roles across Cuban outlets, and perceptions of Spanish news coverage within a broader informational environment. Data are analyzed through thematic analysis combined with role-focused coding, using a deductive codebook based on established role frameworks and iterative inductive refinement from the interview material. Spanish news is not treated as a normative benchmark. Instead, it is examined as a site of informational and representational friction through which understandings of Cuban journalism are recontextualized, challenged, or reaffirmed.

Preliminary findings indicate three dynamics. First, participants describe hybrid, platform-dependent repertoires in which Cuban news is frequently accessed via group circulation and interpersonal sharing, shaping what becomes salient and trustworthy and producing uneven exposure depending on network composition. Second, Cuban state media are often perceived as ideologically constrained and legitimizing yet remain symbolically tied to national identity, while alternative Cuban journalism is more commonly associated with critique, watchdog expectations, and community mediation. Third, Spanish news is valued for everyday orientation but also linked to uneven recognition and representation, which can intensify migrants' reassessments of Cuban outlets in relation to diasporic belonging. Overall, the paper offers a non-deterministic account of how platform infrastructures and role attribution contribute to mediated belonging and political sense-making across borders, with implications for the future formation of diasporic publics under unequal media power.

DMM06 Social Media, Agency and Resilience

PP 0962 Critical integrative resilience and selective visibility: Social media practices, belonging, and critique among post-migrant youth of Turkish origin in Germany

Zeynep Altundag[1]

[1] Freie Universität Berlin, Division Media Analysis and Research Methods - Institute for Media and Communication Studies-, Berlin, Germany

As digital media have become embedded in everyday life, migrants' and post-migrant generations' negotiations of belonging, visibility, and participation increasingly unfold within mediated contexts shaped by public discourses, experiences of discrimination, and conditions of recognition. This paper examines how young descendants of labour migrants from Turkey in Germany use social media not only for communication, but as a space where identity, visibility, and belonging are actively negotiated. It introduces the concept of critical integrative resilience to capture how integrative orientations and critical awareness coexist in everyday digital practices.

Empirically, the study draws on an exploratory sequential mixed-methods design combining six focus group discussions (n = 32), an online survey (n = 117), and short audiovisual "voiceform" interviews with young people aged 15–29 who were born and raised in Germany. The analysis focuses on social media use as a space of self-representation, selective visibility, and mediated participation.

Findings show that most participants articulate integrated, bicultural, or hybrid identifications and routinely move between German, Turkish, and transnational cultural repertoires. Social media platforms—particularly Instagram, YouTube, WhatsApp, and TikTok—function as flexible environments for multilingual expression, peer networking, and cultural exploration. While participants actively follow political news and public debates, public political expression remains limited. This restraint does not reflect political apathy but rather a strategic response to perceived discrimination, misrecognition, and anticipated judgement in digital publics.

Against deficit-oriented integration narratives, participants neither withdraw from public life nor engage in overt confrontation. Instead, they practice critical integrative resilience: a composed, reflective orientation that combines affirmation of belonging with a critical awareness of structural inequalities and dominant media discourses. This form of resilience is enacted through selective self-presentation, careful audience management, bilingual and hybrid expression, and reliance on trusted peer and transnational networks. In this sense, social media emerges as a key site where young people imagine and practice alternative forms of participation that remain engaged yet self-protective.

Conceptually, the paper builds on acculturation and bicultural identity research (Berry, 1997; 2005; Benet-Martínez & Haritatos, 2005), critical approaches to representation (Hall, 1997), and post-migrant perspectives on recognition and belonging (Foroutan, 2020; 2021), while advancing critical integrative resilience as an empirically grounded concept of post-migrant digital agency. It shows that post-migrant youth are neither assimilating nor resisting, but instead develop calm, strategic ways of belonging and critique through everyday digital practices, thereby moving beyond assimilationist or resistance-only frameworks in debates on digital transnationalism.

DMM06 Social Media, Agency and Resilience

PP 0963 Making sense of visibility and belonging: Social media practices of young Chinese migrants in London

Ziyi Song[1]

[1] University of Exeter, Communications- Drama and Film, Exeter, United Kingdom

As a global city, London fosters a diverse and inclusive environment embracing diversity, difference and otherness. However, this sense of openness coexists with enduring racialised boundaries. Stereotypes that portray Chinese migrants as hard-working, silent and compliant continue to shape how they are recognised and how they perceive themselves. Historically, these representations are rooted in the notion of the "Yellow Peril", which positions East Asians as a big threat to Western civilisation and social order. As such overt rhetoric has declined over time, the concept of "Model Minority" arose in the postwar decades, representing a shift from overt exclusion to conditional inclusion. Although these two appear oppositional, both of them are just different ways of control. "Threatening" outsiders should be excluded, while "good" migrants are tolerated as long as they remain compliant, high-achieving and silent. This kind of conditional acceptance can be fragile and reversible under certain situations such as Covid-19.

Therefore, this paper examines how young Chinese migrants in London engage with social media to negotiate exclusion, belonging and identity. Drawing on in-depth interviews and participant observations, it shows that some young people critically reflect on subtle and everyday forms of exclusion and utilise digital platforms to reclaim voice and agency. On more public-facing social media like Rednote, individual frustrations are transformed into public discourses, allowing personal experiences to resonate collectively and using the visibility of the platform to challenge dominant power relations that often remain invisible in institutional contexts. On platforms such as WeChat and Instagram which are more relationally bounded, they maintain existing relationships and establish new connections, building communities and their senses of belongings. Social media thus acts not only as the site of resistance but also spaces for identity performance. Many participants emphasised that they are not simply Chinese or British but occupying fluid identity positions. Identity negotiation is not confined to significant life events but embedded in the everyday life, from how to introduce oneself, to what to eat, what to dress, how to spend leisure time, which all could be traced on social media platforms. On the one hand, digital practices reproduce and reaffirm national attachments through selective content consumption, language-switching, the sharing of culturally and emotionally meaningful moments. On the other hand, social media also facilitates the construction

of cosmopolitan identities rooted in daily life. Through food, clothing, travel, and other ordinary choices, young migrants juxtapose cultural references, signal cosmopolitan openness and remain nationally grounded across platforms, enabling simultaneous attachments while resisting being read through a single, fixed address.

This paper argues that young migrants do not primarily seek full integration into a dominant mainstream. Instead, they value London as a space characterised by less judgement and normative pressure. Social media supports this orientation by enabling relationship maintenance and audience-specific self-presentation, fostering open-ended forms of belonging that align with aspirations for flexibility, autonomy and future mobility.

young Chinese migrants, social media practices, identity performance, nationalism and cosmopolitanism

DMM06 Social Media, Agency and Resilience

PP 0964 A socio-cognitive analysis of Run philosophy as collective cognitive resistance against authoritarian narratives in Chinese digital migration discourse

Luyue Ye[1]

[1] Georgia State University, Communication, Atlanta, USA

Digital activism is frequently framed through the lens of mobilization and visibility; however, in authoritarian contexts, activism often manifests as a nuanced struggle over meaning-making and the reappropriation of life trajectories. This study investigates “Run Philosophy” (润学, Run Philosophy), an emerging and contentious digital discourse phenomenon within the Chinese digital sphere that advocates for emigration as a form of socio-political resistance. While mainstream narratives celebrate digital connectivity, Run Philosophy participants often marginalized by rigid social hierarchies and precarious economic conditions, utilizing platforms like Reddit to circumvent domestic censorship, creating a unique “counter-public” space.

Adopting Teun A. van Dijk’s Socio-Cognitive Approach (SCA) and a Grounded Theory coding process, this research analyzes posts of Run Philosophy group on Reddit to uncover how participants construct “Mental Models” that legitimize migration. The study argues that Run Philosophy is not merely an expression of individual desire but a collective cognitive resistance against the “layered inequalities” imposed by state-driven narratives.

The analysis identifies three core functional themes that underpin this digital activism. First, Politicized Future: through the construction of metaphors such as “historical garbage time” (历史的垃圾时间) and “systemic hopelessness,” participants build a rational survival foundation for migration. This temporal dimension of activism highlights the inequality of “future-making” in a high-pressure society. Second, Politicized Family: the discourse deconstructs traditional Confucian notions of parental love, reframing the parent-child relationship as a site of biopolitical labor exploitation across generations. By objectifying these intimate bonds, participants dismantle the moral barriers to exit. Third, Politicized Everyday Life: through self-alienating and racialized terminology (e.g., “Huminoid Mine(人矿), “ Niuma (牛马)), participants engage in a radical form of self-denigration that serves as a precursor to “self-purification” and de-politization in their envisioned destinations.

This research contributes to the preconference theme by examining the technological and structural barriers that govern this movement. The transition to platforms like Reddit signifies a strategic response to domestic “algorithmic governance,” yet it also exposes new inequalities regarding digital literacy and the “VPN barrier” required to access these dissident spaces. Ultimately, this study asserts that Run Philosophy represents a sophisticated form of digital activism where the “activist” act is not a public protest, but the collective deconstruction of an imposed reality. It challenges the “simplistic measures of access” by showing how influence is built through shared cognitive models that reclaim agency under authoritarianism.

DMM08 Methods, participation and digital inclusion

PP 1163 Navigating formal and informal resources for digital inclusion: The case of refugee integration in the Netherlands

Will Marler[1]

[1] Tilburg University, Department of Communication and Cognition, Tilburg, Netherlands

Refugees from countries in the Middle East, Africa, and elsewhere must adapt quickly to the bureaucratic processes and societal expectations of Western European countries in order to obtain permanent residence. In highly digitalized societies like the Netherlands, integration policies increasingly emphasize rapid “self-sufficiency,” which includes developing digital literacies required for employment, bureaucracy, and social participation. For refugees, this means integrating digitally into a new society. While prior research has examined the role of digital technologies in refugee adaptation more broadly (Alencar & Tsagkroni, 2019; Udwan et al., 2020), less is known about the challenges that emerge within the formal civic integration process (“inburgering” in Dutch). Moreover, existing studies rarely examine both individual and institutional perspectives, leaving a gap in our understanding of how “digital integration” is experienced and perceived across key actors. This paper draws on a qualitative study conducted at an integration organization in the south of the Netherlands, comparing refugees’ digital experiences with the perceptions of staff members. Data collection is ongoing and will conclude in 2025. To date,

ten in-depth interviews have been conducted (eight with staff members and two with refugees), alongside observations of integration courses and a digital skills workshop organized as an action component with a research team. Eight additional interviews with refugees will be completed by the end of 2025. The data are analyzed using thematic analysis, guided by sensitizing concepts from the digital inequality literature. Prior research shows that marginalized communities often rely on informal strategies—such as sharing devices, using family members as digital intermediaries, and balancing official and unofficial information sources—to navigate digitalized bureaucratic systems (Dekker et al., 2018; Katz, 2010; Marler, 2019). However, few case studies examine how these practices emerge during refugee integration. Preliminary findings reveal gaps between the formal support channels promoted by institutions and the informal strategies refugees use to navigate digital requirements. While refugees value and make use of institutional resources, they often turn to family members or peers when encountering digital barriers, rather than to formal help desks at libraries recommended by staff. Language barriers, trust, and accessibility shape these choices. Refugees also rely on social media and AI-based tools, including large language model chatbots, to manage the complexity of integration-related bureaucracy. Staff members, by contrast, express skepticism toward these platforms, emphasizing concerns about misinformation, privacy, and the reliability of non-official sources. Social media, in particular, is viewed by staff as a source of confusion or false rumors, whereas refugees value it for timely and linguistically accessible information. These findings have implications for both theory and practice. Theoretically, the study contributes to research on how marginalized groups navigate digitalized bureaucratic systems by extending this work into the refugee integration context. Refugees' informal digital practices demonstrate resilience and creativity but often remain invisible or are viewed as problematic by institutions. Practically, as integration is increasingly framed as a two-way process, the findings suggest that aligning institutional support with refugees' digital practices may enhance digital inclusion and make integration efforts more responsive to everyday realities.

DMM08 Methods, participation and digital inclusion

PP 1164 Mediating digital welfare: Migrant agency, participation, and the case for early co-design

Martin Lundqvist[1], Deniz Neriman Duru[2]

[1] Lund University, Communication, Lund, Sweden
[2] Lund University, Communication and Media, Lund, Sweden

Mediating Digital Welfare: Migrant Agency, Participation, and the Case for Early Co-Design

Across the Nordic countries, digitalisation has become a central feature of welfare governance and labour market integration, profoundly shaping how migrants encounter public institutions, access rights, and communicate with authorities. Digital platforms, data-driven systems, and increasingly AI-supported tools are often framed as facilitating inclusion and efficiency. However, research increasingly shows that these developments also generate new forms of exclusion, opacity, and uneven participation for migrants navigating highly digitalised welfare and labour market environments. This paper presents a systematic interdisciplinary literature review conducted as part of the Forte-funded project DIG-NAV: Digital Navigation of Migrants in the Swedish Labour Market, focusing on migration at the intersection of media, digital infrastructures, and welfare governance.

Drawing on a corpus of 41 peer-reviewed studies identified through structured searches in Scopus and Web of Science, the review maps dominant analytical themes, methodological approaches, and conceptual gaps in research on migration, media, and labour market inclusion in the Nordic context. The analysis identifies six recurring thematic clusters, including digital tools for migrant inclusion, migrants' use of digital media for job search and entrepreneurship, transnational digital practices, digital placemaking, digital racism, and studies that reference digitalisation without substantively engaging migrants' communicative agency or institutional power relations. Across these strands, the literature often foregrounds technological solutions while giving more limited attention to migrants' lived experiences, mediated encounters with welfare institutions, and opportunities for meaningful participation in the design of digital services.

Building on this review, co-design of the project and the pilot research (2024–2025) the paper argues that sustainable and socially viable digital and AI-supported welfare solutions require moving beyond viewing migrants primarily as end users or data subjects. Instead, it proposes **early, iterative co-design** as a participatory media practice that foregrounds migrant voice, situated knowledge, and communicative agency. By involving migrants, public authorities, civil society organisations, libraries, employers, and frontline professionals already at the problem-framing stage, early co-design enables the articulation of diverse needs, experiences, and forms of expertise that are often marginalised in technology-driven welfare reforms.

By positioning digital welfare systems as mediated sites of inclusion, exclusion, and participation, the paper contributes to research in diaspora, migration and media on digital citizenship, mediated belonging, and migrant agency. It advances early co-design as a critical approach for developing more inclusive, accountable, and socially sustainable digital welfare infrastructures in highly digitalised societies.

DMM08 Methods, participation and digital inclusion

PP 1165 Chinese Londoners and the right to the diasporic city: Cultivating collective imaginaries and building urban futures

Stephanie Guo[1]

[1] London School of Economics and Political Science, Media and Communications, London, United Kingdom

For many Chinese Londoners, the early months of 2020 were defined by increasing hysteria around not only a rapidly spreading virus, but also reports throughout the UK of an alarming rise in racial antagonisms levied against those of Chinese descent. This xenophobic surge was largely a result of popular and political rhetoric that pinned the blame for the virus on specific demographics as the originators and perpetuators of the deadly COVID-19 pandemic. These racially charged narratives pervaded mainstream and social media, stoking scapegoating, stigmatization, and anti-Chinese sentiments that transformed city streets, already made desolate under lockdown mandates, into spaces of hostility, fear, and non-belonging for London's Chinese population. Sheltering in place with nothing but time, Chinese Londoners soon turned to digital platforms in search of safety and solidarity – an effort that solidified an emerging diasporic consciousness and collective that has, in the years since, continued to strengthen in self-determination, seek allies in solidarity, and urgently lay claim to the city (Lefebvre, 1967).

This project examines how these digital communication practices have facilitated diasporic imaginaries and urban futures for London's Chinese diaspora in the years since the pandemic that not only play out at the juncture of London's digital and material streets, but also contribute toward shaping them. My work expands existing notions of the right to the city through an exploration of the practical ways Chinese Londoners have engaged digitally and materially with the mediated city to cultivate future-oriented spaces of belonging. I focus my discussion on understanding the city as a heterogeneous, communal, and participatory space – three aspirational features of the urban landscape that inspire distinct, but related claim-making pursuits. By exploring the impact of an emerging, trans-diasporic East and Southeast Asian identity on re-imagined ethnic and diasporic boundaries, the role of digital placemaking in cultivating collective spaces, and the potential for creative political action to overcome intersectional inequalities, I unpack how London's Chinese diaspora negotiates the right to difference, community, and participation in the city.

My analysis was informed by 43 in-depth interviews conducted with Chinese Londoners from 2022–2023. I leveraged a unique, multi-method approach, drawing from principles of walking interview, photovoice, and photo elicitation in an effort to both privilege the diasporic individual in the telling of their own stories, as well as capture their deep physical and digital entanglements with the city through embodied and visual participatory research techniques. Leveraging a creative, interdisciplinary methodology helped elicit from my interviewees how their everyday digital media practices facilitated moments of encounter and created opportunities for connection in the context of urban environments and their increasingly thrown*together* nature (Massey, 2005). My findings ultimately demonstrate how digital practices and platforms have forged inclusive spaces for healing and solidarity between previously isolated communities, convened and amplified overlooked voices, and energized a collective movement toward the diasporic right to the city.

DCC01 Algorithmic Cultures In Everyday Life

PP 0068 Influencing algorithms: Interaction strategies of Spanish young adults with recommendation systems

Esmeralda Vazquez[1], Celina Navarro[1], Gemma Gomez Bernal[1]

[1] Autonomous University of Barcelona, Department of Audiovisual Communication and Advertising, Barcelona, Spain

Algorithmic recommendation systems have become essential to digital media consumption, fundamentally altering which content is consumed and how users experience it. These systems leverage vast amounts of data to analyse user behaviour, preferences, and interactions through algorithmic profiling processes, resulting in personalised recommendations designed to enhance user engagement and satisfaction. Its personalized results, marked by a high degree of opacity, nevertheless exert a significant cultural impact across societies (Burgess, 2021; Poell, Nieborg, Duffy, 2021). In this context, understanding how users, especially younger demographics, imagine, navigate, and adapt to these systems requires a critical examination of the cultural and technological contexts in which they operate (Bonini & Trerçé, 2025; Bucher, 2017; Frey, 2021).

The main objective of this paper is to understand how young adults in Spain interact with algorithmic recommendation systems to actively shape or influence the personalised content they receive across social media platforms and on-demand audio-visual services such as TikTok, Instagram, Netflix or Spotify. This study has been carried out within the framework project "Perception and generation of personalization algorithms knowledge in digital communication platforms" (ALCOM, PID2023-1-48682OA-I00), funded by the Spanish Ministry of Science, Innovation and Universities. Using qualitative methods, more than 30 in-depth interviews were conducted with Spanish young adult users (18–35 years old), comprising a diverse sample that reflects a range of educational backgrounds and levels of digital literacy. This methodological approach provides a nuanced understanding of how users perceive and navigate these systems, highlighting their agency in crafting their digital content experiences.

The findings indicate a strong awareness among users of how various types of interactions influence the content they encountered, revealing three distinct active strategies for modifying these personalisations: passive, adaptive, and reactive tactics. Users employing passive tactics tend to adopt a hands-off approach, allowing algorithms to determine their content choices without significant intervention, reflecting a form of algorithmic acquiescence. In contrast, those utilising adaptive tactics engage more actively, refining their recommendations through actions such as liking, commenting, and following specific profiles, effectively training the algorithms to present more relevant suggestions. Lastly, users representing the reactive tactics proactively curate their experiences, filtering out unwanted content through blocking or evading strategies, thereby emphasising their control over their digital environments.

These results offer valuable insights into the complexities of young adults' interactions with algorithmic recommendation systems. By identifying various engagement strategies, we highlight the diverse ways users navigate and explain their digital experiences while actively shaping the personalised content they receive. Understanding these dynamics is essential as it highlights the importance of user agency in an era increasingly defined by algorithmic influence. This knowledge is essential to walk towards a higher algorithmic literacy of society in different cultural contexts.

Keywords

algorithmic curation, recommendation systems, user agency, personalization, digital culture, cross-platform practices

DCC01 Algorithmic Cultures In Everyday Life

PP 0069 From awareness to strain: When recommender system algorithmic literacy becomes a psychological burden for young audiences

José Manuel Sotero[1], Paulo Nuno Vicente[2], António Granado[1]

[1] NOVA Communication Institute ICNOVA, iNOVA Media Lab, Lisbon, Portugal
[2] NOVA Communication Institute ICNOVA, Icnova, Lisbon, Portugal

Recommender systems have become a key infrastructure shaping how young people access, interpret, and engage with online audiovisual content. In response, algorithmic literacy has increasingly been promoted as a pathway to transparency, autonomy, and user empowerment in platformised media environments. Yet, despite its normative appeal, limited research has examined whether greater algorithmic literacy about recommender systems is always beneficial for users' well-being.

This communication examines the ambivalent role of recommender system algorithmic literacy among young audiences in Portugal, focusing on how awareness may, under certain conditions, translate into psychological strain rather than protection. The analysis draws on a large-scale survey conducted in Portugal with participants aged 15–25 who report using online audiovisual entertainment platforms (n = 1,564). To deepen and contextualise the survey patterns, four focus groups were also conducted to understand better how young users make sense of recommender systems and experience agency, control, and perceived influence in everyday platform use. The study considers diverse usage patterns and motivations, together with a multidimensional measure of recommender system algorithmic literacy, to explore how knowledge and critical understanding of algorithmic curation relate to self-reported mental well-being.

Instead of positioning algorithmic literacy as a uniformly protective resource, the communication advances a conceptual argument centred on "awareness without agency". It is proposed that increased understanding of how recommender systems operate—particularly about data extraction, behavioural profiling, and optimisation of attention—may heighten cognitive load, perceived loss of control, and reflexive anxiety when users lack meaningful mechanisms to influence, contest, or meaningfully opt out of algorithmic curation. In such contexts, literacy can become a site of tension: users become more conscious of how recommendations steer choices, while simultaneously experiencing limited capacity to act upon that knowledge.

Empirically, the communication presents selective, non-exhaustive evidence indicating that recommender system algorithmic literacy functions as a conditional mechanism rather than a linear predictor of well-being. Depending on usage contexts and motivational orientations, higher levels of literacy are associated with divergent experiential outcomes, suggesting that increased awareness may protect in some circumstances while amplifying strain in others.

By connecting individual sense-making with platform architectures and socio-technical constraints, this communication contributes to debates on digital culture, youth audiences, and digital well-being. The findings also point to the limits of literacy-only approaches and highlight the importance of pairing literacy initiatives with stronger user agency, platform accountability, and design choices that redistribute control in meaningful ways.

DCC01 Algorithmic Cultures In Everyday Life

PP 0070 Tech-dystopian representations of algorithms in streaming platform documentaries

Julia Anna Furo-Makkai[1]

[1] Babes-Bolyai University, Hungarian Department of Cinema and Media, Cluj-Napoca, Romania

Algorithms transformed online media content consumption into a customized user experience. At the same time, a growing popular and academic literature and media content debate the impact on human behaviour. Documentaries or docuseries presenting scientific and technical developments affecting society are among the most viewed video-on-demand (VOD) content. This paper examines these documentaries through the lens of contemporary platform culture, demonstrating how streaming services shape the dissemination and development of algorithmic imaginaries. Without technical expertise, most users derive their understanding of algorithms from digital media, social platforms, and public discourse, typically encountering fragmented information that emphasize technological threats.

The popular discourse about digital technology is dominated by a dystopian approach and a few recurrent topics. These documentaries construct a dystopian narrative, framing algorithmic technologies through interconnected themes of surveillance, loss of control, existential threat, and social fragmentation. However, how streaming platforms shape these representations remains understudied. This research addresses this gap by arguing that mainstream documentaries often mythicize algorithms, simplifying both the technologies and their societal effects. The research identifies various, often contradictory narratives, ranging from portraying algorithms as an existential threat to casting them as humanity's saviors.

To identify representational elements, this research uses the term 'algorithmic imaginary' to describe the stories and myths that shape the collective imagination around recommendation systems. The analysis employs discourse analysis and media narratology to explore how these documentaries construct meaning around the aforementioned dimensions of algorithmic impact. For each thematic dimension, the study examines the narrative structure, audiovisual elements, and representations of digital interfaces, tools, and online content within these films. The analysis also considers how narrators and interview subjects contribute to the construction of algorithmic imaginaries.

Examining how social effects are thematized in documentaries including *The Great Hack* (Amer-Noujaim, 2019), *Coded Bias* (Kantayya, 2020), *The Social Dilemma* (Orlowski, 2020), and the first two episodes of the docuseries *What's Next: The Future with Bill Gates* (Zeldes-Neville, 2024), this study aims to contribute to a broader understanding of how algorithms are culturally (re-)encoded in contemporary VOD documentaries. The paper argues that while these documentaries attempt to deconstruct the mythicization of algorithmic systems, their tech-critical messages remain superficial, ultimately failing to deepen viewers understanding of digital technology's complex social impacts.

DCC02 Gender in Digital Cultures

PP 0039 Reception of tradwife content: How naturalized gender beliefs shape the evaluation of tradwife content on social media

Julia Lück-Benz[1], Franziska Malik[1]

[1] Institute for Media and Communication Studies, Freie Universität Berlin, Berlin, Germany

Tradwife influencers present an idealized vision of women's lives centered on domesticity, heterosexual marriage, and traditional gender roles. While this content is often framed as a personal lifestyle choice, scholars have argued that it may contribute to the normalization of traditionalist and antifeminist gender ideologies—particularly through aestheticized, non-explicitly political formats common on social media. Although research on tradwives has increased in recent years, especially in Anglo-American contexts, little is known about how audiences actually perceive and evaluate this content.

Existing studies predominantly focus on content, discourse, or ideological positioning, leaving the reception side largely unexplored, particularly in German-speaking contexts.

Addressing this gap, the present study examines how users perceive and evaluate tradwife content on social media and which individual attitudes shape these reception processes. Drawing on the dynamic–transactional approach to media reception, the study assumes that media evaluations are shaped by recipients' pre-existing beliefs and interpretive frameworks. Empirically, the study is based on a quantitative online survey (N = 278) conducted in Germany. Participants were shown a short video by a German-speaking tradwife influencer and subsequently assessed the content along multiple dimensions, including critical evaluation, perceived backwardness and dangerousness, emotional responses, agreement with the portrayed gender roles, and intentions for pro-content engagement (e.g., liking, following, or sharing). In addition, the survey measured a range of individual attitudes, including antifeminism, sexism, endorsement of gender-specific division of labor, naturalization of gender differences, profeminism, authoritarianism, and anomia, as well as sociodemographic and political control variables.

Across hierarchical regression models, the naturalization of gender differences emerged as the most consistent and robust predictor of reception outcomes. Participants who perceived gender differences as biologically determined evaluated the content as less problematic, agreed more strongly with the depicted gender roles, reported weaker negative emotional reactions, and showed higher intentions to engage positively with the content. Support for gender-specific division of labor additionally predicted agreement with the portrayed roles. In contrast, antifeminist, sexist, authoritarian, and anomic attitudes did not show independent effects once naturalization was controlled for. Supplementary analyses indicate that right-leaning political self-placement and an ironic reading of the content were associated with lower problematization, while older participants tended to evaluate the content more critically.

The findings highlight the central role of naturalized gender beliefs in shaping the reception of tradwife content and suggest that such beliefs may function as a key interpretive lens through which traditionalist lifestyle narratives are normalized. The study contributes to research on gender, antifeminism, and social media by emphasizing reception processes and by underlining the importance of integrating naturalization as a distinct analytical dimension in quantitative audience research.

DCC02 Gender in Digital Cultures

PP 0040 "Apps don't take things like emotional abuse into account": Dating apps, online harms and women's distant solidarity and community-making on Facebook

Ozge Ozduzen[1]

[1] University of Sheffield, School of Sociological Studies- Politics and International Relations, Sheffield, United Kingdom

Today a substantial part of the romantic partner or date seeking has taken place on dating apps with over 350M users by 2025 (Jiménez-Muro et al. 2024). There is thus bourgeoning research on dating practices and experiences of users on dating apps (e.g., Ranzini and Lutz 2017; Filice et al. 2022; Denby and van Hoof 2024). Informed by this strand of research, this paper focuses on women's engagement with women-only and private online support groups on Facebook to deal with their experiences of and practices with online dating and harms, such as deception and catfishing. The aim of the paper is twofold: 1) what the functions these Facebook groups around online dating are for users and 2) how women negotiate with and build online networks around risks and harms about online dating.

To understand users' online dating experiences and practices, we need to go beyond an examination of dating apps, as communication and socialisation between users are not isolated to them, especially after the initial match (Broeker 2023). Most existing research examining convergence of media in dating study how users engage with other platforms like Spotify or Snapchat to present themselves or exchange messages, photos or other media or look out for the profiles of people that they matched in other platforms (Gillett 2023; Kang 2023). Existing studies have yet to understand how users make community and solidarity networks online around emotions and harms related to online dating. Resting on 29 in-depth interviews with users that identify as women in England who use dating apps and private and women-only Facebook groups for online dating support, this paper studies online dating as a social practice to address the ways online dating experiences and stories could be studied in relation to solidarity and community-making between users. It examines the post-dating app engagement of users, concentrating on women's practices, experiences, feelings and their safety work vis-à-vis online harms with a focus on their engagement with other platforms and spaces, in this case Facebook groups.

DCC02 Gender in Digital Cultures

PP 0041 Expressing queerness through 'playful disengagement': The case of Floptok

Gabriele Ciccarelli[1], Giulia Giorgi[1]

[1] University of Milan, Scienze Politiche- Economiche e Sociali, Milan, Italy

This study investigates the expression of queerness as 'playful disengagement' taking Floptok, a memetic subculture of TikTok, as a case study. In our understanding, 'playful disengagement' is a practice through which queerness is expressed aesthetically rather than representationally or politically. In this context, participatory digital practices like memes crucially allow the construction of communities centered around the 'playfulness' of queerness, detaching it from political tensions.

Social media platforms have been identified as empowering spaces for minoritarian expression and hubs of solidarity (Duguay, 2019; Jackson & Foucault Wells, 2015; Tran et al., 2025). Among others, TikTok is believed to allow marginalized social groups, e.g. queer people, to produce their own identitarian narrative through participation in popular trends (Vizcaíno-Verdú and Aguaded, 2022). In these studies, queer identity expression is frequently associated with its political and activist dimension (Duguay, 2023), while more playful and less engaged aspects tend to remain in the background. These ordinary configurations are just as important for deciphering queer desires, intimacies, and identities formed in relation to the norm, yet made possible by everyday life (Shollenberger, 2025).

Our research aims to understand how the memetic logic of TikTok contributes to the construction of disengaged queer spaces, in which the expression of queerness is partially separated from its activist dimension; this is realized through engagement in folkloristic memetic practices that allow queer users to construct an 'ordinarity' that purports disengagement from discourses surrounding the singularity of queerness. Through ordinarity, 'playful disengagement' from activist and representational practices is achieved and reinforced. Digital infrastructures and memetic tools are central to extend these flamboyant aesthetic endeavours into fully-fledged communities.

Floptok, a TikTok memetic community born around 2020, encourages practices of playful disengagement by stripping queerness of its conventional political charge and re-encoding it as a set of aesthetic practices. Our empirical research combines digital data analysis, digital ethnography, and 10 semi-structured interviews with active members of the community, identified on the basis of the results of the digital analysis. The findings indicate that Floptok users do not merely narrate queerness but live it firsthand through forms of legend tripping (Wiggins, 2024), a participatory practice through which users enact and collectively experience a shared legend by symbolically entering its narrative space and participating in its construction. Memes are used to develop the different narrative arcs, which are then 'formalized' in the dedicated Fandom Wiki. Looking at the dynamics of participation, the Floptok community exhibits a form of porosity similar to that of traditional memetic subcultures, one that is grounded less in belonging to the queer community per se than in the sharing and acceptance of already established vernaculars and mythologies. Our work further elaborates on the extent to which the emptying of explicit political meaning, combined with the playful and imitative logics of memes and TikTok, leads to the establishment of a shared aesthetic that comes to overlap, albeit partially, with queer identity. In this sense, the queerness expressed by Floptok becomes one of the many-core aesthetics thriving on the platform.

DCC02 Gender in Digital Cultures

PP 0042 From "crypto bros to "girl math": Negotiating moral economies around financial risk

Jacob Ørmen[1], Anne Mette Thorhauge[1], Andreas Lindegaard Gregersen[1]

[1] University of Copenhagen, Communication, Copenhagen S, Denmark

Stereotypical figures of finance circulate widely across social platforms, from the daring and entrepreneurial "crypto bro" who supposedly amasses wealth through high-risk trading, to the cautious and self-deprecating figure associated with "girl math," a popular meme framing women's spending practices as irrational or illogical. While such figures are often dismissed as ironic or exaggerated tropes, they nonetheless constitute a powerful repertoire of cultural scripts through which young people may interpret, justify, or contest their own financial practices. This paper investigates the tension between ironic distance and internalization of these financial stereotypes by examining how young Danes engage with speculative activities and negotiate financial risk and responsibility in a digitally mediated cultural environment.

Empirically, the paper draws on a mixed-methods study combining a representative survey of young adults (16–25 yrs) in Denmark with 8 focus groups. This design allows for both a broad mapping of speculative engagement—such as cryptocurrency trading, stock market investments, and other high-risk financial practices—and an in-depth exploration of how participants articulate the meanings, justifications, and moral boundaries surrounding these activities. In particular, the paper takes an interest in how memes, tropes, and influencer narratives inform participants' understandings of what constitutes legitimate or illegitimate financial behaviour.

The analysis is guided by a moral economy framework (integrating Fourcade & Healy 2024; Scott 1976; Thompson 1971; Zelizer 2010) which foregrounds the role of cultural norms, values, and moral judgments in shaping economic practices. Rather than treating financial decision-making as purely rational or individual, the moral economy perspective highlights how ideas of responsibility, deservingness, and risk are socially negotiated and morally evaluated. Applying this framework reveals significant variation in how young Danes position themselves in relation to speculative finance and the digital cultures that promote it.

The findings suggest that perceptions of legitimacy surrounding financial risk-taking are deeply embedded in gendered social constructs. Young men in the study are more likely to frame speculative behaviour as a form of entrepreneurial experimentation, self-reliance, and even moral virtue, drawing on broader cultural narratives of masculinity, innovation, and hustle culture that are prevalent in online finance communities. In contrast, female participants more frequently describe speculative practices as irresponsible, reckless, or ethically questionable, often emphasizing financial security, long-term stability, and moral responsibility. While some women explicitly resist or parody the "girl math" trope, others describe its subtle influence on how their financial competence is perceived by themselves and others.

The paper concludes that there is no unified financial culture among young Danes. Instead, financial practices and attitudes form a fragmented landscape shaped by intersecting factors of gender, values, and participation in digital media cultures. By applying a moral economy lens to the study of speculative finance, this research contributes to digital culture and communication scholarship by demonstrating how internet-born stereotypes both reify and challenge moral understandings of financial risk, responsibility, and legitimacy.

DCC03 Human-AI communication

PP 0176 The value of disagreement in human-LLM collaboration: A critical methodological reflection

Laura Vodden[1], Katharina Esau[1], Michelle Riedlinger[1]

[1] Queensland University of Technology, Digital Media Research Centre, Brisbane, Australia

Digital news and online communication play a central role in shaping contemporary socio-political life, especially in increasingly polarised digital environments where mis- and disinformation and selective exposure exacerbate social divisions. Studying these digital spaces often relies on content analysis – a method that, whether inductive, standardised, quantitative, or qualitative, is labour- and resource-intensive. Standardised approaches require coding schemes, coder training, and rule based manual categorisation, while qualitative methods require close reading and iterative category building. In all cases, the scope of research is constrained by available intellectual and financial resources.

Generative AI tools, such as Large Language Models (LLMs), known for their natural language processing capabilities, are already being used to analyse text content in a variety of ways, with previous studies consistently highlighting their potential as virtual research assistants (Argyle, et al., 2023; Chew et al., 2023; Rytting et al., 2023), particularly with regard to extending the scope of content analysis.

As their use in research becomes more commonplace, it is important to examine the quality, accuracy, validity, and ethical implications of LLM usage and outputs (Liang et al., 2023, Farjam et al., 2025). Evaluation frameworks for computational tools often involve comparing the outputs from computational methods against a 'gold standard' sample of expert-coded data (Gilardi et al., 2023; van Atteveldt et al., 2021), with measurable agreement serving as a key indicator of the quality and reliability of the analysis, and contributing to the overall validity of the study (Kleinheksel et al., 2020).

However, in social science research, the 'gold standard', reflecting ground truth, can be a problematic concept (Lebovitz et al., 2021). Accepting the gold standard as a ground truth has implications for the assessment of LLM outputs using metrics such as accuracy, since accuracy measures the rate at which a machine learning or AI tool *replicates* human responses to a specific task. In many cases, however, accurate replication of a (trained) human annotation does not necessarily equate to replicating the truth (Llansó, 2020), particularly in tasks involving the interpretation of complex information structures such as claims, positions, or justifications, which can be challenging even for human coders (Esau et al., 2025).

This study theoretically and methodologically explores how disagreement between LLMs and human coders can be leveraged to improve and extend content analysis. Using a manually coded representative sample of Australian digital news articles on climate change, we examine categories including actors, actor types (e.g., politics, business, advocacy), claims on climate action, science and social movements, ensuring that LLM use is theoretically informed and empirically grounded. Combining few-shot and chain-of-thought (CoT) prompting techniques, and conducting a critical analysis of coder disagreement (Farjam et al., 2025), we demonstrate how researchers can use LLM 'reasoning' to identify sources of disagreement and focus their efforts on improving human-LLM alignment. This study offers an approach that promotes increased confidence in the robustness of qualitative research where content annotation is supported by AI coders.

DCC03 Human-AI communication

PP 0177 Using large language models as digital twins to replicate and extend game-theoretic experiments on human cooperation

Andrea Cera Palatsi[1], Samuel Martin-Gutierrez[2], Ana S. Cardenal[3], Max Pellert[1]

[1] Barcelona Supercomputing Center, Computational Social Sciences and Humanities, Barcelona, Spain
[2] Universidad Politécnica de Madrid, Grupo de Sistemas Complejos, Madrid, Spain
[3] Universitat Oberta de Catalunya, School of Law and Political Science, Barcelona, Spain

As large language models increasingly serve as autonomous agents and research tools in communication research, understanding whether and how they mirror human decision-making becomes critical. Yet LLMs operate as black boxes shaped by opaque training data, proprietary ownership structures, and systematic biases that raise fundamental questions about their reliability as research instruments. This study addresses a fundamental methodological question for digital culture and communication research: Can LLMs reliably replicate empirically observed patterns of human social behavior, and if so, can they be used to generate testable predictions about unexplored behavioral scenarios?

We develop a digital twin (a computational replica designed to mirror real-world behavioral processes) of classic game-theoretic experiments on cooperation, creating a systematic framework for eliciting and validating strategic decisions from LLMs. We deliberately employ open-source models (Llama-3.1–8B-Instruct, Mistral-7B-Instruct-v0.3, Qwen2.5–7B-Instruct) rather than commercial APIs, ensuring full transparency and reproducibility while reducing dependency on corporate infrastructures whose proprietary interests may compromise scientific independence. Yet open-source models still inherit biases embedded in their training data, requiring rigorous empirical validation rather than uncritical trust. We replicate experiments where over 500 human participants played 121 different dyadic games with varying payoff structures. Our methodological innovation involves testing four progressively complex answer extraction strategies, from simple one-word responses to elaborate multi-step reasoning with logical verification. We found that extraction complexity dramatically transforms the quality of behavioral signals obtained, with simple methods producing near-random patterns while layered verification reveals systematic cooperation structures.

Results demonstrate striking variation across model architectures. Llama reproduces human cooperation patterns with high fidelity, capturing systematic deviations from rational choice predictions. Qwen, conversely, aligns closely with Nash equilibrium solutions, suggesting either superior strategic reasoning or greater exposure to game-theoretic content during training. Mistral exhibits intermediate patterns. Critically, Llama replicates human patterns more accurately than rational choice theory itself, achieving this without persona-based prompting, which is a significant simplification over prior approaches that attempted to simulate individual diversity.

Extending beyond replication, we use the validated framework to simulate 320 novel game configurations outside the original parameter space, generating preregistered, empirically testable hypotheses about human behavior in unexplored strategic scenarios. This approach offers advantages by enabling rapid, cost-effective exploration of experimental landscapes through computational simulation before committing resources to human studies, reducing unnecessary participant burden while sharpening hypothesis generation. Our findings contribute to communication research by demonstrating how independent, rigorous evaluation of LLM behavior can inform responsible AI development. As these systems increasingly mediate human communication and decision-making, understanding their systematic divergences from human patterns becomes essential for holding industry accountable and advancing human-centered design. By establishing transparent methodologies using open-source models, we reduce researcher dependency on commercial platforms that prioritize profit over public interest. This reveals which architectural choices produce human-aligned versus optimization-driven behaviors, informing future development toward systems that genuinely serve human communication needs.

PP 0178 Chatbot sycophancy in human–machine communication: An analysis of the phenomenon through functional, relational, and metaphysical frameworks, by A. L. Guzman and S. C. Lewis

Aleksandra Skrzypiec[1]

[1] Jagiellonian University in Kraków, The Doctoral School in the Social Sciences, Cracow, Poland

The phenomenon of sycophancy in chatbots grounded in large language models can be described as an excessive tendency to agree with users, their beliefs, and their expectations, frequently at the expense of the reliability and factual accuracy of the generated responses. Such behavior constitutes a tangible threat to both the safety and the practical utility of the systems under discussion (Cheng et al. 2025a). Empirical studies conducted by Myra Cheng and colleagues demonstrate that eleven state-of-the-art large language models exhibit sycophantic behavior 50% more frequently than humans, even when the prompts concern manipulation, deception, or harm inflicted within interpersonal relationships (Cheng et al. 2025b). Nevertheless, these models are perceived by users as “objective,” “fair,” and “free from bias,” a perception that may, in turn, give rise to negative consequences, particularly within the sphere of interpersonal relations (Cheng et al. 2025b).

Sycophancy in chatbots, as one of the elements of human–machine interaction, represents a substantive problem that requires urgent diagnosis from the perspective of communication studies, insofar as text-based conversational virtual assistants are increasingly perceived as communication partners rather than as mere technological tools. From the author's standpoint, sycophancy is, on the one hand, an outcome of the training processes applied to large language models, which are grounded in cybernetic feedback loops, on the other hand, it should be examined critically as one of the strategies of anthropomorphization employed in communicative artificial intelligence (AI) systems, aimed at eliciting specific reactions among users. The effects of interactions occurring along the human–chatbot axis may influence communication with other people in real-life contexts and may even affect individuals' psychological well-being (Moore et al., 2025).

The aim of the presentation, conceived as a theoretical reflection grounded in a review of the relevant literature, is to analyze the phenomenon of sycophancy in large language models, employing three analytical frameworks proposed by A. L. Guzman and S. C. Lewis for the study of communicative AI tools functioning as both senders and receivers of content. In order to delineate the thematic scope of the paper in greater detail, the following research questions have been formulated in reference to the functional, relational, and metaphysical frameworks, respectively, which the author seeks to address in the course of the presentation: (1) What constitutes chatbot sycophancy, and what functions does it fulfill from the perspective of social communication? (2) What principal types of relationships may emerge as a result of interactions with sycophantic chatbots? (3) What attributes do users assign to sycophantic chatbots – do these descriptions pertain to perceived similarities between humans and machines, or rather to the differences that exist between them?

The overall purpose of these considerations is to provide a preliminary diagnosis and to situate the phenomenon of sycophancy in large language models within the field of communication studies – at the intersection of such processes as anthropomorphization, gendering, and personalization – in order to elucidate their mutual interrelations as well as the significance of the phenomenon itself, including its meaning and consequences for processes of social communication.

DCC03 Human-AI communication

PP 0179 From computational turn to generative turn: A systematic literature review of LLMs in communication scholarship

Qinghao Guan[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Introduction

Large language models (LLMs) have rapidly entered everyday life, increasingly functioning as assistants and conversational partners. In communication science, scholars have, on the one hand, highlighted LLMs' unprecedented capacity to generate text and images while grappling with risks such as hallucination. On the other hand, a growing body of research interrogates the broader social, political, and economic implications of LLM deployment, including pressing concerns around ethics and copyright.

Challenges

This review addresses three research questions. (a) The speed and diversity of model releases introduce practical and epistemic uncertainty regarding which models are most appropriate for particular tasks and subfields. (b) Communication research treated LLMs in two distinct roles: LLMs as a method and LLMs as a subject/topic. However, conceptual concerns and thematic emphases of these strands remain insufficiently specified. (c) Reported benefits and limitations are frequently discussed in generic terms, with limited systematic synthesis across use cases.

Objectives

RQ1: *How do disciplinary specialization and regional context shape model selection?*; RQ2: *How do studies differ when treating LLMs as a method versus a subject/topic, and how do their topical foci diverge?*; RQ3: *How does LLM use vary across analytical tasks, and what benefits and limitations are associated with these uses?*

Methods

We conducted a systematic review of LLM-related articles published in peer-reviewed communication science journals. Records were collected on 1 October 2025 and updated on 1 January 2026. Following PRISMA procedures, two coders annotated the dataset. The final corpus comprised 618 eligible studies. Analyses combined automated approaches with qualitative synthesis through manual clustering.

Results

The findings indicate that (a) model choice varied significantly across subfields ($\chi^2(120) = 164.59$, $p = .004$). Regionally, publications were dominated by high-income affiliations, with no representation from low-income countries; the income group was not significantly associated with model choice ($\chi^2(24) = 27.55$, $p = .280$). (b) Lexical signatures revealed a pronounced divide. LLMs-as-method studies emphasized operational and evaluative language, whereas LLMs-as-subject/topic studies foregrounded normative, governance-oriented, and user-centered terms. (c) Model deployment differed significantly across tasks ($\chi^2(40) = 108.26$, $p = 3.34\times10^{-8}$). ChatGPT dominated most task categories, particularly content generation and text content analysis, whereas BERT-family models were disproportionately concentrated in analysis-oriented workflows.

Reported benefits clustered around efficiency and scalability for analytic coding and extraction, creativity and pedagogical utility for generative writing and design, and time savings for question answering and information retrieval. Limitations were task-dependent, centering on accuracy for analytic applications, bias for generative outputs, unverifiable sources of information retrieved, and difficulties in multimodal analysis (e.g., cross-modal consistency).

Contributions

This study offers (a) a discipline-wide evidence map of LLM adoption in communication science; (b) a role-based framework distinguishing "LLMs as a method" from "LLMs as a subject/topic", empirically supported by lexical and topical structures; and (c) a task-sensitive synthesis clarifying where LLMs provide measurable value and where heightened methodological caution is required.

Large Language Models; generative turn; systematic literature review

DCC03 Human-AI communication

PP 0180 Evaluating AI as a source of knowledge: A theory-driven and unexpectedly stable two-wave validation of LLM testimony

Aviv Barnoy[1]

[1] Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

Large language models (LLMs) such as ChatGPT are rapidly becoming part of the digital infrastructure through which people search, learn, and make sense of the world. As these systems move from novelty to routine tools, they increasingly function as sources of knowledge in everyday life. This raises a central question: how do people evaluate AI-generated outputs as potential testimony, and how stable are these evaluations over time?

This paper builds on philosophical work on "AI testimony" and uses survey research to examine how lay users position LLMs as informants. Based on Freiman's (2024) theory of "LLM testimony", we develop a theory-driven measure of six epistemic dimensions: intention, normative assessment, trust, propositional content, independence from human involvement, and phenomenological similarity. We study its structure, predictors, and temporal dynamics.

Empirically, we use two preregistered surveys among a representative sample of U.S. adults recruited via Prolific (Wave 1, early 2024: N = 791; Wave 2, early 2025: N = 611). Respondents reported their familiarity with and usage of LLM tools, perceived ease of use, epistemic belief–related orientations (based on the EBI scale), demographics, and their agreement with the six AI Testimony Criteria (ATC) items.

Contrary to expectations grounded in diffusion and public debate, mean ATC levels, factor structure, and predictor patterns remain unexpectedly stable across waves, with only minor exceptions.

Across both waves, the ATC items form a unidimensional, reliable construct, suggesting that users experience these dimensions as facets of a single stance toward AI as a source of knowledge. In Wave 1, a two-step cluster analysis identifies a small sceptical cluster (9.7%, n = 77) and a large consensus cluster (90.3%, n = 714); in Wave 2, the same procedure yields a single homogeneous cluster (N = 611).

Hierarchical regressions show that experiential variables (perceived ease of use and frequency of LLM use) are the strongest predictors of ATC endorsement, followed by epistemic belief orientations that play a consistent role, and demographic variables that have meagre effects.

Theoretically, the findings provide one of the first large-scale empirical tests of a philosophical account of AI testimony. They show that normative dimensions proposed in recent epistemology can be translated into a psychologically meaningful construct and that public epistemic stances toward LLMs consolidate quickly and resist short-term change. Practically, the results highlight that everyday experience and ease of use are central levers through which LLMs are taken up as credible knowledge sources. This suggests that interface design, governance frameworks, and digital literacy initiatives must address not only accuracy and transparency, but also the experiential qualities of using AI systems, if they are to foster calibrated rather than overconfident reliance on AI-generated information.

DCC04 Media Endings: Devaluation, Infrastructures and the Cultural Politics of Shaping Digital Futures

PN 13 Byte blight and digital metabolic literacies: Hospicing software and the politics of preservation

Katherine Clare Mackinnon[1], Nanna Bonde Thylstrup[1], Taina Bucher[2]

[1] University of Copenhagen, Department of Arts and Cultural Studies, Copenhagen, Denmark
[2] University of Oslo, Department of Media and Communication, Oslo, Norway

Software exists in perpetual contradiction: simultaneously ephemeral and essential. When platforms disappear overnight, when interfaces are forcibly "upgraded," when technologies are laid to rest, we glimpse social ruptures that expose the temporal politics of our digital dependencies. This structural condition of "byte blight" fosters ongoing cessations that,

regardless of when it occurs, feels simultaneously inevitable and disruptively premature. Like hardware ruins (Velkova 2023) and satellite reentry (Cohn), software endings are revelatory moments. But software disappearance operates through distinct mechanisms: obsolescence, dependency cascades, infrastructural abandonment. The politics of software preservation turn on which endings are naturalized as progress and which are mourned as loss. Drawing on Vanessa Machado de Oliveira's concept of "hospicing modernity," we propose an alternative framework for engaging with software obsolescence that attends to dying systems and recognizes ourselves within them, precisely when they are failing us. We extend Oliveira's "metabolic literacies" to develop "digital metabolic literacies": practices of attending to software's decline through critical reparative interventions that acknowledge the harms of technological innovation while imagining other relational possibilities. Through analysis of different digital preservation initiatives, we demonstrate how these interventions negotiate the tension between keeping on and letting go. Rather than romanticizing either comprehensive preservation or cheerful "sunsetting," hospicing software invites more complex work: attending meaningfully to software's afterlives and the social relationships embodied within dying technologies.

DCC04 Media Endings: Devaluation, Infrastructures and the Cultural Politics of Shaping Digital Futures

PN 14 Pen and paper: Analog everyday interfaces in the age of digitalization

Elin Franzén[1]

[1] Stockholm University, Department of Ethnology History of Religions and Gender Studies, Stockholm, Sweden

Pens and paper are some of the most taken-for-granted technical items in everyday life. At the same time, digitalization has profoundly changed their meaning. We are expected to interact with public authorities via digital hardware and software, just as private communication has been accommodated in digital correspondence platforms via SMS, e- mail and social media. The practice of writing by hand has, thus, acquired a status that is both shunned and debated; shunned in the sense that it seems increasingly rare in everyday life, but debated in research, education and politics through recurring discussions about the effects of digitalization on learning processes and competencies, especially among young people. Although digital technology has become present in all areas of society, not all people face the changes in the same way; some embrace digital tools and others prefer pens and paper – tools that provide familiar interfaces in a radically changed media landscape. However, many people write both by hand and with a computer or mobile phone, depending on the situation. The situation of the analog must therefore be seen in a wider context, as a media ecology in which the analog and the digital interact and define each other. By ethnographically examining the characteristics and affordances of analog writing tools, the project offers an understanding of how today's socio-technological conditions are perceived against the background of earlier everyday conditions and practices. Through its biographical depth, the project shows how people deal with technological change over time, and also demonstrates the importance of including a life course perspective in the understanding of historical processes. "What kind of objects are pens and paper?" may seem like a trivial question, but it is, on the contrary, a crucial one for grasping the changes, continuities and intersections of old and new technologies through which people navigate everyday life.

DCC04 Media Endings: Devaluation, Infrastructures and the Cultural Politics of Shaping Digital Futures

PN 15 Queer temporality of digitalization of public administration

Sati Sargsyan[1]

[1] Linköping University, Department of Thematic Studies - Technology and Social Change, Linköping, Sweden

Despite recurrent declarations of its death, dying and demise, the fax – often quietly and efficiently – persists in the public administration of Sweden, one of the most digitalized countries in the world. As thousands of fax machines remain central in the operation of the public sector – particularly across healthcare, law enforcement and social services – the discourse and material practices of Sweden's digital transformation rarely acknowledge them as useful. Public administration digitalization strategists themselves are often unaware of the extent of the fax use, and in formal visions of Sweden's public sector, the fax is considered and made to be obsolete, while in practice, it remains in use and deemed necessary by users. This tension between the fax's discursive deaths and its central role in digitalization offers ways of rethinking the temporal politics of technology in the public sector. To unpack it, I start not with the technological future of public administration, but with the fax: its supposed end. Drawing on ethnographic interviews with public administration employees in Sweden and Sara Ahmed's theorization of use, I trace how the fax endures through habitual, infrastructural and legally compliant practices of handling personal and sensitive citizen data. I argue that the fax reveals and embodies a queer temporality of digitalization: It lingers, loops, resists and unsettles the imagined linear progression of technological innovation promoted in national, regional and municipal strategies. The use of fax illustrates a temporal deviation that extends beyond the binary: It is not of the time of digitalization, but it does the work of upholding the linear temporality of digitalization. It both resists and facilitates the digitalization's march forward. It points to persistence, repurposing, and sideways duration of so-called older technologies. While the newer technologies are in the process of becoming used, the difficulty of disuse of the fax

unsettles future-oriented narratives of digital transformation and showcases digitalization as a layered and contradictory process in which old and new technologies remain entangled.

DCC04 Media Endings: Devaluation, Infrastructures and the Cultural Politics of Shaping Digital Futures

PN 16 The vanishing paper: Infrastructural displacement at a critical juncture of digitalization

Fredrik Stiernstedt[1], Anne Kaun[1]

[1] Södertörn university, Department of Media and Communication Studies, Stockholm, Sweden

The starting point of this presentation is the discontinuation of printed news and distribution of letters as empirical examples of current deep-seated societal changes. As a direct outcome of large-scale digitalization as an all-encompassing societal project that has been implemented since the 1970s, today printed news and letters are disappearing as critical networks of distribution for news and information. The presentation engages with the concrete implementation and outlook of the disappearance of paper-based media infrastructures. It also links to broader questions of the common good, shared public orientation and how we come together as societies. Although the process of the displacement of printed newspapers and letters started much earlier, and the death of paper media has been declared repeatedly for at least half a century, it is only now that the distribution infrastructures are disappearing and are actively being dismantled to full extent. For example, Swedish newspapers are rapidly converting to digital distribution, discontinuing their paper distribution in many places in the country. PostNord – the main Swedish postal service – will completely stop the distribution of letters in Denmark from 2026 and in Sweden the distribution has been reduced to three times per week. While digital news and email distribution are taking over, complementary use of paper-based distribution networks is increasingly difficult or becomes constrained to certain groups for example in specific areas. In the case of printed news for example high income earners in urban areas that have access to printed news and can afford paper news. Accordingly, we are witnessing a revaluation of news distribution and the materiality of news. The postal system and newspapers have been identified as key infrastructures of public life connecting individuals across long distances and providing grounds for a shared orientation or public connection. This contemporary moment of digitalization emerges as a breaking point or critical juncture in how societies emerge based on shared public orientations. In order to capture this large-scale change conceptually we propose the notion of infrastructural displacement and argue for the need to explore the "doing", i.e. practices around infrastructural displacement empirical. In the presentation, we outline a proposal of a research design to do so, namely to a) trace and document how infrastructural displacement of printed news and letters is implemented b) develop a conceptual language and methodology to grasp displacement as a necessary part of digitalization as a large-scale societal project and c) highlight and make visible the implications of infrastructural displacement.

DCC04 Media Endings: Devaluation, Infrastructures and the Cultural Politics of Shaping Digital Futures

PN 17 Futures of joy and fear: Emotional landscapes of anticipating the end of landline telephony in Sweden

Julia Velkova[1]

[1] Linköping University, Department of Culture and Society, Norrköping, Sweden

Digital futures require infrastructure. As networks of satellites, data centers and fibre optic cables are expanding to enable more data traffic and computing power, nation-wide large-scale communication infrastructures are simultaneously being taken down. The European Union has mandated all member states to scrap their working landline telephony networks in anticipation of building "the Gigabit Society". The owners of 2G and 3G networks all over Europe are decommissioning these systems in order to release frequencies for a future of 5G and 6G radio communication that is still under development. These processes register an ongoing cultural shift that changes the orientation of such networks, from entities defined by qualities of endurance and longevity into disposable objects subject to pre-empted planned obsolescence. In this paper I examine the emotional landscapes (Ruckenstein, 2023) generated by this shift as one dimension of it, and discuss how people anticipate and develop orientations towards futures without these networks. Taking as an example the dismantling of the landline telephony and ADSL based internet in Sweden, I focus on the feelings of anxiety, joy and fear about the encountered and anticipated end from the perspectives of infrastructure workers and citizens. Borrowing the notion of the killjoy from Sara Ahmed (2017), I suggest how these feelings make visible two subject positions with differing orientations towards the future-- one which we could call the "killjoys of the future" who are the people who do not fit into the sociotechnical future that forcefully lands upon them and mourn the loss of collective values of safety and universal connectivity that comes with it; and another one standing in opposition, the "joyful wizards" who steer the future and develop anticipatory practices to manage, know and inhabit it well. These two subject positions expose the differing power relations and futures that the obsolete network holds together: those of organisational innovation and those of public inclusive communication, safety and collectivity and how the dismantling of landline telephony promotes just one of them and enforces the loss of the other.

DCC05 Digital Disconnection and Wellbeing

PP 0285 Kneeling at the wellbeing altar: Spirituality and disconnection in wellbeing discourses and events

Filipa Neto[1], Ana Jorge[1]

[1] Lusófona University, CICANT, Lisbon, Portugal

Digital media have become the arena where, more than defining what 'healthy' is, what constitutes a 'good life' is circulated and negotiated. Crucially, discourses on wellbeing are entangled in a capitalistic logic of productivity and efficiency (Baker, 2022), and are suffused with neoliberal values, in which each person is morally responsible for their ability, or lack thereof, to live well, while ignoring the structural factors that largely condition it (Docherty, 2025). Wellness influencers are key contributors to the circulation of discourses on wellbeing, leveraging social media affordances and partnering with the industry. Often, however, their advice amounts to disinformation with little accountability (Flores & Sepúlveda, 2025).

The Covid-19 pandemic foregrounded the concern with health and wellness, in tandem with its commodification as well as with disinformation (Baker & Rojek, 2022). This crisis also accentuated the hyperconnectivity (Brubaker, 2023) and deep mediatization (Hepp, 2020). One of the consequences is the complexity for individuals to manage an increasingly digital life, investigated in the growing literature on digital wellbeing and digital disconnection (e.g. Vanden Abeele & Nguyen, 2023; Moe & Madsen, 2021).

We understand wellbeing as a cultural resource encompassing meanings, representations, practices and values (Besecke, 2001). This paper explores the interest in wellbeing – with its focus on the self – as inextricably connected to a curation of an individual spirituality which draws on several aspects of different religions and spiritual traditions (Heelas & Woodhead, 2005). Some of these 'new age spiritualities' intersect with self-help and include meditation retreats.

This paper draws on a two-part study as part of a PhD project on disconnection and wellbeing. First, we conducted a multimodal analysis (Serafini & Reid, 2023) of 600 Instagram and TikTok content using the hashtags 'wellbeing', 'wellness' and 'self-care'. The analysis illustrated how these contents mimetize forms of spirituality by e.g. ritualizing self-care practices. Among these rituals, moments to disconnect from digital media were encouraged. These messages are entangled with products, services and apps that help maintain these practices, and spoken of as life-changing.

Secondly, we conducted a multi-sited ethnography of wellbeing events in a cosmopolitan environment that emphasized disconnecting from digital media. It aimed to identify how digital media are understood, by both the events' participants and the facilitators, to influence wellbeing. We participated in nature walks, meditation classes, spiritual retreats, digital detox events and others, over the second semester of 2025. Preliminary findings point to a high reliance on digital media to promote and organize wellbeing events, even if this reliance is reluctant and oftentimes seen as inescapable. This ambivalence points to a participation that recognizes the advantages of digital media while being discontent with using it (Cassidy, 2018). In the online discourses, digital media are usually used as scapegoats for societal problems – people not spending enough time in nature, resting, enjoying art or giving attention to the spiritual aspects of life. These events are perceived as breaks in the day-to-day life, when the participants can enjoy an 'ideal' life.

DCC05 Digital Disconnection and Wellbeing

PP 0286 (Re)imagining digital disconnection: ADHD narratives of digital life

Alex Beattie[1]

[1] Victoria University of Wellington, School of Information Management, Wellington, New Zealand

Digital detoxes, slow living, and social media age restrictions frame disconnection as a moral imperative for digital wellbeing. Yet these ideals assume a universal subject and rarely account for cognitive diversity, overlooking how disconnection is perceived and negotiated by people with different cognitive styles such as those with Attention-Deficit/Hyperactivity Disorder (ADHD). Despite growing interest in digital wellbeing, we know little about how disconnecting is experienced by neurodivergent populations, or how normative ideals of attention and productivity shape the cultural narratives that guide these practices. Understanding these perspectives matters because those who do not experience disconnection as an uncomplicated good offer critical insights into the assumptions embedded in mainstream digital wellbeing discourse.

To examine these underexplored dimensions, this study focuses on people with ADHD. The question of disconnection is particularly salient for this group because traits like impulsivity, spontaneity, and susceptibility to habitual smartphone use, along with fluctuating attention and focus, can make it difficult to disconnect and meet normative standards of productivity (Beattie, 2025). To understand how people with ADHD negotiate and construct disconnection in their day-to-day digital lives, we used story completion, a generative qualitative method that produces rich, imaginative data by surfacing norms and discourses underlying cultural phenomena (Clarke et al., 2019) such as disconnecting from the Internet. Our study included 80 adults in Aotearoa New Zealand who are formally or self-diagnosed with ADHD. Participants responded to fictional prompts depicting everyday scenarios of connection (notifications, group chats, responsiveness) and disconnection (digital detox, accidental offline moments, app-enforced limits). Guided by disability studies and the concept of crip time, which a framework that reimagines normative timelines to fit diverse bodies and minds (Kafer, 2013), our research

questions asked how people with ADHD make sense of screen time and dis/connection, and how their narratives of dis/connection reshape experiences of time, productivity, and social life. We analysed the narratives using crip-time inspired thematic discourse analysis, attending to how language constructs moral scripts and temporal norms around digital life.

Our findings reveal that disconnection tends to not be imagined as a clean break but what we call 'temporal tethering': strategies that tether a sense of time to digital cues such as notifications, app limits, and screen-time metrics, rather than abandoning connectivity entirely. Stories depict disconnection as a form of self-care, self-constraint, and normative resistance, and in other instances is embraced as scaffolding for focus, but also incompatible with ADHD hyperfocus, relational obligations, or professional visibility. Participants reframed productivity ideals, challenged moral scripts around "good" digital behaviour, and narrated inventive workarounds that expose the ableist assumptions embedded in mainstream digital wellbeing discourse.

Rather than treating disconnection as a universal good or a singular practice, these narratives reveal its plurality—there is no one way to disconnect, nor one ideal state to achieve. Disconnection is imagined as contingent and uneven, shaped by obligations, design, and cognitive difference. By conceptualising temporal tethering, we offer a lens for future research that frames neurodivergent dis/connective practices not as deficit, but as alternative ways of living and pacing digital life.

DCC05 Digital Disconnection and Wellbeing

PP 0287 Moralised digital dis/connection: Navigating the moral scripts that shape digital practices in contemporary China

Shaoying Zhang[1]

[1] The University of Sheffield, School of Sociological Studies- Politics and International Relations, Sheffield, United Kingdom

Living with constant connectivity has become a defining feature of everyday life in contemporary China, where digital media, facilitated by super-app ecosystems like WeChat (Chen, Mao and Qiu, 2018), have moved beyond tools for communication to become a highly integrated digital infrastructure that structures social interactions, work, leisure, and access to services. This integration has raised expectations for individuals to be always 'online'. At the same time, *digital disconnection*, or intentionally limiting or reducing digital media use (Woodstock, 2014), tends to be framed as a primary path toward *digital wellbeing* (Vanden Abeele, 2021). This presentation examines how Chinese citizens navigate, interpret, and negotiate these two sets of competing narratives in everyday lives. I argue that they participate in moralised digital dis/connection in order to navigate the dual moral scripts that shape contemporary digital practices. In these scripts, constant connectivity is linked to diligence, productivity, and responsibility, whereas intentionally reducing digital media use is associated with self-discipline, restraint, and the pursuit of an 'authentic' life. These evaluations are produced through platform infrastructures and institutional demands, and are mediated by broader sociocultural discourses, including 'digital detox' tropes promoted through social media, influencers, and self-help literature.

This paper draws on 30 diary-elicitation interviews with participants from diverse occupational, educational, and geographical backgrounds in China who have sought to reduce or limit their digital media use. This method allows participants to articulate their everyday experiences related to digital dis/connection and wellbeing. It also offers insight into how individuals from different social positions engage in critical reflexivity of their digital media use as they navigate shifting technological and social scales, such as super-app infrastructures, work expectations, and time pressures. In my analysis, I situate these practices within China's sociotechnical context, where they intersect with an intensified work culture, exemplified by the '996' schedule (referring to working from 9 a.m. to 9 p.m., six days a week), and are shaped by technological tools that blur the boundaries between professional and personal life.

I argue that digital disconnection is active and reflexive. It is a complex form of agency through which individuals attempt to secure wellbeing under conditions of constant connectivity, actively engaging with, reinterpreting, and negotiating the aforementioned scripts as they assess what constitutes a 'digitally good' life. However, this agency is constrained by factors such as occupational demands, reliance on digital platforms for essential services, and the pull of entertainment platforms like Douyin and Xiaohongshu. As a result, many participants experience moral conflict when their actual digital use diverges from ideals or expectations, such as the socially valued forms of rest, productivity, or engagement promoted by social, cultural, and educational scripts. This tension reveals unequal access to the time, energy, and support needed to disconnect and maintain personally and socially valued digital practices. In this sense, digital wellbeing emerges as a socially shaped, contested, and adaptive project through which individuals navigate moral scripts of digital practices and boundaries of autonomy in a constantly connected world.

DCC05 Digital Disconnection and Wellbeing

PP 0288 Disconnecting responsibly? How digital disconnection normalises neoliberal accountability

Arturo Cocchi[1], Marthe Mennes[2]

[1] Ghent University, Communication Sciences, Ghent, Belgium
[2] Antwerp University, Communication Sciences, Antwerp, Belgium

In contemporary neoliberal, digitally mediated societies, digital disconnection is increasingly promoted as a desirable and necessary response to the pressures of constant connectivity. From workplace well-being programmes to self-help advice and commercial digital detox practices, individuals are encouraged to manage their availability, attention, and boundaries in the name of balance, productivity, and mental health (Cederström & Spicer, 2015; Lupton, 2016). Correspondingly, academic literature has conceptualised digital disconnection as a set of strategies for managing overload, protecting well-being, or reclaiming control over time (Nassen et al., 2023; Vanden Abeele et al., 2024; Vanden Abeele, 2021). While this work has foregrounded users' experiences of digital strain, it largely reproduces a neoliberal framing by positioning disconnection as an individual and voluntary practice centred on autonomy, self-regulation, and personal responsibility (Mennes et al., Under Review). Such framings obscure how responsibility for managing digital pervasiveness is increasingly relocated from institutions, technologies, and labour arrangements onto individuals themselves (De Leyn et al., 2025; Fast, 2021).

This paper approaches digital disconnection through a critical lens informed by scholarship on neoliberal governmentality, responsibilisation, and the moralisation of wellness and productivity (Bozan, 2024; Cederström & Spicer, 2015; Miller & Rose, 2013). It conceptualises disconnection not simply as an individual strategy of self-care, but as a moralised practice that alleviates immediate strain while legitimising the structural conditions that produce digital overload (Bauman, 2013; Cloud, 1998). Rather than challenging norms of constant availability, digital disconnection may function as a technology of governance that encourages subjects to adapt rather than contest these conditions.

Empirically, the study draws on the 360° interview method, situating participants within relational clusters spanning family, school, and work contexts to examine how neoliberal norms surrounding digital (dis)connection circulate and become internalised.

Preliminary findings identify three interrelated patterns. First, digital engagement is primarily evaluated through a productivity-oriented moral framework: connectivity is legitimised when aligned with work, study, or self-optimisation, frequently overriding personal boundaries, while leisure practices such as scrolling are framed as wasteful. Family time is valued yet frequently subordinated to work-related connectivity normalised as unavoidable (Bauman, 2013; Jorge et al., 2022).

Second, responsibility for managing digital (dis)connection is widely dispersed but unevenly allocated. Participants position themselves as primarily responsible for regulating availability, despite organisational cultures that normalise and reward responsiveness. Policy actors are invoked largely symbolically, with limited expectations of intervention, producing a governance landscape in which responsibility is collectively acknowledged but practically individualised (Miller & Rose, 2013; Syvertsen, 2020).

Third, experiences of digital overload are predominantly interpreted as individual failures of prioritisation or discipline rather than as outcomes of organisational norms, technological design, or labour conditions, reinforcing a moral economy of self-management (Cederström & Spicer, 2015; Cloud, 1998).

Taken together, these findings suggest that digital disconnection operates as a moralised practice through which neoliberal ideals of productivity, self-regulation, and personal responsibility are justified and reproduced, even as discomfort with constant connectivity persists. By foregrounding the justificatory narratives, this paper contributes to critical debates by shifting attention from individual strategies to the socio-political conditions that shape digital (dis)connection.

DCC05 Digital Disconnection and Wellbeing

PP 0289 Connectivity justice: A post-digital approach to mobile lives

André Jansson[1], Cornelia Brantner[1], Karin Fast[1], Linda Ryan Bengtsson[1]

[1] Karlstad University, Department of Geography- Media and Communication, Karlstad, Sweden

This paper introduces the concept of connectivity justice and discusses how it can be utilized in research on mobile, digitally reliant lives. Connectivity justice reframes questions of mobility and data justice for a post-digital world in which digital connection has become both indispensable and intrusive.

Today, we can think about digital connectivity largely as a *precondition for human mobility*. This regards most mobilities linked to some kind of service (e-scooters, air travel, etc.), as well as the support systems related to such services (ticketing, parking, etc.). There are very few non-connected travelers – and those with limited connectivity resources are directly or indirectly excluded from most types of mobility. At the same time, society is increasingly characterized by *post-digital trends*, meaning that many people feel a desire, and are encouraged, to disconnect, "detox", or, at least, monitor their digital engagements (e.g., Cramer, 2015; Jorge et al., 2022; Zhang & Zhang, 2022; Nassen et al., 2023). Some voices even proclaim the "right to disconnect" (see, e.g., Hesselberth, 2018; Kloza et al., 2025) as a component of social justice.

Mobility is thus a social domain where the power differentials and injustices associated with digital connectivity unfold in complex ways. Evidently, such discrepancies have much to do with *mobility justice* (Sheller, 2018), related to whether people's capabilities to move, or stay put, are distributed in a just way. In a platform economy, they also concern *data justice* (e.g., Dencik et al., 2017) and people's capabilities to govern if and how they are affected by datafication. However, an important complementary concept would be *connectivity justice*. Tentatively, connectivity justice refers to the rights and opportunities of different actors, individuals as well as organizations, to manage whether and how they are connected to different – especially digital – networks and infrastructures. This theoretical paper charts the basic properties of connectivity justice, along with mobility justice and data justice, and presents a framework for thinking these notions *together* in research on mobile lives.

In approaching justice, the paper draws on Sen's (2005) capabilities approach to emphasize the real freedoms people have to connect, move, and act, as well as on a feminist ethics of care (Sevenhuijsen, 2003; Verlinghieri & Schwanen, 2020), which highlights the relational and affective conditions of those freedoms. These perspectives together frame connectivity justice as concerned not only with access to infrastructures and data but also with the capacity to sustain meaningful, responsible, and balanced forms of connection in the post-digital condition. This combination invites researchers to view digital mobilities not only as systems of movement and data but as arenas of affective, moral, and political negotiation, where care, autonomy, and power intersect. In the conference presentation, the conceptual and epistemological points will be illustrated by means of focus group interviews about people's practices and experiences of digital connectivity in relation to various types of travel and transit.

DCC06 Attention Economies and Platformed Cultural Production

PP 0255 Against skip culture: Synchronous co-viewing and micro-public spheres in the Korean OTT community 'Watchakjeup'

Jiyoon Park[1]

[1] Arts Council of Korea, Culture Voucher, Naju-si, Republic of Korea

Contemporary digital media systems face a paradox: intensified connectivity coincides with deepening social isolation. Streaming platforms promise frictionless access and personalised choice, yet algorithmic curation and interface design privilege solitary, efficiency-oriented viewing—an emerging "skip culture" of accelerated attention (skipping, fast-forwarding, autoplay, and speed-as-default). This paper shifts attention from dominant "central" platforms to the periphery by examining WATCHA, a South Korean OTT service, and Watchakjeup, a user community organised around WATCHA Party, a feature that enables synchronous co-viewing and live chat. Watchakjeup began as a taste-based space for co-watching and commentary, but it has developed recurring rituals and informal rules that sometimes extend beyond entertainment into civic discussion in everyday practice. The study asks**: How can a taste-based community at the platform periphery develop civic capacities while operating inside commercial infrastructures and metric-based visibility regimes?**

Conceptually, the paper reframes Watchakjeup as a platform-mediated community embedded in—yet partially resistant to—platform governance. Drawing on scholarship on platformization and networked publics, it theorises a tension between top-down convergence (interface design, ranking, and recommendation) and bottom-up convergence (user appropriation and coordination). Civic possibilities, it argues, emerge through constraint: platform metrics limit visibility, but they also provide shared objects (films, ratings, chat threads) around which users coordinate attention and negotiate norms. Rather than locating civic engagement outside platforms, the paper treats constraints as conditions that shape collective attention and discourse. Here, "periphery" denotes a positionality in which users adapt tactically to commercial governance and uncertain visibility.

Empirically, the study combines longitudinal participant observation of WATCHA Party sessions and related spin-off activities (August 2022–August 2024) with semi-structured interviews with ten core members, including the community founder, within a broader pool of over one hundred (active core: approximately twenty). Data include session fieldnotes, chat excerpts, and accounts of off-platform coordination. A phenomenological thematic analysis identifies meaning patterns organising synchronous co-viewing—shared temporality, anonymity, and film-mediated dialogue—and links them to collective practices through which participants negotiate platform power and participation.

Findings identify three interrelated practices. First, participants cultivate temporal resistance to skip culture by collectively enduring slow-paced films without fast-forwarding; synchronised viewing and chat restore shared time and transform solitary streaming into a social ritual. Second, members engage in metric-facing coordination through the "Queen Crab" episode: coordinated viewing, rating, and commentary around an obscure B-movie was followed by increased platform visibility (e.g., appearance in WATCHA's "Top 10"), which participants interpreted as fragile leverage over recommendation signals, dependent on opaque metrics and vulnerable to recalibration. Third, the community sustains low-risk micro-public talk enabled by anonymity, using films as shared reference points for discussion of contentious issues (e.g., feminism, refugee rights, and gender identity) without immediate polarisation.

The paper contributes an account of peripheral streaming communities as emergent, modest civic infrastructures. It shows how participants rework rhythms of attention, engage platform metrics, and sustain deliberative talk, while clarifying limits

imposed by commercial governance, metric dependence, and uneven participation. At the same time, it points to fragile but significant pathways towards more inclusive digital futures.

DCC06 Attention Economies and Platformed Cultural Production

PP 0256 "As If" - Attention and Authenticity on Social Media

David Kneas[1], Katrin Tiidenberg[2]

[1] University of South Carolina, Geography & School of Earth- Ocean- and Environment, Columbia, USA
[2] Tallinn University, Baltic Film Media and Arts School, Tallinn, Estonia

Authenticity is widely understood as a master narrative of social media, yet what counts as or feels authentic is not self-evident. On social media, attention often translates into revenue and within this attention economy, projecting authenticity becomes strategically valuable for creators. Relatedly, dominant conceptualizations of the attention-authenticity relationship have largely focused on influencers and content creators, examining how authenticity is produced through frameworks such as contrived authenticity (Abidin 2017) or as authenticity labor (Duffy and Hund 2015). Our presentation approaches the intersection of attention and authenticity from the perspective of everyday users, whose experiences of online authenticity do not sit comfortably within existing conceptualizations of performed or calculated labor practices. Drawing on a meta-ethnographic analysis of selected data from a range of our research projects over the past 13 years (with users of Tumblr, Instagram, Facebook, Etsy and BeReal) we explore how users:

(1) experience and navigate tensions between attention and authenticity, and
(2) describe recurring strategies for reaffirming their sense of authenticity.

We find that these tensions are experienced in multiple ways. Everyday users' social media practices are often shaped by a tacit imperative of attention, where moments of popularity prompt considerations of whether to capitalize on it. At the same time, "attention seeking" has become an internalized judgement. Further, our data reveal how everyday users reaffirm authenticity. We observe this across several recurring registers: love, where intrinsic passion is emphasized; lifestyle, where a particular way of being or social position- often in relation to labor- is foregrounded; and the greater good, where authenticity is grounded in a moral self focused on helping others, offering advice, or publicly diversifying normative discourses.

To theorize these articulations of authenticity, we draw on theories of "as if" idealizations, (Appiah 2017). An "as if" stance allows a perspective that may not be literally true but is pragmatically useful. In dialogue with Appiah, we suggest that registers such as love, lifestyle, and the greater good allow social media users to enact authenticity as if it was real, and as if it was disconnected from the attention economy. This "as if" framework sustains the cultural ideal of being "real" while navigating the contradictions of platform economies that commodify visibility. Through "as if" idealizations, authenticity for everyday users emerges as something that can be constructed or performed while remaining real- or real enough. In this sense, authenticity becomes flexible, without losing its meaning or value, or becoming entirely instrumental.

DCC06 Attention Economies and Platformed Cultural Production

PP 0257 The business of live-streamed gambling: economic and cultural dimensions of Danish gambling streaming on Twitch and YouTube

Andreas Gregersen[1], Emil Lundedal Hammar[1], Mara Günther[1], Anne Mette Thorhauge[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

This presentation examines the intersection of digital streaming and online gambling through an in-depth case study of a prominent Danish gambling streamer active on Twitch and YouTube. The streamer regularly broadcasts digital casino games to Danish audiences. Our analysis explores the streamer's content strategies, scheduling practices, monetization models, and partnerships with Danish gambling operators, where we situate these within broader trends of influencer-driven marketing in the online gambling industry (Johnson and Jackson 2025).

The study is motivated by the growing prevalence of gambling among Danish youth (Fynbo et al. 2021; Kirkeby 2025) and the increasing convergence between gaming cultures and societal "gamblification" (Thorhauge 2023; Macey et al. 2025). While prior research has addressed gambling-like mechanisms in games and streaming platforms (Abarbanel and Johnson 2020), few studies have examined the rise of gambling streamers on Twitch, YouTube, and Kick (Johnson & Jackson 2025). This phenomenon is particularly relevant given Twitch's gaming-oriented origins and its evolving role in promoting gambling content to younger audiences (Johnson 2024; Reynolds 2025).

Our case study combines qualitative analysis of streaming performances with a mapping of economic networks, including affiliate links, wagering practices, and parasocial trust-building strategies to show how this type of streaming is "calibrated towards monetization" (Gregersen and Ørmen 2025). By tracing these relationships, we reveal how gambling streamers leverage platform affordances and aspects of influencer culture (Abidin 2017; Maddox 2023) to normalize and monetize gambling. This research contributes to understanding the cultural and economic entanglements between streaming platforms, gambling operators, and influencer-driven business models.

DCC06 Attention Economies and Platformed Cultural Production

PP 0258 Behind user-generated content: Factors driving digital media production

Ikonija Jeftić[1]

[1] Faculty of Dramatic Arts, Management and production in theatre- radio and culture, Belgrade, Serbia

This research aims to establish a foundation for understanding the position of creators and their approach to content production in the digital environment. This knowledge is considered a prerequisite for developing a currently non-existent yet highly necessary support system that would prepare and motivate creators to adopt a more adequate sense of responsibility toward their production process and audiences.

More than ever, human experience is mediated by digital tools, materialized in computers, smart devices, and above all mobile phones with various digital media as a part of their regular user experience. User Generated Content (UGC) is what audiences are most frequently exposed to by living technology mediated lives. As all other media content, UGC shapes opinions, complex attitudes, emotions, and influences audience decisions and behaviors. Considering that much power is concentrated in the arms of prosumers (and platforms), it is important to understand what lies behind this content and the editorial and production decisions of digital creators. Namely, to understand the frameworks that determine what UGC will look like, which topics it will address, in what ways, and with what presumed effects.

Aiming to understand what are the key factors influencing digital media production, through theoretical research, conceptual content analysis, and model-building methodology, this study proposes a system of factors that shape digital creators and their content. The proposed system consists of 8 factors- internal (individual moral and ethical code; social class position; demographic characteristics; social and cultural capital, habitus; cultural model affiliation) and external (technological infrastructure; regulatory and normative frameworks; market size and potential). The factors are assumed to determine editorial, thematic, production, and aesthetic components of the content.

After proposing the system, its components, their structure, function, and importance were examined through interviews with ten UGC content creators from the local market (defined by spoken language area), selected so as to adequately represent the local market across different niches and levels of popularity.

DCC06 Attention Economies and Platformed Cultural Production

PP 0259 AI content & platformed cultural production: The case of Suno

Tanja Anna Wiehn[1]

[1] Lund University, Department of Arts and Cultural Sciences, Lund, Sweden

AI content has an increasing influence on how cultural products are created, distributed and consumed across digital platforms. AI content is highly effective to go viral due to its low cost, speedy production and increasingly authentic and hyper realistic features (Stanusch et al. 2025). However, platform companies grapple with the introduction and moderation of AI generated content based on its merits and potential threat for their business models. This paper engages with the question of how AI generated content creates benefits and risks for platform companies. For this, the paper homes in on the case of Suno. Suno is a leading tool for the generation of artificial music and has recently secured a 250-million-dollar investment by venture capital for the extension of their platformed music-ecosystem (Marshall 2025). However, the platform has come under fire as the Danish rights organisation Koda filed a lawsuit against the US based company. Suno has not compensated artists, nor properly disclosed the scope of music data they used to train their generative AI music model. By investigating the case study of Suno, the paper analyses the in-between of profitability and risk for AI content becoming integral part of platformed cultural production.

Theoretically, the paper is situated in scholarship of platform studies and theories on cultural production. The interdisciplinary field of platform studies analyses the ways in which platforms effectively govern cultural production through moderation, policies and algorithmic systems (Caplan & Gillespie 2020; Poell et al. 2022). Theories on cultural production analyse how digitalisation and platformisation impact on cultural industries (Hesmondhalgh 2019; Nieborg 2018; Valtysson 2020) and demonstrate how platforms' business models manage content monetisability (Kaplan & Gillespie 2022; Ørmen & Gregersen 2023; Steinberg et al 2024). Methodologically, the paper applies a critical case study approach (Flyberg 2006), platform analysis (van Dijck 2013; van Dijck et al. 2018) in combination with document and desk research (Bowen 2009) on Suno over the span of three months. The paper argues that new theoretical vocabularies are needed to grasp the dynamics of profitability and risk that AI content plays in the context of platform environments.

DCC07 Internet memes and digital subcultures

PP 0402 "Dank memes with no brakes": Aesthetic judgment and memetic weaponization on r/The_Donald

Johan Wowern Hundrup[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Online political extremism is aestheticized through memes as part of a process called memetic weaponization. Thus, memes are instrumentalized for political mobilization, antagonization of political opponents, and normalization of hateful ideologies (Merrill et al., 2024).

Meanwhile, research has shown that online communities rely on taste in memes to develop common aesthetic sensitivities through the interplay between users and platform affordances (Paßmann & Schubert, 2021). Thus, social stratification in *and* between groups and platforms can be constructed. I bring these insights into an overtly political context by asking how aesthetic judgments and collective aesthetic sensibilities shaped memetic weaponization in a far-right meme-centric political online forum in the mid-2010s.

Through a digital ethnographic case study of the infamous and influential pro-Trump political community r/The_Donald, I show how memes functioned as entangled sites of political instrumentalization and aesthetic praise in this digital public during the 2016 US primary and presidential elections. Ultimately, I argue that memes and aesthetic judgments sustained the reactionary political fantasies of this group.

Using the Internet Archive's comprehensive documentation of the subreddit r/The_Donald, I develop this argument through an ethnographic immersion in this community from its inception on June 27, 2015, to the inauguration of Donald Trump as president of the United States on January 20, 2017. This historical focus ensures the stability of my analytical object.

The users of r/The_Donald famously promoted hateful political viewpoints in the form of memes. Methodologically inspired by Literat and van den Berg's ethnographic study of the meme-centric subreddit r/MemeEconomy (2019), I analyze the discourses surrounding memes in r/The_Donald to determine how users related memes to their grassroots support. My analytical focus is therefore on how users spoke about memes, not the memes themselves. I ask how this forum's users' way of speaking of and using memes developed over the period. Moreover, I ask how memes were appraised, and how support for Trump was imagined to be enacted through memes.

I find that the users of r/The_Donald were deeply engaged in creating, sharing, and enjoying so-called 'dank' memes. Pervasive in masculinized meme cultures on Reddit, 4chan, and YouTube in the 2010s, dankness has been described as an ironic, transgressive, and crass aesthetic category undergirded by anti-mainstream sensibilities. Alongside exploiting Reddit's platform affordances, dank memes were seen as an essential political tool of agitation and mobilization on r/The_Donald which the users imagined played a crucial role in the Trump campaign's success. Users collectively invested

dank memes with a promise of political influence, while performances of aesthetic praise supported this fantasy. In sum, I argue that communities engaged in memetic weaponization rely on forming collective taste through aesthetic judgments.

DCC07 Internet memes and digital subcultures

PP 0403 Hyperawareness: memes, legacy media and layered meaning-making processes in the content network of TikTok

Lisa Plumeier[1], Jana Goyvaerts[2]

[1] Film University Babelsberg KONRAD WOLF, Media Studies, Potsdam, Germany
[2] Vrije Universiteit Brussel, Communication Studies, Brussels, Belgium

While TikTok can be considered a novel and distinct type of social media, at the same time it serves as an outstanding pathway in the interrelation between 'traditional' legacy audio-visual media, like film and tv, and platformed audio-visual entertainment and communication. First, the platform-inherent memetic and intertextual **content** pieces structurally display hints towards established legacy media texts. May it be politically charged memes or nonsensical 'brain-rot' content, legacy texts feature repeatedly on TikTok via different modalities. Secondly, TikTok's **interface** has repeatedly been compared to legacy media environments, especially those of television, based on its algorithmic structuring, user roles and user agency (Faltesek et al. 2023, Siles & Valerio-Alfaro 2025, Firth & Marinelli 2025). Thirdly, from a **user perspective**, TikTok's memetic and trend-based communication patterns stand out, inviting users to participate in repetitive patterns of content and reference recognition (Zeng et al. 2021, Zulli & Zulli 2022). The participatory co-creation of networked referentiality and cross-media intertextuality enhances processes of de- and encoding (Song 2025).

In this presentation we discuss **the interconnections between legacy media artefacts and their appropriation, circulation and reception on TikTok.** While moving at the intersection of these two well-studied areas, we take a closer look at the different overlapping audio-visual cultures and sketch out audience and user consequences of the emergent necessity to navigate an abundance of options in communication and relation. To empirically explore these connections, we conducted a digital ethnography on TikTok with a hybrid research team consisting of 12 student-researchers and two supervising researchers. Over a period of four months, we collected, analysed and discussed content findings and feed navigation over 7 focus groups. This iterative and layered process of collecting and analysing resulted in two main datasets consisting of 1) videos from the individual users' feeds that reference legacy media artefacts and 2) deductions made from participant's individual and joint analyses of the video collection and group discussion outcomes.

By following and analysing legacy content pieces of remix, participatory and meme culture, we gained insights in the link between legacy media, user culture and reference navigation in TikTok's intertextual structure. This allowed us to uncover individual and collective processes of dealing with affective economies, nostalgia and different modes of participation in online practices of audio-visual culture. Throughout this process, we identified a key concept in contemporary meaning-making which we call **'hyperawareness'** – a mode of navigating the abundance of options in content, meaning and systemic embedment as a platform user, drawing from an intertextual and discursive situatedness. TikTok users showed specific ways of displaying and merging their versatile experiences in being participants of different screen cultures, showcasing a synthetisation of user knowledge about legacy media, meme and fan culture as well as affordance and platform vernacular-driven ways of expression and acquired meta-knowledge about digital environments to different degrees. Participation in meaning-making shows up as a layered, audience-based convergence process between traditional and digital media. Our insights open up conceptual possibilities beyond participatory culture, networked publics and audience studies by merging these fields into complex hybridity.

DCC07 Internet memes and digital subcultures

PP 0404 Navigating censorship through play: Nisu fans and the reconfiguration of digital gender politics

Chi Zhang[1]

[1] University of Leeds, School of media and communication, Leeds, United Kingdom

This study examines the digital subcultural community of nisu fans and investigates how "playful participation" functions as a vital tactic for navigating China's complex landscape of social, cultural, and political constraints. Nisu refers to a fan practice in which predominantly female fans feminise male idols through kinship or romantic address, such as calling an idol "sister" or "wife." Drawing on an eight-month digital ethnography and 45 in-depth interviews, the analysis reveals that nisu fans engage in sophisticated forms of ludic resistance, translating potentially radical gender politics into seemingly innocuous entertainment practices, humour, and memetic creativity. In the Chinese context of stringent media regulation and tightly policed gender norms, the findings show that fans possess a keen sensitivity to prevailing gender expectations while recognising the risks posed by direct confrontation. Within an ecosystem where explicit ideological activism is rarely viable, play becomes a socially permissible vehicle for exploring alternative gender imaginaries without provoking censorship. Through irony, exaggeration, and absurdity, fans create plausible deniability, framing their reworking of the male idol's gendered body as "just for fun" rather than as intentional critique. This dynamic complicates the conventional separation between entertainment and politics in Chinese digital cultures. Here, playfulness operates as a protective aesthetic that

enables fans to articulate dissenting affective positions while remaining publicly legible as recreation. Rather than triggering the suppression associated with explicit activism, playfulness performs a serious cultural function: it transforms the community into a liminal space where political commentary is embedded within the surface of entertainment, and where queer possibilities and gender-norm subversions can be explored under the cover of recreational discourse. The study thus conceptualises nisu fandom as a liminal cultural space in which gendered meanings are reworked under conditions of authoritarian normativity, contributing to broader debates on digital subcultures, feminist media practices, and the subtle forms of agency that emerge within restrictive media ecologies.

DCC07 Internet memes and digital subcultures

PP 0405 "i hate my stupid co-fans": Weibo bot, subcultural politics, and conflictual neo-tribes

Yifei Yang[1]

[1] University College Dublin, School of Information and Communication Studies, Dublin, Ireland

As platform infrastructures increasingly structure cultural participation, fandom—long understood as a central form of subculture—has shifted toward digitally mediated, platform-based practices (Jenkins, 2006; Hills, 2013; Stanfill, 2019). Contemporary fan studies have expanded to address issues such as fan activism, affective economies, digital labor and exploitation, and platform governance and censorship. However, relatively little scholarly attention has been paid to the internal differentiation of fandoms: the multiplicity of sub-group identities, their platform-specific organizational forms, and the tensions and conflicts that emerge both within and between fan communities, as well as their entanglements with broader cultural and political dynamics.

This paper addresses this gap by examining transformative fan subcultures on the Chinese social media platform Weibo, with a particular focus on bot accounts as a distinctive organizational form. In contrast to algorithmic bots commonly discussed in studies of political manipulation, market disruption, and misinformation (Ferrara et al., 2016), Weibo bots are typically human-managed accounts that present themselves as automated. Their primary function is to solicit, curate, and repost user submissions under specific thematic frameworks. These bots operate as semi-public, affectively charged spaces that organize fan participation, mediate visibility, and shape collective expression.

Conceptually, the paper draws on post-subcultural theory and Bennett's (1999) notion of neo-tribes to understand bot-centered fan communities as fluid, temporary, and emotionally oriented formations rather than coherent or stable subcultures. Neo-tribalism foregrounds affect, belonging, and collective intensity, offering a useful framework for analyzing contemporary fandom under conditions of platformization. At the same time, this study extends neo-tribal theory by foregrounding conflict, antagonism, and negative affect as constitutive—rather than exceptional—dimensions of neo-tribal relations.

Empirically, the paper analyzes ten Weibo fandom bot accounts between March 2019 and April 2025, based on a corpus of 400 publicly visible posts. Informed by Hughson's (1999) spatial approach to tribes and recent scholarship on the political dimensions of fandom (Huang et al., 2022), a thematic analysis is conducted across four dimensions: digital subcultural organization, content and expressive forms, collective affect, and cultural politics.

The findings suggest that bots function as unstable yet productive spaces through which the "sub-ness" of fan subcultures is preserved in the platform era. While bot culture demonstrates the explanatory power of neo-tribalism in capturing identity fluidity and affective cohesion, it also exposes its limitations. In particular, the analysis highlights how negative emotions, moral antagonisms, and conflictual relations between neo-tribes are vital to the everyday politics of fandom, complicating celebratory accounts of participatory culture and emphasizing the need to take intra-fandom conflict seriously as a form of cultural and political practice.

DCC08 News, Truth, and Audiences in Digital Cultures

PP 0368 Trust in the news among young audiences in the age of generative AI

Nabila Cruz[1]

[1] University of Sheffield, School of Sociological Studies- Politics and International Relations, Sheffield, United Kingdom

Artificial Intelligence (AI) generated content has flooded the information ecosystem, amplifying concerns of increased misinformation and decreased trust in and engagement with the news. This has impacted audiences' perceptions of trusted sources of news. Public Service Media (PSM), such as the UK's British Broadcasting Corporation (BBC), are faced with the challenge of maintaining trust while also informing the public in the context of rapid AI innovation. Since ChatGPT's release

in November 2022, academic attention has focused on how journalists perceive and use generative AI, yet in-depth qualitative studies examining public views of uses of AI in the news, especially the views of young audiences, remain limited. To address this knowledge gap, it is important to examine the perceptions of so-called underserved audiences with methods which enable participants to think critically about generative AI and its effects on the creation and consumption of digital news media.

This paper presents findings from research which investigated how generative AI affects young audiences' trust in the news and how their lived experiences influence their encounters with generative AI and the news. The aim was to identify how these factors affect the trust relationship between the BBC and its young, underserved audiences, a key issue for the broadcaster, which believes low trust impacts engagement with the news.

As trust is a relational concept between trustors and trustees, I conducted 26 semi-structured interviews with 8 BBC staff and 18 young adults aged between 18 and 24 years old. I applied insights from these interviews to design a creative workshop, where 5 young participants used the generative AI tool Google Gemini to simulate how news organisations use AI in news production. This approach enabled an understanding of how young people conceptualise trust and trustworthiness in the context of news consumption.

My fieldwork revealed that audience trust is shaped by both affective and systemic factors. Preliminary findings show that BBC staff tended to have a pragmatic stance towards the use of generative AI, believing that it is here to stay so they must adopt it responsibly in their work to serve the public. Young participants' initial attitudes toward AI in news reporting were marked by scepticism and a keen awareness of bias and misinformation.

Young adults interviewed generally favour the involvement of humans in journalism, regarding automated news production, such as AI anchors or AI-generated summaries, as inauthentic and unnecessary. They also expressed concern that older generations may be susceptible to misinformation and especially vulnerable to the deceptive potential of AI-generated content, as they believe older adults have more difficulty discerning media created with generative AI.

In this paper, I argue that young audiences value transparency and want clear disclosure regarding when AI is used. Significantly, young participants concluded that their trust in news is less affected by journalists' use of AI itself but more so by the transparency with which news organisations disclose such practices.

DCC08 News, Truth, and Audiences in Digital Cultures

PP 0369 Reconsidering impact dimensions of data journalism: Enabling audiences and packaging ideas for sustainable societies in digital circulation cultures

Christoph Raetzsch[1], Will Fee[1], Daniela Rebello[1], Franziska Garms[1]

[1] Aarhus University, Department of Media and Journalism Studies, Aarhus, Denmark

In his book "Communicating the Future" (2021), political scientist Lance Bennett forcefully advocated a vision of journalistic and political communication to foreground the 'packaging' and 'networking' of progressive ideas into larger narratives about sustainable societies. In this paper, we argue that such a shift in media and communication research needs to address the role and relevance of online communities and the 'circulation of communicative objects' (Authors 2016) to spread such ideas. Following the experience of a "social media infodemic" (Cinelli et al. 2020), and broader perceptions of polarisation and the spread of online misinformation in social media, we argue that data journalism can play a crucial role in facilitating more diverse, inclusive and evidence-based public visions of sustainable societies (Guan & Wang 2024; Tong 2024).

The majority of research on data journalism remains tied to "epistemologies of data journalism" (Ramsälv et al. 2024, Borges-Rey 2020) that focus on industry-specific innovations, products, team compositions and business models (de-Lima-Santos 2023; Ausserhofer et al. 2020; Fan et al. 2025). Diverging from this mainstream research field, we present a prototype study to identify impact dimensions for data journalism projects beyond their initial editorial runtime and context. Based on a review of data journalism research from 2019–2025, we consider four dimensions: 1) the potential of data journalism to foster collaborative community engagement (Aitamurto & Chen 2017); 2) to develop engaging interactive storytelling devices relevant to diverse audiences (Garreton et al 2024), 3) to inspire audience-generated content such as "viral visualisations" (Lee et al. 2021), and 4) to facilitate the long-term capacity-building for data analysis through data journalism projects among civil society actors, journalists and citizens (Dodds et al. 2025). Data journalism as a practice contributes to packaging ideas, analysis and insights about sustainable ways of organising society to wider 'networks of publics' (Bruns 2023) leading to wider public "ramifications" (Hamm 2022).

We conceptually outline a research agenda along these four dimensions based on empirical examples of prominent data journalism projects purposively sampled from award-winning projects of the SIGMA awards for data journalism. We foreground the relevance of collaborative data work and interpretation (Bounegru and Gray 2021) to understand larger shifts within new "social epistemologies" (Godler et al. 2020) that resist authoritative or normative knowledge production processes. Data journalism projects create impacts on several levels, not least around what audiences "experience as informative" (Swart et al. 2022: 16). Along the four dimensions of impact, we question conventional genres of data visualisations (Stalph & Heravi 2021; Cheng et al. 2024) and focus on how data stories instead can "enable users to choose their own story" (Weber et al. 2018: 203). The value of this research emphasises data journalism as a crucial practice for packaging

progressive ideas for wider circulation between author-driven and reader-driven interpretations, "enabling interactive exploration and social sharing" (Segel & Heer 2010: 1146–7). We seek to understand these dynamics from a research and practice-based perspective within digital cultures of circulation.

DCC08 News, Truth, and Audiences in Digital Cultures

PP 0371 Facebook users' reactions to Holocaust-related AI slop: A netnographic study

Agnieszka Całek[1]

[1] Jagiellonian University, Faculty of Management and Social Communication- Institute of Journalism- Media and Social Communication, Kraków, Poland

Facebook is increasingly flooded with AI-generated content. One of the themes particularly exploited by digital creators using AI-driven automation is the Holocaust. Such content is only loosely based on historical data, and individual profiles publishing this material may post several hundred different items per day. These posts typically consist of an AI-generated illustration, a narrative description also produced by artificial intelligence, and a set of hashtags. The phenomenon is massive in scale and carries serious social consequences. It not only clutters the internet but also contributes to disinformation, distorts historical facts, supports denialist movements, and undermines the authority of historical institutions and Holocaust memorial sites.

This project focuses on how Facebook users respond to such content, which reaches large audiences (a single post from an average profile publishing Holocaust-related AI slop typically receives several hundred reactions and dozens of comments). Through netnographic observation conducted since February 2025, nearly one thousand examples of Holocaust-related AI slop and several thousand user comments were collected.

A preliminary review of the material led to the formulation of several research questions: How do users react to Holocaust-related AI slop? Do they recognize the content as false? Do they attempt to counteract the phenomenon? Do they interact with one another?

The collected material was analyzed, resulting in the identification of several response strategies. Some users lack sufficient digital literacy to distinguish AI slop from historical materials and factual information. They respond empathetically and take what they see at face value. However, there are also groups of users who clearly react negatively to such content and employ various strategies to address the problem—from informing others that the material is AI-generated, to educating them on how to differentiate AI creations from authentic photographs, to providing instructions on how to report and remove such content from Facebook. Another category includes users who openly deny that the Holocaust took place. Additionally, engagement related to criticism of contemporary Israeli actions in the Gaza Strip is visible, ranging from references to human rights violations in Palestine to satirical content directed primarily at Benjamin Netanyahu.

DCC09 Digital Governance and Moderation

PP 0509 Negotiating the Digital Borderlands: Strategic survival, algorithmic evasion, and the negotiation of Chinese K-pop fandom under intensified platform governance

Ziman Li[1]

[1] Ubiversity of Sheffield, School of Languages- Arts and Societies, Sheffield, United Kingdom

Early scholarship on online space often framed the digital sphere as a utopian conduit for borderless cultural exchange and democratic expression. However, this techno-optimistic narrative is sharply contested by the lived reality of contemporary Chinese K-pop fandom. This paper challenges such idealistic framings by examining the precarious existence of Chinese K-pop fans who must navigate a digital environment increasingly shaped by geopolitical tension and state intervention.

Since 2016, amid heightened geopolitical tensions between China and South Korea and the informal restrictions on Korean popular culture, Chinese K-pop fans have relied heavily on online platforms to sustain transnational fan practices and subcultural connectivity. However, these digital spaces are far from free or autonomous. In particular, the Chinese state-led Qinglang Campaign in cyberspace launched in 2021 marked a turning point, as fan communities became a central target of intensified platform governance, content moderation, and moral regulation.

Drawing on digital ethnography conducted on Weibo between 2024 and 2026, this research traces a process through which Chinese K-pop fans move from reliance on digital platforms to experiencing intensified surveillance and discipline and ultimately to developing modes of strategic survival within those same spaces. As such, this research sheds new light on how fans strategically reconstruct virtual subcultural spaces to maintain community ties, express individuality, and cope with political pressure.

Moving beyond a binary narrative of oppression versus resistance, this paper highlights the subtle digital interventions and survival strategies employed by fans. It details how fans utilise linguistic encoding, performative nationalism, and algorithmic evasion to bypass censorship and sustain their community. These practices range from displays of nationalism and self-censorship to more nuanced and coded forms of resistance, revealing how fans tactically navigate between state ideology, platform logics, and personal worldviews.

Through an examination of subtle forms of resistance and survival, this study moves beyond viewing Chinese K-pop fandom as mere entertainment or escapism, conceptualising it instead as a dynamic site of negotiation at the intersection of identity, politics, and transnational cultural flows. It argues that the digital landscape of Chinese K-pop fandom is not a "free" zone, but rather a highly politicised environment where cultural expression is inextricably linked to state ideology. Ultimately, this research illuminates how Chinese youth strategically navigate and reshape their digital identities within a mediatised and surveilled society, revealing how transnational popular culture acquires distinct political significance in such contexts.

DCC09 Digital Governance and Moderation

PP 0510 Repackaging Miao (Hmong) traditional medicine on Chinese social media: between indigenous knowledge, algorithmic governance, and medical regulations

Shuai Ma[1]

[1] Loughborough University, Criminology- Sociology and Social Policy, Loughborough, United Kingdom

Marginalised within China's formal healthcare hierarchy, Miao (Hmong) ethnomedicine, a knowledge system rooted in oral tradition, is increasingly present on social media. This study investigates how content created by Miao practitioners represents tensions between indigenous knowledge, algorithmic governance, and medical regulations on Douyin (Chinese TikTok). By conceptualising medicinal plants as boundary objects (Star & Griesemer, 1989), the presentation argues that their representations enable a common understanding that brings together cultural tradition, medical regulation, and the digital economy to legitimate and market Miao medicine within a platformised economy.

The data analysed comprises 20 popular Douyin accounts of Miao practitioners over the past 2 years, including 40 of the most-engaged videos and their comments. The content was analysed using a reflexive thematic analysis (Braun & Clarke, 2021), supplemented by semiotic analysis (Barthes, 1977) to decode the visuals.

A key finding is that practitioners presented medicinal plants as visual evidence of authenticity by displaying remote mountain landscapes and botanical details. This aestheticization of medicinal herbs allows marginalised knowledge to bypass medical regulation and algorithmic moderation and to establish credibility through sensory immersion. To construct authority, practitioners also employ a dual naming system for medicinal herbs, interrelating folk designations derived from indigenous knowledge with standardised Chinese medicine terminology. This strategy of aligning with national medical standards suggests an effort by practitioners to seek legitimacy within the state's regulatory framework. The visual representation of plants is further complemented by the curated performance of ethnic identity. Practitioners appear in traditional embroidered Miao costumes, often narrating content in a mixture of Miao-accented Mandarin or indigenous dialects. They utilise storytelling to provide historical depth, sharing folk legends about the use of the plants. Visual elements, including macrophotography of herbs and the depiction of the physical labour of herb-gathering, frame knowledge through the lenses of 'nature' and 'tradition'. Furthermore, medicinal plants exhibit significant interpretive flexibility, existing simultaneously as indigenous knowledge, scientific specimens, and health commodities. By drawing on the acknowledged notion of 'Intangible Cultural Heritage' (ICH) in Chinese culture, creators successfully establish social credibility for Miao medicine within the boundaries of regulation and algorithms.

Ultimately, the digital culture of Miao medicine represents an active, strategic form of survival, presenting a commercial logic of repackaged ethnic identity and culture (Comaroff & Comaroff, 2009) rather than merely preserving tradition. With platform affordances, practitioners transform local herbs into polysemous digital symbols, redrawing the boundaries of the cultural, economic and medicinal landscape. This study deepens understanding of how marginalised knowledge survives and innovates in the algorithmic age, providing empirical findings on the modernisation of ethnic minority medicine and the economic and cultural survival of marginalised communities.

DCC09 Digital Governance and Moderation

PP 0511 Anticipatory (non)compliance: How AI streamers monetize the content moderation game

Blake Hallinan[1], Cj Reynolds[2]

[1] Aarhus University, Media and Journalism Studies, Aarhus, Denmark
[2] Hebrew University of Jerusalem, Communication & Journalism, Jerusalem, Israel

For social media platforms, content moderation is an "exhausting and unwinnable game" (Gillespie, 2018), necessary to create an environment where users and advertisers want to be. For social media users, the game looks a bit different,

especially for content creators and strategic operatives. For these actors, content moderation becomes a game of adversarial creativity, testing and subverting the boundaries of systems to make money or achieve political goals. The availability of generative AI raises the stakes, providing new tools to both enforce and exploit policies. While there is growing research on how creators integrate generative AI tools (e.g., Lyu et al., 2024) and the challenges of moderating synthetic content (e.g., Moreno, 2024), AI agents on social media introduce unique complications, bringing the content moderation of chatbots into the highly public, participatory, and often antagonistic context of social media.

To investigate how AI agents navigate content moderation, we turn to the environment where the challenges are most acute: livestreaming. Because livestreaming involves real-time interactions between a streamer and a chatting crowd, centralized platform moderation tools struggle to keep up. As a result, platforms typically delegate the responsibility for moderating to streamers. We focus on the case of Neuro-sama, the most-subscribed streamer on Twitch, who also happens to be an LLM-powered chatbot (Hale, 2026).

We gathered media coverage about Neuro-sama, resulting in a collection of 64 news articles. We also collected every thread in r/LivestreamFail, a subreddit dedicated to documenting noteworthy moments from livestreamers, about Neuro-sama (n = 108), which typically included a video clip followed by a discussion among fans and anti-fans. We then read through all of the material, watched all attached clips, and identified patterns related to practices of content moderation and fan reactions—interpreted through our background familiarity with the streamer community formed from observing Neuro-sama's livestreams and reading the dedicated fan wiki.

We map the different sites of content moderation in AI streaming, including the moderation of what an LLM-powered agent can say, what the live captions of her speech will show, what the audience can write in the chat or "say" through paid text-to-speech features, and the other media integrated into the stream. The challenges of content moderation are complicated by streaming on multiple platforms, especially when they operate under very different regulatory environments like US-based Twitch and China-based Bilibili. Perhaps the bigger challenge comes from the antagonism of the chat, who enjoy making the robot (who appears as an innocent anime-style girl) say bad things. Neuro-sama's rise to fame was boosted by her early ban on Twitch for, reportedly, denying the holocaust, following in an ignoble chatbot tradition set by Microsoft's Tay (Hallinan, 2019). Almost all of her high-profile moments depict edgy behavior. We argue that the creator of Neuro-sama has effectively gamified content moderation, programming anticipatory (non)compliance into the virtual agent, balancing the need to engage the audience and appease multiple platforms. We conclude with a discussion of what AI streamers tell us about the future of platform governance in the creator economy.

DCC09 Digital Governance and Moderation

PP 0512 Noting Community Notes: A quantitative audit of X's soft content moderation system

Klaus Groebner[1], Kate FitzGerald[1], Ned Watt[1], Michelle Riedlinger[1], Silvia Montaña-Niño[2]

[1] Queensland University of Technology, Digital Media Research Center, Kelvin Grove, Australia
[2] The University of Melbourne, School of Culture and Communication, Melbourne, Australia

While Community Notes style soft moderation approaches are heralded by some politicians and tech executives as a means to harness the 'wisdom of the crowds' to collectively fact check, contextualise disputed information, and moderate content, there is evidence that these programs are overall insufficient and particularly vulnerable to failure when addressing divisive topics. Despite these issues, X, TikTok, and Meta have all either publicly announced or already adopted Community Notes style programs, which has led to several investigations and inquiries by the European Commission.

In this presentation, we share insights from an audit of X's Community Notes based on a public dataset of approximately 1.4 million English language notes proposed between January 2021 and November 2025. We conducted both a quantitative and textual analysis of this dataset, particularly focusing on author activity, the diversity of topics they covered, and the overall engagement with the program. This involved using the state-of-the-art topic modelling package BERTopic to analyse the content of the notes and comparing contributor engagement with various topics over time. The aim of this study was to test the efficacy, sustainability, and functionality of the Community Notes program as it played out on an increasingly polarized platform.

This study is ongoing; however, our initial findings have revealed a decreasing retention rate of contributors to the Community Notes program, correlating with a significant decline in the creation of new Notes in 2025. The presentation will provide further insights into the temporal dynamics of which Notes are deemed helpful, unhelpful, or yet to receive a rating. Our study raises important questions about the efficacy and sustainability of crowd-sourced and algorithmic approaches to content moderation while providing insight into the emergence of novel vernacular verification models. Our presentation offers a critical contribution to the emerging debates around Community Notes, highlighting how the model blurs the line between user participation and platform control over digital communication during a period of heightened polarization and political upheaval.

PP 0479 Sabotage as resistance: Analysing the Telegram presence and practices of grassroots sabotage groups in Russia's war against Ukraine

Miglė Bareikytė[1], Kateryna Maikovska[2], Tetyana Lokot[3]

[1] European University Viadrina, Faculty of Social and Cultural Sciences / European New School of Digital Studies, Frankfurt Oder, Germany
[2] University of Vienna, Department of Communication, Vienna, Austria
[3] Dublin City University, Communications, Dublin, Ireland

Since the start of Russia's full-scale invasion of Ukraine, sabotage as constitutive to hybrid warfare has become more widespread in Russia, Belarus, Ukraine, and Europe at large. Sabotage has been used to attack the Crimean Bridge in Ukraine's Crimea, temporarily occupied by Russia, to disrupt Baltic Sea submarine cables in the EU, or to damage and burn Russian and Belarusian locomotives carrying arms and military equipment.

Sabotage practices can therefore be used as a war tactic and as a means to influence and spread fear and insecurity. Yet they can also be understood as practices of resistance against occupying forces and their supply chains by those being invaded or those opposing the aggressor. We build on Aizman's (2024) theorising of sabotage as an assemblage of cultural-discursive representation and material-physical practices. We also reckon with the use of digital media practices by sabotage actors resisting military aggression to manage their 'strategic visibility' (Pearce et al., 2018) in the context of resistance.

Digital media platforms, including Telegram, have been used as tools for the recruitment and grassroots organisation of potential saboteurs. In our paper, we focus on articulations of sabotage as a resistance practice aimed at destabilising occupying forces. Using a selection of channels from the Telegram Archive of War curated by the Center for Urban History in Lviv, we empirically analyse three sabotage groups from Ukraine and Russia that resist Russian aggression. Specifically, we analyse and compare their establishment and vernacular practices in Telegram's digital spaces, the various ways these groups conceptualise sabotage and explain their positionality, as well as the affective dimension of their practices. Methodologically, we carry out codebook-based collaborative content analysis using rich textual descriptions and take special caution in anonymising content from the Telegram channels. Our initial findings point to diverse vernacular and affective digital cultures as well as multiple layers of sabotage metaphorisation. With our research, we aim to provide a more nuanced understanding and conceptualisation of sabotage as a resistance practice that takes shape on digital platforms and how knowledge about the practices and affective metaphors of sabotage is generated, articulated and shared in these communities.

DCC10 Activism and Political Life on Digital Platforms

PP 0480 Imaginaries of nature and environmental futures in TikTok activism

Gemma San Cornelio Esquerdo[1], Elisenda Ardèvol[2], Ona Anglada-Pujol[3], Sandra Martorell-Fernández[4]

[1] Universitat Oberta de Catalunya, Information and Communication Sciences, Barcelona, Spain
[2] Universitat Oberta de Catalunya, Arts and Humanities Studies, Barcelona, Spain
[3] Universitat de Barcelona, Faculty of Information and Audiovisual Media, Barcelona, Spain
[4] Universidad Politécnica de Valencia, Documentation- Audiovisual Communication and Art History, Valencia, Spain

In the context of the project *Opening up the Future: Emerging Imaginaries of Nature amid the Climate and Environmental Crisis*, this presentation includes preliminary results from the social media strand of the research. More specifically, we examine the imaginaries of nature (Castoriadis, 1987) circulating on TikTok within the current context of the climate crisis.

Using a digital ethnography approach (Pink et al., 2016), the study explores how content creators—particularly Indigenous activists from the Global South—articulate narratives and imaginaries about nature, territory, and environmental futures.

The methodology includes 17 interviews with TikTok content creators from Mexico, Spain, Brazil, Panama, and Ecuador, alongside a qualitative analysis of 60 accounts, with attention to visual narratives, content, and recurring iconographic motifs (Zulli & Zulli, 2022). For the purpose of this presentation, we focus on six Indigenous activists based in Ecuador (in the Amazon and the Andean highlands) whom we have interviewed. Drawing on current research on environmental activism on platforms such as Instagram and TikTok (San Cornelio et al., 2024; Hautea et al., 2021; León & Erviti, 2021), our research questions address the specificity of Indigenous activists' content and the imaginaries they promote.

Preliminary findings show that Indigenous activists produce distinct imaginaries in which nature is neither contemplative (e.g., romantic landscapes or images of pristine nature) nor extractive (e.g., through energetic resources or technological transformation). Instead, nature is presented and performed as a lived, worked, and relational space tied to territorial and community struggles. Visual tropes such as the canoe frame (a typical subjective point-of-view shot) or the use of the first

person in voice-overs (reinforcing the idea that "nature speaks") strengthen this ontological connection, resonating with Indigenous epistemologies that challenge the modern Western nature/culture divide (Latour, 1993). These representations invert dominant values in Western environmental imaginaries and open a promising line of theorisation.

At the same time, our analysis questions the applicability of playful activism (Cervi & Divon, 2023; Ardèvol et al., 2010) to Indigenous creators. While playful strategies are common among non-Indigenous TikTokers, Indigenous activists tend to produce more grounded, non-ludic narratives aligned with community-based struggles and long-standing community media traditions. These findings invite further exploration of how such imaginaries persist or transform across platforms like Instagram and how they may contribute to broader public awareness of environmental issues.

DCC10 Activism and Political Life on Digital Platforms

PP 0481 YouTubers as agents of political socialisation: A large-scale computational analysis of thematic communities

Mercè Oliva[1], Reinald Besalú[1], Aleix Martí-Danés[1], Ona Anglada-Pujol[2]

[1] Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain
[2] Universitat de Barcelona, Department of Library and Information Science and Audiovisual Communication, Barcelona, Spain

Political socialisation-the process by which individuals acquire political values and perceptions (Ohme & de Vreese, 2020)-is increasingly mediated by social media and the influence of content creators (Jakubowski, 2021). Previous scholarship shows that political influencers (content creators specialising in political content) are perceived by young audiences as authentic and reliable sources (Cheng et al., 2024), utilising affective and informal communication styles to foster political engagement (Schmuck et al., 2022; Zimmerman et al., 2023). However, the mechanisms through which political discourse is integrated into ostensibly "non-political" entertainment channels remain under-researched, representing a critical gap in our understanding of the political socialisation of young audiences.

This study seeks to identify and map the presence of political themes and their connections to seemingly non-political issues (such as gaming, sports, or fashion) among Spain's most prominent YouTubers. By employing a network-based approach to topic modelling, we describe the formation of "thematic communities" in the Spanish YouTube landscape and observe the presence and role of politics within these communities.

Methodologically, this research adopts computational methods to analyse a dataset of 59,321 videos published in 2024 by the 381 most followed Spanish YouTubers. We processed video transcripts using the BERTopic language model to detect latent topics and identified thematic co-occurrences to define communities. This large-scale automated content analysis allows for a macro-level mapping of the YouTube ecosystem that fills a significant gap in existing scholarship.

The results reveal a substantial presence of political topics -particularly concerning international conflicts and Spanish domestic policy- competing for attention alongside entertainment staples like gaming or celebrity news. Crucially, while direct thematic overlap is sometimes limited, the study identifies "node YouTubers" who connect non-political content communities with political ones. These creators facilitate a "gateway effect", linking apolitical entertainment communities to more polarised political spheres. In conclusion, YouTube emerges as a space for political socialisation where entertainment YouTubers may function as gateways to more explicitly political accounts and content.

DCC10 Activism and Political Life on Digital Platforms

PP 0482 A Culture War Scandal: Mapping complexity in the case of Claudine Gay

Mikkel Bækby Johansen[1], Anne Jerslev[1]

[1] University of Copenhagen, Department of Communication, Copenhagen S, Denmark

After more than a year of intense political debates, activist campaigning, and much-publicized investigations into several perceived transgressions, Claudine Gay resigned her position as the 30th President of Harvard University in January 2024. This paper maps the cultural and political complexity of the scandalization process leading up to Gay's resignation, focusing on the interplay between news media, social media audiences, and various scandal entrepreneurs in co-creating scandal narratives across media (see Pozner and Hanigan, 2023). Inspired by Zulli's notion of "socio-mediated scandals" (2023), we analyze the discursive and affective intertwining of three levels of scandalization: "the 'context' scandal," "the university scandal," and "the plagiarism scandal."

Through a quantitative analysis of 238 conversations posted across 101 Reddit communities, we categorize narrative themes to map the overlapping levels of scandalization. This is followed by qualitative close readings of the top 200 comments across the top 10 conversations, examining how diverse audience segments negotiate "the scandalous" and verbalize different moral positionings in the multilayered "scandal compound." The analysis is guided by the following research question:

RQ: How is the complexity of the Claudine Gay scandal negotiated across different institutional domains, and how do Reddit audiences co-construct the scandalization process in their responses to scandal actors' engagement with and news stories about the case?

First, the analysis shows how the scandal was about Gay's alleged plagiarism, a disqualifying transgression of academic standards, framing the case as a "classical" scandal (see Thompson, 2000), progressing in routinized ways and involving the usual scandal actors (Grafström and Windell, 2017). Second, the case was also about Gay's initial failure to condemn antisemitism following Hamas' terrorist attack on 7 October 2023; her perceived status as a representative of contested diversity, equity, and inclusion policies; and the broader political role of Harvard in US society. Add to this the context of polarization related to Donald Trump's presidency, competing economic interests in higher education, race relations, free speech, and a year-long culture war between "wokes" and "anti-wokes" (see Johansen, 2025).

Adopting a culture-oriented approach to complexity theory (see Cairney, 2012), we develop a three-step analytical framework centered on the domains, actors, and positions involved in the scandal. The paper contributes with new empirical knowledge to the fields of scandal and culture war research and adds to the conceptual discussion about complex socio-mediated scandals.

DCC10 Activism and Political Life on Digital Platforms

PP 0483 From negative to positive adoption: The Kosher phone as a new phase of religion-social shaping of technology

Moshe Schwartz[1], Michael Birnhack[2]

[1] Ben-Gurion University, Department of Communication, Beerševa, Israel
[2] Tel Aviv University, Faculty of Law, Tel Aviv, Israel

This study suggests the emergence of a new stage in the relationship between a closed ultra-Orthodox community, seeking to differentiate itself from the general population, and information and communication technologies (ICTs). Existing scholarship on the intricate relationship between devout religious communities and digital media has advanced diverse theoretical perspectives, ranging from resistance and hermeneutics of suspicion to the mutual process of adoption and adaptation. Building on the framework of religious-social shaping of technology, the study explores the transition from *negative adoption*, defined by restriction and domestication, to *positive adoption*, in which the already domesticated technology sustains distinct cultural boundaries and becomes an identity marker and moral symbol.

Focusing on the Israeli Haredi (ultra-Orthodox) community, this research examines the "kosher phone," a mobile device designed by rabbinical leadership to limit connectivity and prevent uses deemed inappropriate or spiritually harmful. Unlike former communication technologies, the cell phone and later the smartphone pose a more acute challenge to the Haredi way of life due to their extensive functionality, portability, personal nature, and concealability. The Kosher phone is not merely a simple technological artifact, but a complex socio-technical assemblage shaped by individual, communal, commercial, and state actors. It embodies the community's innovative effort to reconfigure modern communication technologies to serve collective moral objectives while preserving social boundaries.

The study employs in-depth interviews with kosher phone users from both genders across the three principal Haredi subgroups in Israel. The qualitative, bottom-up approach captures the everyday practices and meanings associated with the use of this cultured technology, two decades after inception and institutionalization, as well as users' interpretations of its social and ideological functions.

Findings reveal considerable heterogeneity in practices, reflecting a dynamic interplay between restriction and adaptation. Two main strategies have emerged. The first involves using technology itself to navigate or overcome affordance limitations, for example, converting written messages into voice messages or using curated app stores and dedicated operating systems. The second strategy relies on negotiated intra-communal agreements that delineate normative boundaries and create social workarounds to balance religious observance with practical needs. Despite such adaptations, user attitudes show near-consensus support for the kosher phone system, underscoring its necessity and legitimacy.

Beyond its ideological and functional roles, the kosher phone has acquired deep symbolic meaning as an identity marker, signalling levels of religious observance, communal affiliation, and adherence to moral norms. Patterns of use reveal an

internal hierarchy in which specific devices correspond to social status and eligibility for communal privileges. By tracing and providing a rich account of these processes, the study contributes to existing theories by identifying a new phase in the relationship between religion and technology. This phase is characterized by the transformation of communication technologies from a perceived threat that needs to be modified and shaped to a positive instrument of communal collective self-definition and moral distinction vis-à-vis secular society.

DCC11 Disinformation as Affective Competition: Expanding Mediatization Theory in Deeply Digital Cultures

PN 56 Unpacking strategic approaches to spreading disinformation in Russian propaganda

Dr. Artem Zakharchenko[1]

[1] Taras Shevchenko National University of Kyiv, Institute of Journalism, Kyiv, Ukraine

During Russia's full-scale invasion of Ukraine, hybrid propaganda has functioned not merely as a collection of false claims but as a systemic form of narrative warfare, embedded in contemporary media infrastructures and platform dynamics. This contribution problematises the very idea of "unpacking" hybrid propaganda, arguing that analytical approaches focused on discrete campaigns or isolated messages fail to capture how propaganda operates as a sustained communicative practice aimed at controlling interpretative and affective conditions of public discourse (Jowett & O'Donnell, 2018; Krotz, 2014). From the perspective of strategic narrative theory, contemporary conflicts are fought not only over territory but over meaning, legitimacy, and moral positioning (Miskimmon, O'Loughlin & Roselle, 2017). In this context, Russian propaganda should be understood as a struggle over communicative disposition rather than factual dominance (Paul & Matthews, 2016; Bjola & Pamment, 2019). Influence is exerted less through persuasion or truth claims than through the capacity to structure emotional alignment, temporal attention, and moral judgement across fragmented media environments (Papacharissi, 2015; Hjarvard, 2013).Within this logic, disinformation functions as a performative weapon. Fake narratives are not primarily designed to be believed, but to generate noise, ambiguity, and emotional overload that degrade sense-making itself (Wardle & Derakhshan, 2017; Bennett & Livingston, 2018). The coexistence of contradictory claims, partial truths, and fabricated content creates a communicative environment in which verification loses stabilising power and interpretative fatigue sets in (Venturini et al., 2018; Pomerantsev, 2019). Crucially, this noise is not accidental but systematically produced and strategically maintained. Empirically, the study examines six recurring disinformation themes promoted between February 2022 and February 2023: denial of Russian war crimes in Bucha; dehumanisation of Ukrainian refugees and internally displaced persons; allegations of selling Ukrainian children to paedophiles or organ traffickers; claims of destroying Western weapons in Ukraine; accusations of Ukrainian resale of allied military aid; and speculation about President Volodymyr Zelenskyy's illness. Rather than functioning as separate campaigns, these themes operate as interconnected nodes within a broader dramaturgy of propaganda, activated in waves and synchronised with political events and calendar cycles to maintain affective intensity. The contribution argues for the need to develop a research framework for analysing affective battles between narratives as a continuous strategic activity rather than a sequence of episodic interventions. Three key challenges emerge. For quantitative research, the difficulty lies in operationalising noise, affect, and performativity beyond metrics of reach or virality. For qualitative research, the challenge is to avoid over-interpreting coherence where fragmentation itself is strategic. For mixed-method approaches, the central task is integrating scale with interpretative depth without reproducing the fragmentation imposed by propaganda. Addressing these challenges is essential for understanding hybrid propaganda as a systemic practice of mediated conflict rather than as a set of isolated disinformation events.

DCC11 Disinformation as Affective Competition: Expanding Mediatization Theory in Deeply Digital Cultures

PN 57 Does the war take place at all? Baudrillard essays revisited, or war images viewed through the lenses of the semiotics of internet

Małgorzata Lisowska-Magdziarz[1]

[1] Jagielloninan University, Institute of Journalism Media and Social Communication, Cracow, Poland

Does the war take place at all? Baudrillard essays revisited, or war images viewed through the lenses of the semiotics of InternetAt a certain speed, the speed of light, you lose even your shadow. At a certain speed, the speed of information, things lose their sense.(Baudrillard 1995)In his three essays about the mediatised images of war, published in 1991 in Liberation and The Guardian (that later came to be the book La guerre du Golfe n'a pas eu lieu, 1991, English transl. 1995), Jean Baudrillard analyses contemporary war as a media event; something that people observe as a stream of bits of footage, sanitized news briefings, and carefully structured narratives and controlled information; that is designed to be consumed rather than experienced. For the public, a war then becomes a simulation, or even a simulacrum, as the comprehensibility of those bits of footage and narratives is based on the viewer's previous engagement with fictitious depictions of war, such as films, TV series, and games. The politics of war journalists and public relations specialists is then structured not around the realistic depiction of battle, or atrocities, or humanitarian crises, but around perception. The overabundance and acceleration of the creation of images and bits of information turn war into hyperreality and commodify it as the material

to be reproduced, packaged, sold, resold, etc. This makes it impossible to have a real, possibly complete understanding of the war situation. What's worse, it precludes empathy. Baudrillard's essays, focused on war in the press and television, have been later recalled in the analyses of the media representation strategies of other conflicts and humanitarian crises, albeit in a rather essayist way. This presentation will be an attempt to re-interpret Baudrillard's analysis in terms of the semiotics of interactive media. Based on the images of war in Ukraine, author tries, in a disciplined, methodic way, to analyse how the depictions of war in the social media differ from the television stream, and how semiotic particularities of multimodal interactive stream of semiotic material (fragmentation, velocity, out-of-contextedness, heightened modality, unclear provenience and ontological status etc.) shape the contemporary "Ukrainian war that does not take place".

DCC11 Disinformation as Affective Competition: Expanding Mediatization Theory in Deeply Digital Cultures

PN 58 Situational Ethics of Resilience in Wartime: Transforming Ethical Paradigms and Journalistic Practices in Ukraine's Frontline Cities

Liliia Zmii[1]

[1] V.N.Karazin Kharkiv National University, Media communication Department ER Institute of Sociology and Media communication, Kharkiv, Ukraine

This paper shows transformative processes in contemporary media ethics and professional journalistic practices under the conditions of full-scale war, focusing on journalists working in Ukraine's frontline cities. Central to the analysis is the concept of media resilience, understood as the capacity of a media system to adapt, maintain functionality, and preserve ethical integrity amid extreme circumstances characterized by permanent security threats, limited resources, and intensified information warfare. The research argues that traditional ethical principles of journalism—such as balance, objectivity, and depersonalization—are undergoing critical re-evaluation in the context of an existential threat to national security. Journalists operating in frontline environments face distinct ethical dilemmas that challenge conventional professional norms. These include the need to balance informational transparency with operational security; to navigate between documenting war crimes and protecting traumatized local communities; and to reconcile professional detachment with civic responsibility and personal involvement in the fate of their cities and audiences. An analysis of the functioning of the media system under wartime conditions reveals the emergence of a new ethical paradigm that can be described as "situational ethics of resilience." This paradigm integrates classical journalistic standards with heightened contextual sensitivity to the realities of war, resulting in hybrid models of responsibility. Among the key features of this shift are the strengthening of collective forms of ethical decision-making within newsrooms, the development of adaptive verification protocols in response to coordinated disinformation campaigns, and the institutionalization of trauma-informed approaches to reporting on socially significant events during wartime. A particularly illustrative example of this transformation is the observable shift away from the strict enforcement of objectivity as a dominant norm, toward prioritizing the prevention of re-traumatization of media subjects. This is especially evident in coverage involving civilians who have suffered physical or psychological trauma following shelling of residential areas by the aggressor. In such cases, ethical judgment increasingly favors care, dignity, and harm reduction over formal neutrality. The findings suggest that media resilience should not be understood as a form of passive adaptation to crisis conditions. Rather, it represents an active process of reconfiguring professional identity, ethical frameworks, and organizational structures. Frontline media outlets—most notably those operating in the city of Kharkiv—demonstrate a capacity for innovative reinterpretation of foundational journalistic principles while maintaining a strong commitment to accuracy, transparency, and public service. Future research may explore how the wartime experience of Ukrainian media can contribute to global debates on the boundaries of media ethics in authoritarian and conflict-affected contexts. Such insights may support the development of more nuanced, context-sensitive ethical frameworks for crisis journalism in the era of hybrid warfare and digital disinformation.

DCC12 AI in Work and Practice

PP 0586 Thrown between awe and frustration: The feel of GenAI in the everyday work of Swedish software engineers

Jakob Svensson[1]

[1] Malmö University, School of Arts & Communication, Malmö, Sweden

The landscape of work is evolving at a rapid pace, not least through breakthroughs in Generative AI (GenAI). This is particularly apparent for web and software engineering, at the forefront of digitalization, and the adoption of AI technologies, to the point that it is argued these technologies are redefining the roles of software developers. However, GenAI is not just another technological tool. The inherent feedback loop, its aim to be responsive, and its conversational character push users towards making relationships with GenAI. Some describe GenAI as conversational agents. This implies more social and emotional experiences with GenAIs compared to other tech tools used in working life. This study zooms in on Swedish software developers' stories about, experiences and feelings working with GenAIs.

This study contributes by going beyond a strict separation between man (worker) vs. the machine. GenAI is not an autonomous force but is taking shape in the way GenAI tools are felt and the way stories are told about them. This is about

recognizing GenAIs' relational and dynamic nature, and about highlighting the often invisible, multifaceted, and interrelated labour through which GenAIs are sustained and made meaningful. The analytical framework is centred around theories of dwelling, folk theories, and feelings. Ingold's (2000) "dwelling" perspective is helpful as it underlines humans' (in this case, Swedish software engineers) interconnectedness with their environment, as active participants living and moving within an unfolding (work) landscape. Folk theories help people navigate and reason about technologies and make sense of and learn about the world. Emotions and bodily feelings are also important for this. Ruckenstein (2023) underlines in her book (from which I have borrowed the title) that we get to know, in her case, algorithms, not only by telling stories about them, but also by feeling their actions. Studying how GenAIs are felt becomes an important source to understand GenAI relationships and how software engineers dwell with their GenAIs at work.

Methodologically, the study is based on interviews (individual and in groups) that are currently ongoing (to be finalized during February 2026). Preliminary results suggest folk theories around GenAIs inevitability, especially for software engineers. Participants seem thrown (in a Heideggerian understanding) into GenAI relationships at work, having to navigate largely unknown waters. Beyond the immediate folk theories of GenAI being great, the future, and that you need to "jump on the GenAI bandwagon", the stories that emerge in interviews are that GenAI is, in general, unknown, uncertain, and most of all, unreliable. This, in turn, leads to mixed feelings of being thrown between awe and frustration: awe when new smart tools and functions are introduced, frustration when the GenAI hallucinates or does not really get what the software engineer is after. At the time of the Ecrea conference, this study will have been finalized, and final results will be ready for presentation.

DCC12 AI in Work and Practice

PP 0587 Generative AI in university teaching: Critical reflections from an autoethnographic case study

Simona Tirocchi[1]

[1] University of Turin, Philosophy and Educational Sciences, Turin, Italy

Generative artificial intelligence is increasingly reshaping educational practices, raising critical sociological questions about knowledge production, professional agency, and the redistribution of power within digitally mediated learning environments. This paper presents a qualitative case study examining the educational use of ChatGPT (versions 4.0 to 5.2) during a year-long experimentation conducted between February and December 2025 at the University of Turin. The study was embedded in an institutional pilot in which the platform was provided free of charge to a group of university educators and administrative staff, with the explicit aim of supporting a structured pathway of experimentation in academic work.

The paper focuses on a single, in-depth case: the author's sustained and reflexive use of ChatGPT across teaching, assessment design, academic writing, and pedagogical reflection. From a sociological perspective, generative AI is conceptualized not merely as a neutral technological tool but as a socio-technical actor embedded in everyday academic practices - one that contributes to shaping norms, routines, and forms of authority, while reconfiguring academic labour and subtly automating forms of judgement, as highlighted in critical scholarship on digital education (Selwyn).

Methodologically, the research combines autoethnography with a qualitative analysis of platform-generated content. The autoethnographic component documents the author's situated experience of interacting with the system over time, capturing moments of appropriation, negotiation, and resistance as generative AI becomes integrated into routine academic tasks. This narrative is complemented by an analysis of prompts, outputs, conversational trajectories, and system affordances, with particular attention to advanced features such as Projects, integrated data analysis tools, and Deep Research. These functionalities are examined as infrastructures of knowledge mediation that both support scholarly inquiry and contribute to processes of datafication and epistemic standardization.

The findings reveal a set of ambivalent dynamics. On the one hand, ChatGPT emerges as a resource for supporting reflective teaching practices, scaffolding complex concepts, and enabling exploratory and dialogic engagement with knowledge. On the other hand, the study identifies critical issues that resonate with Selwyn's notion of a "hidden curriculum" of educational technologies: epistemic opacity, normalization of dominant academic discourses, intensification rather than reduction of academic work, and the risk of over-reliance on platform-generated syntheses. These dynamics reflect broader processes of platformization in higher education, in which pedagogical and research practices become increasingly entangled with proprietary digital infrastructures.

Looking toward future uses, the paper argues that generative AI may play a constructive role in higher education only if embedded within critically informed pedagogical frameworks that foreground transparency, reflexivity, and human responsibility. Rather than replacing educators' expertise, AI systems should be approached as objects of inquiry and negotiation, capable of fostering critical digital literacy and awareness of algorithmic mediation. By foregrounding a situated case study conducted at the University of Turin, the contribution underscores the value of qualitative, experience-based research for anticipating both the risks and the transformative potential of generative AI in academic contexts.

DCC12 AI in Work and Practice

PP 0588 Reconfiguring internationalisation: AI-mediated virtual exchange and intercultural learning in European higher education

Sonia Malos[1]

[1] George Emil Palade University of Medicine- Pharmacy- Science and Technology of Târgu Mureș, Department of Science and Letters 2, Târgu Mureș, Romania

The internationalisation of higher education has traditionally privileged physical mobility as the primary mechanism for intercultural learning, yet economic constraints, visa restrictions, and geopolitical instability systematically exclude significant student populations from these experiences. While artificial intelligence (AI) promises to democratise international education through real-time translation and AI-facilitated collaboration, empirical evidence on whether these tools cultivate intercultural competencies remains scarce. This study investigates how students and faculty experience AI-mediated virtual exchange compared to physical mobility, and what forms of intercultural learning are enabled or foreclosed through technological mediation.

Drawing on a mixed-methods design, this study examines virtual exchange initiatives at four Central and Eastern European universities integrating AI-powered collaboration tools. Data collection comprises semi-structured interviews with approximately 30 students and 10 faculty members, complemented by student reflection portfolios and platform interaction logs. The analytical framework integrates mediatization theory with Byram's model of intercultural communicative competence, enabling examination of both mediation processes and specific competency dimensions affected. Preliminary findings reveal a productive tension. AI tools demonstrably reduce participation barriers: students from lower-income backgrounds report meaningful international engagement previously inaccessible to them, and language anxiety appears significantly diminished. However, algorithmic translation tends to 'flatten' cultural nuance—colloquialisms and implicit references are frequently misrendered, leading participants to describe interactions as "efficient but shallow." Most significantly, the study identifies "competence asymmetry": while knowledge dimensions of intercultural competence appear well-supported, attitudinal dimensions—particularly tolerance of ambiguity—show limited development compared to physical exchange.

These findings challenge both techno-optimist narratives positioning AI as a solution to mobility inequities and pessimist framings dismissing virtual exchange as inferior. This paper argues for a complementarity model: AI-mediated internationalisation can supplement physical mobility but requires intentional pedagogical design to counteract inherent limitations. The study proposes design principles that deliberately incorporate ambiguity and unstructured interaction. For the CEE context, where outbound mobility remains economically constrained, thoughtful AI integration represents both opportunity and responsibility.

DCC12 AI in Work and Practice

PP 0589 Faster, better, fairer: How is fairness conceptualised by AI job interviewing platforms?

Lou Therese Brandner[1]

[1] University of Tübingen, International Centre for Ethics in the Sciences and Humanities IZEW, Tübingen, Germany

Artificial intelligence (AI) supported job interviewing presents itself as a new mainstream solution in the human resources (HR) industry. One-sided structured behavioural interviews are recorded in front of a computer camera and analysed by an AI system that generates assessments and rankings on which human recruiters can base further decisions. Given the ubiquity of job interviews and the time, cost, and effort going into them, their automation has disruptive potential; but the technology has also been publicly criticised for a lack of accuracy and potentially producing biased results [1][2]. Since AI systems depend on human input, they can reproduce existing biases and automate them, potentially perpetuating job market discrimination toward different groups [3][4]. The term *AI fairness* describes statistical methods intended to mitigate or eliminate these kinds of biases; fairness concerns linked to the development and use of automated interviewing have been discussed from ethical and legal perspectives [5].

This qualitative contribution analyses how automated interviewing companies communicate their commitment to AI fairness to the public with the aim of assessing how the concept is framed, both to attract paying customers and to mitigate concerns by applicants and the wider public – how and to what extent is the term *fairness* used? How does its framing relate to operationalisations in the available literature on AI ethics?

Based on an initial mapping of 50 companies offering AI-assisted HR technology, the websites of 20 selected video interviewing companies were analysed in-depth to assess how the businesses conceptualise AI fairness and related terminology. Three distinct types of communication strategies were identified: Companies that 1) focus on the comparison between prejudiced human recruiters and supposedly neutral, objective algorithms, 2) emphasise that while AI in general can be biased, theirs is not due to e.g. rigorous debiasing, and 3) underline that combining human and artificial intelligence can tackle fairness concerns best. These conceptualisations have different shortcomings, such as neglecting the well-documented incidences of biased AI outputs, overstating of the effectiveness of technical debiasing methods, or making single human actors responsible for detecting and combating instances of discrimination.

In a further step, a quantitative corpus analysis is currently being conducted on more publicly available material published by the same companies (e.g., blog posts, white papers) to systematically identify larger linguistic patterns and provide empirical grounding to the qualitative assessment. This analysis will be completed at the time of the conference.

DCC12 AI in Work and Practice

PP 0590 Astrology with DeepSeek: Data disclosure, playful labour, and emotional bonds in AI-mediated divination

Hui Lin[1], Yingwen Wang[2]

[1] King's College London, Digital Humanities, London, United Kingdom
[2] University of the Arts London, media and communication, London, United Kingdom

Large language models are increasingly entangled with vernacular spiritual practices. On Xiaohongshu (RedNote), a popular Chinese lifestyle platform, thousands of user-generated posts demonstrate how to prompt DeepSeek, an OpenAI-based chatbot, to perform astrology readings from birth data. These posts circulate step-by-step instructions ("enter your birth hour, ask about your past life"), accompanied by screenshots of personalised readings and comment threads filled with intimate life stories. While users are aware that inputting such sensitive, biographical information raises ethical concerns, they remain eager to engage in these AI-mediated divination practices. To address this paradox, our paper argues that such practices legitimate the extraction of users' personal data under the guise of playful AI-driven astrology. In doing so, it contributes to ongoing debates on how generative AI is appropriated, normalised, and moralised within everyday digital cultures.

While recent scholarship has begun to examine the circulation of astrology content on Chinese platforms such as Douyin, this body of work has primarily focused on *viewership practices* rather than the *disclosure of personal information to generative AI chatbots*. For instance, Zhang and Wang's (2025) study of astrology videos on Douyin argues that astrology content enables users to make sense of their identities and relationships. Drawing on sensemaking theory, they demonstrate how astrology on social media shapes personal self-concepts and intimacy. Yet, what remains underexplored is how the rise of generative AI reconfigures this terrain: when users input highly personal and biographical data into chatbots such as DeepSeek, they not only consume astrological content but also participate in new forms of datafied labour and expose themselves to networked privacy risks.

Our study examines how and why users disclose personal data when engaging with AI-mediated astrology. We adopted a qualitative approach combining content analysis and semi-structured interviews. First, we assembled a corpus of publicly visible Xiaohongshu (RedNote) posts and comments by searching keywords such as "DeepSeek 算命" (DeepSeek fortune-telling), "占卜 prompt," "星盘 AI," and "八字 指令." Second, we conducted semi-structured interviews with Xiaohongshu users who had engaged in AI astrology, focusing on their motivations, perceptions of accuracy, and awareness of privacy risks. Triangulating these two sources allows us to show not only how disclosure practices unfold on the platform, but also why users rationalise and normalise the sharing of intimate data with AI chatbots.

Our findings reveal a paradox at the heart of AI-mediated divination: although many acknowledge the risks of inputting sensitive information, they are drawn to the promise of personalised cosmic insight. Crucially, our interviews show that users turn to AI not only for astrological accuracy but also for *emotional refuge*. Many described AI as a safer, more reliable confidant than friends, emphasising its non-judgmental and always-available qualities. This affective bond helps explain why users normalise the disclosure of personal data despite privacy concerns. We argue that playful AI astrology naturalises data extraction while deepening user–AI emotional attachments in everyday digital cultures.

DCC13 Digital Intimacy and Trust

PP 0727 Presence, pleasure, and power: The social construction of intimacy in VR pornography consumption

David Walewijns[1]

[1] University of Antwerp, Communication Studies, Antwerp, Belgium

Background

Virtual reality (VR) pornography is increasingly integrated into the broader online porn ecology, yet empirical research has only begun to examine how its immersive affordances may affect users' understandings of intimacy and sexual interaction.

Existing work on pornography shows that sexually explicit media can contribute to the acquisition and reinforcement of sexual scripts: the culturally shared norms that structure expectations during sexual interactions (Simon & Gagnon, 1986). Quantitative studies document associations between pornography use and attitudes regarding gender roles, objectification, and sexual performance, particularly among adolescents and emerging adults (Vandenbosch & van Oosten, 2017; Wright, 2014). However, this research has focused almost exclusively on two-dimensional (2D) pornography, leaving largely unexplored how the heightened immersion and presence (see also Fox et al., 2009) characteristic of VR pornography modulate sexual scripts around intimacy, emotional connection, and consent (Evans, 2021).

Aim

The current study integrates Uses & Gratifications (U&G) and Sexual Script Theory (SST) to examine how emerging adults make sense of intimacy in VR pornography. U&G theory understands media users as active agents who selectively use media to satisfy cognitive, affective, social, and escapist needs (Katz et al., 1973; Ruggiero, 2000). In parallel, SST conceptualizes sexuality as socially scripted across cultural, interpersonal, and intrapsychic levels (Simon & Gagnon, 1986). Combining these perspectives allows the study to map out why emerging adults turn to VR pornography, and how this may shape their intimacy-related perceptions. As such, the study addresses three central questions, corresponding to presence, pleasure, and power: (1) Which gratifications do young people report seeking and experiencing in VR pornography, and how do these compare to those associated with traditional 2D pornography? (2) How do young people describe and interpret intimacy, realism, emotional closeness, and relational dynamics (e.g., consent) within VR pornographic scenarios? (3) How do young people reflect on, negotiate, or distance themselves from intimacy-related scripts encountered in VR pornography when discussing their sexual self-understandings and relationships? Rather than testing direct effects, this study focuses on how users experience and interpret VR pornography as an intermediate step in sexual socialization (see also Valkenburg & Peter, 2013).

Method

The study will involve 15–20 in-depth, semi-structured interviews with emerging adults (18–29) who have experience with VR pornography. The interview protocol will include comparisons with offline intimacy and traditional 2D pornography. Data will be analyzed using thematic analysis in Nvivo, with explicit attention to the three levels of scripts (cultural, interpersonal, and intrapsychic) and to how VR-specific affordances (i.e., immersion and presence) shape these levels. Ethical safeguards include clearance by our internal ethical committee, informed consent, protection of confidentiality, and procedures for managing discomfort, in line with current recommendations for research on pornography exposure (cf. Owens et al., 2012; Wright, 2014). By foregrounding users' meaning-making, the project advances theoretical understanding of how VR pornography participates in contemporary sexual socialization. It will refine SST for the context of immersive media and generate empirically grounded insights for porn literacy education and broader discussions of sexual ethics in an era of increasingly immersive sexual media.

Results

Will be presented at the conference.

DCC13 Digital Intimacy and Trust

PP 0728 Beyond missed connections: loneliness narratives in the companion robot industry

Nisa Irem Kırbaç[1], Sander De Ridder[1]

[1] University of Antwerp, Department of Communication Studies, Antwerp, Belgium

Loneliness is commonly and repeatedly defined as a problem to be managed, and each redefinition promotes certain solutions while overlooking deeper structural causes. The contribution of this article is to examine how the social and communicative robot industry participates in this process by framing loneliness as a communication deficit that human-machine communication (HMC) can mitigate. We ask: What values and promises underpin the social and communicative robot industry's efforts to mitigate loneliness through HMC, and how are its promises of companionship made meaningful and legitimate across representational, production, consumption, identity, and regulatory practices?

For this purpose we combined a problematization-oriented approach (Bacchi, 2009), with the circuit of culture framework (du Gay et al., 1997), treating companion robots as communicative artefacts whose meanings are produced across connected sites. We conducted a multi-sited ethnography (Marcus, 1995) across two interconnected industry settings. First, we analysed 42 company-published online materials (2020–2025)—including website pages, marketing materials, and privacy policies—using a frame-informed qualitative content analysis. The materials were drawn from three companies and their associated product websites operating in the United States (California and Rhode Island) and Europe (Netherlands). Second, we extended the analysis through participant observation at the Consumer Electronics Show (CES 2026). We followed live product demonstrations and the surrounding information exchange between exhibitors, industry attendees, and media, to trace how loneliness-mitigation narratives are collectively assembled and circulated.

We contribute to digital culture and communication research by examining how technology-oriented efforts to mitigate loneliness are made meaningful and legitimate through industry narratives and practices. Across the circuit of culture, we show how the companion robot industry reconfigures loneliness by framing it as a communication deficit. This entails

redefining norms of intimacy, while reorganising the politics of care through datafied, market-oriented arrangements of inclusion. In this way, the industry constructs loneliness as governable through communicative imaginaries of companionship—promoting technologically mediated futures of connection.

PP 0729 Feeling the algorithm: Affective engagement with datafication in dating apps

Rita Sepúlveda[1], Veronica Valente[2]

[1] NOVAFCSH, Faculdade de Ciências Sociais e Humanas, Lisboa, Portugal
[2] Iscte-Iul - Cies-Iul, Sociology, Lisboa, Portugal

This work examined how dating app users perceive and engage with datafication processes that structure contemporary intimate life. Dating apps have become central infrastructures of mediated intimacy, converting personal and behavioural data into quantifiable inputs that shape visibility, desirability, and matching outcomes (De Ridder, 2022). In a broader "datafied society" (Couldry & Mejias, 2019), where platforms govern everyday interactions, dating is no exception. While studies have documented the opacity of algorithmic systems (Bucher, 2017) and the rationalisation of romance in digital culture (Illouz, 2019), less attention has been given to how users themselves interpret, feel, and navigate data practices in their daily engagement with dating apps.

This study examined datification in dating apps from a user perspective. For that, a mixed-methods approach was followed, combining an online survey (n = 679; female = 339; heterosexual = 546; Portuguese) with semi-structured interviews (n = 19; ages 24–54; male = 10; Portuguese) with (past) dating app users, both conducted in 2025. Quantitative analysis focused on self-datafication practices, while interviews were thematically analysed (Braun & Clark, 2020) to explore how individuals perceive and make sense of datafication in intimate contexts. Survey participants, 38% (n = 258) reported engaging in practices associated with self-datafication, including counting dates (79.1%), counting matches (73.1%), tracking message response rhythms (70.5%), monitoring app usage time (66.4%), and strategically adjusting their profiles to improve performance (62.3%). Interview analysis revealed four main dimensions of how users perceive and engage with datafication: 1) Data collection awareness: while participants acknowledged that dating apps "collect information," most had limited knowledge of the personal and behavioural data collected; 2) Algorithmic opacity. Participants described the system as a "black box," yet continually attempted to interpret perceived visibility patterns and ranking mechanisms; 3) Strategic self-management emerged as a pragmatic response to uncertainty results, with users curating profiles, adapting swiping patterns, timing interactions, and reshaping their self-presentation according to what they believed algorithms rewarded, and 4) Affective impact. Users associated datafied outcomes (e.g., matches, likes, dates) with emotions ranging from anxiety, frustration, and comparison to validation and perceived efficiency.

Taken together, these findings demonstrate that datafication functions not only as a technical infrastructure but as an affective condition shaping contemporary intimate life. Metrics operate less as neutral indicators and more as emotional signals through which users interpret desirability, visibility, and relational potential. Rather than engaging with datafication cognitively, users navigate algorithmic opacity through affective interpretation, translating uncertain, data-driven cues into emotional meaning and adapting their behaviour accordingly.

Contributing to discussions of digital culture and intimacy, the study shows that datafication functions not only as a technical infrastructure but also as an affective condition that shapes intimate life, in which emotions and metrics intertwine. Relational value is assessed through datafied cues. This work expands the understanding of mediated intimacy by revealing how users domesticate opaque systems and incorporate datafied feedback into the negotiation of self-presentation, desirability, and connection.

DCC13 Digital Intimacy and Trust

PP 0730 'Hi mum, hi dad': The ideal victim of frauds on smartphones

Ana Jorge[1], Jussara Rowland[2]

[1] CICANT, CICANT, Lisboa, Portugal
[2] INESC-ID, INESC-ID, Lisboa, Portugal

The types of fraud using social engineering to exploit asymmetries in digital literacy and trust of consumers are on the rise, as are the occurrences across countries. Besides phishing and cyberattacks, frauds involving mobile phones, social media or digital money services include smishing (SMS), spoofing (email) and vishing (calls); these frauds represent small to large financial losses to consumers but amount to a volume crime (small losses to a large number of victims), only

sometimes covered by insurance. Cybersecurity authorities, telecommunication operators, the financial sector and other stakeholders are taking action through awareness-raising campaigns for consumers, changes in encrypted services, and passing legislation to protect consumers.

Media coverage often refers to these frauds as 'scams' which in turn might downplay the severity of the practices and hinder reporting (Carter et al., 2025). Moreover, it tends to depict victims as gullible and impulsive, ultimately blaming them for the crime (Cross, 2015). Besides financial loss, psychological harms may occur, but they have been considerably less studied (Ha, 2025). Victims have mental, social and physical needs that need to be attended to when recovering from the incident.

This study forms the basis for a larger project, interested in understanding profiles of vulnerability, the efficacy of different forms of support (technical, social, psychological), and the support that should be recommended and offered to victims. It adopts a socioconstructivist perspective that builds on criminology to understand the complexity of the phenomenon and offer insights to build a better ecology of services and restore trust and safety for users. Specifically, this paper analyses news on the press and television about fraud involving smartphones, social media, digital money services and online shopping between consumers (such as circular economy apps), in Portugal, between mid-2024 and mid-2026. We use frame analysis (Kitzinger, 2007) to identify the framing of the problem, of victims and perpetrators, other agents represented, and solutions.

Preliminary findings point to the leveraging of literacy and cautionary behavior as the individual's responsibility, even when frauds mobilise close interpersonal and family-based relations of trust. In turn, perpetrators are represented as resourceful, financially-driven criminals, feeding on technological, regulatory and relational vulnerabilities of the digital ecosystem. While technological measures are listed for restoration after the incident, there is less focus on social or psychological support, and on the importance of reporting.

DCC13 Digital Intimacy and Trust

PP 0731 Technology perception across generations. A comparative overview of grandparents and grandchildren

Lorina Culic[1], Anișoara Pavelea[1], Ioana Iancu[1]

[1] Babes-Bolyai University of Cluj-Napoca, Department of Communication- Public Relations and Advertising, Cluj-Napoca, Romania

With rapid digitalization, understanding age-related differences in technology perception and acceptance has become increasingly important (Sun et al., 2025). Situated at the intersection of population aging and digitalization, elderly are particularly vulnerable to digital exclusion manifested through social marginalization and technology-related anxiety (Ge et al., 2025). Recent scholarship highlights that contemporary digital inequalities are shaped less by access and more by disparities in digital skills, confidence, social support, and technology meaningfulness (Failli & Arpino, 2025; Mirazchiyski, 2025; Miller et al., 2024).

The present study comparatively examines how emerging adults and older adults perceive contemporary technologies within broader socialization and life-course contexts, addressing gaps in prior research that has largely relied on quantitative surveys, focused on single technologies, and overlooked intergenerational family dynamic (Kim & Choudhury, 2020). A total of N = 380 semi-structured interviews were conducted, comprising 190 ageing adults, ranged from 60 to 89 years (M = 65.55, SD = 5.694), and 190 emerging adults, ranged from 18 to 26 years (M = 19.57, SD = 1.381), recruited in intergenerational dyads (one young participant and one senior member from the same family). Interviews address actual technology use, attitudes, perceived usefulness and ease of use, trustworthiness, emotional responses, perceived challenges, the role of family and community in adoption processes, and behavioral intention.

Main findings indicate a clear generational divide in technology perception. Elderly perceive technology as useful yet challenging and engage with it selectively, often relying on family support, whereas emerging adults view technology as intuitive and indispensable, fully integrating it into daily life. Both groups express ambivalence, with older adults emphasizing usability and trust concerns and younger adults highlighting risks related to dependency, time management, and digital overexposure. The study highlights the need for age- and life-course–sensitive technology strategies that leverage intergenerational support while addressing distinct concerns of older and younger users.

DCC14 Influencers, Content Creators, and Platform Labour

PP 0703 Granfluencers in the spanish-speaking world: Algorithmic agency, expressive labour and age politics across TikTok, Instagram and YouTube

Sender Ariel Godoy Gómez[1], Paloma Contreras-Pulido[2]

[1] University of Huelva, Education, Huelva, Spain
[2] International University of La Rioja, Faculty of Education. Department of Technologies Applied to Education, Logroño La Rioja, Spain

The rise of granfluencers-creators over 65 with significant visibility on TikTok, Instagram and YouTube- offers an illuminating perspective on how digital culture reshapes later life. Their presence challenges longstanding assumptions about older adults' roles in digital environments, showing that ageing is not incompatible with creativity, visibility or technological engagement. Recent scholarship indicates that their positive portrayals do not arise spontaneously: they are shaped by algorithmic systems that reward humour, emotional clarity and recognisable forms of authenticity. Participation in social networks also strengthens relational well-being, reduces isolation and fosters a renewed sense of personal agency. At the same time, emerging research frames their practices as expressive labour, highlighting the emotional and aesthetic work required to sustain visibility in attention-driven environments. This study examines the content of six Spanish-speaking granfluencers identified through an exploratory mapping of 36 profiles. A total of 290 videos published between 2023 and 2025 were analysed. The research design combines a systematic literature review (2013–2024) with multimodal qualitative analysis informed by seven recurring themes in existing studies: self-representation, ageism, gender, senior marketing, entertainment, everyday activities and health or emotions. These themes were examined in relation to the specific affordances and performative expectations of TikTok, Instagram and YouTube, allowing us to understand how older adults adapt their narratives to each platform's conditions for visibility. The findings reveal that granfluencers produce alternative imaginaries of ageing while navigating infrastructures that distribute attention unequally. On TikTok, humour, rapid pacing and easily repeatable formats help reframe age-related vulnerability, but they also require alignment with algorithmic logics structured around virality and emotional immediacy. Instagram emphasises aesthetic self-presentation and everyday routines, which become spaces for connection, taste-making and affective curation. YouTube, with its longer forms, enables more sustained storytelling, intergenerational teaching and reflections on identity, though it also demands greater technical competence and persistence. Gender emerges as a central axis of negotiation. Some older women articulate forms of sexual agency and playful desire that challenge deeply rooted assumptions about later-life asexuality, while others reproduce domestic or caregiving roles historically associated with ageing femininity. These representations coexist and often collide, illustrating the complexity of ageing identities in digital spaces. Involvement in senior marketing campaigns introduces further ambivalence: granfluencers gain visibility and recognition, yet they also become targets of commercial appropriation that narrows the spectrum of what ageing can look like. Overall, the study shows that granfluencers reinterpret digital citizenship in later life as a combination of creativity, learning and algorithmic negotiation. Their practices encourage a broader public conversation on ageing, visibility and technological participation, opening new avenues for research on aesthetics, affect and power at the intersection of platforms and older adulthood.

DCC14 Influencers, Content Creators, and Platform Labour

PP 0704 Mainstreaming anti-gender: Female influencers and politicians, social media and anti-gender rhetoric

Marie Hermanova[1], Julia Gottstein[1], Lenka Vochocova[1]

[1] Charles University, Faculty of Social Sciences, Prague, Czech Republic

The anti-gender discourse in Central and Eastern Europe has increasingly been the subject of research across various disciplines, including media and communication studies, sociology, anthropology, and cultural studies (Smrdelj and Kuhar 2025). Most research focuses on far-right political actors and their use of anti-gender rhetoric as a political strategy to attract voters and form coalitions across the conservative political spectrum (Kováts, 2015; Bracewell, 2021; Lewis, 2018; Svatoňová, 2020, among others). At the same time, research in anthropology and cultural studies has also dealt with how the anti-gender strategies have been incorporated into lifestyle content on social media, by conservative influencers as well as everyday users (Lewis 2018; Heřmanová 2022; Baker 2022, among others).

The presented paper attempts to combine these two approaches using a case study from the Czech Republic. Building on data from a larger research project that maps anti-gender discourses across the Czech online space, it identifies main actors with large social media followings that engage with anti-gender discourse in various ways, both professional politicians, pundits, and experts on the one hand, as well as lifestyle influencers, gurus, and coaches on the other, focusing on female actors specifically. Using a range of qualitative methods, including netnography (Kozinets 2021), relational ethnography

(Desmond 2014), and qualitative content analysis, it maps how anti-gender discourse is translated from political to lifestyle spaces and how its content changes in the process.

The preliminary results of the analysis uncover several observations: 1) while the overtly political spaces and lifestyle spaces appear to be separate from the outside, there are overlaps in the type of content that is shared. For example, some female conservative politicians engage with different platforms differently, posting campaign-related content on X and lifestyle content on Instagram. 2) While lifestyle influencers often engage with content that copies the political messages posted by politicians and activists, only very rarely do they express overtly political opinions and support for political candidates or parties. In this sense, the crossover of lifestyle and political content, as seen, for example, in the U.S. tradwife movement (Sykes and Hopner, 2024), does not have a direct counterpart in the Czech space. 3) The issue of migration, connected to Islamophobic content, is often used as a way to connect a political message to a lifestyle concern (for example, how the presence of muslim men in European countries will impact the everyday lives of women). This shows that various conservative anti-discourses interact with each other in the online space.

The aim of the paper is to offer insight into the process of mainstreaming anti-gender discourses from overtly political online spaces to semi-closed, female-led and oriented lifestyle spaces by focusing on concrete online personalities and their content strategies.

DCC14 Influencers, Content Creators, and Platform Labour

PP 0705 #GlowUp Futures: How YouTube Creators Construct Imaginaries of Individual Transformation for Women

Christine Lohmeier[1]

[1] University of Salzburg, Department of Communication, Salzburg, Austria

Public discourse in many Western societies is increasingly shaped by pessimistic assessments of the future (Gallup 2025; Stiftung für Zukunftsfragen 2025). Ongoing geopolitical conflicts, climate crisis, economic insecurity, demographic change, and uncertainties around artificial intelligence contribute to a sense of collective instability and diminishing future horizons. At the same time, digital platforms host a rapidly growing body of aspirational media that foregrounds individual improvement, self-optimisation, and personal transformation.

This presentation examines aspirational YouTube videos that explicitly target women and circulate under labels such as #glowup, “be unrecognizable” in a given time frame, or “level up”. These videos go surface-level lifestyle optimization. They promise profound transformation through changes in appearance, mindset, routines, and self-discipline, framing success, confidence, and social recognition as attainable outcomes of individual effort. Against the backdrop of widespread uncertainty, such content offers seemingly clear and actionable paths toward desirable futures, relocating questions of security, stability, and fulfilment to the level of the self.

Conceptually, the presentation draws on debates of the imaginary (Jasanoff 2015) ,future thinking (Oomen et al. 2022) and media of aspiration (Fran & Tania 2016) to analyse how platformed content constructs future-oriented imaginaries in times of crisis. It asks:

How do aspirational YouTube videos targeting women construct desirable futures and promise individual transformation in times of social and economic uncertainty?

In addressing this question, the proposed presentation focuses on the narratives of success that are mobilised, the promises attached to personal change, and the strategies of self-work presented as legitimate pathways toward a “better” future. Particulr attention is paid to the gendered dimensions of these imaginaries, including norms of femininity, productivity, emotional regulation, and visibility.

Empirically, the study is based on an in-depth qualitative content analysis of a curated sample of 15 popular YouTube videos addressing female audiences (theoretical sampling). The analysis examines narrative structures, recurring motifs, and the articulation of transformation as both a moral and temporal project. A central preliminary finding is that content creators position themselves as living proof of the strategies they promote. Through autobiographical storytelling and recurring before-and-after visuals, creators present their own transformation as evidence that aspirational futures are achievable through disciplined self-work. In this way, transformation is rendered visible, measurable, and seemingly reproducible.

The presentation argues that aspirational YouTube videos function as a central medium through which future-oriented imaginaries are articulated. They reorient future-oriented thinking away from collective and structural conditions and reshape how futures are imagined and made actionable as well as embodied. Moreover, they bring imagined futures into the present as well as offering examples ‘success’ as demonstrated by the content creators. These videos therefore contribute to the reconfiguration of futures on shifting social and economic ground, promoting personalised and actionable paths of aspiration in an era marked by uncertainty and instability.

PP 0706 The vanillization of social media content: How platform economies shape creative expression

Daniela Jaramillo-Dent[1]

[1] University of Zurich, Communication and Media Research, Zurich, Switzerland

Through interviews with 30 content creators in Spain and Switzerland, and an examination of social media content in both countries, this research identifies an emerging phenomenon of "vanilla content"—deliberately sanitized material designed to avoid algorithmic penalties and audience controversy at the expense of authentic self-expression. This research aligns with previous arguments about the difficulty to monetize certain identities as a creator (Glatt, 2023) and it illustrates how, rather than negotiating a balance between authenticity and commerciality (Arriagada & Bishop, 2021), creators increasingly turn to homogenization as a survival strategy, prioritizing financial stability and mental well-being over genuine expression.

This "vanillization" process follows three key patterns. First, creators select universally palatable topics and genres to maximize acceptability. As José, a Spanish comedy influencer, explicitly described his strategic approach: "my content is very white (...) I don't do much black content." When asked whether white content referred to race, he clarified: "White content is fine. It's things like not swearing in videos or getting into, for example, black humour (...) and where you don't discuss politics (...) I also avoid discussing my preferred soccer team." Second, creators systematically avoid political and controversial issues, even when central to their identities or interests. As Mackenzie, a lifestyle influencer in Switzerland, explained: "I usually don't post about political things. Because there's always different opinions, and you don't want to ever offend anyone with your opinion." This self-censorship extends even to creators with political training and interests, who consciously suppress their expertise to maintain platform viability. Rachel, a music influencer in Switzerland with a background in international relations, articulated this tension: "I haven't, but only also on purpose, because before my actual university, I did international relations. So I wanted to be a diplomat (...) and there we learned to be, especially in social media, unless it is something really strong, I try not to be opinionated in that sense. Not that I don't have my opinion, but I know for social media it's something that in the moment, even if you do your own interpretation, it can come out wrong." Third, creators strategically sanitize their outsider status—for instance, self-branding as an "expat" rather than "migrant" to sidestep controversy.

While women and racialized creators with intersecting identities face disproportionate pressure from platform algorithms and monetization systems, the phenomenon extends across demographics. The quotes above illustrate how creators from non-marginalized backgrounds also internalize platform logics, actively policing their own content to avoid controversy.

These practices expose the hidden "conformity labor" required for platform success: constant monitoring and sanitizing of content to fit algorithmic preferences that privilege whiteness, apoliticality, and commercial safety. This dynamic represents a significant expansion of digital censorship beyond the overt content moderation documented in previous research (Gillespie, 2018), revealing how social media platforms regulate race, identity, and expression through economic pressure rather than explicit removal. Though some creators devise resistance strategies, the pervasiveness of vanilla content fundamentally reshapes the boundaries of acceptable online expression, creating a homogenized digital landscape where controversy of any kind becomes economically untenable.

PP 0834 Weight loss drugs and off-label use in the digital discourse: A survey study on social media engagement, perceptions, and health attitudes

Lena Maria Küpper[1], Lars-Ole Wehden[1], Felix Reer[1]

[1] University of Münster, Department of Communication, Münster, Germany

Weight loss management has long been a subject of societal debates, also on social media (SM). Recently, the topic has gained renewed attention due to a "breakthrough" (Couzin-Frankel, 2023) in obesity treatment: Originally developed for the treatment of type 2 diabetes, medications like *Ozempic* showed weight-reducing effects and are increasingly used off-label for weight management, sparking public interest (Han et al., 2023). Discourse around these drugs includes both positive evaluations of medical benefits and criticism related to thin ideals and diet culture (example: Rosin, 09/23/2023, *The Atlantic*).

On SM, appearance-focused drug use is also widely discussed, turning off-label use into a viral trend (Basch et al., 2023). We therefore examine who is exposed to (RQ1) and who engages with (RQ2) related content.

Content analytical data highlights an overrepresentation of weight loss success stories, disseminated by non-medical accounts on SM (Basch et al., 2023; Fong et al., 2024). Yet, content analysis cannot capture perceived exposure since SM feeds are personalized and algorithmically curated. Consequently, we also assess what sources (RQ3a) and subtopics (RQ3b) SM users encounter in SM-postings related to weight loss drugs. We are further interested in how SM users perceive the tone of the discourse, e.g., along dimensions such as ualong dimensions such as good–bad, harmless–dangerous (RQ4a), and in factors influencing these evaluations (RQ4b).

Finally, previous studies suggest that the information quality on the topic is relatively low on SM (e.g., Basch et al., 2023). Consequently, we examine how SM use (i.e., exposure, engagement) and psychosocial factors (e.g., thin-ideal internalization, appearance comparison, self-esteem) may influence attitudes (RQ5a) and intentions (RQ5b) toward off-label drug use for weight management.

Methods

We conducted a survey among a quota-sample (quotation criteria: age, gender, living region in Germany). A polling institute recruited a sample of N = 1,195 German Internet users (M_{age} = 42.7 years, SD = 13.4; 50.3% female) in August/September 2025. Whenever possible, we adapted established scales which showed good reliabilities (Cronbach's α > .800).

Preliminary Results

In total, n = 121 participants (10.1%) reported personal use of *Ozempic*: 3% for diabetes, 7% for weight loss. About 30% of participants reported knowing someone who uses Ozempic for weight loss (family members, friends/colleagues, celebrities/influencers).

More than 50% of SM users have encountered content on weight loss drugs online (RQ1a). The topic was most prevalent on *Instagram*, followed by *TikTok* (RQ1b). However, engagement with related content is rather low (RQ2). Users mostly came across Ozempic-related content posted by journalistic outlets or ordinary users rather than by accounts of medical professionals (RQ3a). The most frequently perceived subtopic was "weight loss, success stories and before-and-after comparisons" (RQ3b). The SM discourse is perceived mainly favorable, especially regarding valence, usefulness, and desirability (RQ4a). Attitudes toward off-label use score slightly below the midpoint of the scale (RQ5a), whereas intentions to use such medication off-label are relatively low albeit with considerable variation (RQ5b). Further analyses, particularly the regression analyses addressing RQ2, RQ4b, and RQ5, will be presented at ECREA'26.

In addition to addressing limitations and practical implications for health professionals, we will discuss the findings from various perspectives, including socio-cultural theory.

DCC15 Digital Health and Wellness

PP 0835 Muscles, yoga mats, and medical gowns: Social media constructions of health expertise and epistemic authority

Marius Liedtke[1]

[1] University of Salzburg, Department of Communications, Salzburg, Austria

For the last decades it has been a rising trend that an increasing number of people seek out health information online. Research has shown that information found on the internet can exert a significant influence on health beliefs, health behaviors, and decisions regarding healthcare seeking (Chen et al., 2018; Tan and Goonawardene, 2017). While social media simplifies access to relevant and helpful information in many ways, it is also identified as a considerable source of health misinformation (Wang et al., 2019; Broniatowski et al., 2018).

For individuals, the question of which sources to trust is intimately connected to perceptions of expertise and epistemic authority, as research in STS has shown for many years (Turner 2003; Shapin 2004). People looking for health information on social media are confronted with a vast variety of actors claiming expertise on multiple grounds, competing with one another for the audience's attention (Beguerisse-Díaz et al. 2017). This contribution examines how health expertise and epistemic authority are communicatively constructed and negotiated by content creators and their audiences on social media. To do so, this research combines insights into both the perspective of platform users as well as content creators.

Concretely, this research analyzed the user experiences of 40 young adults (18–35 years) in Austria, in the form of 36 participants autoethnographies and 4 interviews, as well as the corresponding media content that the users provided via links, screenshots and-recordings. Further, the user perspective was complemented by data gathered through 14 in-depth interviews with health-related content creators from Austria and Germany active on YouTube, Instagram and TikTok. This sample of creators was composed based on the content shared by the users and therefore mirrors the variety present in their data.

The findings show that users indeed encounter a variety of communicative constructions of authoritative health-related knowledge stemming from diverse content creator types like health professionals, lifestyle influencers, and personally affected laypeople. However, stylistically the media productions of these ideal types are often not as distinct as one might think, sharing characteristics, blending aesthetics and adopting practices from one another. Users assess their trustworthiness situationally by weighing credentials, legitimacy within the platform community, as well as perceptions of professionalism and authenticity.

Conversely, the health creators strategically manage their image to align with audience expectations: those with institutional legitimacy (e.g. doctors and nurses) tend to choose a casual, spontaneous appearance to seem more authentic and relatable, while less credentialed creators adopt medical symbolism (e.g.. anatomical models or screenshots of scientific studies) and polished, "professional" aesthetics to enhance credibility and visibility. The interviews showed that beyond

their claims to advanced health knowledge most of the creators also drew from prior professional training in media, marketing and/or communications for their trust-building efforts.

DCC15 Digital Health and Wellness

PP 0836 Liberal optimism as the successful code of eating disorder recovery influpeers: Hybridisation of commercial appeal and biomedical and platform 'safety'

Paula Saukko[1], Hester Hockin-Boyers[2]

[1] Loughborough University, Social Sciences and Humanities, Loughborough, United Kingdom
[2] City St George's- University of London, Department of Sociology and Criminology, London, United Kingdom

The popularity of social media influencers has given rise to 'influencer creep' (Bishop, 2025), content creators from political activists to artists emulating practices, such as personal branding, commercialisation and authenticity. Drawing on sociological and communications research on (mental) health peer support (e.g. McCosker, 2018) and influencer culture (e.g. Abidin, 2021), we examine their hybridisation (see Chadwick, 2017) into influpeers, which have not been investigated before. Our research question is: How does hybridisation shape influpeers' content and how does it develop over time?

We identified 14 popular (between 10K and 1 million followers) eating disorder (ED) recovery influpeers; half were mentioned in interviews with people with EDs, the other half sampled from the networks of the original sample, adding a few to enhance e.g. ethnic diversity. We analysed a selection of most popular content across Instagram, TikTok and YouTube at specific timepoints between 2020–2025. The content was analysed using multimodal discursive thematic analysis.

We identified a spectrum of hybridisation from influ*peers* (displaying mainly personal recovery content) to *influ*peers (displaying branded content on e.g. body positivity and feminism) and influpropeers (mainly marketing their own services/products, such as one-to-one ED coaching and nutrition and fitness apps).

Content mostly conformed to a 'liberal optimistic' code, which combined influencer culture's aspirational positivity and peer support's focus on helpful and safe advice. The code visualised therapeutic and pop psychological trends, such as self-compassion ('don't be critical of yourself' with images of caressing one's bigger body), intuitive eating ('allow yourself to eat when hungry' with images of eating spaghetti and meatballs or lecturing on the topic on camera) and celebrated recovery (with 'before and after' ED images). However, especially influ*peers* intermittently posted about relapse, depression, suicidal thoughts, chronic EDs and criticism of poor treatment, sharing negative experiences and criticism of healthcare, the subversive aspects of peer support.

Some of the 'negative' and critical content was taken down by platforms and some later restored. Some influpeers encouraged audiences to unfollow fellow recovery influencers if they 'trigger' them. Some influpropeers attacked other online ED coaches and apps for marketing fitness and diet plans as ED support. *Influ*peers attacked 'reactionary' female influencers (#tradwives), male trolls as well as followers, who criticised them for bragging about themselves and no longer being relatable, noting they should celebrate other women's success. The liberal, optimistic code was thus policed by platforms and influpeers themselves both in relation to insiders and outsiders.

Over time influ*peers* often sought to develop into *influ*peers, but after they recovered from an acute ED, their content could lose its focus or brand and become close to everyday social media posting on holidays and going for a run. A handful of influ*peers*/*influ*peers, who displayed affinities to non-conformist, such as post-punk, subcultures, neurodiversity and moodiness, maintained a niche popularity. The liberal optimistic code was most successful across time in terms of rising engagement and enterprise, as it hybridised the commercial appeal of influencer culture and the biomedical and platform ideal of safety often subscribed to by peer support.

DCC15 Digital Health and Wellness

PP 0837 Experimental investigation of uncertainty-identity dynamics in audiences of ethnic-based cyberhate: The role of anonymity and discussion norms

Maria Jaron Bedrosova[1], Michal Muzik[1], Hana Machackova[1]

[1] Masaryk University, Interdisciplinary Research Team on Internet and Society IRTIS, Brno, Czech Republic

Online news with discussions often expose audiences to hostile intergroup content and cyberhate, yet little is known about how individual and contextual factors shape audience responses to this content. Drawing on Uncertainty-Identity Theory (Hogg, 2007; Hogg et al., 2007), this pre-registered study examined how different domains of self-uncertainty and online contextual features influence audience responses to ethnic-based cyberhate in online news with discussions.

Using a multiple-message experimental design, we investigated a mediation model in which group identification with other commenting users (representing ingroup members) mediated the relationship between self-uncertainty and perceived threat of cyberhate targeting an ethnic outgroup. As a key contribution, we distinguished three types of self-uncertainty: individual self-uncertainty and two distinct dimensions of social self-uncertainty (related to national identity and national membership), rarely examined jointly in prior research. Technical platform anonymity (anonymous vs. non-anonymous discussion platform) and discussion norms (aggressive vs. no dominant norm) were manipulated as contextual moderators.

Additional exploratory analyses further examined perceived anonymity of users in discussions (supplementing the measurement of technical platform anonymity) and audiences' behavioural intentions (helpful, harmful, or passive) following their exposure to cyberhate in news. Data from 935 Czech adults (49.3% women) aged 18–38 in 2025 were collected online.

The hypothesised mediation model linking self-uncertainty, group identification, and perceived cyberhate threat was not supported. Individual self-uncertainty showed no significant effects. In contrast, social self-uncertainty played a central role in shaping both perceived cyberhate threat and behavioural intentions, with its two dimensions (identity, membership) showing distinct patterns. People who were uncertain about their national identity perceived the witnessed outgroup cyberhate as more threatening. At the same time, this form of uncertainty was linked to a greater likelihood of either remaining passive or engaging in harmful behavioural intentions (e.g., writing hateful comments). Uncertainty about national group membership did not affect perceived cyberhate threat. However, it was linked to both types of active behavioural intentions – harmful and helpful (e.g., writing supportive comments).

Our investigation of the contextual factors (platform anonymity and discussion norms) showed they had no direct effects. However, exploratory analyses indicated that perceived anonymity, rather than mere technical platform anonymity, played a role in shaping responses to cyberhate as it moderated the relationship between social self-uncertainties and group identification. When other users were perceived as less anonymous (i.e., more identifiable), uncertainty about national group membership strengthened identification with the discussion users.

To summarise, our findings offer several important insights. First, they demonstrate the importance of distinguishing between individual and social domains of self-uncertainty when examining audience responses to ethnic-based cyberhate. Second, they underscore that identity and membership self-uncertainties related to national identity show distinct patterns and should be considered separately when investigating such audience responses to cyberhate. Finally, the findings highlight the significance of perceived anonymity as a contextual factor that goes beyond technical platform anonymity. Based on these findings, important implications for Uncertainty–Identity Theory and its application to cyberhate research will be discussed.

DCC16 Australia's Under-16 Social Media Ban and Its International Repercussions

PN 73 Banning technology or banning children? Why bans are against children's rights

Sonia Livingstone[1]

[1] London School of Economics and Political Science, Department of Media and Communications and Digital Futures for Children Centre, London, United Kingdom

Global reporting of the Australian social media ban led to numerous headlines about "banning children …" Though the Online Safety Amendment Act 2024 prioritises restrictions on companies, the public felt the burden of compliance and enforcement to fall less on companies than on children. Informed by the UN Convention on the Rights of the Child (UNCRC), this paper will set out the case that social media bans, such as smartphone bans at school and screen time restrictions at home, are not only poor "solutions" to genuine problems, but they are also problematic in conceptual and normative terms, leaving it unclear what is wrong, what would be better, and what interventions would be preferable. In 2021, the UN Committee on the Rights of the Child adopted General comment No. 25 on Children's Rights in Relation to the Digital Environment, setting out in internationally authoritative terms how the full range of children's rights applies in a digital world, and the steps to be taken by governments, businesses and other relevant actors to realise these rights. Viewed through a child rights lens, social media bans are problematic for at least four main reasons:

- By addressing child protection to the neglect of child expression and participation, access to information, and privacy (through the national reliance on age assurance mechanisms), they fail to recognise that children's rights, as for all human rights instruments, are indivisible and interdependent, and should not be ranked, cherry-picked or traded off against each other. Instead, international law requires that, in the face of strong evidence of risks of harm to children from the use of social media, a best interests determination should be made that carefully weighs policy alternatives to evaluate their intended and likely unintended consequences for all children's rights.
- By not consulting children, whose views on bans are complex, contextual and generally critical, these policies infringe the most hotly-fought over article in the UNCRC, namely Article 12, the right for children to be heard – in ways that are consequential- on matters that affect them, as bans clearly do.
- By imposing a blanket policy on all children, bans neglect children's diverse needs and circumstances, including their evolving capacities, and the ways that the costs of bans likely fall unequally, as well as the host of needs and rights infringed as collateral damage, from vulnerable teens seeking peer support to young human rights defenders exercising their democratic voice.
- By introducing a policy that, many have argued, is likely to be insufficient or flawed in practice, bans miss the opportunity to deploy a host of tried-and-tested tools and processes of child-rights and human-rights assessment and due diligence widely recognised by states, businesses and civil society. While the aim of the paper is to establish 'what good looks like', we can conclude by noting the global pushback against human rights, especially in relation to the digital environment. In such circumstances, children are among the many losers.

DCC16 Australia's Under-16 Social Media Ban and Its International Repercussions

PN 74 "Trapping water with a net" and "hitting the mosquito with a hammer": Young Australians' perspectives on the social media minimum age legislation

Kim Osman[1], Michael Dezuanni[1]

[1] Queensland University of Technology, Digital Media Research Centre, Brisbane, Australia

Australia's Online Safety Amendment (Social Media Minimum Age) Act commonly referred to as the "under 16s social media ban" came into effect in December 2025 with minimal input from young people into the development of the policy, or the conversation surrounding it. Much of the national debate in Australia has focused on youth mental health and wellbeing and the risks posed by social media, and is dominated by parents, carers, state and federal government and legacy media. In response to the lack of young people's voices in the national conversation, our team of 14 leading researchers from five universities interviewed 86 young people aged 12–15 from around Australia (see Osman et al., 2025). We asked them if they used social media, how they used it if they did, what they knew about the then proposed ban, their thoughts on it, and how they think social media can be improved. In this proposed paper, we focus on young people's perceptions of the ban and their visions for alternate regulations that respond more accurately to their needs. The young people we interviewed referred to the legislation as a "blanket ban" that appeases adults but obscures the issues they feel need addressing. Their fears are that the ban will give parents and carers a false sense of security, prevent help seeking from underage users that encounter issues and give platforms less incentive to improve content, safety and gaming features. Banning it fully just straight up makes it a lot harder than finding a solution to the problem… it's like taking the easy solution." Boy, 12Young people call for better education, and more restrictions that respond in a more nuanced way to the problems they actually have with social media. They also recognise that their own experiences on social media may not reflect others' experiences and that the legislation may have unintended consequences as people lose networks of support that are embodied in different ways via social media, a concern shared by experts (Nogrady, 2025).I think there should just be more education and restrictions and openness about it." Girl, 13Far from being the vulnerable users that have been portrayed as at-risk in the Australian national debate, our participants had awareness of the risks and challenges of social media, demonstrated agency and shared informed visions for better national policy related to their social media use. Their perspectives highlight the need for including under-16s in policy- and decision-making that directly affects them, to ensure that future iterations of the legislation are evidence-based, centre their rights and improve their online experiences.

DCC16 Australia's Under-16 Social Media Ban and Its International Repercussions

PN 75 Do young or deviant profiles best predict time spent on YouTube?

David Josias Wegmann[1], Jessica Gabriele Walter[1], Anja Bechmann[1]

[1] Aarhus University, DATALAB Center for Digital Social Research, Aarhus, Denmark

Using the latest ban on social media for children and teenagers in Denmark (under 15) and beyond as a backdrop, this paper sets out to understand what best predicts time spent on YouTube and discusses to what extent this is problematic for the wellbeing of users and society at large. Statistics (Statistics Denmark) show that young people have a higher use of social media than older age groups and that young people report using social media for news to a larger extent than older age groups (Reuters News Report; Danish Ministry of Digitalization). At the same time, time spent on social media has been considered a threat to the wellbeing of children and young people (Haidt; Tølbøll, 2025).However, other studies point to YouTube as a niche medium (Bechmann et al., 2025; Burgess & Green, 2009) where people outside the norm (Munger, 2024) can potentially find topics of interest that would not normally be catered for in mainstream media. Such profiles might therefore be a better predictor of time spent on YouTube than the "young" profile category, and could be an important factor in understanding systemic risks to society that might otherwise go unnoticed. At the same time, using time spent on social media as a proxy for problematic usage across young and deviant profiles could be a simplistic understanding of what is actually problematic, since it does not take into consideration what is viewed or whether people spending above-average time on YouTube themselves find it problematic or productive for their wellbeing (Coyne et al., 2023; Mahalingham, McEvoy, et al., 2023; Tomczyk & Selmanagic Lizde, 2023; Van Den Eijnden et al., 2016). This paper aims to provide more knowledge of the empirical patterns of the Danish population's use of YouTube. Through a combined data donation and survey study of 1,063 Danes approximated to represent the Danish YouTube population (Bechmann et al., 2025), we combine participants' viewing, search, and subscription logs with survey questions on self-reported well-being and profiling batteries. This provides in-depth patterns of daily (and nightly) time spent on YouTube and what best predicts above-average time spent—whether young profiles or deviant profiles (dark psychological triads, extreme political leaning, conspiracy mentality, etc.).Using this analysis as a stepping stone, we discuss whether such usage is problematic by analyzing content viewed and factors such as self-reported problematic use, the ratio between self-selected channels (subscriptions, searches) and viewed content as a proxy for non-algorithmically controlled viewing, compared to viewing without pre-action indicators such as non-search and short-form video viewing (Shorts), which has been proposed to have time-retaining power. We further report to what extent such functions in themselves could predict time spent. These additional analyses lead to a general discussion of how the field and society at large understand problematic social media

usage and contribute a novel national population-scale data donation correlational study that provides new empirical perspectives on a contested topic.

DCC16 Australia's Under-16 Social Media Ban and Its International Repercussions

PN 76 Digital literacy as an alternative to social media bans

Ruth Wendt[1], Larissa Leonhardt[1]

[1] Ludwig-Maximilians-University Munich, Department of Media and Communication, Munich, Germany

Especially for adolescents, social media can provide an important space not only for socializing but also for identity development, including experimenting with self-presentation, finding role models, and interacting with online audiences (Pérez-Torres, 2024). However, the use of social media can come with several risks, for example, being confronted with uncivil, hateful, or non-age-appropriate content. Thus, public discourse in recent years has been dominated by the question of social media bans for adolescents under a certain age. However, it is not yet clear how such measures can be implemented in practice, and whether they really address the problems they are intended to solve. Additionally, it can be argued that theoretically and empirically convincing arguments in favor of specific age restrictions are lacking. Usage data for Germany and many other countries moreover show that even younger adolescents under the age of 16 use social media in a diverse manner and for various developmentally relevant purposes (Feierabend et al., 2024). Completely banning social media from their lives would result in significant and far-reaching disruptions to their social lives and information behavior. The question of whether social media use is beneficial or harmful, especially for adolescents, seems to depend rather on the skills young users possess for using it. As data from Germany show, also younger adolescents are quite reflective when it comes to their perception and usage of algorithmically curated content on social media (Wendt et al., 2024). Although these findings relate to the specific skill set of algorithm literacy, they can also be indicative of possessing general skills that fall under the concept of digital literacy, aiming to minimize the negative effects of digital media use and maximize its benefits (Helsper et al., 2021). Thus, this contribution argues that an early and broadly implemented promotion of digital literacy among children and adolescents might serve as a valuable alternative to social media bans.

DCC16 Australia's Under-16 Social Media Ban and Its International Repercussions

PN 77 Teknalgia and the Anxious Generation of Parents: On Alternatives to Age-Based Social Media Restrictions

Amanda Third Third[1]

[1] Western Sydney University, Young & Resilient Research Centre Institute for Culture & Society, Sydney, Australia

Fuelled by the technologically determinist claims of The Anxious Generation (Haidt, 2024), the campaign to implement social media age restrictions legislation in Australia tapped into deep-seated parental anxieties about the impact of social media on children's mental health and wellbeing. While the concerns articulated by vocal parent groups did not necessarily represent the diverse views of parents and caregivers across the country (Ogun et al., 2025), they were nonetheless backed by powerful political and economic interests (including Murdoch's NewsCorp media holdings in Australia), and this proved decisive in producing social media age restrictions as the only plausible 'solution' to the youth mental health crisis. Parents are right to be concerned about the wellbeing of their children in relation to social media. The internet was never designed for children and too many are exposed to unreasonable risks of harm online (Livingstone & Third, 2017). Stronger regulation – among other measures – will be vital to holding social media companies accountable to the needs, rights and aspirations of children in Australia, and elsewhere. Nonetheless, through a brief analysis of the construction of parental responsibility and idealised childhood in Australian news media coverage of the restrictions, I argue that the heightened parental concern that characterised the debate is a cypher for broader concerns about the loss of childhood – what I label teknalgia (from the Greek teknon (child) and algia (grief/loss) – and an intensifying sense that both government and parental forms of authority are in crisis. This in turn undermines parents' confidence in managing their children's social media practices and prevents governments' development of effective strategies to secure children's rights in relation to social media. To move beyond teknalgia, the paper then proposes a series of alternatives to restrictive regulation to strengthen children's wellbeing in relation to social media use, including:1. Centring children's best interests by adopting a rights-based approach to interventions impacting children's engagement with the digital environment;2. Foregrounding the complexity of drivers of children's mental health and wellbeing, recognising that while social media engagement comes with many risks of harm for children, with the right protections in place, it also enables significant benefits for children's mental health and wellbeing (REF);3. Mobilising an ecosystemic approach to regulation, acknowledging that no single piece of regulation can reasonably address the myriad factors that expose children to risk of harm online;4. Drawing on the evidence base to work with experts, child-facing practitioners and technology companies to develop technical standards to underpin the regulation of platform features that are known to be harmful to children (such as gambling features, privacy-infringing data collection, infinite feeds, algorithmic delivery of age-inappropriate content); 5. Identifying and activating standards via transnational digital governance mechanisms that can hold social media companies to account for children's rights in the digital environment on an international scale and, by levelling the playing field for social media companies, can use competitive drivers to encourage platforms to design not just safe but optimal digital services and products for children.

DCC17 Imaginaries and Collective Identities in Digital Cultures

PP 0945 Generating generations: Cultural and social representations of generational cohorts through visual generative AI

Giulia Giorgi[1], Giorgia Aiello[1], Ilir Rama[1], Massimo Airoldi[1]

[1] University of Milan, Department of Social and Political Sciences, Milan, Italy

While a growing body of literature has focused on generative AI's biases and related harms, less attention has been paid to how 'culture' is encoded within generative models (Airoldi, 2022). We address this gap by examining how generative AI visually reproduces cultural and social representations of different generational cohorts.

Generative AI systems incorporate cultural knowledge and social imaginaries within their technical architectures. When examining AI-generated content, we must consider not so much what is represented, but rather the ways in which the norms embedded within generative texts and images are culturally situated and, in turn, the impact that this content may have on collective representation and perception (Gillespie, 2024).

Due to its culturally loaded and shifting nature, the sociological concept of 'generations' represents a particularly well-suited site for an investigation of this kind. Generations have been defined as birth-cohorts, people experiencing specific historical events, or else sharing the same media of reference (Mannheim, 1952; Bolin, 2016). By focusing on generations, we aim to explore how distinctive cultural visions are reproduced and consolidated through model-generated representations.

To this end, we adopted a mixed-methods approach combining network analysis and qualitative visual analysis to examine a dataset of 1400 images that we generated using DALL·E. We designed our prompts to elicit representations of four generational cohorts alongside an unmarked control group. Informed by literature on generations, the prompts were structured along three dimensions: cohort-based, demographic-based, and performance-based, allowing us to capture demographic, socio-material, and performative aspects of generational identity.

Network analysis was employed to identify shared visual elements, using labels extracted via Google Vision API to map patterns of convergence and differentiation across cohorts (Omena et al., 2021). Qualitative visual analysis was then employed to interpret the aesthetic and narrative dimensions of selected images in greater depth.

Our findings show that DALL·E leveraged cultural markers like fashion styles, technological devices, and social settings to produce distinctive representations of generations. Millennials and Generation Z emerged as closely aligned, both visually and structurally, forming a 'technological cluster' set apart by laptops, smartphones, headphones, and café or 'retro' domestic settings. Baby Boomers were represented through family-oriented and caregiving roles, together with domestic interiors, gardening activities, and print media. Generation X was represented through broader themes such as outdoor leisure, conviviality, and 'analogue' forms of social interaction, thus suggesting a relative lack of distinctive cultural traits embedded in the model.

Beyond cohort-specific traits, our analysis reveals a dominant, cross-generational, 'generic' aesthetic centred on happiness, togetherness and healthy activities, which produces an idealized vision/version of everyday life. This is also the aesthetic that the model mobilizes by default in the absence of explicit indications, thus flattening cultural, geographic, and social differences.

Rather than merely executing prompts, DALL·E reveals how cultural complexity and normative visions are encoded in the model and rendered visible through AI-generated images (Westberg & Kvåle, 2025). We thus argue that generative AI models participate in the construction of imaginaries surrounding generations by reproducing, standardizing and, at times, reshaping both cultural knowledge and social imaginaries.

DCC17 Imaginaries and Collective Identities in Digital Cultures

PP 0946 Creating an alternative or stereotypical image of the nation?: User-generated nation branding in Japan and China

Yunyi Liao[1]

[1] Loughborough University, School of Social Sciences and Humanities, Loughborough, United Kingdom

Existing studies of nation branding tend to focus on how a nation brand is created and disseminated by governments, companies, and branding experts. This has led to a lack of focus on alternative forms and practices of nation branding generated by social media users (e.g., vlogs and photos), and in particular, to what extent users contribute to challenging or reinforcing established images of the nation in traditional forms of nation branding.

To fill this lacuna, theoretically, this study introduces the concept of 'user-generated nation branding' (UGNB), which refers to the voluntary creation and public distribution of nation branding messages undertaken by individuals who are not professional nation branders. The concept draws on several bodies of literature, including work on user-generated content/branding/nationalism, audience engagement in the digital spheres, influencer cultures, Orientalism, and tourism studies.

Empirically, two representative cases of UGNB were examined, the 'Abroad in Japan' and 'Liziqi' social media accounts. These cases involve two influencers – Chris Broad and Li Ziqi – both of whom have millions of followers. While Chris Broad films the everyday life of a British man living in Japan, Li Ziqi records a Chinese woman's daily activities in rural China. They both started as ordinary online users and subsequently became social media influencers. Their accounts thus provide a rich empirical base for understanding the development of UGNB over an extended period of time. Furthermore, these two cases feature UGNB from a foreigner's and a citizen's perspective, and involve two different countries, Japan and China, which are characterised by different histories of UGNB, different political systems, and different social media platforms. The two cases therefore simultaneously serve as maximum variation cases, enabling a comprehensive picture of UGNB and its varieties in different contexts.

A total of 458 video and image posts (255 from the 'AIJ' YouTube and Instagram accounts, and 203 from the 'Liziqi' YouTube and Weibo accounts) were analysed using quantitative content analysis. 18 posts from the large sample were further examined using multimodal analysis to provide a qualitative, in-depth analysis of the multimodal representations of the nation.

The analysis has found different types of themes strategically used by the two nation branders, suggesting the crucial role of the nation brander's positionality in UGNB. In 'AIJ', the brander's thematic focus on travel, food, scenery, and social situation/integration reflected his positionality as a foreigner and his encounters with the Japanese 'Other', while in 'Liziqi', the brander's thematic focus on food, traditional culture, festival, and scenery reflected her positionality as a citizen and her promotion of a traditional China through cooking national food and making traditional handicrafts. Different types of Orientalism were also found, with techno-Orientalism commonly used in 'AIJ' and romanticised self-Orientalism recurrently employed in 'Liziqi'. This points to the issue of stereotyping, and suggests that UGNB does not necessarily contribute to challenging or disrupting traditional forms of nation branding. Finally, support from commercial and institutional actors also influenced UGNB content, resulting in the representation of particular forms of the nation over others.

DCC17 Imaginaries and Collective Identities in Digital Cultures

PP 0947 Cyborg imaginaries and AI: A computational grounded theory of online pioneer community discussions on human augmentation

Giulia Frascaria[1], Daniela Jaramillo-Dent[1], Michael Latzer[1]

[1] University of Zurich, Communication and Media Research, Zurich, Switzerland

Human Augmentation (HA) technologies, including prosthetics, neurostimulation devices, brain–computer interfaces (BCIs), and microchip implants, are advancing for both medical and non-medical purposes, with expectations of expansion beyond current niche experimentation. Pioneer communities (Hepp, 2016) such as biohackers and transhumanists actively experiment with and debate these technologies, making them important spaces in which future imaginaries for HA technologies, which we refer to as cyborg imaginaries, take shape. This study employs computational grounded theory (Carlsen & Ralund, 2022) and draws on 198,003 posts and comments from three Reddit communities to analyze how participants construct cyborg imaginaries.

Our theoretical framework situates HA within the broader process of digitalization, in which datafication, algorithmization, and platformization extend to the human body through cyborgization. This process aligns with transhumanist beliefs that human evolution can be steered through technology and reflects implicit techno-religiosity, as technology becomes a source of meaning, guidance, and transcendence (Latzer, 2025). Pioneer communities contribute to this process by engaging with augmentation technologies as tools for body modification, self-optimization, and long-term human transformation. Drawing on the understanding of future imaginaries as contested and negotiated in community discourse (Mager & Katzenbach, 2021), we examine cyborg imaginaries as they emerge in these pioneer communities.

Our findings show that cyborg imaginaries in online pioneer communities are structured around two key tensions. First, the Apocalyptic–Emancipatory axis contrasts fears of dehumanization, technological dependence, and loss of autonomy with hopeful visions of enhanced capabilities, extended longevity, and liberation from biological constraints. Second, the Inevitability–Contingency axis reflects whether participants view these imagined futures as unavoidable or as dependent on factors such as individual choices, governance, and technological development.

A notable finding is the growing prominence of Artificial Intelligence (AI) in shaping cyborg imaginaries. As discussions of AI, BCIs, and automation increased alongside the rise of large language models (LLMs), AI became a lens through which participants assessed the objectives, implications, and timelines of cyborg imaginaries. As a result HA, and especially BCIs, are reframed as means of adapting to rapid AI advances or remaining competitive with increasingly capable systems, from LLMs to AI-driven robotics. Alongside desirable imaginaries of human-AI symbiosis, a parallel strand emphasizes concerns about dehumanization, loss of autonomy, and widening divides between augmented and non-augmented individuals. While much of this discourse is shaped by current AI developments, some discussions also speculate about Artificial General Intelligence (AGI) as a disruptive future possibility, albeit with considerable uncertainty.

Overall, the study presents a characterization of cyborg imaginaries and highlights the growing role of AI in shaping future imaginaries surrounding human augmentation technologies.

DCC18 Modeling Digital Communication Futures: Large Language Models and Agent-Based Simulations

PN 83 Between control and realism: Learnings from a three-year project

Damian Trilling[1]

[1] Vrije Universiteit Amsterdam, Department of Language Literature and Communication, Amsterdam, Netherlands

How can we study the effects of platform mechanics such as different news feed rankings, moderation policies, or network affordances if we cannot run experiments on the platforms themselves? Besides field experiments in collaboration with the platforms themselves (which suffer from numerous drawbacks as well; see Munger, 2025), it is hard to come up with research designs that allow for experimentally testing such interventions in a way that takes into account complexity, non-linearity, and feedback. One approach is to build a so-called digital twin of online social networks. In doing so, we unite classical simulation with the use of generative AI.Introducing large language models into the world of simulations has come with a great promise: increasing realism. Rather than exchanging states such as 'pro' or 'against' an opinion, agents can exchange actual arguments. And rather than having simple rules and formulas that decide whether an agent engages in a specific behavior or not, agents can rely on artificial intelligence to make these decisions. But this comes at a cost: the number of moving parts in the model becomes tremendous, and it is hard to say what exactly causes an outcome. In essence, clear rules are replaced by black boxes. This is a clash of two worlds. On the one hand, one in which well-defined mathematical models are studied, in which many simplifying assumptions are made, but in which we can clearly isolate the effect of setting one specific parameter. On the other hand, one in which we try to mimic the real world as closely as possible, but have problems isolating effects. The dilemma plays at three levels: (1) Modelling of the network; (2) modelling of user behaviour; (3) modelling of content produced by users. Empirical network structures may not follow standard models; empirical users do not 'take turns' but whether they view, post, or engage with content is influenced by a multitude of factors; and empirical users exchange a variety of texts rather than scalars or vectors. Building agents that are realistic enough is far from easy (Münker et al., 2025), and validation is not as common as it should be (Larooij & Törnberg, 2025). The crucial question, then, is: How much realism within a digital twin is needed to arrive at valid conclusions? Those coming from a classic simulation perspective will not be convinced by a model that cannot be described in mathematical formulas and cannot be said to be well-understood; but policy makers and other stakeholders will not be convinced by a model that makes far-reaching assumptions that in practice are obviously never fulfilled. In this contribution, I am not going to take sides but systematize experiences and insights from three years of a large-scale digital-twin project about such issues, how to deal with them, and what conclusions to draw. With this, I hope to draw a realistic picture of what is possible and what is not, and what caveats and opportunities have to be considered.

DCC18 Modeling Digital Communication Futures: Large Language Models and Agent-Based Simulations

PN 84 An agent-based model of online public discourse

Aytalina Kulichkina[1], Annie Waldherr[1], David Garcia[2], Taehee Kim[2]

[1] University of Vienna, Department of Communication, Vienna, Austria
[2] University of Konstanz, Department of Politics and Public Administration, Konstanz, Germany

Digital media have created unprecedented opportunities for ordinary citizens to access information and engage in political discussions with individuals beyond their immediate social networks. However, this rapidly evolving participatory environment has also exposed citizens to various forms of harmful content, which can fuel conflict, political distrust, and polarization (van Aelst et al., 2017). Such content manifests as hate speech, offensive language, harassment, graphic content, misinformation, and spam, among other forms (Arora et al., 2024). Ultimately, its diffusion erodes the conditions necessary for healthy online discourse and democratic citizenship. In this study, we develop an empirically grounded computational simulation of the online political information environment, where agents engage in political discussions. The study contributes to communication research methodology by combining agent-based modeling (ABM) with large language models (LLMs), while grounding the approach in theoretical and empirical insights from communication science. Specifically, we develop generative agents capable of language-mediated interactions (Vezhnevets et al., 2023) relying on respondent-centered data from representative surveys and social media data donations collected in fall 2025 in the

Netherlands, Spain, Romania, and Lithuania. At the same time, we specify agent behaviors, interaction rules, and the environment based on established knowledge in digital communication. Currently, our model represents an abstract digital public sphere—an online space "where participation is open and freely available to everybody who is interested, where matters of common concern can be discussed, and where proceedings are visible to all" (Schäfer, 2014, p.322). Within this space, generative agents interact by publicly voicing their stances, consuming information, and refraining from participation. The model includes entities representing ordinary citizens, strategic agents (e.g., politicians, media, activists, trolls, or bots), and content (i.e., objects representing opinionated pieces of information). Ordinary citizens are modeled as empirically informed agent types parameterized by survey responses capturing sociodemographic characteristics, media consumption patterns, attitudes, trust, and personality traits. Strategic agents are modeled as theoretical abstractions that simulate interventions in online discourse and are characterized by political opinions, civility level, and activity frequency. The content items are agent-generated objects with attributes such as opinion, civility, quality, and popularity metrics. Ordinary citizens are randomly placed in a scale-free (Barabási & Albert, 1999) network that represents a digital public sphere, where node degrees follow a power-law degree distribution characteristic of many digital media networks (Goel et al., 2016). The network has a community structure, with high connection density within communities (Holland et al., 1983) and homophily with respect to relevant node traits and demographics (De Choudhury, 2011). Undirected links between agents represent mutual channels through which information travels and persuasion occurs (e.g., Flache et al., 2017; Centola, 2018) based on link weights denoting influence strength (Katz & Lazarsfeld, 1955). We explore various outcomes of simulated interactions, including polarization, fragmentation, engagement, and incivility under different moderation strategies. Once validated with forthcoming waves of data, the model will be used to evaluate the potential impacts of alternative digital media regulation strategies and generate insights for policymakers.

DCC18 Modeling Digital Communication Futures: Large Language Models and Agent-Based Simulations

PN 85 Designing for immersion: Surveying frameworks for LLM-based social agents in human-participant experiments

Rupert Kiddle[1], Wouter Van Atteveldt[2]

[1] Vrije Universiteit Amsterdam, Department of Language Literature and Communication, Amsterdam, Netherlands
[2] Vrije Universiteit Amsterdam, Department of Communication Science, Amsterdam, Netherlands

The integration of large language models into agent-based social simulations has created new possibilities for communication research, enabling experiments where human participants interact with believable synthetic social (i.e, multi agent) environments. As the field adopts these methods, the risk emerges that without shared frameworks for social simulation, researchers may resort to bespoke and heterogeneous solutions for agent interaction dynamics—e.g., turn-taking, targeting, action decisions—leading to methodological fragmentation that could undermine the comparability and reproducibility of produced studies. Current mock social media frameworks do not provide guidance on this troublingly open design space (Jagayat et al., 2023). Our contribution to this panel is a presentation of two related works interested in avoiding that outcome. First, we present preliminary findings from an interdisciplinary rapid review addressing:RQ: What design frameworks and principles currently guide researchers in specifying LLM-based social agents for human-participant experiments, particularly regarding multi-agent interaction dynamics that support participant immersion? Drawing on literature from human-computer interaction, computational social science, and games studies, we identify several frameworks—including Generative Agents (Park et al., 2023), Concordia (Vezhnevets et al., 2023), and Inner Thoughts (Ye et al., 2025)—that produce believable interaction dynamics as emergent properties of artificial cognitive architecture. This emergence is potentially a strength, as rather than requiring researchers to manually specify parameters for every aspect of agent behaviour, these frameworks can generate naturalistic interaction from common and reproducible foundations. However, these frameworks were developed in neighbouring disciplines and remain largely untested for the specific demands of human-participant experiments in communication science. In particular, validation efforts have focused on behavioral calibration (whether agent populations match aggregate human response patterns) rather than experiential validity, or whether emergent interactions feel believable to individual participants in experimental settings. This challenge is therefore interdisciplinary: bridging the gap between multi-agent simulation research and experimental methodology. Our review works toward that bridge: surveying available frameworks, assessing their suitability for communication research, and identifying what validation is required before they can serve as standardised foundations for the field. Second, we report on the associated development and deployment of Simulacra, an open-source platform for conducting immersive LLM-augmented social experiments. Simulcra is being developed as part of a three-year project conducting participant-based experiments across multiple platform types and populations in multiple countries. By the time of this panel, we expect to have fielded one or two studies, providing a basis for discussion on whether emergent interaction dynamics from established frameworks can support participant immersion and ecological validity in experimental contexts.

DCC18 Modeling Digital Communication Futures: Large Language Models and Agent-Based Simulations

PN 86 Epistemically vicious LLMs: Influencing the exhibition of epistemic vices in Large Language Models

Dana Bouwknegt[1], Wouter Van Atteveldt[1], Rupert Kiddle[1], Nel Ruigrok[2]

[1] Vrije Universiteit Amsterdam, Department of Communication Science, Amsterdam, Netherlands
[2] Erasmus University of Rotterdam, Department of Media and Communication, Rotterdam, Netherlands

Large Language Models (LLMs) are increasingly used to simulate human behavior in studies of opinion dynamics (Chuang et al., 2024), misinformation spread (Farr et al., 2025), and simulated social media environments (Törnberg et al., 2023). However, LLMs appear more accuracy-oriented and less epistemically flawed than humans (Chuang et al., 2024). This raises important validity concerns, because it is unclear to what extent model behaviors in such research resemble that of the human behavior they are intended to represent. Prior studies suggest that incorporating human-like epistemic shortcomings can result in simulations that better match real-world belief dynamics (Chuang et al., 2024). Drawing on virtue epistemology as a framework for understanding human epistemic shortcomings, this study examines whether LLMs can be prompted to reliably display epistemically vicious behavior. Epistemic vices can be understood as intellectual defects that pose an obstacle to knowledge. The language of epistemic vices is useful in discussing how human character and behavior influence the knowledge gathering process. Building on dual-process accounts of human reasoning, cognitive biases can be treated as the behavioral exhibition of epistemic vices (Samuelson & Church, 2015). Relating cognitive biases to epistemic vices enables the analysis of clusters of interrelated biases in terms of more stable, higher-order intellectual human traits (Roberts & West, 2015).While direct research on epistemic vices in LLMs has been scarce up until now, research on the existence of cognitive biases in such models has had more attention (e.g., Malberg et al., 2025; Xie et al., 2024). Using a paired experimental design adapted from Malberg et al. (2025) for the measurement of cognitive biases in LLMs, two widely-used and state-of-the-art LLMs (ChatGPT-4o and Llama3.1) were provided with system prompts to encourage behavior related to one of the two analyzed epistemic vices in this study, namely closed-mindedness and intellectual conformity. Vice exhibition was measured through scenario pairs targeting biases that are theoretically aligned with their related epistemic vice, namely confirmation bias and conservatism bias for the vice of closed-mindedness and the bandwagon effect and social desirability bias for the vice of intellectual conformity. The inclusion of a chat history was added as an experimental condition to analyze the impact of instruction drift on the endurance of the vice prompting. In total, 2,000 scenario prompts across eight different conditions were used in this study. It was hypothesized that 'vice prompting' would increase the strength and prevalence of related cognitive biases, and that the addition of a chat history would in turn weaken this vice prompting effect. Results show that vice prompting generally increases bias scores, especially for the vice of closed-mindedness. The addition of a modest chat history does not significantly impact the effect of vice prompting. Exploratory analyses of model replies indicate model-specific differences in how vice prompts shift both bias scores and underlying option choices. Overall, the findings support the feasibility of 'vice prompting' as a tool for more human-realistic simulations of epistemic behavior and for studying how epistemic vices shape information ecosystems.

DCC18 Modeling Digital Communication Futures: Large Language Models and Agent-Based Simulations

PN 87 From timelines to agents: Evaluating the behavioral fidelity of LLM-based agents for social media simulation

Taehee Kim[1], David Garcia[1], Giordano De Marzo[1]

[1] University of Konstanz, Department of Politics and Public Administration, Konstanz, Germany

Simulating social media users with generative agents has emerged as a promising methodological approach to studying social media dynamics, including information diffusion and opinion formation (Gao et al., 2024; Park et al., 2023; Törnberg et al., 2023). Such simulations allow researchers to explore counterfactual scenarios, scale empirical analyses, and reduce reliance on costly or incomplete behavioral data. However, the validity of such approaches hinges on a critical yet underexplored question: to what extent can LLM-based agents faithfully replicate real users' attitudes and content production? Despite growing interest in LLM-driven social simulations, systematic empirical evaluations of their behavioral fidelity remain scarce (Larooij & Törnberg, 2025).This study examines the capabilities and limitations of LLM-based generative agents constructed from social media timelines. Specifically, we investigate whether such agents can (1) infer a user's stance on a political topic that the user has not previously discussed, and (2) generate topic-relevant content that aligns with the user's real-world stance, tone, and style. Addressing both predictive and generative dimensions is crucial, as success in one does not necessarily imply success in the other. We build generative agents representing approximately 200 German Twitter users who mentioned the "Great Replacement" conspiracy theory in October 2018. The dataset is balanced between supporters and opponents of the theory. Each agent is created via in-context learning, using up to 100 tweets posted prior to the user's first explicit mention of the topic. We evaluate three LLMs throughout this study: OpenAI's GPT-4o, LLaMA 70B, and Qwen 72B. These models were selected based on their strong performance and widespread adoption. Our analysis reveals substantial variation across models. GPT-4o achieves the highest accuracy in stance prediction, demonstrating

strong inferential capacity even with limited contextual information. However, its performance declines in content generation, particularly for users supporting the conspiracy theory, suggesting that internal safety mechanisms may suppress or distort controversial outputs. Qwen exhibits similar but less pronounced patterns. In contrast, LLaMA underperforms in stance prediction but produces generated tweets that more closely resemble original user content in terms of stance alignment, tone, and diversity, highlighting a trade-off between classification accuracy and generative realism. Moreover, LLaMA was more sensitive to prompt length and benefited from a retrieval-augmented generation (RAG) approach. Finally, we examine the role of social context by incorporating tweets from a user's network. GPT-4o becomes more stance-aligned and more toxic when exposed to toxic peer content, whereas LLaMA frequently fails to generate any outputs under these conditions, suggesting a different kind of safety constraint. Qwen showed minimal responsiveness to the network context. Taken together, these findings demonstrate that LLMs differ markedly in how they model ideological reasoning and social influence. We argue that rigorous evaluation of both predictive and generative behaviors is essential before deploying LLM-based agents in social media simulations. Appropriate integration of suitable LLMs into agent-based simulations is crucial for ensuring the credibility of these simulations as experimental environments for studying online dynamics and for informing the design of social media interventions and related policymaking.

DCC19 Mediated Past, Present, and Future

PP 1042 Remediating the past - retro video games and digital nostalgia on YouTube

Przemyslaw Ciszek[1]

[1] Jan Kochanowski University in Kielce, Faculty of Humanities, Kielce, Poland

In recent years, YouTube has emerged as a important platform for the remediation and circulation of retro gaming culture. This phenomenon is closely tied to the broader cultural trend of *retromania* - a nostalgic fascination with the past particularly prevalent among members of Generations X and Y, who came of age during the formative decades of home video game development and popularization. This paper investigates how retro video games are represented, recontextualized, re-experienced and popularized through contemporary audiovisual content published on YouTube.

Grounded in the theoretical frameworks of media remediation (e.g. Bolter & Grusin), media memory, and digital nostalgia, the study conceptualizes YouTube as both a participatory digital archive and a dynamic platform for reconstructing the embodied experiences of gameplay from past decades. The author proposes a typology of dominant content genres, including retro gameplay and live streams, hardware presentations and restorations, retrospective reviews, and documentary-historical productions. Through qualitative content analysis of selected international channels (*Digital Foundry Retro, Gaming Historian, Nostalgia Nerd*), and their Polish counterparts (*arhn.eu, Grysław, Retrogralnia*) the paper examines how creators employ specific narrative strategies, aesthetic conventions, and platform affordances to construct emotionally resonant and culturally meaningful retrospectives. The emotional charge of these videos, anchored in personal anecdotes, sensory triggers, and shared generational experiences, positions them as powerful agents of affective memory transmission. These materials also contribute to an emergent, decentralized archive of video game culture, filling the gaps left by institutional historiographies and traditional media documentation.

Attention is also devoted to the interplay between retro aesthetics and contemporary editing techniques, as well as to modes of audience engagement that reinforce collective memory and generational identification. YouTube's algorithmic structure and participatory affordances not only shape content visibility, but also influence how nostalgia is curated, circulated, and collectively reinforced within digital subcultures.

Creators operate at the intersection of fan labor, informal media education, and archival practice, offering an affective, bottom-up reconstruction of video game history through the lens of personal and collective memory.

DCC19 Mediated Past, Present, and Future

PP 1043 Platformed witnessing: TikTok as an arena for new testimony practices

Yahav Tavasi[1]

[1] The Hebrew University Of Jerusalem, The Noah Mozes Department of Communication and Journalism, Jerusalem, Israel

Traditionally, witnessing refers to first-hand, retrospective accounts offered by those present at an event (Peters, 2001). While historically authorized by formal institutions (Or et al., 2023), digital-age testimonies are increasingly produced and shared by individuals within networked, algorithmically structured environments (Richardson & Zolkos, 2022; Wu & Montgomery, 2020; Rae et al., 2018). Existing scholarship has demonstrated that Instagram, YouTube, and Weibo afford distinct modes of testimonial performance (Sumiala, 2019; Henig & Ebbrecht-Hartmann, 2022; Wu & Montgomery, 2020). On TikTok, however, scholarship has primarily focused on mediated memory, examining how the platform's "playful" conventions are used to bear witness to distant historical events, most notably Holocaust remembrance (Divon & Ebbrecht-Hartmann, 2022; 2025). Far less is known about how TikTok's distinctive architecture, marked by immediacy and multimodality, shapes testimonies produced in the immediate aftermath of crisis.

To address this gap, this study examines witnessing on TikTok, focusing on testimonies uploaded by survivors of the Nova music festival massacre within the first four months following the Hamas attack on October 7, 2023. Data was collected

through hashtag and keyword searches across multiple devices. To ensure the corpus consisted of verifiable testimonial content, posts were filtered to include only direct first-person witnessing (Peters, 2001) or post-human testimony (Romeo, 2025). Guided by grounded theory, a thematic analysis of the audiovisual materials (Altheide & Schneider, 2013) inductively examined patterns of form across testimonies.

The analysis revealed five testimonial practices. One group of practices reconfigured established testimonial forms by adapting inherited witnessing conventions to TikTok's platformed environment. In *archival testimonies*, witnesses adapt documentary-style archival witnessing conventions to TikTok's short-form vertical format, reflecting an anti-spectacular visual ethic rooted in Holocaust testimony archives (Pinchevski, 2012). In *remediated televised testimonies*, users re-uploaded broadcast segments and reframed them for TikTok. The second group of testimonial practices was more directly shaped by TikTok's platform logic and affordances. In *selfie testimonies* survivors self-recorded and shared their account through a frontal selfie aesthetic. In *return to the field testimony*, survivors presented the event site post-humanly, asserting presence through added textual or audiovisual framing. In *post-factum human field testimony*, raw footages from the event was later uploaded and anchored as testimony through accompanying text. Finally, in *carousel testimony*, survivors and institutions create an unfolding narrative through multimodal slides of images, audio and text screenshots, inviting viewers to control the pace of progression and thus become co-producers of testimony.

Building on these insights, I propose the concept of "platformed witnessing," to describe a strategic platform-oriented process in which survivors and institutions craft and circulate their testimonies in ways that are attuned to platform norms, affordances, perceived audience expectations, and engagement metrics, in order to remain visible within TikTok's algorithmic attention economy (Ristovska, 2016; Abidin, 2020; Kligler-Vilenchik & Literat, 2024; Henig & Ebbrecht-Hartmann, 2022). The study advances the concept of digital testimony by showing that witnessing on TikTok is not merely mediated by the platform but actively produced through it, as witnesses and institutions increasingly professionalize their strategies to enhance the visibility and impact of their testimonies.

DCC19 Mediated Past, Present, and Future

PP 1044 Mourning Meta? A paraplatform reading enterprise social media sunsetting

Christoffer Bagger[1], Katie MacKinnon[1]

[1] University of Copenhagen, Department of Arts and Cultural Studies, Copenhagen, Denmark

Recent years have seen increased attention to the endings of digital platforms (McCammon and Lingel, 2022), with a particular focus on the loss of platforms which were meaningful to people in their personal or private lives (Corry, 2021; Edwards and Boellstorff, 2020; MacKinnon, 2022). This study builds on and departs from these trends to explore how the loss of specific media platforms might manifest itself in professional contexts. Given the increased media-dependent nature of work in general (Andrijasevic et al., 2021; Fast and Jansson, 2019; Plesner and Husted, 2020), this is a topic which deserves attention.

Our case study is the 2025 sunsetting of Workplace, developed by Meta Platforms Inc. As an enterprise social medium (Leonardi et al., 2013), Workplace was explicitly designed for intra-organizational use, making it a rare case of platform loss that affects not users-as-consumers, but users-as-workers. Its shutdown thus opens a window onto how professional identities and organizational memory are negotiated. Our research question is: *What forms of memorialization and mourning are afforded when a professional platform ends, and how are these expressed on other professional media?*

To this end, we analyze Meta's official documentation of the sunsetting of Workplace, as well as content analysis of a thread of LinkedIn comments (n = 362) reacting to the news of the sunsetting. Thus, we use LinkedIn as a methodological *paraplatform* (Steinberg, 2024), offering a vantage point for studying the sunsetting of the Workplace platform. Our content analysis will code for the different communicative valences of responses (nostalgic, regretful, incredulous, etc.), as well as the relation of the speaker to the platform (former user, competitor, former developer, former Meta employee, etc.).

In this paper, we demonstrate that while the sunsetting of a professional platform is often understood as a common and mundane occurrence in digital workplace ecosystems, for the workers, platform loss is more than mere inconvenience. Through analysis of Workplace users' platform eulogies (Mackinnon, 2022), workers also express loss of personal and institutional memory and a breakdown of community, not unlike the loss of more personal platforms. We contextualize this among the discussion about digital media like Workplace complicating the boundary between the personal and professional (Bagger, 2025; Schaefer, 2023). While the use of digital platforms in working life is often associated with either neutrality or hostility from their users (Bagger, 2021; Bonini and Treré, 2024; Nyman et al., 2024), these findings complicate and nuance such assumptions. In doing so, we broaden the scope of platform death studies to include grief not just of platforms, but of the professional selves they scaffold.

DCC19 Mediated Past, Present, and Future

PP 1045 The anticipation machines: Presentism and future-making in digital societies

Sabino Di Chio[1]

[1] University of Bari, Education Psychology and Communication, Bari, Italy

A paradox appears to characterize late modern societies: while contemporary culture is marked by presentism and the contraction of temporal horizons (Harvey, 1989; Hartog, 2015), digital technologies are persistently framed as engines of future-oriented transformation. How, then, is digital transformation restoring a sense of the future within a presentist society? This paper presents the results of a critical investigation of this question, conducted through a mapping of the main contributions in contemporary theoretical and social debate.

The analysis situates this transformation within the broader shift from modern temporal regimes characterized by an open horizon of expectations (Koselleck, 2004) to late modern forms of presentism, in which immediacy, uncertainty, and acceleration dominate social experience (Bauman, 2007; Rosa, 2013). Digital technologies emerge as responses to demands for temporal compression and control, while simultaneously positioning themselves as infrastructures of future-making and collective emancipation (Hassan, 2013; Balbi, 2022; Kitchin, 2023).

Within digital temporality, the future is increasingly enacted through "anticipatory systems" (Poli, 2019). Datification and predictive analytics function as "anticipation machines," transforming uncertainty into probabilistic certainty. In this context, AI systems operate combining historical datasets with real-time inputs to generate actionable predictions. These systems do not merely represent future possibilities but actively intervene in the present, shaping behavior, decision-making, and institutional practices (Kitchin, 2014; Zuboff, 2019). Prediction thus becomes a form of governance, concentrating power in the hands of those who control data infrastructures and narrowing the future to what can be extrapolated from past patterns. In this process, extrapolation replaces potentiality, privileging calculable futures over openness and plurality.

Building on this framework, contemporary digital societies can be understood as structured by a peculiar form of future-making, conceptualized as "regimes of anticipation" (Adam, Murphy, & Clarke, 2009). While anticipation constitutes a necessary mode of future-making that legitimizes action in the present (Anderson, 2010), its transformation into the central axis of a normative regime produces what Adam and Groves (2007) describe as "future present." This shift establishes an obligation to remain informed, vigilant, and prepared, turning anticipation into a moral and affective imperative. Emotions such as hope, fear, and alertness thus become key political forces, reshaping responsibility and redistributing risk from collective institutions to individuals (Poli, 2017).

Highlighting the ethical and political implications of Anticipation in areas such as consumption, reproduction, education, and governance, the paper argues for comparative empirical research on Anticipation as a communicative arena in which shared images of the future are constructed and translated into present action, emphasizing how unequal access to this arena reinforces existing social asymmetries.

DCC20 Rethinking Dis/Connectivity and Inequality

PP 1022 The disconnected citizen: Renegotiating civic participation beyond connectivity

Erika Walukiewicz[1], Krisitna Stenström[2]

[1] Södertörn University, Department of journalism, Stockholm, Sweden
[2] Karlstad University, Department of geography- media and communication, Karlstad, Sweden

This paper explores voluntary digital (dis)connection as a practice that redistributes civic engagement across interpersonal networks and analogue spheres. In the present media landscape, digital disconnection manifests the multifaceted ways individuals resist or disengage from digital technologies and forms part of a *zeitgeist* in which the initial celebration of digital omnipresence is increasingly problematized (Albris et al., 2024).

Citizens who disengage from digital platforms or algorithmic feeds do not necessarily disengage from civic life but reorganize how and where civic participation is enacted. Building on scholarship on distributed citizenship (Moe, 2020; Ytre-Arne & Moe, 2018), and the emerging "disconnection turn" in media and communication studies (Kuntsman & Miyake, 2019; Fast, 2021; Moe & Madsen, 2021; Bagger et al., 2024), the paper argues that voluntary disconnection should not be understood as civic withdrawal. Instead, democratic labor may be redistributed to less digitized spheres of everyday life,

such as interpersonal relations, social and professional networks, and analogue media practices, challenging assumptions that connectivity is a prerequisite for citizenship. Distancing may have implications not only for the disconnected individual but also for their close network, reshaping patterns of support and civic responsibility. This relational perspective draws attention to the distribution of resources, such as time, social capital, and gendered responsibilities within everyday life.

Drawing on interviews with individuals who identify as digitally disconnected and their close networks, this paper examines practices of voluntary digital (dis)connection in the light of ideas about a distributed citizenship. The paper examines participants' everyday media practices, motivations for disconnection, and strategies for remaining informed and civically responsive despite reduced digital connectivity. Particular attention is paid to how close social networks compensate for, are affected by, or actively enable disconnection, revealing its collective dimensions and the fragility of these arrangements, including reliance on interpersonal networks for information.

We conceptualize (dis)connection as complete or partial limitation of digital engagement, ranging from reduced smartphone use to withdrawal from social media or online news. By examining such practices, the paper explores how deliberate withdrawal challenges dominant norms of the "connected citizenship". Rather than treating connection and disconnection as binary, we frame (dis)connection as a dynamic space where civic participation and belonging are renegotiated across interpersonal and analogue networks.

DCC20 Rethinking Dis/Connectivity and Inequality

PP 1023 Digital disconnection and social inequalities: Toward a "stratified digital disconnection model"

Margaux Brecht[1]

[1] University of Salzburg, Communication Science, Salzburg, Austria

Over the past decade, research on digital disconnection has expanded significantly, producing a growing corpus of empirical studies that document diverse practices of digital non-use, limitation, and withdrawal within highly connected societies (Syvertsen & Vanden Abeele, 2016, 2025; Moe & Madsen, 2021). Despite this expansion, the field remains theoretically fragmented, with digital disconnection often conceptualised as an individual choice or lifestyle practice rather than as a socially patterned and structurally embedded phenomenon (Nguyen, 2023). This fragmentation limits our ability to systematically connect digital disconnection to broader processes of social inequality and digital disparity.

This paper contributes to ongoing efforts to theorise digital disconnection by developing an exploratory, integrative, and theory-building conceptual framework grounded in Bourdieusian sociology and in a critical synthesis of the existing literature. Building on Bourdieu's concepts of capital, field, and habitus, and informed by research on digital inequalities and digital capital (Ragnedda & Ruiu, 2020), this contribution proposes a **Stratified Digital Disconnection Model** as an innovative construct, that showcases how being connected and disconnected from digital media is unequally distributed across different social groups. This new framework highlights the implicit relationship between social inequalities and the ongoing oscillation between connection and disconnection, thereby rethinking how research in this field can be conducted.

Within this framework, digital resources, skills and dispositions constitute new forms of capital that operate within digitally structured fields shaped by platformisation, datafication and emerging AI-driven infrastructures. This theoretical contextualization of hyperconnected society contributes to the formation of a medial habitus that structures differentiated perspectives toward practices of connection and disconnection. Based on a critical review of the digital disconnection literature, the model conceptualises digital disconnection as stratified across varied positions, ranging from forced hyper-connectivity and constrained disconnection to more voluntary or privileged modes (Syvertsen & Vanden Abeele, 2025). This model presents an emerging framework that connects people's everyday practices of digital disconnection to broader social inequalities, showing how disconnecting online can either reinforce or challenge different forms of digital divide.

The Stratified Digital Disconnection Model could guide future research on the social and structural dimensions of digital disconnection and the multiple ways individuals experience and perform it.

DCC20 Rethinking Dis/Connectivity and Inequality

PP 1024 Digital spaces as sites of inequalities: Young people navigating technology-facilitated gendered violence

Chiara Gius[1], Claudia Capelli[1]

[1] Alma Mater Studiorum Università di Bologna, Political and Social Sciences, Bologna, Italy

Digital spaces have increasingly become the ground where contemporary personal, socio-cultural, and political life is built. As shifting digital terrains shaped by platforms, metrics, and algorithmic governance, these environments enable participation while simultaneously producing fragmentation and inequality (Hargittai, 2001; Hargittai & Micheli, 2019). This paper engages with these tensions by examining technology-facilitated gender-based violence (TFGBV) as a paradigmatic lens through which to interrogate the contradictory paths of contemporary digital cultures.

Drawing on feminist media studies (Jane, 2016; Powell & Henry, 2017; Ringrose et al., 2013; Wajcman, 2004), and socio-technical approaches (Castells, 1996; Couldry & Hepp, 2017; Elliot & Urry, 2010; Van Dijck et al., 2018), TFGBV is here conceptualised as a structural feature of platformised communication rather than an incidental misuse of digital tools. Digital inequalities and gendered violence are shown to be co-produced through platform infrastructures, algorithmic visibility, and normative cultures of interaction that unevenly distribute voice, exposure, and risk (Hall et al., 2023; 2024). Digital inequalities and gender-based violence are deeply intertwined: digital environments simultaneously enable new forms of expression and participation, while exposing women and girls to heightened risks of harassment, surveillance, coercive control, and symbolic violence. These dynamics contribute to processes of self-regulation, silencing, and withdrawal from public digital spaces, with broader implications for democratic participation and digital citizenship.

The paper presents empirical findings from Italy's largest national research programme on Technology-Facilitated Gender-Based Violence, involving two universities (the University of Bologna and the University of Salento) and one research centre (CNR-IRPPS). While the wider programme also examined media narratives, institutional framings, and prevention campaigns, this paper focuses specifically on the adolescents' and young adults' stream. Drawing on 18 focus groups conducted with participants aged 13–22 (N = 105) across three Italian sites (Bologna, Lecce and Padova), the study employs thematic analysis to explore how young people interpret, negotiate, and respond to gendered harm in everyday digital environments.

Three interconnected dynamics emerge. First, young people navigate a care–control hinge, where practices such as location sharing, password exchange, and device access are framed as intimacy, normalising surveillance within relationships. Second, gendered hierarchies, expressed through double standards, male-gaze logics, and uneven reputational consequences, structure experiences of visibility and vulnerability. Third, while participants describe hostile online environments and algorithmic pressures, platforms are rarely recognized as actors shaping risk, enabling tool-neutral explanations, and reinforcing individualized responsibility.

By situating young people's experiences within broader socio-technical arrangements, the paper contributes to the debate on digital cultures as contested grounds. It argues for imagining alternative digital futures that address platform power, visibility regimes, and inequality as cultural and communicative issues rather than individual failures.

DCC21 Approaches to Researching the Digital

PP 1143 Modeling digital cultures: A scoping review of agent-based models simulating social media phenomena

Aytalina Kulichkina[1], Daisuke Nakamura[1], Taehee Kim[2], Jula Lühring[1], David Garcia[2], Dongyoung Sohn[3], Annie Waldherr[1]

[1] University of Vienna, Department of Communication, Vienna, Austria
[2] University of Konstanz, Department of Politics and Public Administration, Konstanz, Germany
[3] Hanyang University, Department of Media & Communication, Seoul, Republic of Korea

Communication research has advanced our understanding of individual-level processes in digital media communication, yet these insights are rarely linked to meso- and macro-level outcomes relevant to the field, including polarization dynamics, misinformation spread, and public opinion formation. Agent-based modeling (ABM) offers a powerful approach to bridging this gap by linking micro-level interactions to emergent macro-level phenomena (Waldherr et al., 2021). It also enables researchers to better understand the behavior of complex systems, explore key conditions and parameters, and generate hypotheses for future empirical research (Eberlen et al., 2017). Despite its potential, the application of ABM to social media research remains fragmented and underexplored in the social sciences. In this study, we systematically review how ABM has been applied in neighboring fields to study social media phenomena and offer a comprehensive foundation for building on existing models. Our analysis is based on 196 peer-reviewed journal articles and conference proceedings published through 2025 and indexed in EBSCO, Web of Science, and Scopus.

We find that most studies simulate social media platforms without attending to specific platform affordances and features, focusing instead on how users communicate (e.g., via weak or strong ties), how online networks are structured (e.g., scale-free or small world), and how users interact on platforms (e.g., post, comment, react, share). When a specific social media platform is modeled, researchers often draw on empirical data to inform the model, with Twitter (n = 52) and Facebook (n = 19) being the most commonly represented. Considering the wide variety of platforms examined in communication studies, we observe a notable lack of models for popular sites, including Reddit (n = 7) and YouTube (n = 4), as well as

Instagram, TikTok, and LinkedIn. Popular platforms in non-Western countries, such as Weibo (n = 14) and KakaoTalk (n = 1), also warrant further exploration, given their unique affordances and features.

The majority of studies focus on the following four outcomes: opinion and attitude dynamics, information and content diffusion, network properties and structural outcomes, and collective action. To model these phenomena, studies commonly employ opinion dynamics or epidemiological frameworks (e.g., bounded confidence, Susceptible-Infectious-Recovered). Occasionally, theories from sociology and psychology are used to inform agents' decision-making processes and behavior. However, theories commonly used in communication research, such as diffusion of innovation (Rogers et al., 2019) and the spiral of silence (Noelle-Neumann, 1974), are applied only rarely.

Our findings highlight the potential of ABM for modeling digital spaces and communication, while also calling for more diverse contributions from social scientists. Current applications often rely on assumptions from computer science, engineering, mathematics, and economics, often overlooking well-established theories and empirical insights from communication research. To address this gap, we recommend building on existing models by integrating insights from communication theory and empirical findings to enhance the explanatory power of models and contribute to the development of hypotheses and multi-level theories in the field. Through this work, we aim to encourage the broader adoption of ABM in communication research and provide a practical entry point for scholars studying digital cultures and communication.

DCC21 Approaches to Researching the Digital

PP 1144 Fading footprints: A multi-platform comparison of what social media keeps and deletes over five years

Katharina Maubach[1], Jakob Juenger[1], Johanna Stahl[1], Annabell Jendrilek[1]

[1] University of Muenster, Department of Communication, Muenster, Germany

"The Internet never forgets" is a widely coined phrase used to describe the web's presumed archiving function. The underlying myth suggests that once information is published online, it remains accessible indefinitely. However, research on deletion of platform data has repeatedly demonstrated that online content is regularly modified or deleted (see, f. e. Knöpfle & Schatto-Eckrodt, 2024), often by users themselves (Almuhimedi et al., 2023) or as a result of moderation activities by platform providers following violations of terms of service (Kurdi et al., 2021). To date, only a handful of studies (e.g. Tinati et al., 2017; Almuhimedi et al., 2023; Kurdi et al., 2021) have examined these deletion practices, despite their substantial implications for subsequent analyses, results and interpretations (Bühling, 2024). Moreover, existing studies differ in terms of the analysed timeframes, platforms, and research topics, while typically focusing on singular platforms. To develop a more comprehensive picture of deletion practices, our study examines five social media platforms and addresses the following research questions:

1. Method stability – to what extent have access conditions for online data collection changed, and which access routes remain available?
2. Content stability – to what extent is content still available, what proportion of data has been lost, and what platform-, message-, and content-related factors are associated with unavailability?

Empirically, we revisit a five-year-old dataset comprising posts and comments from five platforms – Facebook, Instagram, YouTube, Twitter/X, and Disqus – collected over a three-month period from the accounts of all German news organisations (N = 3,814,366 messages). We assess the continued availability of posts and comments and compare available versus unavailable messages to identify systematic patterns in missing data. In addition, we inductively code and analyse a subsample of messages (n = 2,071 comments) to examine content-related differences between available and deleted content that may indicate potential reasons for deletion.

Our findings reveal pronounced platform-specific differences in both access conditions and deletion rates, ranging from minimal losses on Instagram to substantial attrition on Disqus and severe access restrictions on Twitter/X. The content analysis of comments suggests that political and potentially sensitive content is disproportionately affected by moderation-related removals. In addition, we identify systematic data losses resulting from platform exits, such as organisations discontinuing their presence on a platform. This phenomenon is particularly evident on Disqus, where all missing posts can be attributed to organisational exits.

Overall, our results demonstrate that data collection practices and data disappearance are closely intertwined with platform-specific architectures, access regimes, and moderation practices. Revisiting the original dataset further highlights that long-term accessibility cannot be taken for granted, even when researchers attempt to replicate their own data collection workflows. At least with regard to research access, the internet "forgets" substantial amounts of data. These findings underscore the importance of systematically assessing data attrition across platforms and of developing robust measures of sample quality to support sustainable and reliable research using online communication data.

DCC21 Approaches to Researching the Digital

PP 1145 Rethinking digital sovereignty

Marwan Michel Kraidy[1]

[1] Northwestern University, Northwestern University in Qatar, Doha, Qatar

The growing debate on digital sovereignty has been restricted to states, corporations, social movements that are legally and socially recognized as legitimate actors, notwithstanding their agendas, practices, and impacts.[1] In contrast, this paper examines "rogue digital sovereignty." If digital sovereignty is "the exercise of agency, power, and control in shaping digital infrastructure, data, services, and protocolos"[2] by legitimate actors, "rogue digital sovereignty" refers to sovereign claims or actions over infrastructure, access, and content by groups in violation of legal, political, and ethical norms.

Like their legitimate counterparts, rogues assert sovereignty over digital infrastructure and content in two realms. The first, inward-focused is sovereign monopoly control over a territory—physical or virtual—and the population therein. The second, outward-focused is the professed need to protect territory under sovereign claims from external influence, intervention, or threat.

Theorizing "rogue digital sovereignty" lays bare the unresolved tensions of "digital sovereignty": interaction between sovereign dominions and the international system; tension between the ideal of sovereignty and its frequent violation by digital superpowers like the United States and China; platform and cyberspace sovereignty, and most importantly, the extension of sovereignty by digital networks beyond territory and infrastructure all the way to the human body. To theorize "rogue digital sovereignty" is to get a better grasp of processes of the "delinking [of]sovereignty and geography" that lead to an "indeterminacy of outcomes."[3]

I focus on digital sovereign claims by "Islamic State" and Western White Power, examining a corpus of Arabic, French, and English primary sources (manifestos, maps, currencies, drone footage, infographics, videos). Under the rubric of "rogue sovereignty," I compare these claims to those of nation-states (the US on Greenland; Russia on Ukraine; China on Taiwan) skirting international law.

Drawing on Bataille to analyze the data corpus described above, this article conceptualizes a new typeof digital sovereignty produced through digitally mediated affective manipulation.[4] This broadens the debate on digital sovereignty, and more broadly, sovereignty *tout court* in the digital age.[5]

DGR01 Understanding Player Experiences

PP 0098 How does the community spark? Network role and discourse function in Animal Crossing: New Horizons community

Jinju Kim[1], Vivian Hsueh Hua Chen[1]

[1] Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

Traditional models of online community formation often rely on linear teleologies, such as Tuckman's "forming-storming" sequence or Lave and Wenger's "Legitimate Peripheral Participation" (LPP), which assume a gradual evolution toward stability and core membership. However, recent scholarship challenges these container-based, evolutionary views, proposing instead that digital communities function as multi-space assemblages characterized by accelerated cyclicality. Notably, gaming communities often exist simultaneously across games, Discord, forums, and other platforms, using different tools as their needs change, which produces branching, overlapping community configurations rather than a single, bounded progression. To understand how gaming communities function as adaptive systems, this study examines the sociotechnical dynamics of the Animal Crossing: New Horizons (ACNH) Discord community, drawing on Adaptive Structuration Theory (DeSanctis & Poole, 1994) and Expectancy Violation Theory (Burgoon, 1993).

Methodologically, we employed a mixed-methods approach combining Social Network Analysis (SNA) with Structural Topic Modeling (STM) to examine the co-emergence of network roles and discourse functions in 15,245 messages from 1,229 users during its founding week (May 23–31, 2021). We constructed directed interpersonal interaction networks, calculating degree centrality, betweenness centrality, and in/out message ratios to classify users into network roles: Bridgers (4.1%), Generators (7.0%), Socializers (13.9%), and Peripherals (71.9%). STM analysis showed the discourse patterns of six community functions: knowledge sharing, community moderation, boundary work, solidarity and support, social grooming, and cultural production. By analyzing network role-discourse function interactions across time, we reveal the structural dynamics of community formation invisible to network analysis or discourse modeling alone.

Our analysis yields three findings that illustrate a recursive model. First, we observed immediate role structure crystallization rather than gradual evolution. The absence of significant Role-Day interactions indicates that functional hierarchies emerged swiftly through self-selection rather than socialization. Second, we redefine the "lurker" by validating the "Stable Peripheral" as a permanent, functional niche. Peripherals provided essential knowledge exchange and event coordination, challenging the deficit model of peripheral participation. Meanwhile, Bridgers dominated community moderation and cultural gatekeeping despite modest network centrality. Third, we identify "Affective Misalignment" as the primary driver of early attrition. We found that deleted users exhibited paradoxically higher engagement intensity and emotional labor (vulnerability disclosure) than retained users. Their departure resulted from a negative expectancy violation, where the community's instrumental capacity failed to reciprocate their affective investment, creating a reciprocity deficit during a period of heightened psychosocial need. Conversely, persistent users established multilayer relational portfolios spanning instrumental exchanges (game mechanics, trading networks) and affective practices (social grooming, daily life disclosure). These findings suggest that online communities are not developmental ladders but recursive assemblages, where success depends on the rapid alignment of individual affective needs with available sociotechnical infrastructures.

DGR01 Understanding Player Experiences

PP 0099 "Thinking and feeling it out:" Applying the interactivity-as-demand model to formal playtesting of in-development AAA games

Lily Klinger[1], Nicholas Bowman[1]

[1] Syracuse University, S.I. Newhouse School of Public Communications, Syracuse, USA

The interactivity-as-demand framework (Bowman, 2018; 2021) examines how video game players make sense of the myriad demands on their cognitive, emotional, physical, and social faculties during game play. Broadly, the framework both (a) isolates and specifies discrete demands (e.g., cognitive demands associated with solving in-game challenges; emotional demands associated with player immersion in game-worlds and narratives; physical demands associated with control systems requiring gross and fine motor skill; social demands associated with interacting with human and non-player characters), and (b) specifies their mediating relationship between specific game features and focal gaming outcomes (for examples, see Wulf et al., 2019; Bowman et al., 2021; Lin et al., 2023; Vo et al., 2024).

User perception of these demands is essential to understanding user experiences in video games and has potential to improve the quality of playtesting data essential to game development (Viktorov, 2015). The interactivity-as-demand

framework is compelling insofar as it directly implicates the role of player perceptions in game engagement, demonstrating where and how players are "taking up" myriad game features in ways that compliment or hinder desired gaming outcomes. By identifying player demands of in-development video games, studios can more quickly understand the extent to which design intentions match player perceptions and adjust accordingly.

Collaborating with an AAA game studio, we analyzed recordings of 25 playtesting sessions across three soon-to-be-released video games. Sessions were between 90 minutes and two hours, followed by semi-structured interviews based on the interactivity-as-demand framework, analyzed via thematic analysis (Braun & Clarke, 2006).

Across all three games, physical and social demands were minimal—aligning generally with the rather basic controls (mouse and keyboard or game controller) and single-player gaming formats. However, cognitive and emotional demand experiences varied between genres such that:

The puzzle/strategy game [anonymized, *n* = 7] elicited the highest cognitive demands, as participants described gameplay as planning and cerebral processing. Emotional demands were primarily connected to the fun of solving increasingly difficult puzzles.

For the action/platformer game [anonymized, *n* = 9], cognitive demands were also high, as participants focused on learning curves and timing coordination, along with developing plans for "boss fights." Emotional demands were low but did spike on occasion, oscillating between frustration and fun. For *n* = 8 players who played more than once, cognitive and emotional demands decreased steadily over time (e.g., across multiple interviews). Notably, players reported little connection to the in-game characters or narrative, focusing on game mechanics over game narrative.

For the ball-and-paddle game [anonymized, *n* = 7], participants' emotional demands dominated the cognitive demands of in-game challenges. Game mechanics were seen as uncomplicated and "straightforward," but participants felt that the game's intense music and visuals were overwhelming and discomforting. In-game "power-ups" were complicated, and the game's aesthetics made it difficult to focus on the game action itself (e.g., "where is the ball?").

Future research includes secondary analysis of recorded gameplay footage to synchronize with emergent themes, as well as interviews with game developers to see how playtesting data influenced in-progress game design. Replication is already planned across more in-development games for comparative analysis.

DGR01 Understanding Player Experiences

PP 0100 Validating the video game demand scale in Polish - Exploring demand perceptions and cross-worlds experiences among Polish gamers

Karolina Brylska[1], Marcin Łączyński[1], Nicholas Bowman[2]

[1] University of Warsaw, Faculty of Journalism- Information and Book Studies, Warsaw, Poland
[2] Syracuse University, S.I. Newhouse School of Public Communications, Syracuse, USA

The Video Game Demand Scale (VGDS, Bowman et al., 2018) operationalizes the interactivity-as-demand framework by measuring players' perceptions of cognitive, emotional, physical (controller and exertional), and social demands during gameplay. While VGDS has been successfully validated across multiple languages - German (Koban & Bowman, 2020), Mandarin (Bowman et al., 2021), Turkish (Kosa & Bowman, 2023), Korean (Lee et al., 2023), and Spanish (Lee et al., 2025), no Polish-language version exists. This validation is particularly warranted given Poland's prominent position in the European gaming market. The Polish gaming industry generated over €1 293M in 2024 (PARP; "The Game Industry of Poland Report 2025"), with approximately 16 million active players representing nearly half the population ("Global Power of Play 2025"). Despite this substantial market presence, Polish gamers remain underrepresented in international research (Linxen et al., 2021). While Poland shares many characteristics with Western European countries, distinctive cultural patterns relevant to video games— a robust LAN-party culture, strong offline gaming communities, and pronounced national pride in successful Polish development studios (e.g., CD Projekt Red, Techland) warrant investigation.

We want to present a cross-sectional online survey study (N = 260–300), currently in progress, employing a sequential explanatory mixed-methods design to validate a proposed VGDS-PL. The quantitative component will establish measurement validity through confirmatory factor analysis, alongside the validity tests, following protocols from previous VGDS validations. The study incorporates two distinctive qualitative components extending beyond traditional psychometric validation. First, following the Spanish-language validation approach (Lee et al., 2025), participants will explain in their own words how they understand each demand dimension. This allows verification that Polish gamers interpret VGDS constructs as intended, while also identifying potential culturally driven reinterpretations or nuanced shifts in meaning. Second, we introduce an exploratory investigation of cross-worlds experiences - the phenomenon of transferring experiences, relationships, knowledge, and identities between game worlds and everyday reality (CITE?) Participants will respond to open-ended questions examining social boundary crossing between online and offline relationships, gaming's influence on daily life and skill development and integration of gamer identity with real-world self-concept. This investigation draws on established concepts - games as "third places" (Steinkuehler & Williams, 2006), avatar-player identity blending (Banks, 2015), and game transfer phenomena. As with prior VGDS work, all materials, data, and analysis code will be openly shared following Open Science principles.

Mixed-methods integration will enable triangulation between quantitative demand-outcome correlations and qualitative descriptions of mechanisms, complementarity between standardized measures and rich contextual accounts. This work provides important contributions to digital games and HCI scholarship. Methodologically, it provides direct replication while extending empirical scope to non-WEIRD populations underrepresented in HCI scholarship broadly (Linxen et al., 2018) . Theoretically, it tests the cross-cultural validity of the interactivity-as-demand framework, while exploring the cross-worlds phenomena in the context of specific demand types. Practically, it delivers a validated assessment tool for Polish researchers and game industry professionals. Finally, by systematically documenting Polish gaming experiences, this work contributes to a more complete, globally representative understanding of player psychology.

DGR01 Understanding Player Experiences

PP 0101 Gaming in a shifting life situation. A quantitative study on digital game usage and gaming motivations of young people with cancer

Ruth Kasdorf[1]

[1] Hochschule Wismar, Fakultät Gestaltung, Wismar, Germany

A cancer diagnosis and treatment can be one of the most pressing challenges, disrupting one's life in various aspects, including activity restrictions, impact on social life, and emotional coping (Sodergren et al., 2018). In times of physical limitation, isolation, and mental distress due to the illness, video games can be a helpful resource for many people. Various studies examined the impact of digital games in the context of cancer: They can provide entertainment and distraction for those affected (e.g., Steineck et al., 2022), enable social interaction even while being in physical isolation, and help the development of personal skills and one's identity (e.g., de la Hera & Sanz, 2021). In terms of active video games, gaming can improve physical activity (e.g., Swartz et al., 2022), and regarding serious games about cancer, it can educate players and raise awareness of the illness (e.g., Khalil et al., 2016). However, most studies focus on children or older adults, with young adults (18–39 years) often being overlooked. So far, there has been no examination of how people with cancer in this age group use digital games.

In the present study, an online survey was conducted between 2022 and 2023. Via social media posts, a total of $N = 190$ participants, young people with cancer ($n = 91$) and healthy peers ($n = 99$) were recruited. The questions included gaming preferences regarding platform, genre and specific game titles, reception and production of livestreams and let's plays, as well as game motivations related to social interaction, genre, skills & progress, game world and reality (cf., Bartle, 1996; Hunicke et al., 2004; Yee, 2006; Sherry et al., 2006; Kallio et al., 2011).

The findings demonstrate significant differences between healthy players and those affected by cancer, with the latter showing a preference for less action and social interaction in the gameplay, while being drawn more to mobile games and consoles, as well as games that require logic and concentration. Overall, the illness, for those participants who have been affected by cancer, did not lead to less time spent gaming. The findings contribute to a better understanding of how young people with cancer use digital games, which can help improve their gaming experience in the future (e.g., more inclusive and target group-oriented game development).

DGR01 Understanding Player Experiences

PP 0102 Between empowerment and constraints: Understanding the promise of video games in women's lives

Katharine Sarikakis[1], Ayca Becerir[1], Oleksandra Gudkova[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

This study investigates the extent to which video games can change women's lives and empower them, exploring how video games play a role in identity formation, social connection, and cultural participation. Current research outlines gaming as a space that empowers women by highlighting opportunities for identity exploration, social belonging, and skill development (Lopez-Fernandez et al., 2019). Both online and offline gaming environments offer women new spaces to challenge gender norms and claim visibility within an industry shaped by masculine norms.

At the same time, feminist and critical media scholars caution against overstating the video game's empowering power for women by highlighting the structural issues that limit this power. Video games may bring individual empowerment and a sense of belonging, yet they may also simultaneously reproduce broader structural inequalities related to race, class, and gender (Gray, 2014; Nakamura, 2009). In this context, while women's representation has been drawing much more attention, it is often shaped by market logics that favour surface-level diversity over substantive structural change (Shaw, 2015). Similarly, diversity initiatives primarily remain market-based strategies for success and mostly place the responsibility on the shoulders of individuals rather than institutions and social conditions (Harvey & Fisher, 2014). Under such conditions, inclusion and women's visibility risk becoming a narrative of empowerment that is folded into corporate diversity agendas, leaving entrenched inequities largely untouched.

Recognising both the benefits and limitations of video games in women's lives, this paper examines how video games influence women's lives and gender relations by focusing on both video game environments and industry conditions. While digital play is frequently framed as a site of innovation and empowerment, this study questions whether these spaces

truly challenge gender hierarchies or implicitly continue these issues in order to reach wider audiences. To examine these questions, the study employs semi-structured, in-depth interviews that ask participants to reflect on their lived experiences within video game environments and the broader industry. By conceptually distinguishing between individual and structural change, the paper critically analyses whether innovation in video games contributes to meaningful progress in gender equality and societal values, or merely sustains longstanding disparities under the rhetoric of personal empowerment.

DGR02 Problematic and Risky Aspects of Gaming

PP 0203 Gaming, gambling, and crypto: Masculinity and risk perception

Faltin Karlsen[1]

[1] Kristiania University of Applied Sciences, Department of communication, Norway, Norway

One topic that has received increased attention over the past decade is the integration of gambling-like elements in video games, especially in the form of so-called loot boxes (Zendle et al. 2019, Xiao et al. 2020). Parallel to the gradual blurring of the boundaries between gaming and gambling, a convergence is taking place in parts of the media sector and gaming culture. This is particularly visible on digital platforms such as Twitch and YouTube, where influencers and streamers increasingly publish both gaming-related and gambling-related content. Twitch, originally a platform for streaming video games, now hosts a substantial amount of gambling streams.

American and European studies show that teenage boys and young men spend nearly five times as much time on games and that gaming plays a central part of male identity (Jørgensen and Lindtner 2024, Karlsen 2013). The aim of the project is to investigate how the blending of gaming, gambling, and financial speculation manifests within male culture. The primary focus is on boys and young men aged 16–24. This age group was chosen to study a life stage in which young men transition from economic dependence on their parents to taking independent responsibility for their own finances. The analysis will consist of two datasets: interviews with boys and men aged 16–24, and a selection of live-stream recordings from YouTube and Twitch, subject to a discourse analysis (Fairclough 2003). The project will examine the following research questions:

RQ1: How do boys and young men describe their experiences with digital arenas and livestreaming where gaming, gambling, and cryptocurrency speculation take place?

RQ2: How do Norwegian influencers contribute to normalizing the connection between gaming, gambling, and financial risk-taking among boys and young men?

The study is in its initial stage with preliminary findings from the streaming material. These findings indicate that influencers frequently discuss and model risk-taking behaviors, including high-stakes gaming, betting, and cryptocurrency speculation. Their commentary often frames these activities as exciting, socially rewarding, and aspirational, potentially shaping viewers' perceptions of acceptable financial risk. Viewers actively participate in chats, providing real-time feedback, encouragement, or tips related to gambling and speculative activities. This interaction appears to foster a sense of community around high-risk behaviors.

DGR02 Problematic and Risky Aspects of Gaming

PP 0204 Why we game matters: The role of gameplay motives in engaging with gambling-like elements in and around video games

Eva Grosemans[1], Rozane De Cock[1], Aaleks Kasemi[1], Bieke Zaman[1]

[1] KU Leuven, Media Culture and Policy Lab, Leuven, Belgium

Gambling has been entering the world of video games, resulting in an early engagement with gambling-like elements in and around video games. Examples include skin betting, eSports betting, and loot boxes. As there is some evidence that engaging with these elements could lead to gambling in adolescents (Grosemans et al., 2025; Hayer et al., 2018), it is important to explore the drivers behind this engagement. In this light, we explore the connection between video gaming motives and gambling-like engagement in and around video games. In the past, motives such as escapism and competition have been shown to predict problematic video gaming (Király et al., 2023). However, research on the connection between these motives and gambling-like gaming is lacking.

684 Dutch-speaking adolescents (ages 16–19, mean age = 16.62, SD = 0.66; 54.93% male) took part in a school survey in October-December 2025 on video gaming motives (measured by the Motives for Online Gaming Questionnaire; Demetrovics et al., 2011) and gambling-like engagement in and around video games ("free" engagement: opening of free loot boxes, watching loot box openings, watching gambling streams, and spinning prize wheels; and "paid" engagement: paying for loot boxes, eSports betting, skin betting, paying for items in social casino games). The study received ethical consent beforehand (anonymized). Three multiple regression models were computed in RStudio, in which video gaming motives (social motives, escapism, competition, coping, skill development, fantasy, and fun) were entered as independent variables, next to gender as a control variable, and gambling-like engagement as dependent variable (all activities in the first model, free activities in the second model, and paid activities in the third model). In the first model, social motives ($\beta = .09$), escapism ($\beta = .16$), competition ($\beta = .09$), and video gaming for fun ($\beta = .18$) significantly predicted gambling-like engagement (all $p < .05$; adjusted $R2 = .23$). Next to that, in the second model, escapism ($\beta = .17$) and fun ($\beta = .23$) predicted free gambling-like engagement (all $p < .001$; adjusted $R2 = .23$). Regarding paid gambling-like engagement (third model), social motives ($\beta = .14$) and competition ($\beta = .09$) were significant predictors (all $p < .05$, adjusted $R2 = 0.08$). Gender was a significant predictor in all models, with boys scoring higher on gambling-like engagement than girls (all $p < .001$). Longitudinal research is needed to discern the direction of effects, and to study whether free gambling-like engagement could lead to paid engagement in the long run.

In conclusion, different types of video gaming motives could predict different types of gambling-like gaming in and around video games. While escapism and video gaming for fun could predict free gambling-like engagement, social motives and competition predict paid gambling-like engagement. It could therefore be of importance to not only look at video gaming behavior itself when researching the effects of gambling-like engagement, but also at why adolescents play video games.

DGR02 Problematic and Risky Aspects of Gaming

PP 0205 Playing Fortnite: The relevance of different types of literacy for purposeful engagement with a gaming metaverse

Max De Baey-Ernsten[1], Sven Joeckel[1]

[1] University of Erfurt, Seminar for Media and Communication, Erfurt, Germany

Contemporary video games have evolved into metaverse-like ecosystems where social play, entertainment, participatory culture, and complex in-game economies converge. In such platformized environments, user-generated content (UGC) plays a central role, while gaming activities extend to game-adjacent platforms (e.g., Discord and Twitch). The creation of UGC – whether in-game content or a stream on Twitch – is often marketed with the promise that users can monetize their creativity. This blurs the boundaries between play, labour, and consumption under the logic of digital capitalism. While metaverse-like gaming spaces offer opportunities for connection, they expose players to financial risks. Fortnite serves as a prime example of this development. In our study, we adopt a literacy perspective to understand how different types of literacy prepare gamers to navigate the universe of Fortnite.

We focus on the roles of New Media Literacy (NML), as a specific type of media literacy, and Economic Literacy (ECL) as a more general competence related to the economic aspects of games such as Fortnite. NML encompasses functional and critical competencies in both consumption and prosumption, and while prior research has largely applied NML to journalistic content or general social media, we test its relevance for a metaverse-like game. Additionally, we employ a definition of ECL involving knowledge of economic systems and responsible decision-making.

Our empirical study then tests whether these two types of literacies help players mitigate risks (monetary spending) and realize positive outcomes, specifically Fortnite-specific Social Capital and economic profit. As an empirical basis, we conducted an online survey with Fortnite players in Germany (max. N = 275), measuring weekly playtime, expenditures, income, and literacy levels. Using hierarchical regression analysis, we reveal the ambivalent role of the two types of literacy.

Results confirm that higher playtime predicts higher expenditure. However, ECL acts as a crucial buffer, significantly attenuating this link. In contrast, NML demonstrates a complex interaction: while it lowers spending directly, high NML combined with high playtime increases expenditure. This suggests that highly literate "prosumers" may invest financial capital to fuel their participation. Regarding positive outcomes, NML positively predicts bonding Social Capital, whereas ECL is negatively related to bridging Social Capital. Notably, despite the presence of a few top earners in our sample, neither literacy predicted economic profit generally.

Our study faces limitations regarding high dropout rates and a sample skewed toward highly engaged, male players, reflecting the specific difficulty of recruiting players who had spent money within platformized environments. We conclude with a) a discussion on the perspectives for conducting user-centred research in a gaming context, and b) an elaboration on further methodological aspects, such as non-linear moderation effects and reciprocal dynamics between literacy, social capital, and expenditure. These aspects may better explain the complex impact of different types of literacy on gaming behaviour. As an outlook, we raise the question: Can different types of literacy effectively protect users against the vast power asymmetries of platform capitalism, or do they merely facilitate deeper integration into its commercial logic?

DGR02 Problematic and Risky Aspects of Gaming

PP 0206 The exploitation of incivility. Performing negative emotions as a mean of audience engagement in game video content on Twitch and YouTube

Federico Gorziglia[1], Stefania Parisi[1]

[1] La Sapienza- University of Rome, Communication- Methods and Marketing, Rome, Italy

In the attention economy (Terranova 2012) that characterizes the current media system – particularly the digital platforms ecosystem – the study of incivility as a strategic resource to attract (and retain) the audience interest has mainly focused on political communication (Muddiman et al. 2017; Bentivegna, Rega 2024), highlighting how behaviors and language associated with an aggressive and even violent discursive style align with one of the core values of the media logic – that of entertainment. Building on these premises, and drawing on research from different media environments, this contribution aims to investigate how frustration and rage, key elements of the flow experience in specific videogame genres (Csìkszentmihályi, 1997; Juul 2013), can be exploited by Twitch streamers and YouTube content creators.

The research develops from previous studies on how the gamer communities support each other through social media (Gee, 2005; Robinson et al., 2023) and shifts the focus on streamers who deliberately ignore the advice of their audiences, intentionally increasing the difficulty of the games, to enable the performance of violent acts of frustration and rage. We consider this performance as relational, affective and emotional labor (Hochschild, 2012; Baym, 2015; Johnson & Woodcock, 2019) that the streamers need to perform to keep the viewers engaged. Furthermore, in a peer-to-peer environment (Kreissl et al., 2021) like Twitch and YouTube, these acts enhance the streamers' perceived authenticity (Anderson, 2017; Postigo, 2021), strengthening the relationships with their audience. We also examine the digital labor performed by some viewers to shift their social status from simple audience member to "affiliated" content creator by freebooting[1] live moments for their own YouTube channels, gaining recognition by the live streamers and their community (Marwick, 2015; Raun, 2018; Jackson, 2020).

We adopt a netnographic approach, focusing on a comparative analysis of two types of YouTube channels: six "official" freebooting channels that reupload edited Twitch streams of Italian content creators, generally perceived as well-mannered yet nonetheless display sudden or recurrent outbursts when playing rage-inducing games; and four multilingual channels that upload playlists compiling rage moments from different gaming streamers. The resulting dataset, comprising approximately two Video on Demand from each channel, will support a multimodal discourse analysis (Andersson, 2024) examining both the audiovisual dimensions of game-related content and the interactive affordances of the platforms. This includes: examining the embodied movements and the read, read-aloud, and respond mechanisms (Reed, 2024) afforded by Twitch, through which rage can be identified as sporadic and intentional performance enacted by the streamer in response to live gameplay and chat comments; analysing conversations in the YouTube comment sections to understand the type of engagement generated by rage, frustration and incivility in game video content. Comparing these different kinds of freebooting channels highlights how this practice exploits the affective and emotional streamer labor through the spread of memetic media (Jackson, 2020) to foster a vicious cycle of incivility and a virtuous cycle of engagement between platforms.

1. Freebooting is the act of posting other people's original content online for personal gain, without permission of the content creator (Urban Dictionary).

DGR03 Games Between Industry, AI, and Platformization

PP 0316 Shifting grounds of game journalism: Role orientations, platformization, and professional challenges in German-speaking media

Benjamin Bigl[1]

[1] Technische Universität Dortmund, Journalism, Dortmund, Germany

Game journalism has become a key interface between cultural reporting, technology communication, and participatory platform labor, yet its working conditions remain underexplored—especially in European contexts. Building on the Game Journalism Field Model (Bigl, 2023) and a communicative-ecology perspective grounded in field theory (Bourdieu, 1993), this paper examines how people who report on games in German-speaking media navigate shifting professional boundaries under platformization (Nieborg & Poell, 2018) and journalism's broader post-institutional transformation (Deuze & Witschge, 2018; Nieborg & Foxman, 2016).

We draw on a sequential mixed-method design. First, 16 semi-structured interviews with journalists and creators portrayed in 2025 game journalism as a profession marked by informal entry routes, autodidactic skill acquisition, and continuous boundary work vis-à-vis PR, fandom, and influencer cultures. Respondents frame legitimacy through cultural mediation ("journalism about games, not fan journalism") and treat transparency and credibility as professional currencies. At the same time, they describe persistent tension between editorial standards and platform pressure, as well as precarity and access dependence (review conditions, embargoes). The qualitative analysis identified four recurring role orientations: Cultural Translator, Public Service Specialist, Independent Analyst, and Participatory Mediator (Bigl, 2025).

Second, the study at hand now reports findings from an ongoing anonymous online survey. Because no directory of game journalists or game-related creators exists, recruitment follows a snowball strategy: approximately 120 editorial teams and outlets were contacted and asked to forward the invitation to relevant staff and collaborators, which also explains the extended field period. As of 8 January 2026, 42 completed cases are available (indicative only). Among respondents, Top-2-box agreement (4–5 on a 1–5 scale; averaged per role) is highest for the Public Service Specialist (70%) and Cultural Translator (60%), followed by the Independent Analyst (50%) and Participatory Mediator (40%). Platformization indicators are pronounced: 70% agree that visibility fluctuates strongly without their own doing. Future-oriented challenge items show concern about structural dependencies on advertising/cooperations/platforms, 90% agree that reach is only partly planable due to platform mechanisms, and 80% perceive games as still insufficiently recognized as cultural goods. Notably, none expresses optimism that the field will professionally develop.

Overall, game journalism is conceptualized as a "shifting ground" profession whose legitimacy is increasingly negotiated between cultural expertise, platform governance, and hybridized roles. Given the questionnaire's scope (33 questions), fieldwork remains open; a final sample of n = 150 is expected by April 2026, enabling more robust mapping of role profiles, platformization, and perceived challenges across organizational settings.

DGR03 Games Between Industry, AI, and Platformization

PP 0317 Between stability and sustainability: How foreign workers evaluate the Czech game industry

Jan Houška[1]

[1] Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

This paper is part of my dissertation project and presents the evaluations of the Czech game industry among its international workers. The evaluations include the internationals' motivations for coming into the Czech game industry, their assessments of the local production ecosystem and its future. The study draws on three rounds of longitudinal semi-structured interviews conducted between 2022 and 2024 with 28 respondents: 14 from Central Eastern Europe, 12 from Western Europe, 1 from South America, and 1 from North America. Largely, the respondents were juniors and worked as artists, game designers, or programmers at 10 bigger game studios (with 50+ employees). The longitudinal approach allowed for tracing changes in internationals' perceptions over time, capturing their evolving assessments of working conditions, and

the future sustainability of the Czech game industry. Foreign game developers in Czechia remain underrepresented in research, despite constituting one-third of the workforce in Czech game production (GDACZ, 2025).

International workers have diverse motivations for coming into the Czech game industry, shaped by prior professional experience, dissatisfaction with precarious labour markets elsewhere, and the perceived stability of Czech game studios and Czech society. Many respondents value the relatively dense ecosystem of successful studios in Czechia, which enables circulation between employers and offers career security in an otherwise volatile global game industry.

Nevertheless, this stability also constitutes the challenge of the Czech game industry and one of its paradoxical qualities. Specifically, the findings highlight a diversity–meritocracy paradox (Deuze, 2025; Konrad et al., 2021) in which stability and business success are prioritized at the expense of inclusive and innovative practices. While workforce diversity is formally welcomed, respondents report that their creative input is sidelined once it challenges entrenched production logics or managerial hierarchies.

Regarding futures, international workers articulate ambivalent assessments of the Czech game industry's sustainability. While acknowledging its current economic resilience—particularly in contrast to widespread global layoffs—they frame the Czech game industry as less competitive in the long run due to creative stagnation, concentration of profits in a small number of studios, and limited emergence of new startups. While resistance to change in Czech game production is seen as uncreative, innovation to new products might be risky and destructive, as it might challenge existing hierarchies and disregard the contextual practices that facilitated local achievements (Bilton, 2015). On the other hand, foreigners often see Czech game production as "too stable" and call for diversification in production.

With state funding for video games in Czechia on the way, there are current discussions on how to make the Czech game industry more diversified by financing smaller studios and startups. However, to make local game development sustainable and retain the foreign workforce, changes should also follow in bigger studios. By foregrounding international workers' evaluations, the paper positions them as essential actors for understanding the shifting grounds of the Czech game industry in its transformation from an industry dominated by a few industry hegemons to a more diversified production space.

DGR03 Games Between Industry, AI, and Platformization

PP 0318 Copyright intelligence prosthethics: The illusion of authorship protection in video games during the AI revolution

Krzysztof Chmielewski[1]

[1] Kazimierz Wielki University, Game Studies and Digital Culture, Bydgoszcz, Poland

If three authors design a deep-learning algorithm's architecture, ten implement its code, eighteen graphic artists develop user stories for prompts, design engineers formulate those prompts, and the algorithm's training dataset contains images and photographs of eighty million users—why is it still possible to appropriate authorship of St. Mark's Square in Rome?

This presentation examines the principal domains of artificial intelligence application in digital games, focusing on the growing tension between technologically distributed creative processes and traditional legal concepts of authorship. It highlights the conceptual, doctrinal, and practical difficulties involved in formulating an adequate definition of authorship under conditions of AI-assisted and AI-driven production. Particular attention is paid to the unstable and often contested relationships between creators, performers, and publishers across different legal regimes, as well as to the unresolved issue of recognizing authorship attributed to entities other than natural persons.

Drawing on doctrinal legal analysis, case studies of transnational and internal legal disputes, and expert interviews with game producers and publishers, the paper reconstructs the complex and inherently ephemeral industry consensus that governs authorship practices in the video game sector. This informal consensus frequently operates alongside—and at times in open tension with—existing formal legal frameworks, filling regulatory gaps through contractual practice, professional norms, and risk-management strategies rather than statutory clarity.

The presentation pursues two complementary objectives. First, it offers a forward-looking assessment of the evolving legal landscape of the global video game market in the context of rapidly advancing AI technologies. Second, it formulates normative proposals addressing three key areas of computer game copyright law that present significant challenges for contemporary legislators and courts: (1) the need for an explicit legal position on recognizing authorship by non-human agents or systems; (2) the development of workable authorship criteria in the context of "dispersed auteurship," where creative agency is fragmented across large, heterogeneous production teams and automated systems; and (3) the guarantee of access to specialized legal expertise in computer game law for the judiciary, in order to ensure informed and consistent adjudication.

The presentation integrates perspectives from the law of new technologies, copyright law, and digital culture studies, informed by the author's professional experience as a video game producer, thereby combining theoretical analysis with industry-grounded insight

DGR03 Games Between Industry, AI, and Platformization

PP 0319 Generative AI in game design: Game industry professionals' perceptions and experiences

Marko Siitonen[1], Jasmine Poikela[2]

[1] University of Jyväskylä, Department of Language and Communication Studies, University of Jyväskylä, Finland
[2] University of Jyväskylä, Department of Music- Art and Culture Studies, University of Jyväskylä, Finland

There is a long and close connection between so-called artificial intelligence, automated algorithms and game design. After all, practically all digital games utilize the power of automated algorithms themselves, from those that help build game worlds to computer-controlled opponents to algorithms that dynamically adjust the flow of gameplay. However, game design, like most fields of knowledge-intensive and creative work, has only recently been introduced to the affordances of generative AI (GenAI). GenAI is an umbrella term used to describe generative models that, once trained, produce new data. For example, many GenAI models leverage the power of transformer neural networks in generating new content that often emulates human-created output (see e.g., Bordas et al., 2024). GenAI applications include e.g. art generation tools, and tools for writing, editing and even for coding.

While the long-term impact of GenAI tools is yet to be seen, it is clear that they have made an entrance into different creative fields such as advertising and marketing (Anantrasirichai & Bull, 2021), and game development (Werning 2024) in the early 2020s. Indeed, Anantrasirichai and Bull (2021, p. 590) assert that AI is applied more frequently in games and immersive experiences, alongside with advertising and marketing, than in any other creative domains.

Our study contributes to the emerging understanding of the role of GenAI in creative industries by analyzing how professionals involved in game design and production describe and make sense of GenAI. Our data comprises ten semi-structured interviews and one group interview collected in 2024, and five semi-structured interviews and one group interview collected in 2025. The professionals taking part in these interviews come from several European countries, and represent various roles within game design companies. Based on the principles of reflexive thematic analysis (Braun & Clarke 2022), our analysis illustrates the potential use cases of GenAI for game design, as well as the doubts and shortcomings games industry professionals link to it. Interview data always focuses on experiences and perceptions, as well as the discursive strategies through which people make sense of the world around them. Analyzing the way games industry professionals perceive and talk about GenAI is crucial in understanding their underlying attitudes towards this new technology.

DGR04 Analyzing Games and Play

PP 0435 The alternate realities of Baldur's Gate 3: Non-human creatures, voice and recognition as moral contexts in digital fantasy games

Michael Rübsamen[1], Magnus Johansson[1]

[1] Lund University, Communication, Lund, Sweden

Within digital games, the traditional role of the animal is the role of a monster (and at times even non-human animals such as the wolf or bear) to slay or run away from (Johansson & Rübsamen 2024). This presents a dichotomous relationship between the representation of the animal and the human-animal interactions, in which the player is often left with few choices in how to act. In many open-world fantasy games, the animal is often placed in a 'natural' environment, but as a gameplay element it's restricted to few functions, being an obstacle or source of loot for the player. Scholars have increasingly pointed to that "digital animal violence is morally problematic" (Coghlan & Sparrow 2021), as it potentially reflects human attitudes towards non-human animals in other cultural contexts.

The fantasy video game *Baldur's Gate 3*, offers an alternative: Through the games magic system, interactions with non-human creatures presents another layer through the ability to use magic in order to converse with monsters. In this paper, we pose the question of how giving voice to fantasy creatures, often perceived as monsters or dangerous non-human animals, opens up new dimensions of moral interactions within the game. This presentation explores the ways the different interactions with monsters and animals are presented in *Baldur's Gate 3*, as a way to experience moral obligations towards digital animals. As such, this is an investigation into considerations around "how a game's ideology might be communicated through its rules" (Baerg 2025:310).

Through the act of "voice", as discussed by Couldry (2010), recognition is given to the existence of monsters showing that morals is not only a question of choice, but also of ability and visibility. The game thus actively presents a way for the player give recognition to the non-human creature's voice, which is in many ways a moral act. Within the ideology of the game, our main question focuses on how voice and recognition function as opportunities to explore contexts where voice is not a given.

DGR04 Analyzing Games and Play

PP 0436 From quests to story arcs: A dynamic and validated framework for procedural narrative generation in video games

Marcin Łączyński[1]

[1] Uniwersytet Warszawski, Wydział Dziennikarstwa Informacji i Bibliologii, Warszawa, Poland

This article constitutes the second part of a research project devoted to an original conceptual framework for procedural storytelling in video games. While the first publication focused on the foundational aspects of the system, including a five-layer architecture encompassing culture, world, non-player characters, simple quests, and textual units, the present study extends this model by introducing two key components: a dynamic architecture for story arc generation and an advanced content validation module. In the first part of the paper, the author presents mechanisms that enable a shift from generating single, isolated quests to complex narrative structures operating at the macro level. Drawing on Seymour Chatman's distinction between story and discourse (1978), the system implements algorithms for dynamically allocating narrative threads within the game space. The newly introduced architectural layer enables the binding of narrative instances to specific locations and regions defined in the previous model. In this way, the system aims to address the limitations of large language models in maintaining long-term narrative coherence, as identified by Nasir, James, and Togelius (2024) and Zhou et al. (2025). The study also builds upon the classical work of Riedl and Young (2010) on narrative planning, aiming to balance plot structure with the autonomy of character actions in a procedurally generated world. The second part of the article is dedicated to the design of a narrative validator. This tool functions as a critical module responsible for verifying the integrity and logical relationships between generated narrative instances. The validator automatically checks the factual consistency of generated texts against the world database, directly addressing challenges identified in the preliminary phase of the research. A central component of the validator is a sensitive content editing module. Based on the guidelines of Short and Adams (2017) concerning the design of dramaturgy and conflict, this module enables parametric adaptation of generated content to different age groups. The system filters content with respect to violence, vulgarity, and stereotypes, while preserving narrative depth by allowing credible in-world conflicts, provided they remain consistent with the established design assumptions. In conclusion, the presented research demonstrates that extending the conceptual framework with dynamic story arcs and a validation system significantly reduces the so-called authorial bottleneck (Spierling and Szilas, 2009). At the same time, the study demonstrates that the resulting system remains highly cost-effective compared to traditional narrative content production methods, while maintaining the scalability required for contemporary open-world games. This work completes the transition from a theoretical structuralist model to a functional tool supporting modern game design.

DGR04 Analyzing Games and Play

PP 0437 Are you playing with me? A systematic literature review on the attitudes and actions of play

Laura Cañete Sanz[1], Zeph M.C. van Berlo[2]

[1] Erasmus University Rotterdam, Erasmus School of History- Culture and Communication, Rotterdam, Netherlands
[2] University of Amsterdam, Faculty of Social and Behavioural Sciences, Amsterdam, Netherlands

How are playful attitudes in relation to serious and ludic actions studied in academia? Throughout the last decades, the ludification of culture has been analyzed from different perspectives. Concepts such as gamification or edutainment show the impact and effectiveness of using ludic elements in serious contexts. However, studies on the attitude of play without a clear activity of play are limited, reducing the concept of playfulness to specific areas, such as entertainment and digital games.

This paper presents a systematic literature review on empirical and theoretical academic works that deal with the concept of playfulness. The main objective is to explore the understanding of 'playful attitudes' in ludic and serious contexts, to link it to the concepts of play as activity and the activity of play, and to identify patterns that describe how the attitude of play is examined from a communicational aspect.

As theoretical framework, two main works will be used to operationalize the study: Sicart's understanding of playfulness ("a physical, psychological and emotional attitude towards things, people and situations"), and the activity of play (a finite set of actions, with a specific purpose). Secondly, Caillois' concepts of *paidia* (spontaneous action) and *ludus* (rule-driven game) will be applied to code the (playful and non-playful) actions presented in the studies analyzed. In this respect, games are understood as a form of playfulness.

The review collects empirical and theoretical papers indexed in Scopus and the Web of Science. By following the PRISMA statement, and after applying specific inclusion and exclusion criteria, 46 documents were retrieved and studied by using an inductive and deductive approach.

Data was analyzed using thematic analysis in which the initial coding phase was centered on the identification of the topic analyzed, context, form of playfulness, relation to other concepts (ludic and non-ludic), and type of interaction. The data was coded, studied and clustered to identify the focus points in this debate, focused on the use and understanding of playful attitudes in ludic and serious contexts and the link to the concept of play as action.

The initial results show that playful attitudes studies are commonly conveyed through the activity of play, more specifically through games. Common areas that are explored through qualitative analysis are related to game studies, education (and playful learning, linked to game design) and health (concretely, psychology). These studies tend to explore play from *ludus*, however spontaneous actions are also studied.

Secondly, the results also presented a group of studies related to playful attitudes through actions related to unexplored spaces, such as literature, magic tricks or religion. These works study attitudes through different actions, not always related to play, and are commonly identified as *paidia*.

These preliminary results show that it is important to focus on a broader perspective regarding play studies, where the attitude of play can be conveyed through non-playful activities. The field of play should be expanded beyond solely games and venture into the realm of communication, interaction and persuasion.

DGR04 Analyzing Games and Play

PP 0438 Making culture playable: A game analysis of youth-developed games in a Cultural Game Jam

Francisco Assis[1], Conceição Costa[1], Maria Costa[2], Paula Lopes[1]

[1] Lusófona University - CICANT, ECATI, Lisboa, Portugal
[2] Lusófona University - HEI-Lab, Ecati, Lisboa, Portugal

Young people have increasingly distanced themselves from traditional forms of cultural consumption, such as books, museums, and theatre, in favour of digital media such as social media and video games (Weingartner, 2021). Rather than signalling a decline in cultural engagement, this trend reflects a reconfiguration of cultural practices within a context of digitization and changing socioeconomic constraints (Valtysson, 2022; Vicari & Kirby, 2023).

The present research sought to analyse how young people engage with cultural production through digital game-making, through the analysis of game prototypes created during a Cultural Game Jam (CGJ) as a case study. CGJs are an emerging form of Serious Game Jam (Aibara et al., 2022), where participants design game prototypes inspired by cultural heritage (Author1 et al, 2025), based on the Quadruple Helix innovation model (Carayannis and Campbell, 2022; Schütz et al., 2019), place-based environments where cultural innovation is co-created by four sectors: higher education, cultural heritage institutions, creative industries, and youth citizens, organized and developed in the context of Project XXXX. The CGJ took place from April 29th to May 2nd of 2024 in XXXX, with the theme "Sustainability and Biodiversity- XXXX Lagoon", and a total of 40 participants, including 25 university students from a videogames course and 15 high school students, aged 15–25, M = 19.0 years (SD = 2.63).

The objective of the CGJ was to develop game prototypes that meaningfully integrated Sustainable Development Goals (SDGs) 14 (Life Below Water) and 15 (Life on Land) as core cultural values.

Participants attended workshops about the theme given by cultural facilitators, such as local marine biologists and professors, and visited the lagoon two weeks before the event. Participants stayed in XXXX for the duration of the game jam, forming eleven groups. Each group produced one game prototype, subsequently analysed by two researchers.

For the game analysis, a research-based instrument was developed within the framework of Project XXXX. The instrument drew on the researcher's expertise to contextualise the evaluation and comprised both closed-ended and open-ended questions. Closed-ended items employed a Likert scale to generate quantitative data across six dimensions: Topic Incorporation, Topic Learning, Visuals, Storytelling, Mechanics, and Enjoyability. Open-ended questions were included to elicit more nuanced qualitative feedback on learning outcomes, social issues, and the ways in which the games function as cultural artefacts.

Results show several games accomplished this goal. The Game_Name, the highest ranked game across all the analysis' dimensions, provided interesting gameplay and learning opportunities about the local fauna of the XXXX Lagoon, while increasing awareness of issues such as water pollution and environmental conservatorship. Lower rated games had issues implementing the mentioned SDGs in meaningful ways. In conclusion, although participants demonstrated the capacity to conceptualise cultural game narratives, these were not fully realised in the final prototypes. This finding underscores the complexity of game creation. Nevertheless, the development of cultural games addressing the specificities of a lagoon was achievable within the limited timeframe of a game jam due to the Quadruple Helix partners' collective commitment to co-creation.

DGR05 Games and Society

PP 0546 Mapping digital game practices in Romanian county libraries: A thematic content analysis of online communication

Paula-Gratiela Cernamorit[1]

[1] University of Bucharest, Faculty of Journalism and Communication Sciences, Bucharest, Romania

This article examines the diversity of digital games used in Romanian county libraries in 2025 by analysing Facebook posts, website content, and local press articles. Although public libraries are traditionally known as spaces for reading, lending, and social interaction, less is known about how they integrate digital games into their everyday activities. To address this gap, the study investigates the online communication of all county libraries using a qualitative approach based on thematic content analysis, with the aim of identifying whether and how these cultural institutions employ digital games, what types of games are used, the formats in which they are integrated, and the target groups they address. The analysis has two stages: the first provides a general mapping of the presence of digital games in the public communication of all county libraries; the second consists of an in-depth thematic content analysis of five libraries that displayed the highest frequency and diversity of digital game-based activities. Among these, two county libraries operate makerspaces, one hosts a Smart Lab, and two run Code Kids programs. The findings reveal significant differences between libraries. Some institutions consistently integrate digital games into their programs—particularly within coding and digital education activities—using platforms such as Scratch, Kahoot!, Quizizz, code.org, AppInventor, Flappy Bird (educational versions), Tinkercad Games, Hour of Code, Minecraft, or other game-based learning tools employed in initiatives such as Code Kids, Makerspace and Smart Lab. Other libraries use digital games only occasionally, while some do not mention them at all in their public communication. The identified activities are primarily aimed at children and adolescents and are embedded in thematic workshops, programming clubs, or educational events. The results highlight unequal access to digital technologies, differences in institutional priorities, and varying levels of initiative in adopting digital games. By offering the first systematic mapping of digital game practices in Romanian county libraries, the study offers a clearer understanding of how they integrate digital play into their activities and broader the discussions on the role of libraries within the digital education. In addition to this, the in-depth analysis of the five selected libraries illustrates how the use of digital games can enhance the service offerings of county libraries, helping them better engage younger generations and reshape the image and purpose of these institutions within a rapidly changing society.

PP 0547 Games analysis, transforming pixels into plates: Harnessing game strategies for sustainable food practices

Fabian Bellaard[1], Teresa De La Hera[1], Julia Kneer[1]

[1] Erasmus University, ESHCC, Rotterdam, Netherlands

The purpose of this study is to explore how game strategies are used in digital games to promote sustainable food habits. This study is part of Horizon's ANONYMISED research project, which aims to advance citizen-driven, gamification-supported approaches for transforming food consumption patterns toward healthy and sustainable practices.

Recent systematic literature reviews have explored the current academic discourse on using gamification strategies and serious games to encourage behavioral changes related to sustainable practices (Authors, In Prep; Chow et al.,; Lim et al., 2024; Mabalay, 2025). These reviews highlight that a universal approach is often ineffective in achieving desired outcomes (Nasirzadeh, 2024). Instead, the effectiveness of the use of digital games to promote sustainable behaviors appears to depend significantly on the specific characteristics of the target audience and the primary objectives of the strategy employed.

For example, Scaffolding strategies, like structured challenges and quests, effectively motivate individuals hesitant to change their behavior (Jones et al., 2014; Mitis et al., 2019). Tracking strategies enhance environmental responsibility and self-efficacy, as demonstrated in a gamified environmental conservation platform (Du et al., 2019). Cooperative strategies boost motivation for sustainable behavior, evidenced by a digital simulation game for sustainable development (Ivens et al., 2020). These findings underscore the importance of customizing digital game strategies to meet the specific needs

of target audiences, rather than adopting a universal approach. Understanding how digital games can foster sustainable food behaviors is crucial. However, a recent literature review (Authors, In Prep) indicates that most studies on food-related games focus on nutrition literacy or dietary changes, not sustainable food habits (Luhanga et al., 2016; Barwood et al., 2020; Okpanachi & Adaji). This study aims to address this gap by investigating how game mechanics and aesthetics are utilized in digital games to promote sustainable food habits. Our research question is: How are game mechanics and aesthetics used in digital games to encourage sustainable food practices?

We employed comprehensive sampling (Gray, 2004), meaning we examined each and every case we could find that matched the sampling criteria. Including: (1) games must address sustainable food practices; (2) considering the language proficiency of the researchers involved (Titles must be in English, Spanish, Portuguese, German, or Dutch, or use no written/oral language); (3) they must be definable as games; and (4) at least partially digital. Games centered on quizzes and non-digital formats are excluded. A systematic online search with sustainability-related terms identifies suitable games.

We used Mäyrä's (2008) "utilitarian" analytical play approach to connect games to broader contexts and understand player communities, aiding in research question development. For analysis, we followed Fernández-Vara's (2024) thematic method to examine game strategies related to sustainability, identifying common strategies and their implementation.

While specific results are not yet available, the study is expected to reveal how digital games communicate food sustainability themes. By analyzing game mechanics/ aesthetics that promote sustainable food behaviors, the research aims to offer insights into using gaming to encourage sustainable habits. The findings are anticipated to guide future efforts in creating digital games with sustainability themes, supporting educational/ environmental goals.

DGR05 Games and Society

PP 0548 "It's just a hoax": Climate futures and climate change denial in civilization vi's Reddit communities

Gaia Amadori[1]

[1] Università Cattolica del Sacro Cuore, Department of Communication, Milano, Italy

Player communities have become key arenas where users negotiate the political meanings that games convey, especially when they address contested issues such as climate change. In ecogames, which model environmental issues through interactive systems with awareness-raising aims (op de Beke et al. 2024), these debates may reinforce in-game representations but also rework, contest, or satirise how environmental problems are staged. As a result, online platforms hosting these exchanges – such as forums, social media, and streaming services – become crucial spaces where ecological imaginaries and the epistemic authority of climate science are negotiated, challenged, and at times openly denied, with significant consequences for how shared environmental futures are imagined.

Against this backdrop, this contribution examines *Civilization VI: Gathering Storm* (Firaxis Games 2016) as a contested site for climate change denial within the wider ecology that includes the game itself and its paratextual extensions on Reddit (Consalvo 2017). The game foregrounds anthropogenic CO_2 emissions and their impacts, asking players to monitor atmospheric concentrations that rise with fossil fuel consumption and trigger more frequent and intense natural disasters, including floods, droughts, storms, and the permanent submersion of coastal tiles. Once specific CO_2 thresholds are crossed, these processes become irreversible, directly simulating real-world climate tipping points.

Methodologically, the study adopts Reddit as the main site of investigation due to its relatively weak moderation and persistent, highly politicised discussions (Massanari 2015). Eight subreddits were selected using queries combining "civilization", "gathering storm", "climate change" and "global warming", yielding a corpus of 616 comments posted between 2019 and 2020. After identifying recurrent words, bigrams, and trigrams, a semantic network analysis was conducted on terms co-occurring within a five-word window of "climate". On this basis, an inductive thematic analysis was carried out on a subset of comments to reconstruct users' dominant frames and narrative devices.

Findings show a strongly polarised discourse clustered around four nuclei. A first cluster frames climate change as a hoax and conspiracy, linking "climate change" and "global warming" to "fake news", "taxes", and "agenda", with users dismissing climate change as propaganda for new forms of taxation and control. A second nucleus opposes anthropogenic accounts to narratives of natural cycles, arguing that current warming is "nothing new" and that the game exaggerates human responsibility. A third cluster centres on distrust of expertise, mobilising controversies such as "Climategate" to erode the epistemic authority underpinning the game's design. In contrast, a smaller but visible nucleus defends the game as broadly aligned with mainstream scientific assessments and uses it to discuss mitigation and long-term consequences, yet these contributions are often dismissed as importing "real-world politics" into a leisure space.

These results illuminate how player communities participate in the social construction of climate imaginaries on "shifting grounds", where game-adjacent online platforms can both foster connections across epistemic divides and circulate alternative environmental knowledge. The study thus shows how the paths taken by game communities in mediating climate knowledge foreground both the opportunities and the challenges they pose for imagining shared environmental futures.

DGR05 Games and Society

PP 0549 Gender positioning in online game livestreams: An interaction analysis

Marzieh Ghavidel Darestani[1], Sven Joeckel[1]

[1] University of Erfurt, Faculty of Philosophy, Erfurt, Germany

Video game livestreams are the interactional space where gamers not only play, but they also perform their gender position in front of other individuals. Despite the presence of women in the gaming sphere, toxic masculinity remains a central issue. Phenomena like Gamergate exposed the institutionalized misogyny of toxic gamer culture. With the livestream spread, the fake-girl-gamer discourse surrounding female streamers has shaped, questioning the legitimacy of women's presence and, along with geek masculinity, seriously challenging meritocracy claims and equality in gaming.

The women's presence in the gaming sphere remains controversial even in seemingly democratic Western societies, but in a society like Iran, where women's voices are silenced by mainstream society, political and religious structures, the situation becomes even more problematic. Along with the significant increase in video game enthusiasts in Iran and its social and cultural consequences, there is a noticeable lack of gender-centric research. We aim to analyze gender representation and power dynamics in Iranian gamers' livestreams.

Gender Position and Performativity

Livestream platforms such as Twitch and YouTube-Gaming have become dominant platforms for video games display and experience. This development has raised fundamental questions about how gender is perceived and represented in this environment. We draw on positioning theory (PT) and Butler's gender performativity to analyze the process of gender formation in livestreaming interactions. PT, emphasizing the discursive roots of interactions, shows how gamers construct their positions according to their gender versus other players and audiences through their speech, presence, and performance. As a vital complement, gender performativity views gender as a social act, fluid, and dependent on repetition and power relations. The overlap of these two approaches allows for an analysis of the reproduction of gender positions and the role of language, norms, and dominant power in video games' livestreams.

Research Goals

This research aims to demonstrate the process of Iranian gamers' performativity and position during gaming livestreams, with a particular focus on how gender positions are represented and constructed among male and female players. This research assumes that gamers actively enact and perform their gender through gaming and social interactions within the context of livestreaming discourse. We analyze the process by which gamers shape their position in interactions with other gamers. It is also assumed that gender plays a determining role in accessing dominant and leadership positions and that there are significant differences in the way gender is performed between male and female gamers during interactions.

Methodology and State of Research

To examine the gender positions and gamers' performativity layers; We use qualitative content analysis. Our focuses are on Iranian game streamers (Mean≈ 89K followers) regularly broadcasting their gameplay in the in-group games form, evenly split according to gender. We study twelve hours recorded livestreams. Gender positions are divided into dominant and subordinate categories based on the PT and gender performativity and are operationalized through interactional indicators. Storylines, speech-acts, and interaction patterns between gamers and viewers are analyzed as mechanisms for the formation of these positions. Material has been coded and is currently reviewed and interpreted.

FIS01 Circulation, the (Post-)Colonial and Modernity

PP 0448 Shifting screens: VHS repertoires and film circulation in late socialist Romania

Alexandra Bardan[1]

[1] University of Bucharest, Faculty of Journalism and Communication Studies, Bucharest, Romania

During the 1980s, film circulation and consumption in socialist Romania were reshaped by a convergence of institutional restrictions and emerging media technologies. While imports of foreign (particularly Western) films for cinema were heavily reduced, in January 1985 state television limited its daily broadcasting schedule to approximately two hours (Bardan 2010). Within this context, the expansion of VHS-based film screenings marked a significant shift in the organization, accessibility, and experience of film culture. Initially, video screenings were organized as public events in theaters, opera houses, and philharmonic halls, often as part of institutional strategies to compensate for the financial pressures generated by state-imposed self-financing measures (Parvulescu and Copilas 2013). From late 1985 onward, VHS exhibition migrated into private domestic spaces, where informal collective screenings proliferated (Kovács 2021). Scholarship on Eastern European socialism has frequently approached the rise of video in the region through the lenses of piracy, and technological disruption, positioning VHS primarily as a subversive alternative to state-regulated cinema. This paper proposes a historically grounded analysis that situates the video phenomenon within broader continuities and transformations of film circulation in socialist Romania. Rather than treating the VHS technology as an exceptional rupture, this study examines how video screening intersected with established practices of film programming, distribution, and reception across different institutional and informal settings.

Methodologically, the paper adopts a multi-level historical approach, combining archival research with comparative repertoire analysis. The empirical corpus consists of archival documents containing film repertoires from both state videotheques and private video collections active during the 1980s. The films are analyzed in relation to earlier state cinema programming, allowing for cross-temporal comparison of genres, national origins, and programming patterns. Particular attention is paid to the circulation of foreign films and to the ways in which film content moved across formats, venues, and regulatory frameworks. By analyzing films both as cultural products and commodities circulating within specific economic and institutional conditions, this study identifies the main features of VHS repertoires during late socialism and highlights both ruptures and continuities in Romanian cinema cultures.

The findings suggest that VHS screenings did not simply oppose or replace theatrical cinema, but reconfigured existing modes of access and viewing while remaining embedded in longer-term structures of socialist cinema cultures. In dialogue with the conference theme “Shifting Grounds: Paths, Connections, and Futures,” this proposal argues for historically informed and methodologically open approaches that can account for media transitions without reproducing narratives of technological exceptionalism.

PP 0449 Participatory and collaborative filmmaking as anti-racist pedagogies in post-colonial Spain

Irene Gutiérrez Torres[1], Miguel Fernandez-Rodriguez Labayen[1]

[1] University Carlos III of Madrid, Communication, Madrid, Spain

This presentation examines how collaborative filmmaking (CF) and participatory filmmaking (PF), a set of methods that involve groups in the co-creation of films, can be mobilised as pedagogical interventions and critical methodologies to build anti-racist solidarities through critical media analysis and counter-media production. Drawing on our experience as members of the research project “Institutional documentary and amateur cinema in the colonial era: analysis and uses” (PID2021-123567NB-I00), which has organised, studied, and digitised Filmoteca Española’s colonial film collection, we focus on a series of CF and PF workshops developed with Spanish and Equatoguinean institutions and partners. We introduce and analyse our work with the school Malabo Eyi Moan Ndong, the Madrid-based association 24 Posibilidades por segundo, and the Cameroon-born filmmaker based in Madrid, David Bingong. These activities brought together young students and artists from diverse geographical, ethnic, religious, and social backgrounds to engage with historical and contemporary footage shot in former Spanish and European colonies.

We argue that these workshops and film collaborations operate as anti-racist pedagogies in three interconnected ways. First, they generate collaborative creative dynamics that resist extractive, top-down knowledge-making by centring the

political agency and lived experience of those most targeted by racist discourse. Second, they repurpose amateur colonial archives and personal recordings of Africa-to-Europe border crossing through shared acts of curation animated by anti-racist and decolonial imaginations, transforming archival engagement into a collective practice of critique and re-signification. Third, they open dialogic spaces within and beyond academia where researchers, co-researchers, filmmakers, NGOs, and grassroots cultural actors can name racism as a structural problem and negotiate how it is represented, discussed, and challenged.

We contend that when PF and CF are rooted in care, mutual accountability, and political commitment, they can function as anti-racist pedagogies capable of confronting epistemic violence and supporting solidarities grounded in relational, experience-led modes of knowledge production and circulation. At the same time, we attend to their limits and to the conditions under which these practices unfold, including dilemmas of authorship and representation; ethical complexities around cultural safety, consent, and visibility; and institutional pressures that can re-inscribe asymmetries in funding, credit, and circulation. Taken together, these cases offer a practice-based account of how PF and CF can retool film education and counter-media production as sites of collective learning, counter-archival work, and civic co-creation, and they conclude with practical recommendations for ethically grounded practice.

PP 0450 Fanhall and the circulation of Chinese independent cinema: An internet archaeological approach to informal infrastructure

Laiwo Xie[1]

[1] Vrije Universiteit Brussel, Faculty of Languages and Humanities, Brussels, Belgium

This paper examines Fanhall (Fanhall.com), one of the most influential online communities for Chinese independent cinema between 2001 and its closure in 2011. Drawing on an archaeological and sociological approach to digital media, the study treats Fanhall not merely as a website but as a historically situated informal infrastructure. It enabled Chinese independent films to gain visibility and dissemination outside the official and commercial systems, constructing a unique alternative archive of the collective memory of Chinese independent cinema.

After outlining the historical development of Fanhall, as well as its interface design and content structure, the paper moves to the analysis of three interconnected empirical objects. First, it analyzes Fanhall's "activity posts" (Huodong), which announced screenings, discussions, lectures, forums, festivals, recruitment, call for submissions, workshops, and training courses. Based on their themes and content, these activities can be categorized into several specific types. These activities and their publicly available information, to some extent, reflect the specific patterns and practices of the Chinese independent cinema circulation network at that time.

Second, this paper focuses on a set of key human and organizational actants—such as Zhu Rikun, Lu Zhixin, Lixianting's film school and some of the most active festivals, clubs, salons, etc.—whose repeated involvement helped establish a relatively stable network for the distribution and exhibition of Chinese independent films. These figures can be understood as mediators of visibility, whose organizational work shaped access, participation, and forms of self-granted legitimacy within the informal media economy.

Third, the study examines posts from the forum group "Xianxiang Improvement Group," (Xianxiang Gaijin Zu) where users could discuss things like technical maintenance, community governance, and, more importantly, the survival of the community itself, especially in the period leading up to Fanhall's closure in 2011. Through close reading of some highly emotional and even aggressive contents, the analysis reveals the fragility of Fanhall as a heterogeneous space of resistance. This fragility, in turn, reflects the broader instability and potential invisibility that have characterized the historical development of Chinese independent cinema.

Through its discussion of these cases, the paper suggests that the expectations regarding the future of Chinese independent cinema articulated through Fanhall can, to some extent, be understood as a form of networked activism grounded in the everyday practices of ordinary participants. However, in light of some recent developments and events, the paper argues for a critical re-examination of the technological optimism that once accompanied such expectations.

PP 0559 Youth's labour in the creative industries: The case of the European film industry

Simon Haslauer[1], Katharine Sarikakis[1], Angeliki Chatziefraimidou[1], Gentiana Ramadani[1], Chetanay Wahi[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Cinema has a dual position within the battle for social justice: it is a medium that enables representational and challenges social inequalities and at the same time it is an industry whose structures often reproduce these injustices. This study examines social justice in the European film industry, focusing on the experiences of emerging professionals. Drawing on theoretical perspectives which distinguish between the film content and the conditions of film production, the study

explores social justice as a structural issue within the labour practices, which extends to access opportunities within the industry.

Grounded in definitions of social justice that emphasise fairness, equity, participation and well-being, the study analyses how justice is enacted or denied in filmmaking practices. For this purpose, the research is based on 26 semi-structured interviews with young film professionals aged 18 to 35 from across Europe, representing a wide range of roles including directing, producing, writing, acting, editing as well as technical positions. These interviews are complemented by document and policy analysis to position individual experiences within broader industry structures of the European film industry.

Findings reveal that young filmmakers face forms of social injustice related to age, gender, ethnicity, socioeconomic background, education level and language. Participants describe barriers such as unpaid or underpaid labour, limited access to professional networks, exclusion from decision-making processes and age-related challenges at their creative work. Additionally, gender discrimination remains apparent, particularly in technical roles and leadership positions, while diversity measures are often perceived as biased. Migrant filmmakers and those from minority or lower socioeconomic backgrounds face also disadvantages, such as restricted access to institutional support and professional opportunities. Participants also highlight the marginalisation of disabled professionals and a generational distansing that limits the inclusion of younger voices in creative decision-making. Finally, the study argues that these experiences reflect established industry cultures that prioritise power hierarchies, while undermine inclusivity and equality.

FIS02 Film Industries

PP 0560 At the fringes of cinema voices in the European film competitiveness

Katharine Sarikakis[1], Gentiana Ramadani[1], Daniel Biltereyst[2], Angeliki Chatziefraimidou[1], Simon Haslauer[1], Yves Saint Clair Zogo[1]

[1] University of Vienna, Communication, Vienna, Austria
[2] University of Ghent, Cinema and Media Studies CIMS research centre, Ghent, Belgium

The European film industry continues to reproduce structural inequalities that marginalise migrants, diasporic communities, women, and young filmmakers, restricting their access to funding, institutional support, and opportunities for representation. These groups often face systemic disadvantages. Migrants are confined to stereotypical narratives and excluded from mainstream cultural institutions (Salgado & Patuzzi, 2022), diasporic filmmakers contribute significantly to diversity yet remain underacknowledged (Jäckel, 2010), women remain underrepresented across key creative and decision-making roles (Simone, 2023) and young filmmakers struggle with precarious production contexts and limited pathways to sustainability (Sarikakis, Ramadani, & Juengst, 2026).

The concept of “fringes” in film refers to independent, experimental, and niche productions that challenge conventional cinema through alternative storytelling and techniques. These spaces function as incubators for innovation and diversity, enabling new voices and cultural expressions that often remain marginalised in mainstream contexts (Missen, 2002).

This paper positions the fringes of filmmaking, independent, experimental, and niche spaces, not as peripheral but as central arenas for innovation, diversity, and emancipatory cultural practice. Far from being mere margins, these spaces incubate new voices, alternative narratives, and artistic experimentation, allowing marginalised creators to challenge hierarchies and expand the cultural and economic vitality of the European film industry.

Drawing on case studies from six EU member states (Austria, Belgium, France, Greece, Poland, and Spain), the document examines how marginalised groups participate in and shape these spaces, as well as how national policies, industry practices, and initiatives such as film festivals mediate their access.

PP 0561 Young people shaping the film industry

Angeliki Chatziefraimidou[1], Katharine Sarikakis[1], Simon Haslauer[1], Yves Saint Clair Zogo[1], Alexandra Alekseeva[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Young people are both the present and the future of cultural creative industries, dynamically shaping creative sectors such as the film industry. Existing literature on the role of young people as young audiences and consumers, underlines the lack of studies capturing youth's voices and providing a comprehensive understanding of young people's perceptions on preferences, interests and challenges, regarding film consumption and engagement with a film-related interactions, which range from film clubs to filmmaking itself. To address this gap, the current study uses mixed-methods, combining survey data of 320 responses and focus group interviews of 60 young people aged 18 to 24 of the Austrian capital, Vienna.

The findings of the study point out that young people's preferences are associated with emotional attachment and films with which they can feel related and connected and evoke strong emotional responses, inspiration and personal projection. Young audiences value complex and alternative film narratives, nostalgic films related to their childhood and authenticity over artificial storytelling. Additionally, young people are not restrained to film consumption but rather adopt an interactive approach to film by generating conversations via sharing film-related cultural perceptions and experiences on social media platforms. Similarly, platforms like Letterboxd, provide space for active engagement in a collective meaning-making of the movie.

A further layer of interaction with films is young people's engagement with video- and even filmmaking. Film production is a multifaceted process combining from the one hand, skills development and professional exploration and expanding on the other hand, to creativity boundaries, identity discovery, self-expression and social engagement. Finally, young people are shifting learning paradigms towards the democratisation of video and filmmaking education through autodidactic models and everyday equipment, such as smartphones, generating an informal, alternative, self-motivated creative path. To foster the competitiveness of the European film industry is necessary to embrace the new filmmaking paradigm that young people employ and adopt a democratic approach in film creation and film distribution, by fostering and funding small projects of young creators.

FIS02 Film Industries

PP 0562 Balancing cultural distinctiveness and economic survival: Analyzing challenges of small-scale film exhibitors in Flanders and Brussels

Sien Van De Wouwer[1]

[1] Vrije Universiteit Brussel, Communicatiewetenschappen, Brussel, Belgium

Theatrical exhibition remains a central component of the audiovisual ecosystem, functioning as a key indicator of a feature film's economic value and as a cultural infrastructure that shapes access to and engagement with cinema (Kehoe & Mateer, 2015; UNIC, 2025). While the theatrical performance influences circulation across release windows and territories (European Audiovisual Observatory, 2024; Gaustad, 2019), they also play a vital cultural role by curating viewing experiences, supporting diverse repertoires, and establishing and sustaining local film cultures. Small-scall exhibition contexts, in particular, embody these dual economic and cultural roles. Ultimately, creating a reality where exhibitors must continuously negotiate commercial viability and cultural missions.

This paper examines the small-scale exhibition circuit in Flanders and Brussels, a fragmented audiovisual market that exemplifies the challenges faced by independent profit cinemas, arthouses, and cultural exhibitors in Europe. In recent years, these exhibitors have been confronted with competition from global streaming services, effects of prolonged COVID-19 closures, rising energy and labour costs, and increasing infrastructural demands.

Despite their central role in connecting films and audiences, exhibitors remain underrepresented in research on audiovisual sustainability and policy. Existing research has largely focused on audience experiences (e.g. Tintel & Raats, 2022; Veenstra et al., 2021), while audiovisual policy frameworks have traditionally prioritized production over distribution and exhibition (Drake, 2018; Harris, 2018; Santos & Miranda, 2023). Consequently, little attention has been paid to how small-scale exhibitors negotiate economic and cultural tensions in practice and how their perspectives could inform more integrated policy approaches.

Addressing this gap, the paper asks: *What are the main infrastructural and programming needs of the small-scale exhibition circuit in Flanders, and how do these relate to the current exhibition landscape and policy frameworks?* To answer this question, we adopted a mixed-method case study of Flanders and Brussels, a small and fragmented audiovisual market that exemplifies the challenges faced by small-scale exhibitors in Europe. We conducted an online survey (n = 35) complemented with expert interviews (n = 16), allowing us to identify exhibitors' infrastructural and staffing needs, trace broader sectoral dynamics, and situate them within policy debates. While the survey allowed us to ask about the organizational

structures and more operational specifics, the in-depth interviews created possibilities to question exhibitors' strategies, infrastructural challenges, and policy expectations.

The results bring together the findings into a framework that identifies key leverage points that are necessary for a more coherent and sustainable strategy for small-scale film exhibition. By highlighting the interconnected economic, cultural, and infrastructural needs of small-scale exhibitors, the framework aims to support both industry actors and policymakers in establishing support measures that take into consideration the lived realities of cinema exhibition. In doing so, the paper contributes to ongoing debates on the future of theatrical exhibition and the development of a more holistic audiovisual and cultural policy framework.

FIS03 Alternative Cinemas

PP 0783 From testimony to evidence: Documentary portraiture in a post-testimonial digital culture

Anastasija Ljubašenko[1]

[1] Palacky University, Faculty of Arts- Film and Theatre Studies, Olomouc, Czech Republic

This paper argues that the documentary portrait constitutes a distinct genre within documentary cinema. Nowadays, the methodological principles of the named genre have shifted in response to the epistemological expectations of contemporary digital culture. In particular, it suggests that interview-based self-narration is no longer widely perceived as sufficient evidence when portraying controversial historical figures. This argument is developed through a comparative analysis of two documentary portraits of Leni Riefenstahl: Ray Müller's *The Wonderful, Horrible Life of* Leni *Riefenstahl* (1993) and Andres Veiel's *Riefenstahl* (2024).

Within documentary film studies, the documentary portrait has often been subsumed under biographical or auteur-oriented documentary forms. Drawing on Bill Nichols' theory of documentary modes, this paper conceptualises the documentary portrait as a genre centred on the representation of an individual figure as a site of ideological negotiation, ethical responsibility, and historical accountability.

Müller's 1993 film exemplifies a late twentieth-century documentary paradigm in which extended interviews and first-person testimony function as primary sources of meaning. Although the film incorporates critical commentary and archival footage, its narrative structure remains heavily dependent on Riefenstahl's self-presentation. Her repeated claims of political innocence and artistic autonomy shape the film's interpretative framework, reflecting a documentary ethics grounded in dialogue, presence, and performative self-disclosure.

Within Nichols' framework, the film operates primarily within participatory and reflexive modes, yet ultimately grants the subject considerable narrative authority.

By contrast, Veiel's *Riefenstahl* (2024) represents a decisive methodological shift characteristic of contemporary documentary portraiture. Produced in a post-testimonial and digitally mediated media environment, the film largely removes the subject's spoken voice and constructs its argument through extensive archival material, including private correspondence, unpublished manuscripts, audio recordings, and visual documents. This archive-driven approach reflects a broader scepticism toward personal testimony as evidence, particularly in the representation of historically compromised figures.

The documentary portrait thus becomes investigative and evidentiary rather than confessional.

This transformation is closely linked to the epistemological demands of contemporary digital culture. Increased media literacy, awareness of self-mythologisation, and the prevalence of post-truth discourse have reshaped expectations of documentary credibility. In this context, interviews are increasingly perceived as performative rather than evidentiary, prompting filmmakers to adopt archival, forensic, and reconstructive strategies. The documentary portrait responds by repositioning itself as a mode of critical reconstruction rather than self-representation.

The comparison of the two films demonstrates how the documentary portrait is reshaped by a digital media culture in which testimony alone no longer functions as proof. As a result, the genre redefines its ethical and methodological foundations, prioritising the contextualisation, contradiction, and historical responsibility. The documentary portrait thus emerges as a critical cinematic form that reflects contemporary concerns with evidence, power, and mediated memory.

PP 0784 What is the future for film critics?

Ruth Barton[1]

[1] Trinity College, Film, Dublin, Ireland

This paper considers the role of the traditional film critic in an age of online commentary, aggregators and influencers. Fears around the demise of the art of film criticism are not new. In 1990, for instance, Richard Corliss, the *Time* critic, wrote:

Movie criticism of the elevated sort, as practiced over the past half-century by James Agee and Manny Farber, Andrew Sarris and Pauline Kael, J. Hoberman and Dave Kehr—in the mainstream press and in magazines like *Film Comment*—is an endangered species. Once it flourished; soon it may perish, to be replaced by a consumer service that is no brains and all thumbs.

(https://www.filmcomment.com/article/richard-corliss-all-thumbs-or-is-there-a-future-for-film-criticism/)

More recently, in December 2025, A.S. Hamrah wrote in the *New York Review of Books*:

Most mainstream film criticism is of the average Rotten Tomatoes variety […] Critics [in the past] had personality, style, originality, wit, and deep knowledge borne of seeing many films, but for the most part publishers replaced them as they retired or died with people who could always be counted on to tell readers that *Good Time* was a bad movie and *Three Billboards Outside Ebbing, Missouri* or *1917* were good ones. I think of these critics as fake humanists, devoid of any of the values or pleasure I expect when I read film criticism.

https://www.nybooks.com/online/2025/12/02/a-total-breakdown-of-all-the-easter-eggs/.

Is this just a couple of old dinosaurs raging against change or is the de-professionalisation (read democratisation) of film criticism a cause for concern? As an academic who also works as a film critic (on national radio), I think of myself as speaking to those listeners who are looking for informed but also entertaining reviews of upcoming releases. I also recognise that I am speaking to an older, middle-class cohort.

To provide a deeper analysis of the issue, I will be conducting semi-structured interviews with a range of local (Irish) film critics and publicists. Questions will include whether they are full time or freelance, and whether they can support themselves solely as film critics; how long they have been working as film critics; whether they have seen their outlets remain steady or reduce/expand in size; what they see their function as film critics to be; what they see as the future of film criticism. I will also be asking publicists what outlets they consider most effective for the promotion of films; and eliciting from them how they consider the business of film promotion has changed in the past twenty years.

FIS03 Alternative Cinemas

PP 0785 Leviathans in the desert: Dams, cinema and state power in Egypt, Syria and Sudan

Fèlix Maisel[1]

[1] Universitat Pompeu Fabra, Communication, Barcelona, Spain

Large-scale dams in arid and semi-arid regions function as instruments of resource control and technologies of political authority and subject formation. By comparing films set in Nasserist Egypt, Ba'athist Syria, and Bashirist Sudan, this paper studies how Arab cinemas have represented three state-sponsored mega-dams—the Aswan High Dam in Egypt, the Tabqa Dam in Syria, and the Merowe Dam in Sudan—as Leviathan-like formations of state power: modern infrastructures through which the modern nation-state disciplines territory and population. Under the administrations of Gamal Abdel Nasser, Hafez al-Assad, and Omar al-Bashir, images of dams were often linked, both figuratively and discursively, to the promise of turning arid deserts into water-fattened gardens and "backward" peasants into "modern citizens."

The study centers on a series of films that trace the rise, erosion, and suspension of hydraulic sovereignty: *The Nile and the Life* (Youssef Chahine, 1968), Omar Amiralay's *Euphrates Dam* trilogy (1970–2003), and *The Dam* (Ali Cherri, 2022). Across these works, desertscapes appear as "technological hydroscapes" (Nüsser and Baghel 2017), landscapes transformed by the implementation of new systems of water and energy governance. In *The Nile and the Life*, the Aswan High Dam is represented as a revolutionary "accelerator of time" intended to affirm national autonomy. However, this modernization campaign is revealed to rely on colonial-era paradigms of domesticating the population through nature, which results in the formation of what Rob Nixon (2011) terms "non-imagined communities" and the forced displacement of the Nubian community. Amiralay's trilogy documents the collapse of Ba'athist agrarian reforms in the al-Jazira region. The three documentaries that constitute the trilogy—*Film-Essay on the Euphrates Dam* (1970), *Everyday Life in a Syrian Village* (1974) and *A Flood in Baath Country* (2003)—show how the centralization of water resources has led to socio-cultural stagnation and the emergence of a regime of absence, in which the state's rhetoric of progress is contested through the persistence of feudal tribal power and anthropogenic degradation. Finally, *The Dam*, set in the shadow of the 2019 Sudanese revolution, situates its narrative around the legacy hydro-agricultural mission initiated under al-Bashir's regime as it sought to distinguish itself from Hassan al-Turabi's earlier project of militarized Islamism. Here, the desert operates as an extra-institutional zone where political possibility can still be sensed, rehearsed, and materially shaped. As such, the horizon of the desert is

closely aligned with what Franco Berardi (2017) calls the "horizon of possibility." By reading dams as cinematic objects of state imagination, the paper argues that Arab cinema offers a privileged lens through which to trace shifting configurations of infrastructural power, from revolutionary futurism to authoritarian stagnation and suspended political possibility.

FIS04 Narration and Representation in Film

PP 0891 Weather as narrative element in contemporary Nordic film

Heidi Philipsen[1], Sara Mosberg Iversen[2]

[1] University of Southern Denmark, Department for the research of culture, Odense M, Denmark
[2] University of Southern Denmark, Department of Design- Media- and Educational Science, Odense M, Denmark

This paper examines how contemporary Nordic fiction films may contribute to public climate understanding and nature experiences. It does so by narrating life in what Bronwyn (2024) terms the hydrocene, an era in which floods, droughts, storms, and melting ice increasingly shape experience. Fictional weather and water worlds—such as the catastrophic storm in *The Perfect Storm* (Petersen, 2000), the lethal rainfall in *The Rain* (Bose & Allen, 2018–2020), or the snowbound isolation in *Trapped* (Kjartansson, 2016–2021)—can be seen as elements in "green storytelling". They do more than dramatize crisis or drive the plot we argue. They function as weather stories that allow audiences to sense climate and nature issues not as abstract data but as embodied, affective, and dramaturgical experiences. As Angelone argues, persuasion emerges not from information alone but from storytelling (2022).

Drawing on both film dramaturgy (Truby, 2008; Aronson, 2010) and ecoliteracy (Orr, 1992; Capra, 1996), we analyse how five Nordic films use weather—both as disruptive element and ambient condition—to create cultural meaning. Ecoliteracy is understood here as a form of knowledge and awareness that foregrounds natural systems, interdependence, and the ethical imperative to understand the more-than-human world.

Based on close analysis of five Nordic films from the past decade, the paper investigates:

1. The narrative and affective functions of weather, including its role as inciting incident, actant, tonal driver, part of the arena, and mediator of character–environment relations.
2. Expressions of ecoliteracy, such as the decentring of human agency and portrayals of humans as embedded within or estranged from natural environments.

Our main research question is: Which functions do weather elements serve in the five selected Nordic films? The paper thus discusses how cinematic weather elements may operate as cultural "laboratories" in which audiences can rehearse responses to crisis, sense vulnerability, and imagine sustainable and equitable futures. We argue that films in which weather is a narrative element hold artistic and communicative potential, fostering affective engagement, ecological awareness, and new modes of nature sense-making.

PP 0892 The isolated white frame in narrative film editing: A pragmatic and cognitive analysis

Javier Sanz[1], Caballero-Molina Juan José[1]

[1] University of Barcelona, Philology and Communication, Barcelona, Spain

The insertion of isolated white frames into a film technically constitutes a disruptive strategy within the photogrammatic chain, introducing an extraneous, content-void element that is potentially capable of disturbing the spectator's filmic experience. However, this practice has been recurrently employed by commercial film editors to enhance specific narrative events, thereby intensifying the spectator's response.

The systematic analysis undertaken around this device has consisted in identifying examples in order to obtain the most exhaustive census possible, organized according to the different uses of this technique throughout the history of cinema, as well as in implementing an experimental design in which 40 participants underwent EEG recording while viewing 30 film excerpts containing such frames, in order to assess their cognitive effects.

The generation of the broadest possible census was conducted by consulting the open database *Cinemetrics*. Through this one, films were selected where the duration of the shortest shot was equal to or less than 0.1 second. After that, an automatic analysis (on Python) was conducted based on the shot boundary detection (SBD) to locate isolated shots. The analysis was based on a sequential filter combination involving a color histogram analysis, a mean squared error analysis (MSE), a structural similarity index measure (SSIM), and a histogram correlation analysis. The cut analysis was automated to detect shots consisting of a single frame, after which a manual selection was performed according to the obtained results.

To evaluate the cognitive effects, EEG recording was conducted using a 31-electrode system, with mastoid referencing and a sampling rate of 500 Hz. The data obtained were analyzed using event-related potentials (ERPs). The experiment consisted of confronting participants with either the original film material that includes a white frame or the edited versions in which it has been removed. The analysis was performed on the frame immediately following the white frame, which served as the starting point of the analysis in the same frame in both versions.

The results showed that white frames are consistently associated with punctual events. Specifically, among the 740 cases identified, the following categories were distinguished: I) explosions or shots, II) lights, III) hits, IV) spatial/temporal jumps, V) chromatic changes, and VI) mental images.

The ERP analysis revealed that the white frame exhibits clearly differentiated waveforms compared to conditions in which it is absent during the first 200 ms. This response is consistent with low-level visual processing of the white frame. However, from approximately 250 ms onward, this pattern appears to be inhibited by the processes triggered by the subsequent frame, with an amplitude difference showing a similar waveform when comparing ERPs from conditions with the white frame to those in which it was removed. This suggests that, after producing an early independent effect, the stimulus represented by the white frame is cognitively absorbed by the following shot, becoming integrated into the response elicited by the succeeding shot.

FIS04 Narration and Representation in Film

PP 0893 Negotiating cultural modernity in contemporary Saudi cinema: Representation, identity, and subjectivity in Basma (2023)

Mahd Zaiter[1], Arnau Castells[1]

[1] Universidad Autónoma de Barcelona, Audiovisual Communication and Advertising, Barcelona, Spain

Saudi cinema's recent "shifting grounds" are not only institutional, marked by the re-emergence of theatrical exhibition and the establishment of new cultural governance (Alamri, 2021; Shesha & Yusuf, 2021), but also, crucially, within cinematic representation itself. These shifts are increasingly articulated through domestic narratives that foreground everyday experience as a site where cultural meanings are negotiated (Foley, 2022; Alardawi, Saqah, & Zakari, 2023). This paper examines *Basma* (2023), written and directed by Fatima Al-Banawi, as a case study of how contemporary Saudi cinema encodes cultural modernity through representational strategies that foreground identity, family authority, affective belonging, and subjective experience.

Grounded in cultural studies, the analysis combines film text analysis with insights drawn from a semi-structured interview conducted with the filmmaker. Stuart Hall's theory of representation and his encoding/decoding model provide the primary conceptual framework, positioning *Basma* as a negotiated cultural text in which meaning is not fixed but produced through representational strategies and potential audience readings (Hall, 2019, 2020). Rather than framing modernization as rupture or ideological opposition, the film constructs cultural change as a process that unfolds through dialogue, emotional expression, and everyday interaction.

The analysis demonstrates how *Basma* mobilizes cinematic form mise-en-scène, cinematography, editing rhythm, sound design, and narrative structure to render emotional register a key representational resource (Dyer, 2023; Wildfeuer, 2014). Domestic spaces, conversational exchanges, affective soundscapes, and visual aesthetics become sites where authority,

belonging, and self-expression are rearticulated. These formal choices frame subjectivity not as overt resistance but as a relational and situational capacity emerging within familial and social contexts.

Methodologically, the study combines film text analysis, as articulated by Bateman and Wildfeuer, emphasizing the multimodal organization of meaning across visuals, sound, and narrative, and foregrounding how cinematic texts actively construct social meanings through form as well as content, with thematic analysis of the interview material following Braun and Clarke's approach, enabling a dialogue between how meaning is constructed on screen and how it is articulated and negotiated by the filmmaker (Braun & Clarke, 2013; Bateman & Wildfeuer, 2016).

Situated within debates on national cinema, the paper engages with scholarship by Higson (1989), Crofts (1993), and Vitali & Willemen (2019) to argue that Basma articulates national cinema as a dynamic and contested cultural formation. The film forges connections between personal experience and collective identity, navigates paths between local cultural specificity and transnational circulation, and gestures toward future imaginaries of Saudi cinema grounded in negotiated representation. In doing so, the paper contributes to film studies discussions on how cinema intervenes in moments of social transformation through the politics of representation.

GSC01 Gendered technologies and AI

PP 0063 Rewriting the rules: Women-led initiatives and gender equity in the gaming ecosystem

Katharine Sarikakis[1], Oleksandra Gudkova[1], Ayca Becerir[1], Lisa Baumgartner[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Women account for nearly half of the global gaming population (Bryter, 2024), yet videogame cultures and industries remain shaped by persistent gender inequalities. Within games and gaming communities, women are frequently marginalised, stereotyped, or sexualised, and harassment is widespread: 59% of women report experiencing abuse, while 26% report sexual harassment in online gaming environments (Bryter, 2024; Fox & Tang, 2017). Despite women's substantial participation as players, dominant discourses in gaming culture continue to privilege male perspectives, influencing both character representation and the norms governing interaction within gaming spaces.

These inequities, however, extend beyond player experiences. Gender inequality operates across interconnected social and institutional contexts, each reinforcing the other. To fully understand these dynamics, the gaming ecosystem must be examined not only through online play but also through the structures of game design, production, and distribution. Within the European videogame industry, women represent only 24.9% of the workforce and are significantly underrepresented in senior and executive positions (Video Games Europe & EGDF, 2025). While industry-led initiatives such as the UK's Raise the Game programme (Taylor, 2022) and Video Games Europe's Diversity Pledge (VGE, 2022) have brought increased visibility to issues of equity and inclusion, their reliance on voluntary participation and self-reporting limits their capacity to produce sustained structural change.

In response to these limitations, women-led initiatives have emerged across Europe as grassroots advocacy actors. Rather than waiting for institutional or policy-driven solutions, these organisations develop independent strategies centred on empowerment, community-building, and advocacy. This paper examines how women-led initiatives intervene in male-dominated discourses within the gaming ecosystem by producing alternative narratives of participation, authority, and belonging. Drawing on policy analysis, grey literature, and semi-structured interviews, the study focuses on organisations such as Women in Games and GAME:IN, which operate as both advocacy actors and cultural intermediaries within Europe's gaming landscape.

The paper addresses two central research questions: how do women-led organisations identify and contest the structural and cultural conditions that sustain gender inequality in gaming, and in what ways do they mobilise grassroots advocacy and policy engagement to expand inclusion and leadership opportunities for women? We argue that these initiatives reveal how struggles over representation extend beyond on-screen imagery to encompass the narratives and power relations embedded in cultural production itself. By generating counter-discourses of equity and empowerment, women-led initiatives expose the limitations of surface-level diversity efforts and highlight the necessity of structural, cultural, and symbolic transformation within the videogame industry.

PP 0064 Platformization, gender, and comedic authority beyond late-night programming

Elisa Paz[1], Lidiane Nunes de Castro[1]

[1] EU Business School, Communication, Barcelona, Spain

There seems to be a perceived tension between femininity and the performance of comedy. In numerous Western societies, women are considered to lack humour, a cultural assumption that directly affects their popularity and agency as comedians. Usually, reputed comedy content is broadcast during prime time and late-night timeslots. Hosts of late-night television shows, which are spaces of high reputation and visibility, are usually people who were successful in stand-up comedy, an environment in which women were not easily accepted and not as successful as their male colleagues.

Previous scholarship has shown how institutional gatekeeping, format conventions, and cultural expectations have historically limited women's access to hosting roles and sustained visibility within the comedy industry, including late-night television. However, the platformization of comedy, particularly through stand-up specials distributed by global streaming services, has begun to reshape the conditions under which comic voices circulate, gain recognition, and establish authority. Building on this shift, this research focuses on examining Netflix original stand-up specials available on the platform in early 2026 as part of the comedy ecology. These specials give comedians the opportunity to perform a full hour under their own name, giving them a level of authority and visibility that can be compared to the one of hosting a comedy show in broadcast and cable television.

This paper examines how platformization potentially reconfigures gendered power relations in audiovisual humor media, shifting attention from broadcast formats to stand-up comedy specials available on streaming platforms, and whether existing hierarchies are reproduced or challenged. Methodologically, this paper combines a classification of the profiles of comedians who headline original stand-up content on Netflix, observing their professional positioning and overall profiles, including gender identity as well as analytical dimensions such as ethnicity, age and nationality, with content analysis of selected stand-up specials (e.g.: Aziz Ansari's, Ali Wong's, Joe Rogan's, Mae Martin's, Amy Schumer's, Kevin Hart's, or Wanda Sykes').

Through this approach, we explore whether platform-based stand-up comedy reproduces existing gendered hierarchies of humour, reinforces them in new ways, or instead opens up new possibilities for women's comedic authority and recognition in contemporary media cultures. This study contributes to feminist media and communication scholarship by critically examining how visibility, humor styles and authority are negotiated along gendered lines in platformized comedy spaces.

PP 0065 From flesh to code: reimagining gender, body and affect in female visual artists' AI-generated visuals

Sofie Van Bauwel[1], Bouko Catherine[1]

[1] UGhent, Communication sciences, Ghent, Belgium

This paper will examine how AI-generated visuals reconfigure the relations between body, emotion, and gender representation, through the imaginaries that female visual artists create around gendered embodiment and affect. Scholars have demonstrated that emotions circulate through media texts, platforms, and practices, shaping subjectivities and social relations. What AI adds to this history is a shift in how embodiment appears: generative AI produces synthetic images that are not anchored in lived bodies. This detachment from material experience forces us to revisit earlier debates about affect and embodiment in order to understand how these imaginaries are transformed when corporeality is simulated rather than experienced. Affect theory has been particularly influential in highlighting the nondiscursive, precognitive, and sensory dimensions of media engagement (Paasonen, 2015). Our framework builds on affect theory and feminist media studies, which have consistently shown that gendered representations cannot be understood without considering their affective and embodied dimensions. The materialist turn and feminist posthumanism (Ringrose et al., 2018; Marston, 2024) have foregrounded the interconnections of body, technology, and affect. Affect theory complements this by focusing on how media works through feelings rather than only what it means (Kannabiran, 2013). This perspective is crucial for AI-generated imagery, which reproduces cultural scripts of gender while simultaneously destabilizing the visceral, embodied anchoring of those representations. By situating AI within feminist debates about affect and embodiment, we aim to conceptualize the imaginaries it creates as both continuities with and departures from earlier digital media forms. For this paper, we aim to conduct semi-structured interviews with nine international female artists (i.e. Alex Naghavi, Arvida Byström, Mara Barros, Yéil, X New Worlds, Carly Fridhandler, Olya Golovko, Jeannette Bergen & Yasmin Gross) to examine their experiences using AI-generated visuals in order to explore how they rethink embodiment, affect and gender. We will question how they play with the visceral and challenge assumptions about embodiment, notably by creating hyperreal images that appear more realistic than human ones (Miller et al., 2023), how they potentially engage with the uncanny sensations their AI-generated images may evoke, due to glitches, lifeless eyes, or because they defy our perceptual norms (Manovich & Arielli, 2024), and ask how in their experiences lifelike bodies coexist with a visibly synthetic structure. We will also discuss whether the boundaries between human and machine are becoming increasingly blurry in their work, pointing to identities formed through continuous interaction with technology (Haraway, 2013), as well as how they interrogate both affect and the construction of emotion—understood not as individual psychology but as socially, politically, and materially produced—when reproducing or subverting cultural scripts of gender, particularly capitalist ones. In doing so, we will offer insights in how female artists reimage gender, the body and affect in AI-generated visuals.

GSC01 Gendered technologies and AI

PP 0066 Face filters as technologies of gender: A multimethod approach to gender performances on TikTok

Gaia Giorgi[1], Giorgia Aiello[1]

[1] University of Milan, Department of Social and Political Sciences, Milan, Italy

Over the last decade, face filters have become a major affordance of contemporary visual social media platforms, increasingly shaping how users construct and negotiate their identities online. This paper investigates how augmented-reality (AR) face filters on TikTok operate as "technologies of gender" (de Lauretis, 1987), actively shaping users' visual self-representation and reinforcing normative gender performances.

Although early AR face filters were popularized for playful and ironic distortions of facial features, they have gradually evolved into tools of self-enhancement and self-surveillance (Elias & Gill, 2018). The mediated representation of the body through technology is, of course, never neutral. Specifically, face filters foreground the role of digital technologies in amplifying existing social norms and cultural stereotypes. TikTok is a particularly significant site for an investigation of AR face filters' implications for gendered representation due to the relationship between its multimodal affordances, creator economies, and user base. These characteristics position TikTok as a key platform for examining contemporary visual practices of digital self-representation, with face filters engaging users in co-creative practices that foster experimentation with their appearance.

Through a multimethod research design combining digital methods, visual analysis, interviews with creators and analysis of users' comments, this research critically examines four different 'sites' of AR filters' visuality (Rose, 2022), namely production, circulation, audiencing, and visual content in its own right.

Our findings reveal that face filters function as tools which- alongside makeup, posing, framing, and editing- contribute to producing a 'hyperfeminine' representation of gender. Users primarily use these filters for makeover purposes, constructing this practice as a form of empowerment promoted by and for young women, also fostering a relationship described by Winch (2013) as "surveillance sisterhood", in which self-monitoring and mutual observation are normalized and encouraged. This discursive construction aligns with what the platform has typically rewarded: a heteronormative, traditionally feminine identity (Kennedy, 2020).

Moreover, our research shows that this gendered performance is actively produced through production practices as well. Our interviews with three women working as face filter designers indicate that representational resources are mobilized with the aim to create standardized, conventionally attractive features. This underscores how normative beauty ideals are embedded in the technical infrastructure of filters and reinforced by platform dynamics.

In conclusion, this research demonstrates that AR face filters function as socio-cultural technologies that produce and promote highly standardized modalities of gendered visual self-representation on TikTok.

PP 0067 Visual gendered disinformation: A two-part systematic literature review

Cosima Annabelle Hofacker[1], Marília Gehrke[1], Eedan Amit-Danhi[1], Scott A. Eldridge II[1]

[1] University of Groningen, Centre for Media and Journalism Studies- Faculty of Arts, Groningen, Netherlands

The general surge in disinformation and its consequences for democracy have become well-known and widely discussed issues among scholars and the public. What has received less attention is how women and gender minorities in positions of power, such as activists, journalists and particularly women politicians, are increasingly becoming the targets of disinformation that employs sexualised and gendered narratives in ways that upend their careers or dissuade them from pursuing them in the first place. This threatens not only women's participation and representation in politics but also democratic ideals of pluralism and gender equality.

Gendered disinformation refers to the instrumentalisation of gender-based stereotypes in false and misleading narratives in an effort to defame and oust women from positions of public trust (Judson et al., 2020; Jankowicz et al., 2021). With ever-new technologies, disinformation has advanced from text-based to AI-manufactured images and videos. Visual disinformation – information that uses visuals (original or manipulated) to deliberately deceive (Weikmann & Lecheler,

2022) – carries the risk of being perceived as even more credible, a result of the evidentiary quality and persuasiveness of images (Hameleers, 2020). Facilitated by gen-AI tools that amplify the spread of disinformation and the impact it has, deepfakes and non-consensual intimate imagery of women politicians, as examples from the UK show (Newman, 2024), have emerged as a particular challenge to democracies.

Within a growing body of research focused on visual disinformation or gendered disinformation, a scholarly gap emerges at the conjunction of these phenomena, for the analysis of which a systematic literature review (SLR) was considered a useful approach. SLRs are a structured process for transparently and reproducibly summarising the state of research on a specific topic, and help identify research gaps and future research needs (Grant & Booth, 2009; Sutton et al., 2019; Page et al., 2021). Thus, following the PRISMA guidelines ("PRISMA", n.d.), an SLR of visual gendered disinformation (VGD) was conducted.

The analytical process began with testing multiple systematic curations of keywords and query structures. The conceptual lacuna around VGD, noted above, manifested in this stage in the form of two distinct bodies of literature, gendered disinformation and visual disinformation, with only minimal overlap. Following this confirmation that VGD has not been addressed sufficiently as a singular concept, this paper pursues this need for further conceptualisation. To do so, the analytical process was redesigned by conducting two separate SLRs and then analysing their overlap in pursuit of a combined definition and typology of VGD via thematic analysis. The paper offers a typology of VGD which reflects a comprehensive and exhaustive understanding of the phenomenon and its conceptual boundaries. It is conceptualised and theorised with a view of VGD as a form of gendered discursive violence, operating at differing sites, including Audiences/Targets, Creators/Perpetrators, and Systems.

The proposed findings serve as a theoretical basis for further research, such as analysis of VGD content, audience perception of VGD content and effects on the women and gender minorities targeted by VGD.

GSC02 LGBTQIA+ and Media I: Experiences, Practices and Place-Making

PP 0172 Digital Place-Making and Queer Belonging: Examining the discursive construction of safe spaces on Philippine Subreddits

Randy Jay Solis[1], Jonalou Labor[1], Jon Benedik Bunquin[1], Maria Jeriesa Osorio[1]

[1] University of the Philippines, Department of Communication Research, Quezon City, Philippines

Safe spaces are crucial for the LGBTQ+ community, providing essential havens of belonging and acceptance. In the Philippines, where discrimination based on sexual orientation and gender identity remains a contentious legislative issue, individuals increasingly rely on digital platforms to discover, create, and "place-make" these havens. Our study explores how queer safe spaces in the Philippines are discursively constructed, aiming to understand the affective and behavioral associations that define them.

While traditionally a physical process involving symbols and norms, place-making has extended into the digital realm through hashtags, geotags, and threaded discussions. This study focuses on Reddit, a platform where users crowdsource opinions and share personal experiences with a level of anonymity that fosters both supportive and toxic interactions. Using the R package 'redditextractoR,' we collected a corpus of 7,741 comments from Philippine-centric and LGBT-specific subreddits, including r/phlgbt and r/Philippines collected from 2024 to 2025. Through computational analysis, we examined semantic associations with the phrase "safe space." Using topic modeling, we find that discourses predominantly centered on themes of harassment and discrimination. The Safe Spaces Act (RA 11313) emerged as the most relevant topic, followed by intense discussions regarding physical locations like bathrooms and fitting rooms, often sparked by real-world incidents, such as a trans woman being denied access to a female fitting room in a Manila mall.

Word embedding results reveal semantic clusters that characterize the discursive construction of the phrase "safe spaces". Redditors frame this construct as inclusive, private environments where individuals can freely express their identities and celebrate differences. Furthermore, safe spaces are conceptualized as a necessary response to pervasive experiences of discrimination, trauma, violence, and assault.

The discourse also highlights significant power imbalances, as certain users dismiss transgender struggles or categorize the creation of gender-neutral facilities as a "waste" of resources. These word embeddings illustrate that safe spaces are dynamic and constantly in flux, where negative or discriminatory encounters can rapidly diminish a sense of security. Finally, these constructs extend beyond the physical to include digital platforms, which serve as non-physical safe havens where queer individuals can express themselves and share their experiences without judgment.

The findings demonstrate that queer safe spaces in the Philippines are not merely physical backdrops but cultural and social constructs shaped by digital communication. These spaces are defined by the provision of privacy and freedom from harassment. Ultimately, this research reinforces the need for a comprehensive SOGIESC Law in the Philippines to provide legal protection beyond the current scope of the Safe Spaces Act. Our findings also inform the construction of safety and security by revealing the affective and embodied experiences of queer people in their articulations surrounding safe spaces in social media. These narratives illustrate that security is not merely a matter of physical protection or legislative compliance, but a felt sense of belonging and bodily autonomy that is constantly negotiated within both digital and physical landscapes.

GSC02 LGBTQIA+ and Media I: Experiences, Practices and Place-Making

PP 0173 Exclusionary solidarity: Transmasculinity, affective contracts, and the dilemma of post-#MeToo Chinese digital feminism — A Weibo discourse analysis of the Cocona controversy

Yuan Liu[1]

[1] Communication University of China, State Key Laboratory of Media Convergence and Communication, Beijing, China

On December 6, 2025, Cocona—a member of the Japanese girl group XG—publicly announced having undergone top surgery and identifying as transmasculine non-binary. This corporeal practice, disrupting the gender binary of the J-pop/K-pop idol industry, ignited intense discursive contention within Chinese digital fan communities. Distinguished from typical 'idol disqualification', this controversy centered on a clash between global queer narratives and a specific strand of local digital feminism known as 'all-female' advocacy. Critics accused the idol of 'exploiting girl group dividends', 'backstabbing women', and 'encroaching on female survival space'. Conceptualizing these reactions as a 'betrayal narrative', and drawing on theories of the 'affective contract' and 'moral economy,' this study investigates how fans interpreted this gender transition not as an act of personal liberation, but as a moral violation. It explores how the fan community, confronting the rupture of their projected ideals of 'female power', employed these narratives to reconstruct group boundaries and expel the transmasculine subject.

This study employs a computer-assisted qualitative design combining corpus mapping with Critical Discourse Analysis. A dataset of 7,471 Weibo posts was harvested via Python and keyword retrieval (6–13 December 2025), then cleaned and de-duplicated. Mapping reveals a compressed 48-hour attention burst, yet highlights a long-tail distribution where low-visibility posts sedimented moralised frames of 'betrayal' and 'resource competition'. These patterns guided the purposive selection of cases for a Faircloughian analysis examining: (1) textual strategies, (2) discursive practices, and (3) social practices associated with post-#MeToo digital gender politics in China.

The analysis reveals that the exclusion of transmasculinity is constructed through the interplay of economic metaphors, essentialist recontextualization, and affective mobilization. Specifically, fans reframe gender transition as a breach of commercial contract, interpreting the non-binary body as a 'theft' of resources meant for cisgender women. This economic logic is reinforced by the repurposing of feminist concepts like 'Girl Power' into tools of biological essentialism. Consequently, the study characterizes this backlash as a form of 'exclusionary solidarity' where transmasculinity is conflated with the 'patriarchal ghost' to secure a fragile utopian boundary. However, this study also notes that such exclusion is not totalizing but operates within a highly contested field. It reveals a profound fissure within digital feminism: a struggle between a defensive retreat into biological essentialism for safety and an emerging exploration of more fluid gender contracts. This study illuminates the 'translation mechanism' through which ontological gender debates are recontextualized into mobilized moral-economic discourse. It further demonstrates how platform vernaculars automate the enforcement of exclusionary norms. Ultimately, by unpacking these dynamics, the study exposes the structural dilemma of post-#MeToo digital feminism: the tension between constructing a safe 'utopian' boundary and the systemic erasure of gender diversity.

GSC02 LGBTQIA+ and Media I: Experiences, Practices and Place-Making

PP 0174 The algorithmized bisexual self: Digital representation and fragmented identification among Italian men

Vincenzo Cicala[1]

[1] Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

This study explores the intersection of digital media consumption, bisexual identity, and social identity among Italian bisexual men. Within the broader field of gender, sexuality, and communication studies, it addresses the research question: **What does engagement with bisexual-themed content on social media generate among Italian bisexual men concerning their sexual identity?**

Drawing on the theoretical framework of identity and social identity (Ramos 2023; Gowland & Thompson, 2013, Thompson 2001, Mead 1934) and *mutual shaping* (Allouch et al., 2020 Wajcman, 2007; Barkardjieva, 2005; van Zoonen, 2002), this research aims to examine if algorithms and digital representation shape a more nuanced identity belonging or solitude within bisexual men in Italy. Employing a qualitative methodology, this work in progress presents preliminary findings from thematic analysis of semi-structured interviews with seven Italian bisexual men (with data collection ongoing towards a target of 20 participants by the end of spring). Rather than discrete states of belonging or solitude, findings reveal complex, nuanced and fragmented patterns of identification mediated by algorithmic logics and varied forms of digital representation.

Results reveal a hierarchical architecture of identification in which visibility functions as a foundational yet non-deterministic condition for identificatory belonging. The mere existence of digital representation, even when stereotyped, holds significance for participants, indicating that visibility constitutes a necessary precondition for identification. However, meaningful belonging emerges primarily through content shared by Italian bi+ associations, and critically, only among those already aware of these organizations. Participants unfamiliar with such associations experience neither belonging

nor solitude, even when encountering LGBTIQ+ content more broadly. Identification through stereotyped representations (memes, humorous reels) occurs rarely and superficially.

Most notably, identification manifests predominantly through sexually objectified male content, a pattern that exemplifies Bhandari and Bimo's (2022) concept of the *algorithmized self*. This theoretical lens illuminates how platform logics, particularly algorithms that prioritize engagement through visual stimulation, actively shape sexualized self-perception by rendering certain representations of male bisexuality more visible, and acceptable, through *embodied masculinity* (Connel 2005). Consequently, participants' identification processes appear to be not merely facilitated but structurally constrained by algorithmic affordances that foreground sexualized content as the primary vector for bisexual recognition.

Diverging from prevalent patterns, one participant reported identification when bisexuality appeared within civil and human rights discourse, revealing an alternative identificatory logic wherein politicized representation offers more resonant pathways to self-recognition than algorithm-privileged sexualized content.

Interestingly, many participants perceive offline spaces as facilitating easier identity identification, attributing this to more authentic *impression management* (Goffman, 1959). However, this perception may itself be shaped by social constraints existing in digital environments, which foster self-conceptions influenced by distortions and group expectations (Bissaca et al., 2020).

GSC02 LGBTQIA+ and Media I: Experiences, Practices and Place-Making

PP 0175 Mapping Czech queer media: Homonormativity, satire, and queering of the mainstream

Tomáš Pacovský[1]

[1] Faculty of Social Sciences- Charles University Prague, The Institute of Communication Studies and Journalism, Prague, Czech Republic

This paper aims to analyse the contemporary queer media landscape in Czechia within the broader socio-cultural conditions of post-socialism, focusing on three queer online media outlets: Lui, Qult, and Buzerant. While Anglophone and Western queer media benefited from decades-long institutionalisation, queer media in post-communist countries remain fragmented or almost non-existent. However, such media play a crucial role in validating queer identities, fostering community, and promoting acceptance, especially in the face of limited mainstream representations. '

Even though Czechia (formerly Czechoslovakia) has a surprisingly long history of queer media, dating back to 1931, it was only in the 1990s that a proliferation of queer media initiatives emerged; however, most of these initiatives failed to undergo digital transformation. Shows and sections of mainstream media have absorbed their role, while queer media nowadays often take the form of individual profiles on social media. Today, Lui remains the only long-running queer magazine still published in print, while Qult represents one of the newest projects, and Buzerant (Czech for "faggot") operates as a satirical blog.

Despite more positive LGBTQ+ representations in contemporary fictional and non-fictional media content and growing social acceptance, existing research indicates that mainstream media continue to rely on reductive narratives; they rely on stereotypes or controversy. There is also a lack of respectful and inclusive language, especially regarding trans people. Moreover, the mainstreaming of queer themes may obscure diversity and flatten queer representation. This renders queer media important as they provide nuanced and intersectional media content, particularly in the light of rising hate crimes towards LGBTQ+ people, even in relatively liberal societies, including Czechia.

Methodologically, this study employs a qualitative thematic analysis of 40 articles published between 2023 and 2026, a period marked by intense political and public debate on queer issues. This includes the introduction of same-sex partnerships, the decision to abolish mandatory sterilisation for legal gender recognition for trans people, and the election of a populist government with partially anti-LGBTQ+ positions. This part is complemented by a critical discourse analysis of nine selected texts.

Preliminary results suggest that the three outlets adopt distinct strategies of representing queer themes. Lui tends toward a more homonormative and commercialised approach largely–but not exclusively–addressing gay male audiences. In contrast, Qult embraces a broader understanding of queerness and employs a subversive approach towards mainstream media conventions while centring queer perspectives. Buzerant, as a blog, uses parody and satire to queer both explicitly queer and non-queer topics.

Overall, this research contributes to the broader debate on minority media and queer representation by highlighting the strategies employed in queer media production in post-socialist Czechia. Together, these strategies reveal how queerness can be differently articulated across queer and non-queer topics, showcasing how Western models of queer sensitivity are translated and reconfigured within the post-socialist media landscape.

PP 0280 Laughing through labor: Humorous representations of motherhood and care work on Instagram

Friederike Jage-D'Aprile[1]

[1] Filmuniversity Babelsberg Konrad Wolf, Digital Media Culture, Potsdam, Germany

The study of motherhood representations in digital media has gained increasing scholarly attention in recent years (Beuckels & De Wolf, 2024; Mary et al., 2024). Parallel debates, from the *Wages for Housework* movement (Callaci, 2025) to the visibility of unpaid care work during the COVID-19 pandemic (Chatzidakis et al., 2020), have long emphasized the need for a nuanced understanding of care as reproductive and affective labor. In media and communication research, this is analytically complex: private care work is embedded in hegemonic power structures, shaped by intersectional inequalities, and culturally gendered (Hatton, 2017). In neoliberal contexts, these inequalities are further individualized and depoliticized (Fraser, 2016), making operationalization of care inherently multilayered. While much research focuses on the commodification of motherhood and the reproduction of neoliberal motherhood ideologies on social media, discussions of care work remain sporadic (e.g., Hunter, 2016; Knauf & Schramme, 2023). Some studies, however, highlight the emancipatory potential of digital motherhood representations and their negotiation (e.g., Lopez, 2009; Van Cleaf, 2020). Humor emerges in this context as an aesthetic practice that challenges traditional motherhood images and enables new forms of visibility (Lehto, 2020; Lemish & Elias, 2020; Rowley, 2025; Stone, 2016). This paper investigates humorous visualization practices by German motherhood creators on Instagram, examining whether and how such posts intervene in visibility regimes of private care work. Central questions include: Which aesthetic forms of humor are employed? How do platform affordances enable the (in)visibility of care work? To what extent are dominant motherhood ideologies disrupted? A qualitative case study was conducted in spring 2025. From an initial dataset of 534 German-language Instagram accounts posting motherhood-related content with at least 10,000 followers, 20 accounts were selected based on account descriptions and humorous hashtags. The last five humorous posts from each account (n = 100; 98 Reels, 2 images) were analyzed using a Polytextual Thematic Analysis (Gleeson, 2020), integrating audiovisual and textual elements. Results highlight the intertextual structure of posts, combining visuals, popular sounds, memetic references, text overlays, and performative gestures. Four main humor forms were identified: (1) sketches and role-plays exaggerating everyday dynamics; (2) visual-narrative storytelling linking personal experiences with emotional-dramatic tension; (3) memetic formats using culturally recognizable symbols and remix techniques; and (4) child-centered humor. Three dimensions of private care were particularly salient in my analysis: (a) everyday care experiences and affective, repetitive labor; (b) satirical interventions in cis-heteronormative couple dynamics; and (c) humor addressing failures to meet motherhood ideals, enabling community identification and coping. Overall, the analysis shows that humor functions as an aesthetic practice shifting between affective community-building around care experiences and structural de-thematization of care conditions. Crucially, by engaging with everyday objects, routines, and visual symbols, these humorous practices constitute a form of *everyday aesthetics* that operationalizes care which make private care work communicable and culturally legible. While structural critique remains often muted in the "just a joke" mode, the study demonstrates that Instagram humor offers a pathway for mediating care, negotiating hegemonic motherhood norms, and creating affective spaces for shared understanding of care work.

PP 0281 Navigating the digital "third space": Gender identity, ethnic representation, and resistance among unmarried Arab women in Israel on Instagram

Nissim Katz[1]

[1] Kinneret College, Communication, Tiberas, Israel

In the contemporary digital landscape, social media platforms have evolved beyond tools for communication into complex arenas for identity construction and negotiation. This study investigates the intersectional experiences of unmarried Arab women in Israel, exploring how they utilize Instagram to navigate the dual pressures of a traditional, patriarchal society and the demands of a modern, globalized digital culture. Situated at the crossroads of gender, ethnicity, and marital status, these women occupy a unique socio-political location where their online self-presentation becomes a significant act of agency and resistance.

Drawing on Erving Goffman's dramaturgical approach to self-presentation, alongside functionalist and empowerment theories, this research posits that Instagram functions as a "third space"—a digital territory where disparate cultural scripts can be synthesized. The study employs a qualitative methodology based on semi-structured, in-depth interviews conducted in 2024 with 30 unmarried Arab women aged 18–38 from diverse socio-demographic backgrounds across Israel.

The findings reveal that participants actively curate their profiles to manage three primary dialectics. First, under the theme of **Navigating Dual Identities**, the study demonstrates how women perform a sophisticated balancing act. They construct a hybrid persona that respects traditional cultural norms while simultaneously signaling modernity and independence. This involves a conscious "code-switching" of visual and textual content to satisfy different imagined audiences, from conservative family members to liberal peers and global followers.

Second, the theme of **Empowerment and Resistance** highlights how Instagram serves as a site for counter-discourse. Participants use the platform to dismantle double stereotypes: those regarding the "submissive" Arab woman prevalent in Western/Israeli discourse, and those regarding the "spinster" prevalent in their own communities. By showcasing professional achievements, educational pursuits, and cosmopolitan lifestyles, these women reclaim the narrative of their femininity and ethnicity. The platform facilitates a form of "intra-personal empowerment," where the accumulation of social and symbolic capital (likes, comments) translates into increased self-efficacy and psychological well-being.

Finally, the theme of **Negotiating Modernity and Tradition** reveals that participants do not view these concepts as binary opposites but as fluid resources. Rather than rejecting tradition, they reinterpret it—displaying pride in ethnic heritage (cuisine, fashion) while reframing it within a modern aesthetic.

This study concludes that unmarried Arab women in Israel are not passive consumers of digital media but active agents who leverage Instagram to harmonize their fragmented identities. By creating a space where they can be both "Arab" and "modern," "modest" and "liberated," they challenge the hegemonic boundaries of their offline reality. These findings contribute to the broader discourse on gender and media by illustrating how marginalized groups utilize digital architecture to negotiate social risks and construct coherent, empowered identities in the face of intersectional oppression.

PP 0282 YouTube podcasts as counter-archival trans life-writing: Transgender activism in Pakistan

Fatima Zahid Ali[1]

[1] Vrije Universiteit Brussel, Department of Communication Sciences, Brussels, Belgium

On Pakistan's social media counterpublics, YouTube has become a key platform where *khwajasiras* (transgender or trans-feminine "third gender" in South Asia) activists talk back to escalating moral panics around gender, sexuality, Western queer discourses and national belonging. *Khwajasira* is a term used for individuals who identity as transgender, non-binary, gender non-conforming and is widely understood as an indigenous (often spiritual) category with ancestral roots in pre-colonial South Asian history. This paper conceptualizes YouTube podcasts featuring *khwajasira* activists as a form of platformed trans 'life-writing' that doubles as a living counter-archive. In literary studies, life writing connotes culturally and historically situated acts in which narrators recount their lives in order to claim identities, make sense of experiences and address others (Smith & Watson, 2016). Through extended autobiographical narration, communal testimony and platform-specific genres such as conversational podcasts, rant monologues and reaction videos, activists appropriate and abrogate dominant religious, legal and trans-rights discourses as they narrate personal and collective histories. Drawing on the analytic framework of postcolonial appropriation and abrogation (Ashcroft, Griffiths & Tiffin, 1989, 2002) combined with content and multimodal critical discourse analysis (Kress & van Leeuwen, 2006; Machin & Mayr 2012), we examine more than 30 podcast episodes featuring five diverse transgender activists. Appropriation refers to the reworking/adaption of dominant languages and discourses for locally meaningful purposes; whereas abrogation rejects and displaces normative authority and hegemonic discourses. Our findings show how transgender activists: (1) 'appropriate' and 'abrogate' global trans-rights vocabularies and state categories into locally intelligible terms (2) re-narrate life trajectories and *khwajasira* realities across different layers of podcast discourse (autobiographical, communal-historical, legal-bureaucratic, religious-moral and pop cultural); and (3) negotiate YouTube podcasts as a genre blending form of life-writing to produce a counter-archive of *khwajasira* experiences and political work. In doing so, the article extends postcolonial theories of appropriation and abrogation from literary texts to non-literary, platformed media and contributes to scholarship on social media and queer/trans publics in the Global South by showing how transgender activists mobilize YouTube podcasts to assemble a fragile yet persistent trans public and counter-archive under conditions of heightened political and moral scrutiny. Lastly, it speaks to debates on social media by underscoring how transgender activists navigate social media's ambivalent affordances as both an amplifier of trans visibility and as a site of harassment and transphobia.

PP 0283 Affective temporalities and digital feminist activism: communicative practices of the 8M movement in Portugal and Brazil

Camila Lamartine[1]

[1] ICNOVA, FCSH, LISBON, Portugal

This paper is part of a broader research project that examines how time is experienced, narrated and politicised within contemporary feminist communication practices. Drawing on the concept of *affective temporality* (Chamberlain, 2019), the study explores how affects such as pain, anger, hope and solidarity are articulated with specific temporal regimes—often mobilised through the metaphor of feminist "waves"—to produce narratives that connect past experiences, present urgencies and future projections.

The analysis focuses on digital communication practices developed by feminist collectives involved in the 8M (International Women's Strike) movement in Portugal and Brazil. Adopting a qualitative and intersectional approach, the research is based on in-depth interviews with activists, participant observation, and the analysis of digital content produced on social media platforms between 2019 and 2024.

The paper argues that the 8M movement mobilises a distinct politics of time that challenges neoliberal logics of acceleration, productivity and forgetting. Through the activation of colonial memories, collective affects and dissident temporalities (e.g.time of care, listening and revolt) feminist digital activism constructs alternative ways of inhabiting time. In this sense, the movement does not merely communicate political demands but actively proposes new temporal imaginaries and modes of collective existence.

Digital narratives and mobilisation rituals within the 8M produce a specific temporal experience in which the past is continuously reactivated through historical memory, the present is lived as collective urgency, and the future is imagined as a space of radical transformation. These affective-temporal dynamics directly shape how female, racialised and dissident bodies occupy both public and digital spaces.

By engaging with the Gender, Sexuality and Communication Section, this paper contributes to debates on time as a structuring, yet often invisible, dimension of feminist struggles and gendered communication. Conceptualising time as an affective and political construction allows for the denaturalisation of normative forms of social and communicational organisation, highlighting alternative practices of meaning-making, memory and resistance in digital feminist activism.

PP 0284 Digital Feminism and Transnational Repertoires of Contention: the Case of the #EleNão Movement in Portugal

Célia Taborda Silva[1], Carla Cerqueira[1]

[1] Universidade Lusófona, Comunicação, Porto, Portugal

#EleNão movement emerged in 2018 as an initiative led by Brazilian women on Facebook (Barajas, 2020; Carvalho et al., 2023) and rapidly expanded into street mobilizations through the organization of multiple protests in Brazil and in other countries around the world. These demonstrations were promoted by women from the Brazilian diaspora as well as by local organizations. This study analyses the repertoires of contestation of the #EleNão movement in Portugal as a digital glocal expression of feminist resistance to the rise of authoritarianism and misogynistic, anti-gender political rhetoric, focusing on the movement's hybrid performance between digital and street action.

The methodology adopted combines social movement theory with an analysis of the movement's repertoires of action, based on 70 journalistic pieces published in two newsmagazines, one weekly newspaper, and five leading daily newspapers in Portugal. Based on the concept of collective action repertoires (Tilly, 1978, 2008; McAdam, Tarrow & Tilly, 2004), the study shows how #EleNão mobilised transmediatic strategies: hashtags, performances, political aesthetics, in a logic of affective and visual protest, expanding the classic forms of mobilisation to include emotional, symbolic and decentralised dynamics. In the Portuguese case, the movement materialises in demonstrations organised by feminist collectives from the Brazilian diaspora, in conjunction with local associations, constituting a space for transnational solidarity and the re-configuration of protest practices in the digital era (Pavan & Mainardi, 2018). The analysis reveals a movement marked by the politicisation of testimony, the aestheticisation of protest and the constitution of an intersectional collective identity. This research lies in analysing #EleNão as a transnational digital feminist repertoire whose circulation does not primarily depend on formal organisational structures, but rather on platform-based communicational infrastructures. Instead of approaching transnationalisation as a linear process of diffusion, the research conceptualises it as a process of discursive and performative recontextualisation enabled by the connective logic of digital networks (Bennett & Segerberg, 2012). Within this framework, the projection of #EleNão in Portugal is analysed not as a mere geographical extension of the Brazilian protest, but as a symbolic displacement that articulates local experiences with global feminist frames. By foregrounding the innovative dimension of digital feminist repertoires, the study argues that #EleNão in Portugal exemplifies a model of transnational contention grounded in connectivity, the circulation of affects, and the co-presence of digital and public space. It concludes that understanding contemporary feminism requires a rethinking of classical analytical categories in light of digital dynamics, thereby contributing to theoretical advances in social movement studies, gender studies, and communication research.

PP 0397 Exploring feminicide through pop culture on TikTok: Gendered communication in two Italian cases

Antonella Mascio[1], Simona Tirocchi[2]

[1] University of Bologna, Department of Political and Social Sciences, Bologna, Italy
[2] University of Turin, Philosophy and Educational Sciences, Turin, Italy

Exploring feminicide through pop culture on TikTok: gendered communication in two Italian cases

This paper examines how gender operates as a communicative structure within social media responses to feminicide, with the aim of analysing how gender issues- and feminicide in particular- are reworked within contemporary public discourse and popular culture. Focusing on TikTok, the study conceptualises social platforms as key sites where gendered meanings, power relations, and affective norms are produced, negotiated, and contested through everyday communicative practices.

The analysis focuses on platformed discourses surrounding the feminicides of Giulia Cecchettin and Giulia Tramontano, two highly visible cases in the Italian context. Rather than treating these events solely as social tragedies, the paper approaches them as moments of intensified gender communication, in which public narratives about violence, responsibility, emotions, and gender norms are actively constructed within platformed popular culture.

The study draws on a qualitative digital ethnography focusing on TikTok materials published between November 2023 and June 2024 and adopts a dual-criteria purposive sampling strategy. The corpus consists of 30 TikTok videos related to the two cases, selected through two complementary subsamples. The first includes 15 high-visibility videos, identified on the basis of observable engagement metrics (minimum thresholds of 100,000 views and 300 comments) and their ranking among the most visible results for relevant hashtags (#giuliacecchettin, #giuliatramontano, #femminicidio) within 30 days of each event. The second comprises 15 pop-expressive videos, selected to capture diverse platform-native expressive forms- such as confessional storytelling, meme-based irony, audio trends, duet/stitch responses, and aesthetic or AI-assisted videos- each meeting minimum circulation thresholds.

For each video, the top and most recent comments were collected. The material was analysed through critical discourse analysis and thematic coding, focusing on gendered accountability, emotional legitimacy, and symbolic violence as they emerge in comment interactions.

Preliminary analysis points to TikTok as a highly gendered communicative arena in which different types of content coexist and compete, including informational narratives, expressions of support and solidarity, as well as posts and interactions that reproduce forms of symbolic violence such as ironic backlash and victim-blaming. Platform affordances and algorithmic visibility shape the circulation and relative prominence of these communicative forms, influencing which voices are amplified and how legitimacy and exposure are unevenly distributed along gendered lines.

By situating feminicide-related communication within platformed popular culture, the paper argues that social media function as informal yet powerful sites of gender education. Through affective exchanges, aesthetic practices, and everyday interactions, TikTok contributes to the ways young users learn, negotiate, and contest meanings of gender, violence, and responsibility in contemporary digital environments.

PP 0398 "Families are attacked every day": The Portuguese case of far-right wing and anti-feminist conservative discourses on TikTok

Jéssica Neves Caetano Ribeiro[1], Juliana Alcantara[2], Hadassa Guimarães Oliveira[3]

[1] Faculdade de Letras da Universidade de Coimbra, Jornalismo e Comunicação, Coimbra, Portugal
[2] Erasmus University Rotterdam- Erasmus School of History- Culture and Communication, Department of Media and Communication, Rotterdam, Netherlands
[3] Instituto Politécnico de Lisboa- Escola Superior de Comunicação Social - ESCS, Laboratório de Investigação Aplicada em Comunicação e Média - LIACOM, Lisboa, Portugal

Political communication strategies on social media are filled with alarming right-wing extremist rhetoric that incites hatred against women (Caldeira & Machado, 2023). Around the globe, we witnessed cases that denounce this issue as a problem for democracy (Krook, 2017), and we are urged to consider emerging responses from different spheres of society. In Portugal, this phenomenon is reflected in the Chega party, which was established as the third national political force and won 9.9% of the vote in the 2024 European elections (European Parliament, 2024). Not surprisingly, André Ventura, leader of the far-right Portuguese party, has used digital platforms to expand his presence among younger voters in recent years (Vieira & Joaquim, 2023).

In academic research purposes, gender is not seen as a central issue in political communication, although the far-right carries the mark of gender in its discourse. We bring gender issues to the centre of discussion to avoid what scholars in the news media field of research frequently neglect. We assume that political issues are not separate from gender in a discursive strategy which tends to contribute to the erosion of democratic public space through the promotion of symbolic violence and misogyny.

In this communication, we examine how the country's main far-right figure frames women and feminism on his TikTok profile. We examine his posts from a political and feminist perspective, taking into account how ideologies are spread through public-sphere discourses. The research is designed using a qualitative approach following a critical feminist discourse perspective (Lazar, 2018) on data analysis. The corpus consists of 164 posts from Ventura's TikTok profile. The data set includes 24 videos that mention and/or show actions by women and about women between March 1 and August 31, 2024. The six-month data collection period considers the three months before and the three months following the European Parliament elections. Three critical themes emerged: Femonationalism and strategic instrumentalisation, Gender as a floating signifier in political conflict, and Political gender violence and performances of masculinity.

Therefore, we discuss how far-right populism instrumentalises gender and feminist topics to promote ideas of exclusion. Extremist discourses feed on violence against women politicians to silence these dissenting feminist voices while building, behind digital performances of masculinity, a national identity that excludes this 'other'. Gender is a fluid mechanism, a resource that is always available to be shaped according to the political conflict of the moment. We argue that gender is not a marginal aspect of the far-right wing discursive strategies, but a central mechanism to normalise extremist ideologies. Women's rights issues are either exploited for xenophobic purposes or revived for use in a conservative context where family and traditions are valued, and women have a fixed place within this revived past.

PP 0399 Tradwife discourses and digital labor within the alt-right imaginary on Instagram: The case of RoRo Bueno

Pablo Romero-Medina[1], Júlia Vilasís-Pamos[2]

[1] Independent researcher, Independent researcher, Granada, Spain
[2] University of the Balearic Islands, Department of Applied Pedagogy and Psychology of Education, Palma, Spain

This article aims to analyze the tradwife trend through the case study of Spanish content creator Rocío (also known as RoRo) Bueno (@whoisroro), who has 4.8 million followers on Instagram, focusing on the reels published on her Instagram profile during 2025. The study examines how traditional gender roles are aesthetically and discursively rearticulated in contemporary influencer culture and how these representations resonate within broader ideological frameworks circulating in digital environments.

Emerging in the United States and the United Kingdom and gaining visibility between 2020 and 2024, the tradwife movement is led by women who promote a lifestyle centered on domesticity, heterosexual marriage, and gendered divisions of

labor. Although often described as antifeminist, tradwives frequently frame their practices using the rhetoric of individual choice and empowerment, rejecting explicit opposition to feminism while simultaneously distancing themselves from what they characterize as woke ideology and institutional feminism. In this sense, the tradwife phenomenon can be understood as part of an alt-right imaginary, in which narratives of gender order, nostalgia, and moral restoration are depoliticized and reframed as personal lifestyle choices. Moreover, it is also presented as a potential alternative for women to address the crisis of work and care under neoliberalism, portraying their lifestyle as more desirable than participation in the labor market. This imaginary operates primarily through affective, aesthetic, and everyday discourses rather than overt political messaging, enabling its circulation across mainstream platforms such as Instagram. Each tradwife must adapt this imaginary to the political context of her respective country to connect with the nostalgia and symbols associated with traditional gender regimes, generating a convergence between global elements and local realities.

Methodologically, the study adopts a qualitative case study design combining multimodal qualitative content analysis with tools from discourse analysis, complemented by the analysis of follower comments as an entry point into processes of reception and meaning co-construction. The main corpus consists of reels published in 2025 on RoRo's Instagram account. From a total of 67 reels, a simple random sample of 58 posts was selected, ensuring a 95% confidence level. A purposive sub-sample of 14 reels was then selected based on their relevance to the tradwife trend and analyzed discursively. Additionally, a purposive selection of comments—prioritizing highly visible and interaction-generating responses—was examined to explore audience engagement and validation dynamics.

The findings reveal two interconnected ideological tendencies. First, the reinforcement of traditional gender roles within a patriarchal and heteronormative framework, positioning women as devoted caregivers, economically dependent, and professionally disengaged. Second, the normalization of content creation as a precarious, non-professional activity, framed as a hobby rather than legitimate labor. Together, these dynamics consolidate what we conceptualize as digital traditional lifebour: a form of platform-based self-branding that obscures professionalization processes while reaffirming traditional family values and relegating women to unpaid care work and constant male validation.

PP 0400 Gatekeepers of patriarchal dogma: Anti-feminist rhetoric and the prerogative of gender essentialism in female-led American conservative podcasting

Iulia Mureșan[1]

[1] Faculty of Political- Administrative and Communication Sciences, Department of Journalism and Digital Media, Cluj-Napoca, Romania

Gatekeepers of patriarchal dogma: *anti-feminist rhetoric and the prerogative of gender essentialism in female-led American conservative podcasting*

The proposed study examines the stringent evolution of the gendered discourse surrounding reproductive rights and the abortion dilemma within the disputed framework of the American far-right alternative media ecosystem. The targeted timespan lengthens between January 2022 and December 2025. This period is achingly characterized by monumental shifts in both the legal and the social milieu preceding and following the overturned *Roe v. Wade*. During this period of vulnerability sweeping through the masses and digital exploitation, the "womanosphere" began to thrive. This encompassed a convoluted network of conservative female podcasters who have become central disseminators of anti-feminist and hegemonic pro-natalist narratives.

More concisely, the study aims to address the paradox of the female podcasters advocating for the dismantling of their very own bodily autonomies and social emancipation by formulating and distributing anti-feminist commentary. Previous research has solely focused on male-dominated institutions or religious filaments, but there remains a significant gap in understanding the narratives projected by female podcasters who conflate wellness and morality with far-right policies and anti-feminist axioms. Rhetorical phrases such as "judgment", "isolation" and "community condemnation" (Cockrill et al., 2013, p. 79) begin to emerge in this niche more robustly and swiftly became coordinates of substantial validation.

From a methodological vantage point, the female-led conservative sphere, fabricated via individual audio productions or podcasts, comprises leading names, such as Allie Beth Stuckey's *Relatable* podcast, Candace Owens' *Candace* podcast, Pearl Davis's *JustPearlyThings* podcast, Brett Cooper's *The Comments Section*, Kristan Hawkins' *The Kristan Hawkins Show* or Julie Barrett's *Womansplaining*.

Utilizing a mixed-method approach, this research combines the quantitative inspection of the linguistic corpus with a qualitative, thematically inclined discourse analysis. The quantitative segment tracks the frequency, the collocation or the reach of specific keywords and expressions that annihilate any feminist infusion, such as biological reality, gender-critical complementarianism, foetal personhood or the sanctity of unborn life. As a symbiotic addition, the qualitative analysis identifies the underlying ideological frames and the scheming and knavishly refined rhetorical devices that support fearmongering, the transgressive appeal, networked intimacy and ultimately, the engendering of affective publics.

The preliminary findings reveal that the primary discursive pillars are founded on the rejection of autonomy for the privilege of gender essentialism, medical disinformation and skewed personal anecdotes as artifacts of empowerment and above all, the myth of the oppressed majority (Co, 2021, p. 7). The womanly configuration is thus, reduced to a domestic-preeminent

outlook where fertility is regarded as the highest civic duty, where contraception goes against a pre-determined universal order and where the liberal hegemony dismantles the holy family.

Within gender and communication studies, the manosphere has been examined as a heterogeneous set of digitally networked communities in which antifeminist and male-centred discourses are articulated and circulated (Ging, 2017; Ging & Siapera, 2018). Recent scholarship has further suggested that the contemporary manosphere is undergoing an expansion toward explicitly economic and neoliberal discursive frameworks, increasingly articulating masculinity, intimacy, and gender relations through the logics of self-optimisation, market rationality, and entrepreneurial subjectivity (Gerrard et al., 2025; Iñigo & Ging, 2026). Building on this perspective, this article approaches the manosphere not merely as a set of online communities, but as a transmedia sociocultural ecosystem whose influence extends beyond digital platforms through the production and circulation of offline cultural artifacts which the manosphere discourses are reproduced, stabilised, and commercialised. Specifically, it examines 182 (self-)published Pick Up Artist (PUA) books distributed via Amazon in the Italian context, and the comments of the buyers on Amazon.

The study conceptualises these books as material nodes within a transmedia manosphere ecosystem, where digitally rooted narratives of seduction, masculinity, and gender relations are rearticulated through print-based self-help formats. Drawing on scholarship on mediated masculinities, neoliberal selfhood, and the cultural politics of self-help, the article addresses two research questions: (1) how is seduction discursively constructed in Italian PUA books, and (2) how do reader reviews contribute to the interpretation and legitimation of these constructions?

Methodologically, the study combines Structural Topic Modelling, STM (Roberts et al., 2014), with lexical and semantic analysis applied to a corpus of Italian-language PUA books. The analysis includes both book descriptions authored by writers and reader reviews posted on Amazon, enabling a comparative examination of authorial discourse and reader reception.

Results indicate a highly standardised and instrumentalised lexicon in which seduction is framed as a technical, goal-oriented, and transferable skill. Book descriptions are dominated by semantic fields related to techniques, mindset, control, and gender difference, while references to reciprocity, emotional relationality, or mutual desire are marginal. Seduction is primarily constructed through procedural and optimisation-oriented frameworks, positioning women as objects of strategic action rather than discursive subjects. Topic modelling further reveals systematic differences across authorship, with male-authored texts emphasising performance, discipline, and tactical mastery, and female-authored texts placing greater emphasis on emotional authenticity and “natural” attraction. Reader reviews, by contrast, foreground evaluative criteria related to usability, clarity, and perceived effectiveness, often framing the books in terms of personal transformation and practical outcomes rather than ideological content. Through these evaluative practices, readers contribute to the symbolic construction of PUA authors as credible experts operating largely outside established publishing and academic institutions.

By analysing PUA books as slow, material media embedded in platform economies, this article contributes to an emerging body of research that links the contemporary manosphere to broader neoliberal and economic rationalities. It demonstrates how the construction of gender relations and intimate practices becomes increasingly intertwined with market-oriented logics of optimisation, performance, and self-investment, highlighting the relevance of offline cultural artefacts for understanding the evolving political economy of masculinity and intimacy in contemporary capitalism.

PP 0406 Gender medicine in the public eye: Written and visual coverage in Austrian newspapers between 2010 and 2025

Irmgard Wetzstein[1]

[1] University of Applied Sciences St. Pölten, Digital Business and Innovation, St. Pölten, Austria

Medical education and research have been based on a specific male body prototype, weighing 80 kg and being 35 years old, for a long time, with little questioning of the transferability of findings to non-male bodies. From the 1980s the discussion of gender-related characteristics in terms of disease progression have begun to take shape, finally manifesting in the scientific discipline of gender medicine: Concerned with both mental and physical health, gender medicine acknowledges

(perceptions of) health and illness being linked to sex and gender and respective biological and social circumstances, and creates evidence of gender-sensitive treatment and diagnostics (see for example web appearance Medical University of Vienna / Gender Medicine).

The study addresses written and visual coverage of gender medicine in Austrian printed news media, which is relevant considering media constructions of gender being able to reinforce corresponding social expectations of behavior, and journalistic content being part of individuals' and social groups' larger health information repertoires (Fisse et al., 2024). It applied a quantitative content analysis of 224 news articles in a period of 15 years from 2010, when gender medicine was first institutionalized in Austria at the Medical University Vienna with a designated chair, to 2025. Articles were retrieved from quality journalistic, mid-market and tabloid newspapers with national reach, including Der Standard, Kronen Zeitung, Die Presse, Kurier, Kleine Zeitung, and Heute, using the APA-OnlineManager Library database and the German-language search term "Gendermedizin" (gender medicine). Informed by- "doing gender" (West & Zimmerman, 1987) and intersectional perspectives (Crenshaw, 1991), the study explored written and visual content regarding main topics, thematic assignments (e.g. physical or mental health), main actors and speakers, allocations of needs for action (individual/micro-level, organizational/meso-level, systemic and societal/macro-level), biological sex or gender foci, connections to further identity characteristics (such as age, race, class), used visual image types, content, sources, functions, and placements, and depicted actors.

Results show that gender medicine is rather discussed as matter of individual responsibility and biological differences between the sexes, decoupled from societal structures and systemic imbalances. Visual representation remains on the surface, with generic images prevailing for dramaturgic purposes. The presentation will address study limitations and highlight contributions the analysis aims to provide. Regarding the latter, that is, finding longer-term thematic patterns in the coverage of gender medicine, integrating insights from gender (media) studies and health communication, and generating new knowledge to the scarce research body of gendered health visualizations in journalism.

PP 0407 What is written about #MeToo in Portugal? An analysis of digital newspapers

Carla Cerqueira[1], Célia Taborda[1], Sónia Lamy[2], Ana Sofia Pereira[1]

[1] Lusófona University, Cicant, Porto, Portugal
[2] Lusófona University, Cicant, Lisbon, Portugal

#MeToo is one of the most prominent digital feminist activist movements of recent years (Fileborn & Loney-Howes, 2019; Loney-Howes et al., 2021; Mendes et al., 2018). Created in 2006 by African-American activist Tarana Burke, the movement only gained global visibility in 2017 after a Twitter post by actress Alyssa Milano, becoming a viral feminist hashtag and a transnational movement (Clark-Parsons, 2021). The widespread circulation of #MeToo through digital platforms expanded the movement granting it global resonance. In some national contexts, such as Portugal, #MeToo has been largely debated as a movement confined to the digital sphere (Prata, 2021) and to its discussion in the press.

This study analyses how #MeToo has been represented in the Portuguese digital press, focusing on the main topics and narratives present in journalistic coverage. The corpus consists of journalistic articles published between October 2017 and June 2022 in two national generalist newspapers, Público, a daily newspaper, and Expresso, a weekly newspaper. A search for the keyword "MeToo" resulted in 263 articles, including both news and opinion pieces. These articles were subjected to a thematic analysis (Braun & Clarke, 2006) in order to identify, analyse, and report recurring patterns and themes.

The analysis identified four central themes: sexual harassment and violence; the questioning of (re)victimization and the normalization of violence; the ambivalence of feminisms within the #MeToo movement; and backlash against #MeToo and feminisms. The findings show that in Portugal the movement gained particular media prominence following the Mayorga versus Ronaldo case in 2018 and again in 2021, when women celebrities from different professional fields publicly shared experiences of harassment.

Nevertheless, the journalistic narratives analysed reveal a persistent ambivalence towards feminisms and #MeToo, expressed through favourable, unfavourable, and sometimes paradoxical positions. Sexual harassment and violence are portrayed either in ways that question victims' legitimacy or that normalize these forms of violence, resulting in a fragmented and non-consensual public discourse. While violence and harassment are acknowledged as social issues, the movement and its protagonists are simultaneously discredited, and backlash against feminisms is particularly evident in discussions

surrounding sexual violence. Additionally, the repetition of the same voices and public figures limits the diversity of perspectives represented in the coverage.

Overall, the results highlight the multiplicity and complexity of contemporary feminisms in a context marked by both progress and backlash. While the digital sphere enables wider national and global visibility for feminist causes, it can also reinforce paradoxical discourses and setbacks. The Portuguese case of #MeToo illustrates these tensions, revealing the ambivalent role of digital journalism in shaping feminist public debate.

PP 0408 Social impact of news coverage on gender violence prevention

Cristina Pulido[1], Beatriz Villarejo[1]

[1] Autonomous University of Barcelona, Department of Journalism and Communication Sciences, Bellaterra, Spain

Gender-based violence represents a major social and public health issue whose prevention requires not only institutional policies and resources, but also an active and responsible role from the media. Journalism plays a decisive role in shaping interpretative frameworks, influencing public opinion, and either illuminating or distorting the causes, consequences and possible solutions to this form of violence. Consequently, it is essential to examine whether media coverage incorporates scientific evidence into its social impact and effectively contributes to prevention, while avoiding harmful effects such as revictimization or the normalisation of violence.

The SafeNarratives research project, funded by the Ministry of Science, Innovation and Universities of Spain, aims to analyse the current state of journalistic coverage of gender-based violence, with a particular focus on integrating scientific evidence oriented towards social impact in prevention. This paper presents the findings of a literature review of the scientific literature addressing the impact of news coverage of gender-based violence, understood both in terms of its preventive potential and its possible adverse effects, such as the revictimization of victims and survivors, as well as isolating violence directed at those who support them. Based on a structured search strategy conducted in the Web of Science database, 180 peer-reviewed scientific articles were selected and analysed. The results indicate that media coverage frequently prioritises sensationalist and episodic frames focused on isolated events, to the detriment of contextualised and evidence-based explanations, thereby undermining prevention efforts. Nevertheless, the findings also demonstrate that journalism can contribute meaningfully to the prevention of gender-based violence when it adopts a responsible approach grounded in scientific evidence with proven social impact. Although the literature highlights the transformative potential of such journalistic practices, their social impact has so far received insufficient attention. At the same time, the reviewed studies identify key conditions under which journalism can generate positive social impact, including thematic framing, contextualisation, adherence to ethical guidelines and the incorporation of scientific evidence with demonstrated social impact as the main sources of the news coverage. Editorial decision-making emerges as a crucial factor in orienting news coverage towards prevention. This review, therefore, constitutes an initial step towards advancing systematic research in this field.

PP 0409 Towards Global Media Monitoring Project 2030 – Exploring new methodological trails in the coding practices of the international news flow study

Jonita Siivonen[1]

[1] Swedish School of Social Science at the University of Helsinki, Journalism and communication, Helsinki, Finland

The Global Media Monitoring Project GMMP is an international news media study conducted every fifth year since 1995. The latest monitoring day was 6th of May 2025, and the next round of 2030 is to be planned for during the next years. This paper aims at presenting further sharpening of the coding practices for the future of this only remaining international news flow study, now contributed to by researchers in around a hundred participating counties. GMMP started out as a (binary) gender equality study thirty years ago and has grown into monitoring the interviewees and other news subjects in a more subtle way for every round. For example, the gender categories have developed from female/male via female/male/other into female/male/gender diverse. In 1995 the GMMP comprised journalistic news content in 71 countries, in 2025 the number of participating countries was 94. In 1995 the people represented as interviewees or other news subjects in legacy media (print, radio, television) were 17% female, while the number was 26% thirty years later (29% female people in news websites). Being a study that in 2025 comprised 30.049 separate news items and 59.563 interviewees and news subjects, it is worth continuing to perfect the coding methodology to get even more insights out of this effort engaging so many researchers and students in different parts of the world.

Albeit the improvements of the categorizations of the people monitored (e.g. gender category “other” changed into “gender diverse”), some limitations in the coding practices remain. The use of the concept of “minority” for example in the

coding question "Is this person depicted as part of a minority group (sexual, ethnic, racial, religious or other)?" bundles together people from different groups and does not take intersectionality into account. And—it can be read as it is used in everyday language as connoting to marginalised groups of people. But as "minority" literally means "a smaller number", it is not a functioning concept in a study that monitors the power relations between people of different group belongingness through the distribution of numerical representation. It is evident that privileged minorities and minorities that are in as good a societal position as the majority, should not be coded as minorities in the everyday language usage sense as people belonging to groups that are marginalised in society in one or another way are. For example, the Sámi people and the Swedish language minority in Finland are both minorities by number, but their societal position in relation to the Finnish majority is different. Also, another challenge with the concept is that a group of people obviously can represent the majority of the people living in a country or region and thus be even strongly marginalised. This paper suggests sharpened focus on vulnerable groups of people whose gender, sexuality, ethnicity, language or religion marginalises or disconnects them from participating fully in the core of the society.

GSC05 Representations and Comments in News Media

PP 0410 User comments in Slovak journalism when it's popular, male, gay, and without consent: The case of Fero Joke

Matúš Ján Capko[1]

[1] University of Prešov, Institute of Slovak and Media Studies, Prešov, Slovakia

In recent years, the view on the issue of sexual violence in Slovak society has been inconsistent. Specifically, with the diversity of opinions, topics such as sexual consent are often understood in public discussions as well as on media platforms in contradiction with the recommendations of experts, human rights and non-governmental organizations. Therefore, themes like consent covered by the media appear to be controversial. The dynamics in society in connection with consent can, for example, be characterized by the current state. The Slovak government has been repeatedly called upon by NGOs such as Amnesty International Slovakia (2025) to include a definition of rape in the criminal law, emphasizing that sexualized violence is based on the absence of consent in sexual activities, and to ratify the Istanbul Convention. This research examines the case of Slovak comedian Fero Joke (František Košarišťan) from December 2025, which has been associated in the media with topics such as consent, sexual violence, sexual harassment, sexuality, sexual orientation, masculinity, or victim blaming. Fero Joke, a well-known Slovak comedian and influencer, an openly gay man and supporter of the LGBTQ+ community, according to his statement and the statements of the victims, sexually harassed two men who attended one of Joke's performances in Prague in December 2025. The information became public after the victims posted a video about their experience on the social network Instagram. The main objective of this research is to examine the readers' perceptions of the Fero Joke case with a focus on the content analysis of comments from users of selected media. The research methodology is based on content analysis, which, with reference to previous studies of this type (Reimer et. al. 2023), is also used to analyse user comments in journalism. Consequently, the content analysis in this research focuses on user comments in discussion sections of articles in widely read Slovak online daily newspapers such as Denník N, SME, or Pravda published in December 2025. The content analysis is accompanied by Judith Butler's (1990) perspectives on the concepts of social structure, violence, and masculinity, which the research draws on when grasping the terms related to the subject of analysis. Hence, the following question arose: How do commenting users on the platforms of Slovak online daily newspapers Denník N, Sme, and Pravda perceive the issue of consent in the context of articles about the Fero Joke case published in December 2025? The findings of this research so far suggest that the Fero Joke case highlights the need to examine how media audiences respond to a complex event, and that views on consent can be influenced particularly by male-on-male sexual harassment, power dynamics between the two parties involved, audience favouritism, and the history of the victims.

GSC06 LGBTQIA+ and Media II: Representations, Experiences and Place-Making

PP 0513 Lost in representation: Italian adolescents' practices of recognition and disalignment vis-à-vis LGBTQIA+ representations in social media

Lorenza Parisi[1], Cosimo Marco Scarcelli[2], Francesca Comunello[1], Raffaella Maiullo[3], Vittoria Bernardini[2]

[1] Sapienza- Università di Roma, Coris, Rome, Italy
[2] Università di Padova, Dipartimento FISPPA, Padova, Italy
[3] Istituto degli Innocenti, Istituto degli Innocenti, Firenze, Italy

Early accounts of digital media framed online platforms as spaces of liberation, visibility, and identity experimentation for LGBTQIA+ people. Within gender and communication studies, visibility has often been treated as a proxy for recognition and social progress. More recent scholarship, however, has questioned this assumption by foregrounding the role of platform governance, algorithmic selection, and commercial logics in shaping which gendered and sexual subjectivities become visible, legible, and socially legitimate.

The goals of this contribution are to:

- investigate how LGBTQIA+ adolescents in Italy perceive, interpret and negotiate digital representations of queer identities on social media (with a focus on Instagram and TikTok);
- explore tensions between authenticity, visibility, and recognition;
- analyse practices of distancing, silence, and selective sharing as forms of agency.

We adopt a mutual shaping of gender and digital technology approach, focusing on how users negotiate with platforms affordances; we build on feminist and queer media studies that conceptualize digital platforms as ambivalent spaces of empowerment and constraint (Duguay, 2016; Hanckel et al., 2019; Selkie et al., 2019). We also engage with the notion of algorithmic imaginary (Bucher, 2016) to analyse how adolescents make sense of opaque systems of content selection and virality, and how these perceptions shape their evaluative practices. The analysis also draws on the distinction between master and alternative narratives of gender and sexuality (Barsigian et al., 2023), showing how even representations positioned as alternative or counter-hegemonic may reproduce standardized aesthetics, performative expectations, and engagement-oriented formats. In this sense, the paper contributes to gender and communication scholarship by problematizing normative models of queer visibility and authenticity (Kreling et al., 2022).

We draw on in-depth interviews with 21 people who self-identify as LBGTQIA+, aged 16–18, living in Italy. Interviews were informed by prior exploratory focus groups and co-designed with a group of adolescents acting as epistemic partners (Holmes & Marcus, 2012; Livingstone & Third, 2017), ensuring sensitivity to participants' language, meanings, and everyday experiences. All interviews were transcribed verbatim and underwent thematic analysis (Braun & Clarke, 2006).

The findings highlight four interconnected dimensions. First, adolescents actively manage visibility through selective disclosure, multiple accounts, and audience segmentation, conceptualizing privacy as relational and negotiated rather than individual (Petronio, 2002; Ebert et al., 2023). Second, many participants express symbolic distance from queer representations perceived as overly performative, stereotypical, or commercially driven, echoing processes of disidentification (Jenzen, 2022). Third, recognition is strongly mediated by tone, aesthetics, and narrative style: content perceived as sober, intimate, and experiential fosters empathy and identification, while spectacularized or "rainbow-washed" representations often generate discomfort or refusal (Cover, 2022; Illouz, 2022). Finally, adolescents demonstrate a critical awareness of algorithmic logics, linking visibility and virality to opaque systems of selection rather than to authenticity or representativeness (Bucher, 2016; Parisi & Firth, 2023).

We can conclude that visibility emerges not as a neutral or universally positive condition: we need to reconceptualize it as a plural, situated, and negotiated concept.

GSC06 LGBTQIA+ and Media II: Representations, Experiences and Place-Making

PP 0514 Sex Education and Back to 15: Representations of diversity under Netflix's grammar of transnationalism

Natalia Engler Prudencio[1]

[1] Escola de Comunicacoes e Artes da Universidade de Sao Paulo ECA-USP, Programa de Pos-Graduacao em Meios e Processos Audiovisuais PPGMPA, Sao Paulo, Brazil

This paper analyzes how the Brazilian series *Back to 15* (2022–2024) and the British series *Sex Education* (2019–2023) exemplify Netflix's strategic use of "diversity" to build a transnational audience. Drawing on the "circuit of culture" approach (Du Gay et al., 1997), we discuss how the platform's "grammar of transnationalism" (Jenner, 2018) emphasizes certain markers of difference while obscuring others, including national cultural markers.

The study is part of an ongoing doctoral project investigating the meanings attributed to diversity within its circulation in contemporary media culture. It examines the articulation between the appropriation of this notion by global audiovisual platforms (specifically Netflix) and its subsequent (re)appropriation by consuming audiences. This specific piece explores the transnational facet of the circulation of diversity through Netflix productions, focusing on the process of representation, one of the five processes that constitute the circuit of culture.

The investigation is situated amidst intensifying struggles for media visibility and recognition by historically subordinated and marginalized groups. Concurrently, large global media companies, in response to market demands and the acceleration of globalization, have been strategically adopting diversity in their corporate discourses to segment the global market. This strategy is central to the emergence of new transnational television models.

In Netflix's case, a diversity strategy is a key element for its transnational expansion. It is applied to segment global markets by appealing to a cosmopolitan, transnational audience and by positioning the platform as an upright and progressive actor. This strategy integrates Netflix's overall "grammar of transnationalism": a set of "specific textual features that make texts viable in a reciprocal relationship across borders" (Jenner, 2018, p. 220). These features include: the use of globally recognizable narrative genres; a version of history marked by depoliticization, drawing more on the history of media culture than on historical reality; an emphasis on aesthetics; an appeal to a progressive humanism grounded in Western value systems presented as "universal"; and multilingualism. All of this operates within what has been referred to as a "quality TV" paradigm.

The employment of this grammar of transnationalism reflects the fundamental transnational character of Netflix's production, which increasingly takes place in different countries but considers a global audience from the outset. However, this strategy raises questions regarding the risks of commodifying identities while increasing their visibility, as well as the homogenization of representations of specific cultural identities. *Back to 15* and *Sex Education* were selected because they both heavily address issues related to diversity, including transgender experiences and fluid sexualities, within different national contexts with strong television traditions: Brazil and the UK. This comparative approach allows us to assess Netflix's transnational strategy and its consequences for diverse representations in the contemporary landscape.

GSC06 LGBTQIA+ and Media II: Representations, Experiences and Place-Making

PP 0515 Queering the map: how queer Muslims of Palestine are online

Aisha Nazim[1], Zaur Gouliev[1]

[1] University College Dublin, Information and Communication Studies, Dublin, Ireland

Queer Palestinian Muslim experiences of online visibility are shaped by, and respond to, wider forces of Islamophobia, nationalism, and global queer rights discourse in the context of Israel's ongoing occupation of Gaza. Since October 7, 2023, renewed international queer solidarity with Palestine has emerged alongside intensified pinkwashing and homonationalist narratives that position Israel as a protector of LGBTQ+ rights while portraying Palestinian and Muslim societies as inherently homophobic. These discourses render queer Muslim identities contradictory or unintelligible, mobilising queer rights to legitimise colonial violence and obscure both Israeli homophobia and systemic human rights violations.

Drawing on theories of queer visibility, homonationalism, and intersectionality, the article argues that queer Palestinian Muslims occupy a uniquely precarious position within global debates on sexuality and rights. They are simultaneously marginalised by Islamophobic assumptions within Western queer politics and by homophobic interpretations within their own communities, all while living under occupation, surveillance, displacement, and mass violence. As a result, visibility becomes a contested and risky practice rather than an unqualified marker of liberation.

Centering Queering the Map (QtM), a community generated mapping platform as a case study to explore how queer Palestinian Muslims negotiate visibility under these conditions. QtM's anonymous, location-based digital architecture enables queer Palestinians to narrate experiences of desire, grief, fear, and belonging without the exposure demanded by mainstream LGBTQ+ visibility politics. Through analysis of QtM entries, we conceptualise online visibility as an act of resistance that simultaneously refuses both erasure and instrumentalisation. Rather than affirming homonationalist models of queer rights tied to state recognition, QtM facilitates forms of queer self-representation grounded in survival, memory, and collective witnessing. QtM reveals how queer Palestinian Muslims use digital space to challenge Islamophobic and nationalist framings of queerness, exposing the limits of Western queer rights paradigms while articulating alternative modes of belonging that refuse colonial logics. In doing so, the article reframes visibility as a fragile, strategic, and deeply political practice shaped by ongoing violence and resistance.

GSC06 LGBTQIA+ and Media II: Representations, Experiences and Place-Making

PP 0516 "I don't belong here": Digital colonialism, platform power, and LGBTQIA+ vulnerability in South India

Christo Thomas Jacob[1]

[1] University College Dublin, Information and Communication Studies, Dublin, Ireland

This completed study investigated how LGBTQIA+ activists in South India perceive and manage vulnerability on Western-centric Big Tech social media platforms. British colonialism introduced Section 377 to the Indian Penal Code (IPC), criminalising homosexual relationships as 'unnatural' and pushing LGBTQIA+ to the margins. After gaining independence, it stayed in the IPC until the landmark 2018 ruling. However, colonial legacy persisted, contributing to regressive attitudes and animosity. Similarly, social media sites that were previously praised for their LGBTQIA+ visibility are today used to spread discrimination, unequal power relations, and intolerance (Jacob, 2025). This development raises worries about Big Tech operating as neocolonial entities, undermining the agency and visibility of LGBTQIA+ communities in the global south.

This paper employs digital colonialism as an analytical framework to examine how US-based technology corporations reassert historical colonial power relations while simultaneously producing new forms of domination through control over data, digital infrastructures and platform economies (Kwet, 2019). While the concept of digital colonialism has gained increasing traction, existing scholarship has failed to interrogate its effects on historically marginalised communities, including India's LGBTQIA+ populations. Moreover, attempts to universalise digital colonialism reduce colonialism to a loose metaphor, neglecting the enduring legacies of Eurocentrism, colonial values and structural violence that continue to shape lived experiences in postcolonial contexts. These omissions are consequential for LGBTQIA+ communities in India, whose

contemporary marginalisation is inseparable from colonial histories of regulation, moral governance and legal repression. At the same time, much LGBTQIA+ research in India remains geographically and socially constrained, privileging English-speaking, urban, technologically literate queer populations in North India. This study directly addresses these gaps by centring marginalised LGBTQIA+ experiences beyond dominant urban and linguistic frameworks, and by re-embedding digital colonialism within the material, historical and cultural realities of postcolonial India.

This study adopts a qualitative approach based on semi-structured interviews with 24 LGBTQIA+ social media activists from three South Indian states - Kerala, Tamil Nadu and Karnataka. Participants were selected using purposive sampling due to their visible, sustained activist engagement on platforms such as Facebook and Instagram, and their work supporting queer communities across the region. Interviews were conducted in participants' native languages (Malayalam, Tamil and Kannada), translated and transcribed into English by the researcher, and analysed using reflexive thematic analysis. The interview is audio recorded, and all participants provided informed consent.

The findings identify three interconnected themes that highlight how digital colonialism intensifies the vulnerabilisation of LGBTQIA+ communities in South India. Firstly, participants described heightened forms of vulnerability shaped by the reactivation of colonial moral logics online, alongside targeted harassment, coordinated hate speech and digitally mediated violence. Secondly, participants noted how platform governance regimes, which included content moderation, reporting mechanisms, community standards and practices such as shadow banning, systematically reproduce and exacerbate these vulnerabilities. Thirdly, participants articulated psychological and emotional harms, leading to withdrawal from online spaces and practices of self-censorship. Taken together, these findings extend digital colonialism by demonstrating how platform governance, when entangled with postcolonial social contexts, actively produces and sustains forms of digital queer vulnerability.

GSC06 LGBTQIA+ and Media II: Representations, Experiences and Place-Making

PP 0517 Walking the tightrope: LGBTQIA+ media in Azerbaijan

Christian Pentzold[1], Seyidov Ilgar[2]

[1] Leipzig University, Institute for Communication and Media Studies, Leipzig, Germany
[2] Atilim University, Department PR & Advertising Department, Ankara, Turkey

Queer media exist, also in hostile environments, yet their strategies to keep afloat remain underexplored. Even in the homophobic and transphobic spheres of Post-Soviet states, a pink press has managed to endure despite LGBTQIA+ prosecution, discrimination, and control (Szulc, 2020). Still, this heighted visibility can backfire and produce increased surveillance.

In our paper, we focus on Azerbaijan, a country that sits at the crossroads of Soviet, Turkish, and Iranian spheres of influence. It is one of the least hospitable places for queer people (UN, 2024; Jesus, 2025). Yet, despite the dire situation, there are queer media—but how? (Aliyev, 2017; Rashidova, 2022). More precisely, we ask: What kind of media profile do publications targeted at the queer Azeri-speaking audience maintain? The question refers us to their visible output that is the touchstone for readers and at the same time the most evident document for censors and an antagonistic majority society. Analyzing the kind of content provided and the framings offered will help us, we argue, to appreciate queer media's tightrope walk of staying relevant for their audience while dodging prohibition.

We conducted a manual content analysis and inductive framing analysis of all digital outlets associated with Azerbaijan's LGBTQIA+ community. The framing analysis particularly looked for the existence of diagnostic, prognostic, and motivational frames. The dataset includes 2,474 items in total: 332 articles from *Minority Azerbaijan Journal*, 1,257 posts from *Minority Azerbaijan*'s Instagram account, 333 posts from the NAFAS LGBT Azerbaijan NGO platform, 10 episodes from the *Nafas LGBTI Azerbaijan* Spotify podcast series, 293 posts from the *Qıyvar* platform, and 18 episodes from the *Qıyvar* Spotify podcast series. The audio content was transcribed before analysis.

The findings demonstrate that Azerbaijani LGBTQIA+ community media deploy differentiated yet interconnected framing strategies across platforms to sustain visibility, solidarity, and resistance under conditions of repression. *Minority* primarily adopts diagnostic framing, foregrounding discrimination, violence, homophobic attacks, and legal inequalities, while also incorporating motivational elements through coverage of NGO support and activist initiatives. In contrast, its Instagram account is dominated by prognostic framing, emphasizing visibility through queer representation, global LGBTQIA+ developments, educational content, and positive role models, alongside continued attention to rights violations. *Nafas LGBTI*'s Instagram presence is largely shaped by motivational framing, centering on solidarity, social and legal services, Pride-related activities, and domestic activism. *Qıyvar* presents a more balanced mix of diagnostic and prognostic frames, combining reporting on local homophobic violence and rights issues with global agendas and awareness-oriented content, while also highlighting key legal cases.

Overall, the material makes clear that queer Azeri media do not fall silent about topics deemed problematic by the heteronormative society. They extensively cover homophobic attacks and the LGBTQIA+ rights situation in Azerbaijan. Their strategy to cope with hate speech and legal actions is not self-censorship. Rather, it seems that in reaction to the hostile environment, the publications rely on a highly precarious yet flexible infrastructure of queer activists, some of which not based in Azerbaijan, easy-access platforms, and financial sponsorship, often coming from outside of the country.

GSC07 Feminist Solidarity and Queer Resistance Through Media

PP 0620 Mediating resistance under authoritarian repression: Strategic visibility in digital feminist activism in Iran

Mitra Shamsi[1]

[1] Center for Advanced Internet Studies CAIS, CAIS, Bochum, Germany

The growing popularity of digital media platforms in Iranian society coincided with the conservative takeover in 2005, intensifying the suppression of women's rights activists. This led to the most discriminatory conditions for Iranian women, rendering part of the women's movement underground. Since the political structure has afforded minimal opportunities for women's movements, public debates regarding women's issues have increasingly shifted to digital platforms, creating a substitute public sphere where Iranian women's considerable presence has transformed these platforms into a battleground for resistance.

This study investigates how Iranian feminist activists strategically appropriate affordances of digital platforms to challenge gendered inequalities and reshape public discourse under politically constrained conditions between 2017 and 2022. Drawing on multi-sited ethnographic analysis of key digital and hybrid campaign, I examine how activists leverage digital platforms to perform resistance, circulate counter-narratives, and build collective memory.

Engaging with Bart Cammaerts' mediation opportunity structure and its attention to media, discursive, and networked affordances, this study extends this framework to authoritarian contexts. I argue that visibility offered by digital media operates as both a vital resource and a site of vulnerability. Activists contest a complex political and media ecology marked by state surveillance, misogynistic backlash, discursive delegitimization, and geopolitical co-optation. The analysis traces how activists navigate these tensions across hybrid environments where online and offline spaces intertwine.

The study demonstrates that increased visibility through digital feminist activism exposes activists to systematic backlash from state and pro-government media, which craft strategic narratives through interconnected strategies of securitization, othering, and devaluation. Yet activists have disrupted official narratives through compelling visual storytelling and counter-narratives. The research reveals how networked practices extend beyond national borders, employing platforms' transnational potential while creating digital archives that preserve movement history and sustain collective memory. By demonstrating how Iranian activists use digital platforms not simply as tools but as contested spaces where feminist agency and legitimacy are continuously negotiated under constraints, this research extends mediation opportunity structure theory to repressive contexts. It contributes empirical depth to understanding how visibility itself becomes an ambivalent terrain where feminist activists navigate power, surveillance, and strategic resistance under authoritarian conditions.

GSC07 Feminist Solidarity and Queer Resistance Through Media

PP 0621 "I want to be the cool abla from Instagram, the big sis you can talk to." – Muslim Women of Colour and their digital subject positioning in post-migrant Germany

Selma Güney[1]

[1] University of Tübingen, Institute of Media Studies, Tübingen, Germany

Digital platforms are crucial for Muslim Women of Colour (WoC) in Germany who want to gain visibility on their own terms. As content creators they use versatile media practices in digital spaces and produce content for a variety of platforms: They present empowering self-images on Instagram and YouTube or produce podcasts to comment on gendered everyday racism. By doing so, Muslim WoC voice their diverse perspectives and bring change through creating alternative media content in this post-migrant media landscape.

Confronted with the expectations of their own 'communities' on the one hand and the pressures of the dominant society on the other, Muslim WoC use digital public spheres as spaces to negotiate self-determined subject positions. My study investigates the conditions under which these transmedial negotiations take place and aims to understand the subject positionings Muslim WoC resist and those they invest in.

To explore these questions, the presentation is theoretically informed by the work of Cultural Studies. Drawing on feminist and postcolonial theories of subjectification research, as well as media space theories, self-positionings are understood as ongoing social processes of appropriation and engagement with subject positionings. These develop within the hegemonial context of external positionings and structural subject positionings (Walgenbach, 2014, 82). This study frames such processes as being shaped by particular conditions in digital spaces, where self-positionings are performatively (re)configured and mediated by digital practices that can disrupt traditional biopolitical paradigms of space and open up renegotiations of feminist self-positionings (Tuzcu, 2016, 150–154).

In this presentation, these possibilities are examined as part of a qualitative study. It is based on eight qualitative in-depth interviews conducted with Muslim WoC journalists and content creators. The interview participants include successful influencers such as Dalal Mahra, founder of the media platform 'Kopftuchmädchen' (Headscarf Girl(s)), and Erva Yılmaz, initiator of the queer-feminist podcast 'Gedankensalat' (Thought Salad). The analysis applies the grounded theory method.

The results show how the ambivalent confrontations with criticism and hate speech in digital spaces motivate and undermine Muslim WoC as they engage with structural subject positionings in the German (media) public sphere(s) and with external positionings from their marginalised groups. My presentation highlights in detail, how Muslim WoC, in the context of this post-migrant society (Foroutan 2021), find ways to construct new intersectional subject positions as post-migrant feminists with their own stories by resisting essentialist and othering classifications and investing in media practices of solidarity. In their role as influencers, they put effort into connecting with various groups and take on responsibilities to act with care towards them. In doing so, they navigate between the role of an experienced and knowledgeable "abla" (Turkish for "big sister") and that of a supportive "friend" and educator or discussion partner. Thereby, they transform the German media landscape into a more inclusive space.

This study empirically contributes to understanding how feminist marginalised voices in a post-migrant society take advantage of digital media spaces' emancipatory potential for societal transformation and at the same time find solutions for the limitations they impose.

PP 0622 Creative methodologies for feminist alliances: 'Cine dialógico' as a case study

Núria Araüna[1], David Archibald[2]

[1] University Rovira i Virgili - ESQ9350003A / University of Glasgow, Comunication Studies, Tarragona, Spain
[2] School of Culture and Creative Arts, Department of Film studies, Glasgow, United Kingdom

Our presentation is an illustrated paper that establishes a dialogue of our voices with excerpts from the film in progress, Cine Dialógico. This audiovisual work emerges from the British Academy research project 'Filmmaking and the Academy in Times of (Dis)Order: Deep Listening | Dialogue | Diffraction' and both the project and the film are collectively built through support and labour from networks of feminist activists and local institutions. Cine Dialógico moves across remote geographies to reflect on a project that uses audiovisual technologies to foster conversations between feminist activists in four historically linked cities: Havana (Cuba), twinned with Glasgow (Scotland), and Matanzas (Cuba), twinned with Vilanova i la Geltrú (Catalonia). We explore how non-budget, collaborative filmmaking can encourage experience-sharing between activists in the Global South and North to develop translocal networks of support and solidarity. By developing this cross-cultural project within specific patriarchal states—both capitalist and communist—Cine Dialógico rethinks local-authority twinning. It shifts focus towards the often-unheard voices of nonstate actors, using their exchanges as material for creating 'alliancial thinking'. Through participants' voices across the four cities, the film tackles feminism's multilocality—the various sites where it is remade daily, within and beyond universities and borders, through creative acts. Concretely, audiovisual technologies are used as tools for deep listening, setting encounters in motion, and amplifying voices marginalised by corporate media and institutional regulation. This aligns with the need for a "restitution of the space of enunciation and of the times of audibility" for subaltern voices that can "(dis)organise in, from, for the South in every audible interruption, restoring a History from below" (Alvarado, 2022: 53). Through making films together-apart, we—the participants in Matanzas, Havana, Vilanova, Glasgow, and ourselves—offer our voices and seek others whose voices will be heard in the process, the film, and its exhibition. For us, listening opens a gate to further develop alliancial thinking, a prerequisite for building material alliances. During the presentation, we expect to share an invitation to imagine collectively what film can do to open a space for utopian and translocal imaginings—an alternative form of being together, virtually or physically.

PP 0623 Livelihood as a Communicative Regime: Hierarchies, solidarity, and urban survival under gendered marginalization in Izmir, Turkey

Gizem Kiziltunali Sonyol[1]

[1] Yasar university, New Media and Communication, Izmir, Turkey

This study examines how sex work shapes community dynamics, communication practices, in-group perceptions, and urban settlement structures among trans women living in İzmir, Turkey. Situating sex work not only as an economic activity but as a social and communicative condition, the study explores how everyday interactions are structured through shared yet uneven experiences of labor, risk, and survival. Drawing on in-depth interviews with Turkish trans women aged 19–46, the research analyzes how peer networks operate as key sites where communication, belonging, and hierarchy are continuously negotiated. The findings identify three interrelated patterns. First, sex work intensifies intra-community bonding. Shared experiences of marginalization, exposure to violence, and economic precarity foster dense networks of mutual care, trust, and information exchange. These networks function as informal support systems through which participants share safety strategies, emotional labor, and practical knowledge necessary for navigating everyday life in the city. Second, sex work actively regulates communication and relational dynamics by producing internal hierarchies of recognition, jealousy, and exclusion. Community relations are shaped by differential access to aesthetic capital, perceived attractiveness, and economic success, which determine who is respected, envied, or rendered socially peripheral. Participants describe how social authority, credibility, and influence—both within the community and in interactions with clients—are closely tied to bodily presentation, market value, and accumulated economic resources. Communication thus becomes a site

where status is performed, contested, and reinforced. Third, sex work structures spatial communication practices, shaping where trans women live, circulate, and socialize within the city. Access to safer neighborhoods, housing options, and social spaces is unevenly distributed and closely linked to income, visibility, and conformity to aesthetic norms. These dynamics reproduce spatialized hierarchies that map social inequalities onto the urban landscape. Overall, the study argues that sex work operates as a constitutive communicative force that organizes social relations, status hierarchies, and spatial belonging. By foregrounding the interplay between structural violence and creative survival, the analysis highlights the social and communicative significance of sex work as a survival mechanism—one that simultaneously produces solidarity and stratification, shaping economic relations, community dynamics, and urban settlement patterns.

GSC07 Feminist Solidarity and Queer Resistance Through Media

PP 0624 Block, report, repeat – How technological skills shape agency in queer sexting

Mária Juríková[1], Iveta Jansová[1], Michaela Šaradín Lebedíková[1]

[1] Masaryk University, Department of Media and Journalism Studies, Brno, Czech Republic

Sexting, defined as the act of sending and receiving of suggestive or sexually explicit media through various devices, has become a standard part of digital intimacy for queer people. Even though sexting can play a positive role in building self-esteem, healthy sexual exploration and providing an insight into intimacy, previous research shows that queer people are more likely to experience the possible negatives of sexting, such as coercion or pressure to engage in sexting.

Majority of research describes queer people as primarily the subjects of negative experiences, without sufficient acknowledgment of their agency in coping with and shaping those experiences. Consequently, how queer people handle negative interactions in sexting, and how they attempt to avoid such interactions, has not yet been adequately addressed in the literature. Our article addresses this research gap by focusing on following research question: How do queer individuals engaging in sexting deploy technological skills to manage risk and safety within spaces of digital intimacy?

Our study has revealed that the attention of our communication partners when engaging in sexting is not limited to fulfilling their desires, but also attentively extends to the strategic ways of using blocking features, learning about safe data storage, using tools for anonymizing, and more. Our research has shown that queer people possess a great number of different technological skills to ensure safety and manage boundaries. Such skills overreach outside of sexting as well, with providing technological knowledge to queer peers also engaging in sexting. This set of skills is a way of emphasizing agency in online spaces. While non-queer people might also develop technological skills when it comes to safety and agency, queer people are more prone to additional possible threats of queerphobia or being outed against their will, making it crucial to have such skills.

We have conducted 24 interviews with self-identified queer people above the legal age of 18 years that have been actively sexting in the last 12 months. We have coded the data in Atlas.ti and analyzed them using thematic analysis. The results challenge research portraying queer people engaging in sexting only as helpless in context of negative sexting experiences and focuses research of queer sexting beyond sexuality and desire. Researching technological skills queer people develop and use when sexting is important, as it could serve as a helpful tool for sexual education and an inspiration for app developers that want to ensure user safety.

GSC08 Gender issues in journalism

PP 0732 De-contextualizing as a media process: TV news and gender-based violence against women in Austria

Priska Wikus[1]

[1] Universitiy of Vienna, Communication, Vienna, Austria

Television news are a central site where gender-based violence against women* becomes publicly intelligible. While existing research has extensively examined how such violence is framed or made visible in news discourse, less attention has been paid to the processes through which violence is turned into a news event. This paper addresses this gap by focusing on de-contextualization as a key media process in television news reporting on violence against women*.

Drawing on an ongoing PhD project, the study examines Austrian television news coverage from 2017 onwards. The analysis does not approach news items as fixed representations or containers of meaning. Instead, it understands de-contextualization as a dynamic process through which social, relational and gendered dimensions of violence are reorganized within episodic, event-centered narratives. In this sense, de-contextualization is not simply the absence of context, but an active restructuring of meaning that privileges immediacy, visual dramatization and institutional perspectives.

Methodologically, the paper adopts an ethnographically informed media-analytical approach that combines close analysis of narrative structure, text–image relations and visual sequencing. Attention is paid to how spoken commentary, visual material and editing practices interact across news segments and to how interpretative boundaries are produced through these interactions. Rather than identifying stable categories or typologies, the analysis reconstructs how meaning is shaped within the flow of television news.

The paper examines how de-contextualization contributes to the constitution of gender-based violence against women* as an individualized and exceptional occurrence, while broader gendered power relations tend to remain marginal. By foregrounding singular events and immediate actors, television news shape the conditions under which violence can be understood as a structural social phenomenon. This perspective opens up questions of how responsibility, causality and social relevance are communicated to audiences.

By theorizing de-contextualization as an analytical media process rather than an analytical outcome, the paper contributes to research on gender, sexuality and communication by offering a conceptual framework for examining how television news organize public knowledge about gender-based violence. The study thus advances feminist media analysis by focusing on the conditions of representation, without presupposing normative evaluations of journalistic practice.

GSC08 Gender issues in journalism

PP 0733 The precarious 'one-woman show': Overload, self-management and mental health in freelance journalism

Bibiana Garcez Da Silva[1]

[1] Universidade de Coimbra, Faculdade de Letras - Departamento de Filosofia- Comunicação e Informação, Coimbra, Portugal

In the field of journalism, atypical and precarious work has increasingly been recognized as the "new normal". Although discussions of precariousness in journalistic labor are extensive, they have largely focused on newsroom-based work. One form of atypical labor that has gained visibility is freelance journalism, whose analytical relevance has intensified in the contemporary scenario. While freelance work is not a new dynamic within the field, it acquires new contours in the current context, marked by the valorization of an entrepreneurial neoliberal subjectivity in which notions such as autonomy, freedom, and flexibility occupy a central place. From a gender perspective, postfeminist discourses tend to frame women's successful participation in the labor market as the result of individual merit and personal effort, while presenting the ability to personally achieve "work and life balance" as a key condition for "having it all". Within this framework, success and failure are individualized, while structural critiques of labour conditions and gender inequalities are frequently silenced. Public debate thus shifts toward individualized solutions centered on self-management, personal initiative, and resilience, obscuring the effects of broader structural transformations of work. This work-in-progress paper aims to examine how the individualization of labor relations in freelance journalism produces experiences of overload and self-management among women journalists, with impacts on mental health and personal life. Methodologically, the study is based on a reflexive thematic analysis of in-depth semi-structured interviews conducted with women freelance journalists in Brazil and Portugal, as part of an ongoing doctoral research project. The sample comprises 31 interviews carried out between 2023 and 2024 with 31 women who self-identified as freelance journalists. The analysis focuses on how the individualization of work materializes in everyday practices and experiences, centering on accounts related to work organization, time management, task multiplication, and emotional and affective experiences associated with freelance journalistic activity. Preliminary findings indicate that overload emerges as a structural condition of freelance work and is frequently described by interviewees through the metaphor of the "one-woman show/band". This expression encapsulates the continuous accumulation of journalistic and extra-journalistic tasks, from story sourcing and pitching to financial, administrative, and ethical decision-making, performed individually and on a permanent basis. Despite recognizing the structural conditions of precarity, interviewees demonstrate a strong internalization of individual responsibility for managing both work and well-being. The accounts further suggest that, while freelance journalists value flexible working hours and attempt to establish what they consider healthy boundaries around work, they face constant demands for availability and increasingly blurred boundaries between work and personal life. These conditions are frequently accompanied by feelings of powerlessness and frustration and, in some cases, by experiences of burnout, anxiety, and depression, associated with processes of medicalization. The study highlights the need to consider journalistic work outside traditional newsrooms as a central axis for critical communication studies and the political economy of media, highlighting the mental health of women freelance journalists as a labor and gender issue inseparable from contemporary transformations of work in the field of communication.

GSC08 Gender issues in journalism

PP 0734 Intersecting precarity. A study of experienced precarity amongst Swedish journalists

Margareta Melin[1]

[1] Malmö University, K3 - School of Arts and Communication, Malmö, Sweden

Sweden as the champion of gender equality hides persistent inequalities. Previous studies show that these shape journalists' working lives. Ongoing digitalization have reconfigured newsroom practices and intensified demands for flexibility, contributing to job insecurity, blurred boundaries between work and private life, and adverse mental-health outcomes. And these pressures are gendered. The transformation of Swedish media organizations has simultaneously weakened collective professional power and strengthened employer control, normalizing temporary contracts, and staffing-agency placements, while eroding employment security and professional autonomy. For many journalists, flexibility and freelancing functions less as autonomy than as compulsion, and this is not equally distributed as previous research, including my own, indicate.

I argue that one can not only understand such complicated structures looking only at one structural factor, but they must be understood intersecting different power structures. This paper, thus, examines how gender intersects primarily with age and ethnicity in experiences of precarity among Swedish journalists.

I draw on 23 in-depth, thematic interviews conducted in 2018–2019 and 2022 with journalists who self-identify as precarious workers. Participants were recruited via a trade-union contact and an open call in the Facebook group *Journalistbubblan*. The sample includes 6 men and 16 women, 3 of non-Swedish ethnicity, aged 25–57, working mainly in newspapers; many held short-term contracts or were placed through staffing agencies. All had higher education, including a journalism degree. Interviews (1–2 hours) were conducted on campus, as a safe space, or online (cf. Melin & Wiik 2024).

The analytical framework combines three connected concepts: ***precarity*** (the systemic normalization of insecure work, here in Media, as Deuze discusses), Bauman's ***liquid life*** (the dissolution of stable boundaries between personal and professional spheres), and Bourdieu's ***gendered habitus*** (how embodied dispositions and social positions pattern access to resources and recognition).

Findings show that precarity is stratified by intersecting social positions. Young journalists struggle to establish themselves; older face redundancy and outsourcing pressures; minority women and younger women report compounded barriers. Those described being passed over for promotions, seeing ideas sidelined, and facing implicit expectations of self-branding and constant networking – practices experienced as unevenly gendered. In fluid, short-term labour markets, traits such as extroversion, social ease, and rapid adaptability are valorised, and perceived to advantage men. The affective load of contingent employment is significant: participants recounted stress, fatigue, and episodes suggestive of anxiety or depression. Yet commitment to journalism and its public mission keeps many invested – or stuck – as they repeatedly pursue the stability of a permanent contract.

I conclude that Swedish journalism's precarity is not an individual misfortune but structurally produced and differentially borne. Addressing it requires measures that curb reliance on temporary staffing and agency placements, strengthen Swedish traditional collective bargaining and welfare protections. Central is to confront ageism, gender and ethnicity discrimination, and to understand that discriminatory structures intersect. Without such reforms, the profession's democratic role is undermined by a labour regime that offloads risk onto those, least able to handle the precarious side of journalism.

- Melin, M. & Wiik, J.(2024) Living the liquid life: *Nordic Journal of Media Studies.*

GSC09 Shifting Narratives in Advertising and Audiovisual Media

PP 0830 Gender representations and persuasive advertising in gambling brands communication

Diana-Maria Cornea[1], Andreea-Nicoleta Voina[1], Delia-Anca Dobrovăț[1]

[1] College of Political- Administrative Communication Sciences, Communication Department, Cluj-Napoca, Romania

In recent years, the gambling sector has emerged as a leader in the use of internet technology and experiential marketing by using gamification and influencers to shape behaviors and stimulate consumer loyalty (Gainsbury et al., 2015; Guillou-Landreat et al., 2021; Hing et al., 2017; Reith, 2013). Since gambling is not only a common social activity but also an industry heavily influenced by cultural norms and regulatory frameworks unique to various societies (Fannin et al., 2024; Guillou-Landreat et al., 2021), this expansion has been identified as a public health issue (Fannin et al., 2024; Palmer du Preez et al., 2021; Ukhova & Prever 2024).

The literature highlights that women's participation in gambling is increasing, and gender perspectives are essential for understanding negative experiences and effects (Lelonek-Kuleta; 2022; Wardle, 2017). Patriarchal norms, gender roles, and advertising stereotypes shape women access and gaming motivations (Holdsworth et al., 2012; Kolandai-Matchett et al., 2017). According to studies (Casey, 2024; Lelonek-Kuleta, 2022; Palmer du Preez et al., 2021), women frequently use gambling as an emotional coping mechanism for stress, loneliness, or financial pressures. Additionally, because of the telescoping phenomenon, women are more likely than men to develop an addiction (Castrén et al., 2018; Fonseca et al., 2021).

Based on existing literature, through our exploratory investigation, we aim to gain an in-depth understanding of the communication and promotional strategies used in gambling advertisements aimed at women. The goal of the current study is to identify the discursive framework, persuasive mechanisms and gender representations that underpin these advertisements. This study examines how advertising rhetoric is expressed in relation to gender dynamics, sociocultural norms, and processes of normalizing gambling behaviors through an analysis of gambling advertisements targeting women in Romania. Thus, we aim to provide a useful analytical framework for developing intervention and regulatory directions in the field of gambling.

In order to implement our research strategy, we decided to use a thematic analysis of eighteen promotional videos that targeted women and belonged to the biggest gambling companies. According to preliminary findings, advertisements frequently include aestheticized representations of success, feminine independence, and personal comfort, while risks are minimized or absent. According to Dowling et al. (2016) and Guillou-Landreat et al. (2021), these communication typologies are very compelling to women who are emotionally or financially vulnerable and can cause gambling disorders.

GSC09 Shifting Narratives in Advertising and Audiovisual Media

PP 0831 From reel to reality: Ageing on screen and the perception of later life representations among older adults in Belgian fiction films (1945–2022)

Femke De Sutter[1]

[1] Ghent University, Communication Sciences, Gent, Belgium

Research in cultural and media studies has long prioritised youth, while ageing and later life have only recently gained scholarly attention. Existing research remains largely centred on Hollywood films (Chivers, 2011; Dolan, 2013) or limited to specific genres and periods (Kline et al., 2023; Markov & Yoon, 2021; Lauzen, 2025). While these studies have made important contributions, there remains a need for longitudinal research that traces changes over time and for analyses that move beyond Hollywood-centric film cultures. This presentation addresses these gaps by outlining my PhD research on the representations of older adults in Belgian feature fiction films (1945–2022), as well as on how older adults themselves perceive these representations and how they would reimagine ageing, later life, and older age on screen.

The research is made up of four studies examining the representation of older adults, ageing and later life in Belgian fiction films, through: (I) a quantitative content analysis of the 15 per cent most popular majority-Belgian films across eight decades (1945–2022), (II) a qualitative content analysis of 145 films from the same period, identifying recurring tropes of ageing femininity, with textual analyses of *The Departure, Death of a Nun, The Over the Hill Band,* and *Behind the Clouds*, (III) a thematic analysis of precarity in later life in contemporary Belgian fiction films (2000–2022), supplemented by textual analyses of *Many Heavens* and *Irina Palm*, foregrounding gender differences of economic and social precarity on screen, and (IV) a creative and participatory study in which older adults rewrote a self-selected scene from the film *Rosetta*, followed by in-depth semi-structured interviews discussing both their rewritings and their perceptions of media representations of ageing, and later life.

The findings reveal a persistent underrepresentation of older adults in popular Belgian feature fiction films. Although the presence of older characters has increased over the past two decades, significant gaps remain. Older characters lack diversity: they are predominantly white, middle- or upper-class, non-disabled, young-old (65–74 years), and heterosexual. Notably, young-old women are overrepresented compared to young-old men, pointing to an unexpected gender difference in the representations. However, the qualitative content analysis identified only four dominant tropes for older women: *ageing as decline, grandmothers at the top, heroines of ageing,* and *rebels with a cause*. Thus, although women are over-represented, their roles are very limited.

Older adults are also largely depicted as living financially and socially comfortable lives, despite Belgian statistics showing that older adults, alongside young adults, face the highest risk of poverty and social exclusion (Statbel, 2024). When precarity in later life is represented, it primarily affects older women, particularly through care responsibilities that result in economic and social precarity. Finally, interviews with older adults reveal a representation-recognition paradox: although participants note a growth in the number of representations, they rarely recognise themselves in them. These representations tend to oscillate between ideals of *successful ageing* and *narratives of decline*, leaving little room for the in-between experiences of ageing and later life.

GSC09 Shifting Narratives in Advertising and Audiovisual Media

PP 0832 Shifts in the representation of fatherhood in spanish audiovisual fiction: Berto Romero and imperfection through humour

Laia Puig-Fontrodona[1]

[1] Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain

In the contemporary sociocultural landscape, the conceptualisation of masculinities has shifted from a monolithic model to a plurality of socially and culturally constructed practices (Mercer & Smith, 2025). This change has placed the male body and identity at the epicentre of a set of intense tensions that construct the so-called contemporary crisis of masculinity and, consequently, hierarchise emerging masculinities in the public sphere. Based on the premise that "media culture is a fundamental site in the construction, distribution and meaning-making work of masculinities" (Mercer & Smith, 2025:14), this presentation will focus on analysing how celebrities, as key figures in Spanish popular culture, can negotiate the contradictions of fatherhood through their public media image and their audiovisual productions.

The analysis will be carried out using the case study of comedian and actor Berto Romero and his series *Mira lo que has hecho* (2018–2020). Its premiere in 2018 coincided with a crucial moment in Spain, as various shifts in the representation and social expectations of fatherhood were observed. Methodologically, this research combines the theoretical and analytical frameworks proposed by *Celebrity Studies* —focused on the management of public figures and the analysis of media paratext— with the contributions of *Masculinities Studies* in terms of the representation of fatherhood. Specifically, a textual analysis of the series and the construction of Romero's public figure will be carried out to identify the key discursive mechanisms that enable this negotiation of fatherhood.

The central thesis of this paper is that the figure of Berto Romero crystallises the emergence of a fatherhood that eschews strict polarisation and perfection. Previous categorisations distinguished between the traditional Spanish model of fatherhood, seen as a figure of authority, economic provision and emotional detachment (Jerónimo, 2023), and "new" fatherhood, which emphasises the father's commitment and emotional involvement with his children (Freeman, 2003). It is argued that Romero offers a unique approach to the concept of the "good-enough father" (Freeman, 2003), the imperfect father, through the strategic use of irony and taboo humour. According to Luca and Barra (2016), this type of humour can be ambivalent, as it is capable of both questioning and sustaining hegemonic structures. Romero's work ultimately reveals the inertia and contradictions characteristic of a generation grappling with shifting expectations of fatherhood. These are difficulties that arise when trying to reconcile ideal conceptions of fatherhood with the experiences of parenting itself. Therefore, this work shows how Berto Romero, through humour, models a more humanised fatherhood and negotiates gender roles regarding fatherhood in Spanish popular culture and its audiovisual fiction.

GSC09 Shifting Narratives in Advertising and Audiovisual Media

PP 0833 Masculinity and sociopolitical shifts: revisiting the narratives and negotiations around masculinity in Estonia

Kaarel Lott[1]

[1] University of Tartu, Institute of Social Studies, Tartu, Estonia

Recent public discussions in Estonia (and many other countries) surrounding the rise of the manosphere, toxic masculinity and (extreme) right-wing political movements centering gender issues have brought pressing questions regarding masculinity to the forefront. A study among Estonian 15-year-olds found that a gaping divide in values regarding gender roles and equality is emerging among boys and girls, where the former are becoming increasingly conservative and the latter more progressive (Ümarik et al., 2022). However, most of the studies exploring men and masculinity in Estonia were conducted in the 2000s and 2010s, highlighting a need to critically revisit this theme (Aavik, 2024).

Theoretically, this study draws on gender studies, particularly Butler's (1990) theory of gender performativity and concepts from critical studies of men and masculinities, such as hegemonic and hybrid masculinities (Bridges & Pascoe, 2014; Connell, 1987). However, it avoids typologising masculinity, as problematised by various academics (e.g., Allen, 2023), and instead aims to adopt a material-discursive approach to critically examine men and masculinities (Hearn, 2014).

This study aims to explore the narratives surrounding men and masculinity in Estonia. It employs a combination of individual semi-structured interviews (n = 16) and group interviews (n = 3) with men from various age groups (ranging from ages 23–68), educational backgrounds (high schools, vocational schools, university), work fields and living environments (rural and urban). Participants were asked to reflect on issues relating to the (de)construction of masculinity, emotional vulnerability, relationships with friends and partners, parenthood, mental health and their positioning towards public narratives about masculinity. Group interviews included a creative component where participants mapped influences on masculinity. The data collection phase is set to finish in January 2026. Analysis combines thematic analysis (Braun & Clarke, 2006) and visual analysis (Kress & van Leeuwen, 2021) for the creative outputs of group interviews.

Initial results indicate that dominant narratives among men often rely on biological essentialism with limited acknowledgment of the socially constructed nature of gender. Masculinity is often tied to economic well-being, while using material means to express care in the family. Media narratives surrounding men are often perceived as negative and unjust, which is often attributed to the manipulative nature of clickbait journalism and the attention economy. Interviewees describe absent fathers in their childhood, which they describe as a motivating factor for expressing care and emotional investment in their own family lives. The results of this study are crucial for understanding how the dominant narratives surrounding masculinity among men relate to the problematic sociopolitical phenomena outlined in the beginning.

GSC10 Visibility, Agency and Struggles in Media Representation and Reception

PP 0810 Neoliberal feminist articulations of emancipated femininity: Sanna Marin's negotiation of double binds of gendered leadership

Anja Vranic[1], Sine Nørholm Just[2]

[1] University of Oslo, Department of Media and Communication, Oslo, Norway
[2] Roskilde University, Department of Communication and Arts, Roskilde, Denmark

Women leaders, classical studies have shown, are caught in so-called "double binds" where leadership is equated with masculinity and femininity is positioned outside the political sphere, challenging women leaders' credibility either as leaders or women (e.g., Jamieson, 1995). Accordingly, they are at high risk of failing to build credibility as they must navigate contradicting expectations. Tensions of gendered leadership remain relevant today, as contemporary media play a central role in constructing and perpetuating double binds, shaping public evaluations of women leaders' credibility (Bordo, 2017). Some political actors are, however, redefining the possibilities of gendered leadership. Notably, the case of previous Prime Minister of Finland, Sanna Marin, who has transitioned to a career in political advising, suggests changing conditions of possibility for simultaneously performing "woman" and "leader."

In this study, by drawing on critical perspectives on neoliberal feminism and popular-/postfeminism, we investigate how Marin negotiates gendered norms, through her insistence on being "free to be herself" (e.g., Adler, 2024). We argue that Marin can be viewed as a critical case of one prominent strategy for resolving the double bind: namely, that of "leaning in" to difference and celebrating the specific performance of the individual woman in question (e.g., Sandberg, 2013). This strategy became apparent after an infamous leak of footage of her dancing with friends at a private party in 2022. Under the monicker of "partygate", the incident resulted in a global media scandal that questioned Marin's credibility as a national leader. Instead of listening to critics and seeking to adapt to the tight line of the double bind, Marin's performance of certain stereotypically feminine traits became more pronounced and defiant in the wake of "partygate."

To understand how Marin negotiates double binds, we conducted a two-party study. First, by using a selection of news media and women's magazine articles, we conducted a descriptive analysis where we mapped the main incidents and gendered media scandals that shaped her credibility as head of state, and that, as we argue, ultimately led to what we call her "postpolitical emancipation." Second, by collecting posts and stories from her Instagram, we conducted an interpretative analysis of her own articulation of her postpolitical identity. Through these analyses, we found an evolution in her gendered performance, culminating in what we call "emancipated femininity." Marin, we argue, resolves traditional double binds by individualizing gendered emancipation, however, on the other hand, she creates new gendered norms that even she herself must now always maintain. In this study, then, we identify persistent tensions between individual empowerment and structural inequities, offering critical insights into intersectional conditions of possibility for gendered performances in the context of mediated politics.

PP 0811 Invisible fathers? Media discourse of non-transferable parental leave in Lithuania

Rūta Kupetytė[1], Gintė Martinkėnė[2], Dovilė Galdauskaitė[2]

[1] Vilnius University, Faculty of Communication, Vilnius, Lithuania
[2] Vilnius University, Faculty of Philosophy, Vilnius, Lithuania

The European Union (EU) Directive (2019/1158), adopted in 2019, aims to structurally change the division of childcare within the family by establishing a non-transferable two-month parental leave entitlement for each parent. This provision aims to encourage fathers to become more actively involved in childcare, reduce the burden of childcare on women, and promote gender equality in the labor market (European Union, 2019). In Lithuania, this measure came into force in 2023; however, statistics indicate limited use of this measure, with approximately 1,340 men taking advantage of the non-transferable months in 2023 (Sodra, 2024).

In this context, discussions about non-transferable months of parental leave have intensified not only in politics but also in the media, which plays an important role in shaping social norms and stereotypes (Keuper, 2022). Previous studies have shown that parental leave policies are mostly framed positively in the media, emphasizing economic well-being, gender equality, health, and inclusive parenting (Korsvik & Warat, 2016; Valarino & Bernardi, 2010, 2011). However, less attention is paid to how specific policy measures and the associated images of masculinity and fatherhood that shape a father's identity are framed in the media.

Our research aims to analyze how the Lithuanian media framed non-transferable months of parental leave from 2018 to 2025, what images of fatherhood are constructed within them, and how these discourses are reflected in fathers' experiences. The study is based on critical discourse and framing theories. The empirical analysis consists of two parts: semi-structured qualitative interviews with fathers who have taken non-transferable months of parental leave, and a critical discourse analysis of articles published on the most widely read Lithuanian news portals.

The results of the research show that non-transferable months of parental leave are often "invisible" in the public sphere. The participants in the research indicated that they had seen almost no clear, consistent, and reliable information about this measure in the media or had only encountered fragmentary messages. The media was assessed as a source of information with limited reliability and poor accessibility.

An analysis of news portal articles reveals that the majority of articles published on Lithuanian news portals consist of unoriginal texts created by the media, but also include press releases prepared by governmental and non-governmental organizations. In original media articles, non-transferable months of parental leave are often framed as a means of conflict- a threat to the family, coercion, or financial loss to fathers- and the articles are dominated by the voices of politicians rather than family policy or gender equality experts. The results of this research complement previous research by revealing that although parental leave policy is often framed positively in the media (Korsvik & Warat, 2016; Valarino & Bernardi, 2011),

non-transferable months of parental leave stand out in the Lithuanian media as a controversial and often negatively framed measure, whose discourse contributes to the normalization of limited father involvement.

PP 0813 From endurance to defiance: Women's agency in contemporary television drama of Pakistan

Faiza Muneeb[1]

[1] Universidade Católica Portuguesa, Faculty of Human Sciences- CECC, Lisboa, Portugal

The tele-drama has become one of the most important arenas of culture in Pakistan in which gender norms, moral values, and social hierarchies are both constructed and contested in a narrative form. The women in tele-dramas often play key roles in representing endurance, resistance, and agency. In this article, we will focus on how women's agency is represented in contemporary Pakistani television dramas, examining the transition from endurance to defiance in a patriarchal framework. We used qualitative textual analysis of a corpus of four prime-time Pakistani tele-dramas that aired between 2020–2025, and two of those were recent productions of Pamal (2025) and Case No. 9 (2025) for our analysis.

Using feminist media theory and representation studies, the analysis includes the structural elements of narrative, dialogic exchange and visual framing. The analysis of endurance was conducted through repeated representational strategies such as emotional restraint, silence, repetition of suffering, and moral placement of female characters within family-based spaces. These strategies construct patience and sacrifice as feminine virtues, reinforcing gendered expectations of compliance and respectability, especially in relation to domestic and relational contexts. Additionally, the article analyzed narrative transitions at which point endurance turns into defiance. Through the analysis, the authors found that defiance is rarely represented as an impulsive act and is instead legitimised through suffering, ethical standing, and conformity to socially acceptable values. Therefore, women's agency is constructed as conditional and mediated rather than unqualified. This work demonstrates that Pakistani television drama represents a site of ambiguous gender politics in which patriarchy is reinforced while at the same time allowing women some degree of agency through their resistance. Ultimately, the growth of defiant female protagonists in recent tele-dramas illustrates the increasing cultural tension and possibility of new forms of representation of women's agency; however, the study also illustrates the continued restrictions placed on women's agency through television narratives.

PP 0814 Navigating visibility – young Bedouin women students' digital participation under infrastructural gaps, social control, and political pressures in Israel

Lior Solomovich[1], Shai Solomovich[2]

[1] Sapir Academic College, Marketing Techonologhy, Sderot, Israel
[2] Kaye Academic College, Education, Beer Sheva, Israel

The Bedouin community in Israel is a structurally vulnerable minority, shaped by socio-economic marginalization and strong conservative norms. While digitization has expanded educational and employment opportunities, studies of digital inequality show that excluded groups often reproduce online disadvantage, through limited access, lower digital capital, and limited participation.

In higher education in Israel, the digital divide between Jewish and Bedouin students has persisted for decades and became more visible during the war, as academic learning and institutional communication shifted online. Common barriers include inadequate communications infrastructure, unstable connectivity, and lower levels of digital literacy. However, for Bedouin women, digital participation is shaped not only by access but also by gendered power relations, family monitoring, and community expectations that regulate online expression.

This study examines how cultural, familial, and institutional conditions intersect to shape the digital practices of young Bedouin women during their academic studies. It uses a quantitative design based on an anonymous online questionnaire distributed in November-December 2024 through educational institutions and student-only WhatsApp groups. The sample includes 200 Bedouin female students. The measures addressed internet access, social media activity, learning-related uses, and perceptions of monitoring and control.

The results show that only 32.5% reported regular internet access, indicating persistent infrastructural inequalities even among higher education students. At the same time, social media presence is widespread (85.2%). Their social media posts focus primarily on social (66%) and personal (17.7%) issues, while political expression is minimal (1.5%) and stems from concerns about censorship. Some of their digital activity is linked to their student identity and therefore some of their internet use is learning-oriented (73%), with an emphasis on coursework and educational experiences. The majority, 87.6%, reported a strong sense of control due to family and community norms, alongside concerns stemming from political sensitivities.

The findings point to a multidimensional digital divide that combines access constraints with gender surveillance and socio-political pressures. The study discusses the implications for higher education institutions and calls for culturally

responsive digital inclusion strategies that address infrastructure and skills while addressing the social conditions that silence women's voices online.

PP 0917 "She's SO tacky… I LOVE her": Class distinction and the moral surveillance of celebrities among young women in Spain. Unpacking "the Choni, the Pija and the Chonija"

Marina Romero Bermejo[1]

[1] Pompeu Fabra University, Communication, Barcelona, Spain

The "choni", the "pija" and the "chonija" are local categories, which emerge from fieldwork with young women in Spain that reveal that judging a celebrity is an implicit mechanism for social positioning. This research explores how female audiences navigate and negotiate their own class and gender identities through high-impact celebrities, by contrasting the perceived "excess" of the *choni* (*chavy girl*) with the "traditional respectability" of the *pija* (*posh girl*), and the emerging "hybrid opulence" of the *chonija* (*chav-ish rich girl*).

This research is theoretically framed by the intersection of postfeminist sensibility (Gill, 2007) and the sociology of social class and it moves beyond an aesthetic analysis of media to explore the moral economy of celebrity reception. Based on Bourdieu's (1979) theory of distinction with Lawler's (2005) conceptualization of class as a moral property, the study argues that celebrity figures function as symbolic arenas where the legitimacy of female identities is scrutinized.

While international scholarship has theorized the "New Rich" through figures such as the "WAG" or the "glamour girl" (Biressi & Nunn, 2005), and the "celebrity chav" (Wood & Skeggs, 2011), there is a lack of empirical research on how these archetypes are hybridized in contemporary Southern Europe. This study addresses this gap and introduces the concept of the "*chonija*": a figure who might possess high economic capital (or not) but maintains an aesthetic and behavioral code that the traditional elite labels as "vulgar" or "*wannabe*".

This qualitative study employs a multi-method design based on the triangulation of 4 focus groups (n = 24) and 10 semi-structured interviews, with a total sample of 34 women (aged 20–30) in Spain. The participants were segmented by cultural capital (high and low) to observe how social trajectory shapes the interpretation of celebrity culture. The focus groups captured collective discursive negotiations of femininity and class-based labeling, while individual interviews provided subjective depth to explore class and gender anxieties. The data was processed through Thematic Analysis (Braun & Clarke, 2006) and identifies recurring patterns across thematic axes which include motherhood, family, professional success, aesthetics, and romantic relationships.

The analysis reveals that the celebrity functions as a mirror for the women's own class anxieties, though the judgment is far from uniform. High cultural capital participants often display a complex "post-ironic empathy" towards the "choni" aesthetic, using it as a tool for distinction to distance themselves from the "rancid" or rigid stigma of the traditional "pija", summarized in the sentiment: "She's SO taky… I LOVE her". On the contrary, a sharp class consciousness among other participants triggers a political critique of the celebrity's opulence as an "insult" in a context of precariousness. In other cases, moral surveillance over the celebrity's family acts as a "dignifying" tool. Notably, labels like "*chonija*" serve as discursive safety valves, which allow women to process the frustrations of the neoliberal mandate and contest the legitimacy of those who have "made it".

GSC11 Articulations of Activism in Media and Field Work

PP 0918 Contested bodies: A longitudinal, computational analysis of trans athlete representation in UK and US legacy media

Yen Nee Wong[1]

[1] University of Leeds, Sociology and Social Policy, Leeds, United Kingdom

In recent years, anti-trans narratives have increasingly shifted from the political margins to the mainstream, driven by strategic alliances among right wing, populist, religious and conservative actors (Hines, 2025). This convergence has politicised trans bodies, with tangible impacts on access to public participation, healthcare and legal recognition. Elite sports have become a key battleground, where trans athletes face increasing exclusion. In the UK and US, news media play a pivotal role in amplifying gender-critical discourses (McCann, 2023) that support bans on trans athletes from competitions (Fae, 2023). This study critically examines how trans athletes are represented in legacy media across the UK and US over an 11-year period. Drawing on a corpus of 10,629 English-language articles, the research employs BERT-based topic modelling and RoBERTa sentiment analysis to uncover dominant discursive frames and emotional tone in media coverage.

Findings reveal seven dominant frames across 24 prominent and unique topics: (1) medical and biological discourse (2) prominent athletes (3) sporting bodies, (4) legal and policy frameworks, (5) political influence, (6) financial, and (7) social media commentary. Most topics exhibited multiple dominant frames, highlighting interconnected and crosscutting narratives. Polarity differences between athlete-focused and policy-focused topics reveal a dual-track framing strategy: positive sentiment clusters around athlete narratives, while negativity concentrates in governance and legislative debates.

This bifurcation complicates prior claims of one-sided hostility (Palmer, 2023; Monteil-McCann, 2023) and suggests that polarisation is frame-contingent rather than monolithic.

Over time, coverage shifts towards politicised governance frames, weaponizing trans athlete participation as a wedge issue in broader culture wars. Transwomen athletes are often portrayed through cisnormative lens as threats to the fairness and safety of ciswomen. Media narratives of trans athletes often serve as fuel for political actors to mobilise moral outrage and reassert symbolic control under the guise of fairness. These representations contribute to moral panic, legitimise exclusionary policies and marginalise trans voices in media and sports institutions. Recommendations are made for ethical journalism, inclusive media practices and the centring of trans perspectives to challenge exclusionary framings and promote equity in sports discourse.

PP 0919 Emotions from the fieldwork: Navigating ethnography research on digital feminist activism

Azadeh Shamsi[1]

[1] University of Vienna, Communication- Political Communication Reserch Group, Vienna, Islamic Republic of Iran

Abstract This paper is a methodological contribution presenting a personal experience of a critical self-reflexive research journey, negotiating the fluctuating positionalities between being an insider and an outsider while researching digital feminist activism. This reflexive ethnography reflects on a cluster of small but significant methodological decision-making, emotional challenges, conundrums and uncertainties that I faced during conducting online and offline fieldwork over the first eight months (September 2022-April 2023) of the "Woman, Life, Freedom" movement in Iran during a revolutionary moment in the history of Iran's women's movement. This paper tells the story of my study focused on how women practiced resistance against the state and patriarchal culture by sharing their feelings, recalling their own memories of violence and inequality, weaving their personal and life experiences into digital narratives communicated by textual and visual content, and how they found a voice across multiple platforms and spaces, and simultaneously imagined collective alternative futures for themselves and other women in Iran. It highlights the emotional engagement in feminist research, emphasizing the importance of acknowledging and reflecting on the emotional dimensions of the research process. This research journey can be seen as a situated example of how to negotiate one's positionalities, dealing with ethical dilemmas and personal emotions during ethnographic encounters in offline and online research settings, especially when researching sensitive contexts. By making the emotional challenges and methodological struggles typically hidden in ethnography visible, this reflexive account offers examples of how to navigate the dilemmas of positionality in sensitive research contexts. It reveals the messy, rather than straightforward, process of decision-making, showing that researchers' emotions that can inform the research design and analysis are worthy of documentation. Furthermore, the ethnographic observations documented in this study provide valuable insights into the dynamics of social media platforms and the socio-political context of Iran during the initial months following the "Woman, Life, Freedom" movement. Within the conceptual framing of critical reflexivity and feminist methodology, and grounded in these established fields of scholarship, this paper is informed by questions such as: How does a researcher's insider/outsider positionality shape interactions in both offline and online research, particularly in politically sensitive contexts? How can researchers' affect, and emotions be understood both as part of the research process and as valuable research data in feminist methodology? Documenting the behind-the-scenes emotions and uncertainties researchers experience provides suggestions to others facing similar challenges.

GSC11 Articulations of Activism in Media and Field Work

PP 0920 Make-up activism on TikTok: Between popular feminism and 'artivist' strategy

Verena Straub[1], Laura Cervi[2]

[1] Dresden University of Technology, Art History, Dresden, Germany
[2] Universitat Autonoma de Barcelona, Department of Communication Sciences, Barcelona, Spain

Throughout history, the relationship between make-up and feminism has been ambivalent. While some feminist positions critique make-up as a tool of discipline that reinforces normative beauty standards and commodifies women's bodies, others emphasize its potential for empowerment, self-expression, and the disruption of gendered stereotypes. This tension is particularly visible in recent feminist protest practices on social media.

On TikTok, make-up videos have emerged as a flexible and highly visible genre of feminist resistance. Some activists post fake make-up tutorials that 'hijack' the popularity and algorithmic visibility of beauty content on the platform to circulate political messages on topics such as state violence, sexual abuse or hate speech. Other videos stage elaborate make-up routines that culminate in simulated bruises or blood, turning practices of beautification into visual acts of protest against gender-based violence.

Our paper discusses these TikTok trends as part of a larger, transcultural visual protest culture that we define as "make-up activism." Drawing on case studies from the Iranian *Woman, Life, Freedom* movement and Latin American protests against femicides under the hashtag *#NiUnaMenos*, we analyze the contested, and at times contradictory relationship between make-up activism and (popular) feminism. While make-up activism resonates with neoliberal notions of individual

empowerment and the commercial logics of platformed feminism, we argue that it also reclaims the aesthetics of popular feminism for political movements that are driven by a collective struggle for structural change.

From an interdisciplinary perspective at the intersection of political science, visual communication and art history, the paper frames make-up activism on TikTok as a form of 'artivism' that blurs boundaries between activism, art, and everyday digital culture. By turning their faces into canvases and using the vulnerability of their bodies as a medium of protest, TikTok activists draw on a much longer, transcultural history of feminist performance art. While this history is overlooked in most studies of video activism on social media, we suggest that make-up activism reactivates this artistic lineage within platform-based protest, combining it with the visual languages of popular feminism and street mobilization.

GSC11 Articulations of Activism in Media and Field Work

PP 0921 Exploring care work and digital media (non)use among professional cleaners

Sara Van Bruyssel[1]

[1] Ghent University, Communication Sciences, Gent, Belgium

This research aims to better understand the role of digitisation in shaping the conditions of care work that maintains everyday life. I do so by particularly focusing on the professional cleaning industry and consider their work as part of the social reproductive work necessary to re-produce the everyday lives of those they clean for. I focus on this population group because digital disconnection and critical data studies research has shown that care work, and hence also gendered divisions of labour (Bhattacharya, 2017), take part in shaping how digital media and technologies are (and are not) used (Huws, 2019; Lai, 2023; Van Bruyssel et. al., 2024).

However, so far, digital disconnection and wellbeing studies have largely focused on middle to upper-class population groups and presupposed more obviously digitised professions such as office work. This has left a blind spot in understanding what digital media (non)use translates to in more precarious and marginalised workplaces, and if these concepts keep their relevance in these contexts and life-worlds. In turn, critical data studies and digital surveillance fields have shown that digital technologies reify existing structural inequalities shaped by intersections of gender, class and race (Brown, 2015; Eubanks, 2018; Gillespie, 2016). Hence, centring the professional cleaning industry brings forward precarious working conditions and a largely female and migrant labour force (Safuta & Camargo, 2019) that allows to analyse how precarity, care work and digitisation shape experiences and possibilities with digital media (non)use.

To gain a relational understanding I will conduct a three-month ethnographic fieldwork with six professional cleaners from April to June 2026. On the one hand, I will map out their relations to the institutions, employers and clients, and their entwinement in mundane digital devices and digital infrastructures like surveillance technologies. These relations will be mapped out on the backdrop of Tronto and Fischer (1990), and Puig de la Bellacasa's (2017) understanding of care as a relational, political and affective process. This will result mapping out who receives care, who gives it to whom and how, as well as who or what creates the conditions and resources for that care work to take place.

On the other hand, I aim to understand how these paid care working conditions shape cleaners' lives outside work and the social reproductive work that must still happen for themselves and those they care for. By following participants throughout their day in and out of their cleaning work I aim to better understand how care work permeates the various spheres of their lives with and through digital technologies. By doing so, this research aims to broaden an understanding of what it takes to be digitally "well" and questions how attainable it is when gendered, classist and racialized inequalities shape the structural conditions in which human flourishing is expected.

GSC12 Disinformation, Gendered Violence and Communicative Regimes

PP 1025 Rape myths in online discourse: A qualitative analysis of user comments on German social networking sites

Leonie Dellwig[1], Alexander Rihl[1], Carla Koppe[1]

[1] University of Greifswald, Department of Political Science and Communication Studies, Greifswald, Germany

The recent case of Dominique Pélicot in France reaffirmed how rape myths (Burt, 1998) continue to inform understandings of sexual violence – even among perpetrators, who, in certain instances, mobilised such myths to justify their actions (Hofmann, 2024, Prange de Oliveira, 2024). Building on this broader concern, this study explores how rape myths are articulated in user comments on German news reports about (attempted) rape, posted on social networking sites. We

examined the evolving forms these myths may take in contemporary online discourses, drawing on script theory (Schank & Ableson, 1977), gender studies (Purucker 2017). We understand rape myths as cognitive shortcuts embedded within broader gendered social scripts that regulate sexuality and sexual violence (Bohner 1996). Within patriarchal cultures, these myths operate not simply at the level of individual belief and understanding, but as communicative and cultural resources that normalise gendered power hierarchies, legitimize male sexual entitlement, shape how sexual violence is publicly discussed, interpreted, and justified.

This qualitative study employed a deductive–inductive content analysis of 504 user comments responding to 98 Facebook posts linking to news articles on (attempted) rape published by five regional and national German newspapers in 2024. The analysis focused on how rape myths were articulated within these discussions, drawing on a deductive categorisation of rape myths (Burt, 1980), which was subsequently extended and refined through the development of inductive subcategories. The study sought to understand how rape myths are reproduced, negotiated, and adapted within contemporary online discourse.

The analysis identified the presence of rape myths previously described in the literature (e.g. Burt, 1980), including victim-blaming narratives as well as the minimisation or complete denial of sexual violence. In addition, the coding process led to the development of new subcategories within the myth type 'rapists are sex-starved', capturing references to the (assumed) migration background of alleged perpetrators as well as racist stereotypes interwoven with existing rape myths. A corresponding subcategory was also created within the contradiction category to reflect comments explicitly challenging such racist associations. Furthermore, two additional contradiction categories were developed: 'critique of victim blaming' and 'critique of perpetrator exoneration'. These enabled the coding of comments that rejected core functions of rape myths – such as blaming victims and downplaying perpetrator responsibility – where they did not refer to specific, previously described rape myth types.

Taken together, the findings illustrate how rape myths circulate and are negotiated within everyday online communication, functioning as shared cognitive and communicative resources through which sexual violence is interpreted. These myths are not only reproduced but are also adapted and, at times, contested, as users draw on and challenge broader cultural scripts to make sense of sexual assault. In some instances, racialised assumptions entered these meaning-making processes, shaping how responsibility, credibility, and harm were discussed. In this respect, the study contributes to ongoing work within the Section Gender, Sexuality and Communication by demonstrating how narratives surrounding sexual violence are constructed, debated, and re-circulated in contemporary media environments.

GSC12 Disinformation, Gendered Violence and Communicative Regimes

PP 1026 What is gendered disinformation? A theoretical multi-level approach

Marília Gehrke[1], Martha Stolze[2]

[1] University of Groningen, Center for Journalism and Media Studies, Groningen, Netherlands
[2] Weizenbaum Institute- Freie Universität Berlin, Research group "Platform Algorithms and Digital Propaganda"- Otto Suhr Institute of Political Science, Berlin, Germany

Individuals in the public arena, such as politicians and journalists, are often targeted by violent attacks. Recently, these kinds of abuses, many of which are misogynistic, have been exacerbated by Artificial Intelligence (Bates, 2024). AI-manipulated text, photos, and videos, including sexually explicit deepfakes, are examples of gendered disinformation (GenDis), which translates into the weaponization of gender stereotypes and intersectional identities (i.e., race and ethnicity) in multiple flows of violence (Gehrke & Amit-Danhi, 2025), using misleading, defamatory claims (Stolze, 2025).

This study offers a novel theoretical multi-level model of GenDis to conceptualize an emerging strand of research that unites rather than separates approaches to gender and disinformation. Informed by critical disinformation studies (Kuo & Marwick, 2021), decolonial feminist theory (Vergès, 2020; 2021) and illiberal public spheres (Bennet & Kneuer, 2024; Štětka & Mihelj, 2024), our model comprises three levels: (1) The patriarchal order, as the underlying systemic, violent, and exploitative ideology, (2) the societal level, which entails socialization into gender norms, and dynamics of oppression, and (3) the content level, which entails individual and in-group defamation via misleading anti-gender content. We argue that gendered disinformation occurs primarily at the intersection of levels 2 and 3, with level 1 as the overarching structure that enables and upholds the system.

Women and LGBTQIA+ individuals are particularly at risk of being targeted and might quit the public arena (Sobieraj, 2020). Circumstances leading to refraining from political participation are related, for instance, to having their faces and bodies violently exploited in Non-Consensual Intimate Imagery (NCII). In some countries, such as the United States, reports have shown that women are 70 times more likely than men to become targets of sexualized deepfakes (Rodriguez & Mithani, 2024). In Germany, the only female candidate of recent chancellor elections, Annalena Baerbock, was disproportionally targeted by disinformation campaigns (Smirnova et al., 2021). In Brazil, black and indigenous women were punished with narratives anchored on stereotypes of race and ethnicity (Gehrke, 2025).

To be clear, men can also be targeted with gendered disinformation, particularly if they do not comply with the gendered expectations prescribed by hegemonic masculinity, such as being dominant and expressing anger (Smiler, 2019). Our model therefore accounts for intersectionality, and we argue that patriarchy is a system of exploitation and oppression that harms

everyone, with some groups of people being affected more than others. That is, some groups have historically profited from dominating unconscious schemes of perception and appreciation (Bourdieu, 2001).

The exacerbation of gen-AI in combination with the ongoing democratic backsliding and anti-gender backlash witnessed in Europe and elsewhere comes from a colonial tradition of gendered, sexualized, and racialized patterns of violence that continues to perpetuate (Sánchez-Acochea, 2021; Vergès, 2020). "Gender" becomes the external force to be blamed for the loss of patriarchal power in the family and the State (Butler, 2024). Theorizing the distinct levels of GenDis is now crucial to advancing our understanding of the phenomenon and promoting societal change.

GSC12 Disinformation, Gendered Violence and Communicative Regimes

PP 1027 The role of social media in anti-gender mobilization: Exposure, endorsement, and political participation

Nicola Righetti[1]

[1] University of Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

The anti-gender movement—a transnational mobilization of a loose constellation of actors contesting feminist and LGBTQIA+ claims through the notion of "gender ideology"—represents a significant phenomenon in the contemporary political landscape, with profound implications for democratic life and civil rights.

Over the past two decades, research has highlighted the crucial role of social media in political activism, populist dynamics, and the construction of like-minded political communities. For anti-gender organizations, social media function as a strategic infrastructure for circulating newsletters and petitions used to quantify and legitimize support and to influence decision-making processes. A growing body of scholarship has shown how digital media are employed to disseminate anti-gender narratives, disinformation, and conspiracy theories targeting LGBTQIA+ people.

It is therefore essential to investigate the role of social media in the dissemination of anti-gender discourse. Yet, most studies have focused on observational analyses of social media data, while more general population-based research on the impact of social media remains scarce. This study helps to address this gap by assessing the relationships between social media, exposure, endorsement, and political participation in relation to anti-gender discourse, based on a sample of 800 Italian adults representative by gender, age, and area of residence.

First, the prevalence of anti-gender beliefs in the population is measured, contributing new data to recent efforts in this area. The analysis then documents how frequently respondents encounter anti-gender content on social media, comparing this exposure with that observed through other channels such as television, newspapers, or informal conversations.

The focus subsequently shifts to digitally mediated forms of participation, examining the extent to which individuals actively engage with anti-gender content on social media (e.g. commenting, sharing, and participating in online discussions), thereby directly and indirectly contributing to its salience. In light of the low levels of commitment required by digital interaction—sometimes criticized for having limited political impact—the study investigates whether and how these forms of participation are connected to more demanding political actions, ranging from signing petitions to participating in offline protests and electoral choices. In particular, it examines whether a candidate's position on so-called "gender theory" constitutes a relevant criterion for voting.

Overall, the findings provide new evidence on the role of social media in the diffusion of anti-gender discourse, highlighting its relationship with levels of endorsement in the Italian population and with different forms of political participation, and offering insights for further scholarly investigation and the development of targeted counter-strategies.

PP 1028 Misogyny and discursive toxicity in the context of illness content creation on TikTok and Instagram

Hannah Ditchfield[1], Stefania Vicari[1]

[1] University of Sheffield, School of Sociological Studies- Politics and International Relations, Sheffield, United Kingdom

Misogyny online has been highlighted as a "serious cause for concern" (Ging and Siapera, 2019) with scholars emphasising its close entanglement with the affordances of social media platforms (Banet-Weiser and Miltner, 2016; Ozkula et al., 2024). Despite much scholarly attention, whether and how misogynistic discourse shows up in the context of illness content on social media remains underexplored. Thinking of illness content as a potential home for misogynistic discourse may be surprising as social media is often highlighted as a supportive, therapeutic and safe space to share stories of illness (see Myrick et al., 2016; Kingod et al., 2017; La et al., 2019). Illness creators' content, though, includes high degrees of self exposure making it particularly vulnerable to cultural narratives of ableism (Tembeck, 2016), regimes of shame (Frohlich and Zmyslinski-Seelig, 2016; Philpot et al. 2022; Rademacher, 2018) and gendered notions of sexuality, responsibility, physical attractiveness and body propriety (Pitts, 2004; Authors, 2025). Therefore, we argue that these factors actually make illness content creators vulnerable to gender based hate online. Because of this, our paper asks whether and how misogyny is experienced in the context of illness content creation on Instagram and TikTok, paying particular attention to how this may be entangled with platform infrastructures such as algorithms and moderation policies.

To do this, we employ the concept of discursive toxicity (Recuero, 2024) to understand how misogynistic discourse, in an illness context, can be enabled by platforms resulting in 1) spread, 2) legitimisation and 3) harm. We draw on the case of two hereditary cancer syndromes: BReast CAncer (BRCA) and Lynch Syndrome, both genetic conditions which increase the risk of developing certain types of cancer (Cancer Research UK, 2025). Data was collected as part of a larger Leverhulme Trust funded project looking at experiences and understandings of hereditary cancer syndromes across social media platforms. For this paper, we draw on 29 semi-structured, online, interviews with English speaking hereditary cancer creators across two conditions (BRCA and Lynch Syndrome) and on two social media platforms (TikTok and Instagram). In addition to these interviews, our analysis also draws on observational field notes (on our interview participants' social media profiles and posts) and a qualitative content analysis of 'top' TikTok content (conducted as part of an earlier work package, see authors 2025).

Our paper contributes to existing knowledge by showing how misogyny manifests in the (somewhat surprising) context of illness content creation. Our findings show how misogyny in the illness context is entangled with virality and harm in the form of silencing women's voices in the health and illness space. Our findings build on literature that shows misogyny to be entangled with platform infrastructures (Recuero, 2024), yet we extend this by arguing that moderation practices are experienced as legitimising misogynistic discourse.

GSC12 Disinformation, Gendered Violence and Communicative Regimes

PP 1029 What happened?: A comparative analysis of news coverage of intimate partner femicides in quality newspapers in Spain and Belgium

Cilia Willem[1], Sofie Van Bauwel[2], Iolanda Tortajada[1]

[1] Universitat Rovira i Virgili, Dept. of Communication Studies, Tarragona, Spain
[2] Ghent University, Communication Sciences, Gent, Belgium

Introduction

This paper presents a quantitative and qualitative content analysis of newspaper articles reporting on intimate partner femicides (IPF) in Spain and Belgium between 2022 and 2024. While Spain has a long-standing tradition of acknowledging the killing of women by their partners or ex-partners as gender-based violence, and most Spanish press frame IPF as a structural, gender-based problem (Aldrete & Fernández-Ardèvol, 2023; Walker, 2022; Comas-d'Argemir, 2015; Berganza, 2003; López-Díez, 2002; Fagoaga, 1994; Fernández-Arribas & Noblejas, 2010; Carballido-González, 2009), Belgium only recognized femicide legally in 2023. No previous research has examined Flemish press coverage of such cases.

Aim

The aim of our study was to compare four quality newspapers—two in Spain and two in Belgium—reporting on IPF in terms of coverage rates, the use of tags and editor's notes, and the framing of cases: structural gendered frames on the one hand, or private non-gendered frames on the other.

Methodology

As illustrated by previous research a content analysis is a good methodological tool to analyse the representation of femicides in factual media content (e.g. Gius & Lalli, 2014; Rosa & Flores, 2020; Pröll & Magin, 2022). In total, the sample consisted of 392 articles extracted from El País and El Mundo in Spain, and De Standaard and De Morgen in the Dutch-speaking part of Belgium. We analysed the material using two major frames: the Structural Gendered Social Problem (SSP) frame and the Private/Isolated Non-Gendered Problem (PIP) frame.

Results

Our findings reveal stark contrasts: the Spanish newspapers in our sample reported up to 96% of documented intimate partner femicides and predominantly applied frames referring to IPF as a structural gendered problem, systematically tagging cases as gender-based violence (violencia de género/violencia machista) and providing helplines for victims. By contrast, Flemish newspapers covered up to 62.5% of IPF cases documented, and reporting relied heavily on frames referring to femicides as a private or isolated problem, often using terms such as "domestic violence" or "family drama", thereby relegating the problem to the private sphere rather than presenting it as a social problem with a gender dimension. These disparities suggest that Spanish journalism fosters (or is a consequence of) greater public recognition of femicide as a societal issue, whereas Flemish reporting risks depoliticizing and privatizing gender-based violence. Addressing this gap requires clearer editorial guidelines, the systematic inclusion of gender-based violence helplines in coverage, and appropriate training for (future) journalists.

PP 1129 The occupation wives of TikTok: Tradwife aesthetics and the legitimisation of Israeli settler colonialism

Jilly Kay[1], Yuval Katz[1]

[1] Loughborough University, Department of Communication and Media, Loughborough, United Kingdom

This presentation considers the emergent phenomenon of women content creators in the extreme settler movement in the Israeli-occupied West Bank, in the context of escalating settler violence against Palestinians. We term these "occupation wives", and we argue that they must be understood as a conjuncturally specific iteration or mutation of the reactionary, white supremacist "tradwife" phenomenon associated with the MAGA movement in the US. We situate "occupation wives" in the broader context of online "mirror-worlds" (Klein 2024), political "confusionism" (Gidley 2025) and reactionary digital politics (Finlayson 2021, 2023). Increasingly, the reactionary right mirrors and absorbs ideas and discourses from the left, and the very notion of "feminism" is being appropriated, warped and rearticulated to serve reactionary political agendas. We closely analyse TikTok videos made by extreme settler women creators; these typically focus on women's domestic labour in the settlements, with an orientation towards "wholesome" and "relatable" content, and "demystifying" the settler movement through the offer of intimate glimpses into their daily lives. Through modalities of domesticity, care, motherhood, religion, and love for the land, the systemic violence against and dispossession of Palestinians is premised is rendered invisible.

We argue that the videos are characterised by the mimetic, topsy-turvy qualities of contemporary reactionary digital culture. In their aesthetic presentation and communicative style, they are substantially aligned with US tradwife content, with disorienting ideological mash-ups of "back to the land" pastoral aesthetics that exist alongside an embrace of digital media technologies. Like tradwives, they both embrace and reject feminism; while stating they are "not feminists" in some videos, they focus on showcasing the power of women in a conservative, male-dominated community in others (yet without challenging its heteropatriarchal values). They are thus part of a globally networked, resurgent new right appropriating left-wing and feminist discourse.

On the other hand, however, occupation wives are a highly conjuncturally specific phenomenon; whereas the term "tradwife" is routinely conflated with Anglo-American, white and Christian nationalist influencers, we argue that we must also look to its manifestations in other geo-cultural and racialised contexts. As such, our analysis of occupation wives is contextualised within longer histories of "femo-Zionism" in which women have long played a role in far-right Israeli politics and the active dispossession of Palestinians.

What is "new" about the occupation-wife phenomenon is its articulation through the celebrity logics of platform media, organised around concepts such as "authenticity" and "relatability". We use the term "strategic confusionism" to explain its simultaneous gesturing towards TikTok pop culture while supporting an extreme, violent settler colonialist project. Strategic confusionism offers a new way of thinking about the topsy-turvy logics of "reactionary feminism"; unlike Anglo-American examples, where it is often hard to pin down the politics of tradwives, here the stakes are obvious and high. We demonstrate how the hodgepodge of cuteness and violence, submissiveness and assertiveness, domestication and liberation found in their videos cleverly whitewashes the settler colonial project by creating an unintimidating brand in which influencers' performances of femininity serve as the ultimate proof of the project's innocuousness.

GSC13 Influencers and Online Aesthetics

PP 1130 Godfluencers: The christian influencers teaching followers to feel truth by materializing the devil and the divine

Gabriela De La Vega[1]

[1] Erasmus Universiteit Rotterdam, Media &- Communication, Rotterdam, Netherlands

This paper discusses how some female christian influencers are critically recontextualizing the notion of truth, asserting that truth equates God, biblical order, conservative morality, and traditional gender norms, while lies are equated with Satan, contemporary culture, feminism, and liberal politics. Using a theoretical framework based on material religion, affect, and post-truth, this study answers the question ". How do Christian influencers materially conceptualize truth and how do they use social media's affective affordances to teach followers how to distinguish "truth" from "lies"?", based on 11 months of digital ethnographic research on female social media influencers, including daily participant observation and archival work.

The theoretical approach considers religion as a deeply material practice, something that is felt, seen, and sensed in everyday life by believers (Hazard, 2013; Meyer, 2011; Morgan, 2016). In this context, media are crucial in organizing access to the divine, acting as anything that organizes access to the transcendental. On social media, emotions intensify as platforms amplify affect (Abdel-Fadil, 2019; Papacharissi, 2016). Influencers are also emerging as new kinds of digital religious authorities on social media (H. Campbell & Bellar, 2023). In a post-truth culture, subjective experiences and emotional appeals often outweigh objective facts, redefining how truth is understood in digital environments (H. A. Campbell, 2025; McIntyre, 2018).

The analysis reveals that Christian influencers materially conceptualize both the divine and the devilish influences through embodied storytelling and sensory cues. Through highly personal narratives, traditional gender roles are presented not only as a divine mandate but also as a solution to cultural anxieties. For example, joy in motherhood is positioned as proof that God's design is inherently fulfilling. The devil is materialized as a tangible force hiding in secular discourses, such as the feminist movement, or even in innocent content like Disney movies. Furthermore, modesty and purity become material practices that produce a specific affective state, such as the "Jesus glow," which is read as evidence of divine presence.

Ultimately, these influencers construct truth by leveraging the materiality of both God and Satan through embodied storytelling, sensory cues, emotional testimonies, and the interface logics of social media. Truth is framed as that which can only be achieved by following the word of God, and denying the lies of Satan. The influencers position themselves as both witness and teacher, modelling how followers should read their emotions and how to decipher 'real' truth from them. They collapse the boundary between spiritual warfare and cultural crisis, politicizing the personal and spiritualizing the political. Crucially, fear runs throughout these discourses as a central emotional force, presenting the devil as a tangible force at work in everyday life and facilitating the othering of outsiders. In this context, Truth is not argued. Truth is felt. This framing expands existing scholarship on material religion and digital religion by showing how the sensory, affective, and embodied dynamics of platforms actively shape what counts as truth.

PP 1131 Waging war on feminism through jiaoqi discourse: Chinese tradwife influencers on Douyin

Altman Yuzhu Peng[1]

[1] University of Warwick, Applied Linguistics, Coventry, United Kingdom

Today, a 'tradwife' (traditional wife) aesthetic has gained traction across Euro-American societies. A tradwife comes into being through her repertoire of traditional 'white femininity'. The American '1950s housewife' is arguably the most representative archetype; still localized variants may be reshaped by such cultural markers as '"vintage" Victorian and homesteader' traditions in Australia and 'traditional "ethnic" dress' in Montenegro and the Netherlands. Yet, tradwife influencers do not merely embody an aesthetic but prophesy a discourse that romanticizes women's divine responsibilities as signifiers of white, middle-class, heteronormative traditions, associated with the West's past 'glories'. Mimicking their Euro-American tradwife counterparts, the *jiaoqi* aesthetic on the Chinese-language internet is adjacent to the imaginary of a young, beautiful wife who loves her husband devotedly. Being a *jiaoqi* anchors a woman's deference to male dominance specifically crafted under China's sociopolitical conditions. *Jiaoqi*-stylized submission to husbands does not assume an overtly racial form, nor does it draw on biblical teachings; instead, it underscores a perceived imperative for women to navigate a de facto male-dominated world by investing in their appeals within romantic contexts. Drawing on the concept of therapeutic governance, which interrogates the application of sociopsychological measures in population management, we examine how the *jiaoqi* imaginary contributes to a discursive apparatus shaped by China's neoliberal-style market economy under the party-state's political control. To this end, we adopt a sociocognitive approach, analysing the Douyin videos of a high-profile influencer who is dubbed '*jiaoqi*' by Chinese netizens. It is worth noting that *jiaoqi* influencers and *jiaoqi* discourse may function as parallel rather than allied forces. While *jiaoqi* influencers selectively draw on the aesthetic to build their social media presence, they may contextually downplay it to achieve specific personal agendas. Yet, focusing on an ideal-typical case, whose imaginary not only aligns principally with the aesthetic but also amplifies it as a trending issue on the Chinese-language internet, we probe into the dual politico-economic shape of *jiaoqi* discourse. We argue that this discourse commercially operates as a persona-building strategy within China's influencer economy. By prescribing sociopsychological self-help practices, *jiaoqi* influencers offer their followers counselling-style guidance on navigating home-work tensions. This content strategy reflects a pivotal axis of the influencer economy, where appealing to a broad heteronormative audience is key to success. Beneath this commercial logic, however, women's reconciliation with the status quo is explicitly glorified, rendering the discourse well aligned with a cooperative approach to systemic gender asymmetry that finds resonance in Chinese society. Amid the Chinese MeToo movement and related initiatives unfolding on social media, feminist debates are considered threats to regime stability. Adopting a cooperative posture, *jiaoqi* discourse responds to heightened intergender tensions by delegitimizing feminist struggles. In doing so, it has evolved into a grassroots ideological intervention that appears self-voluntarily aligned with the party-state's governing doctrines. Foregrounding the dual shape of *jiaoqi* discourse, the analysis underscores its sociopolitical significance within post-socialist China, where neoliberalism and authoritarianism weave a tangled web.

PP 1132 "If a woman needs industrial tools to be satisfied, she's a slut" – Portrayals of sex and sexuality among Estonian manfluencers and spiritpreneurials

Annika Tamme[1], Kaarel Lott[2]

[1] University of Tartu, Institute of Psychology, Tartu, Estonia
[2] University of Tartu, Institute of Social Studies, Tartu, Estonia

There are different reasons and functions for people to be involved with the NoFap movement, refraining from masturbation, not all of them (such as kinks and fetishes) necessarily harmful (Burnett, 2021). However, many of these spaces carry misogynist, anti-LGBT, antisemitic, self-harm and pro-violence views supporting hegemonic masculinity (Dashiell & Rowland, 2024; Prause & Binnie, 2023), idealizing innate masculinity and the need for 'real sex' (Taylor & Jackson, 2018). This has created a space for creators without standardized credentials to provide interventions without scientific evidence (Kompatsiaris, 2025; Prause, 2023). Paradoxically, such "Reboot" or "Semen Retention" programs tend to cause more distress instead of decreasing it (Prause & Binnie, 2023).

This study focuses on the representations of sexuality and sexual activity among Estonian manfluencers and spiritpreneurials on TikTok and YouTube. Manfluencers are social media content creators who weaponize highly performative and extremist notions of masculinity (Wescott et al., 2024). Spiritpreneurials, on the other hand, privilege both entrepreneurialism and spiritual values for producing the ideal masculinity, while coaching audiences about male sexual energy (Kompatsiaris, 2024). Through a thematic analysis (Braun and Clarke, 2006) of the manfluencers' and spiritpreneurials' videos, we explore how they construct masculinity in the context of sexual identities and sexual behavior. Preliminary results indicate that manfluencers construct sexual abstinence and refraining from the use of pornography as a test of discipline and self-restraint necessary to conform to the ideals of hegemonic masculinity. Heterosexuality is presumed from audiences and the formation of sexual relations is highly based on 'sexual marketplace' ideals, where values are assigned to people based on physical as well as behavioral traits. At the same time, spiritpreneurials differ from manfluencers by framing relationships in an evolutionary mating context and emphasizing the need for love, security and connection. Sex is framed in the context of men as givers of pleasure to female partners, while appealing to differences in desire between men and women.

It is important to understand this type of content and how the ideas of various subgroups affiliated with the NoFap community relate to each other. Furthermore, the insights of this study can provide valuable insight into potential pipelines to the more discriminatory or extreme views that manfluencers and spiritpreneurials are associated with.

GSC13 Influencers and Online Aesthetics

PP 1133 "Why do women steal away men's joy?" – A qualitative content analysis of manfluencers (design) discourse of YouTube short content

Matteo Rinaldi[1], Julia Kneer[1], Freya De Keyzer[1], Simone Driessen[1]

[1] Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

The rise of social media platforms facilitated both positive conversations and the host and spread of the manosphere- a digital ecosystem where "manfluencers" share misogynistic and toxic views. Prior research examined manosphere discourse in text-based forums and limited attention has been paid to how it is articulated in short video content (SVC), which exploit entertainment design phenomena to reinforce specific world-narratives, easily promoting engaging but toxic content, where manfluencers can strategically use SVC multimodalities to reach virality and maximize persuasion. This novel and powerful way to express toxicity deserves scholarly attention.

To investigate the characteristics of this content, this study deployed a qualitative content analysis via a Visual-Verbal Video Analysis (VVVA). SVC was selected from manfluencers' profiles, and their general, visual, multimodal, character, and compositional elements were analyzed via a six-steps iterative approach. Videos were stored in an extraction matrix, transcribed, and coded according to the aforementioned elements. The VVVA was chosen for two reasons: its flexibility, as its iterative approach allowed for codes and groups to be modified throughout data collection, in accordance with the exploratory nature of this research, and its ability to collect speech as well as multimodal element with relative ease of retrieval.

Findings revealed the presence of two overarching themes- and other multimodal design sub-phenomena characterizing manfluencers' content. One of these themes was the *win/lose theme*. In virtually all videos, manfluencers won the confrontation with their opponents. This was empowered by *editing* choices reinforcing manfluencers' views. For example, strategic *jump-cuts* showed opponents listening with a submissive demeanor, using *zooms* showing opponents left in disbelief, and *video-ending cuts* silencing the manfluencers' rivals, effectively censoring their rebuttals. Manfluencers edited themselves *reacting* to other creators' videos, reducing them to visual symbols and imagery to enhance their own persuasion via the use of self-disclosure and conversational tones, and engaged in *sketch-comedy,* persuading and winning against their "opponents" through the use of dramatic narrative tactics.

The second theme, *business-lingo,* had a high symbolic value. Manfluencers asked what others *bring to the table*, commodifying (romantic) relationships. They referred to *high-value* men and women, picturing men as *going out in the world* and "valuable" women having *raw, supportive femininity,* whose role is to be on *a man's side*.

Overall, this study shows how manfluencers strategically use SVC's multimodalities in synergy to share their values with the intent of persuading their audience of their views. Insofar, it made apparent how manfluencers do not only use speech, but also entertainment design phenomena as an attempt to persuade through discourse, and as such they should be considered as persuasive elements altogether.

HCO01 (Effects of) Representations of Health, Illness, and the Body

PP 0053 Academic perspectives on mental health representations in streaming fiction: an integrative review across communication and psychiatric research

Filipe Barrocas Lima[1], António Granado[1], Pedro Morgado[2]

[1] ICNOVA – NOVA Institute of Communication, iNOVA Media Lab, Lisbon, Portugal
[2] ICVS Research Institute, Stress and Compulsivity from Brain to Mental Health, Braga, Portugal

The growing centrality of television fiction – particularly content distributed through streaming platforms (Cardoso & Baldi, 2022; Grece, 2021; Nielsen, 2022) – has intensified scholarly attention to how mental disorders are represented in audiovisual narratives and how such representations may influence public understanding of mental health (Xia et al., 2022; Yeo & Silberg, 2021). Situated within the field of health communication, this study examines how mental disorders are conceptualised, evaluated, and problematised across academic research traditions, focusing on divergences and convergences between scholars from communication and audiovisual studies and those from psychiatric and mental health sciences.

Drawing on an integrative literature review approach (Whittemore & Knafl, 2005), this study synthesises academic articles and monographs published between 2013 and 2024 that address representations of mental disorders in television fiction. The integrative methodology enables the combination of heterogeneous theoretical perspectives, methodological approaches, and epistemological positions, allowing for a comparative reading of how mental health representations are framed across disciplinary boundaries. Rather than aggregating empirical effects, the review seeks to map dominant analytical concerns, evaluative criteria, and underlying assumptions within each research tradition, while identifying areas of overlap and tension, acknowledging the potential snowball effect that the investigation predicts (Dermeval et al., 2020).

The analysis is structured around three thematic axes. First, it contextualises television fiction within the broader transformation of audiovisual consumption, considering the technological, cultural, and industrial dynamics associated with contemporary streaming ecosystems. Second, it examines how mental health is framed within media scholarship and health-related research, including recurring discussions on stigma, normalisation, responsibility, and public knowledge (Grandón et al., 2021; Johnson, 2016; Lacerda & Santos, 2020; Miller, 2021; Ray & Hinnant, 2009; Tüysüz, 2020). Finally, the review focuses specifically on research addressing mental disorders in films and television series distributed via streaming platforms, such as Netflix, Prime Video, Disney+, and HBO Max (e.g., Katseanes, 2023; Peña & Sarrionandia, 2023), assessing what has been studied, what remains underexplored, and how disciplinary perspectives shape research agendas and interpretations.

Preliminary findings suggest that communication and audiovisual studies tend to emphasise narrative structures, representational patterns, audience interpretation, and cultural meaning-making (e.g., Wang et al., 2023), whereas psychiatric and mental health research more frequently foregrounds clinical accuracy, potential risks, and public health implications (e.g., Bridge et al., 2020; Niederkrotenthaler et al., 2019). While these perspectives are sometimes presented as conflicting, the review identifies emerging points of intersection that highlight the potential for interdisciplinary dialogue.

By systematically comparing academic insights across fields, this presentation contributes to health communication research by clarifying how disciplinary lenses shape understandings of mental health representation in television fiction and by outlining pathways for more integrated, ethically informed, and socially responsible research in an evolving media landscape.

HCO01 (Effects of) Representations of Health, Illness, and the Body

PP 0054 The body of body image research: A computational topic analysis (1980–2025)

Lena Maria Küpper[1], Saïd Unger[1], Thorsten Quandt[1]

[1] University of Münster, Department of Communication, Münster, Germany

Body image (BI) research has historically been situated at the intersection of medicine, psychology, social, and media studies. After scholars have examined the conceptualizations, characteristics, and correlates of BI for several decades, we contend that a data-driven mapping of the field is both timely and necessary. By combining computational topic modeling with qualitative interpretation, the current study offers a longitudinal perspective on the evolving landscape of BI research.

We query the bibliometric open-source database OpenAlex (Priem et al., 2022) for English-language journal articles whose abstracts contain the keyword “body image” published between 1980 and 2025. After removing duplicates 51,846 articles remain. We focus on the social science and (media) psychology perspective and consequently filter the subfields accordingly, leading to a sample of 12,807 articles. To ascertain the development of the research field, we apply transformer-based topic modeling (BERTopic) to the abstracts of the retrieved articles and identify 113 topics. Afterwards, we qualitatively group these topics into 22 thematic clusters.

At the level of individual topics, the most prominent topic captures research on neuropsychological mechanisms in eating disorders, including information and emotion processing. Although the proportion of this research decreases over the years, the topic remains prevalent. Though initially among the most prominent topics, our data shows that research on

Rorschach tests and body boundaries effectively vanishes after the early 2000s. This reflects a broader shift away from psychoanalytical diagnostic approaches in psychology. Conversely, ethnicity- and culture-related BI research emerges in the early 1990s, aligning with a wider move toward context-sensitive psychological perspectives.

When shifting the focus from individual topics to the level of topic clusters, a different set of longer-term patterns becomes visible. The analysis indicates that research on cancer and its effects on BI remains a consistent focus. Research clustered around media, models, and advertising peaks around the turn of the millennium, which can be interpreted against the backdrop of the diet culture of the 1990s. According to our data, research explicitly addressing positive body image emerges only in the 2010s. During the same period, we observe a steady increase in social media-related research, even overtaking all others in terms of relative share in recent years.

We find that the field has diversified substantially, especially following the institutionalization of BI research in the early 2000s (e.g., the launch of dedicated journals; see Cash, 2004). Taken together, the results indicate a constitution of a dynamic field whose thematic priorities shift in dialogue with changing media environments, social norms, and medical-psychological discourses. Future analyses will address publication patterns within the field, including gender and geographical imbalances, the role of specific journals and the proportion of publications in top-tier outlets to not only describe, but further explain these trends.

HCO01 (Effects of) Representations of Health, Illness, and the Body

PP 0055 The role of embodied and affective communication of children's pain and suffering in paediatric palliative care narratives

Outi Hakola[1]

[1] University of Eastern Finland, Communication Studies, Joensuu, Finland

In countries such as the United Kingdom, where paediatric palliative care partly relies on charitable donations, public broadcasting and online videos have become key tools for raising awareness and public support. These advocacy campaigns navigate a delicate balance: presenting the benefits of palliative care while depicting the tragic realities of dying children. In this paper, I examine the communicative functions of children's pain and suffering in these audiovisual narratives.

These representations are part of a historical continuum. Until the late 20th century, scientific theories assumed that children's immature nervous systems limited their pain experience, resulting in minimal pain treatment (Sisk et al. 2020). Consequently, early research on terminally ill children prioritised parental anxiety, with studies acknowledging children's experiences emerging only in the late 1970s and paediatric pain research gaining traction in the 1980s. Today, palliative care and pain management adopt holistic models that centre children's perceptions. In audiovisual campaigns, foregrounding children's experiences reflects this cultural shift, even as these representations continue to struggle with the long-standing denial of children's pain.

Using a multimodal analysis of documentary series *Beautiful Lives* (BBC, 2011), *The Hospice* (Together TV, 2018), and the online campaign *From That Moment* (Noah's Ark Children's Hospice, 2022–2025), I study how these projects seek to give visibility to paediatric care and to educate people about the necessity of addressing children's mortality. While these narratives often emphasize hospice staff's and parents' care efforts, contemporary representations also include children's voices to avoid trivialising their experiences. I draw on phenomenological pain theories (e.g., Bueno-Gómez 2017), where pain is not only symptomatic but a meaning-making process that includes efforts to make painful experiences understandable to others. The intersubjectivity of pain experiences allows the documentary materials to create affective and embodied connections between the suffering children and audiences.

Such engagement with children's pain is achieved through what Laura Marks (2000) calls "haptic visuality", which refers to aesthetic strategies like close-ups and off-kilter images that encourage viewers to feel rather than rationalise. I argue that these material and sensory elements are crucial for generating public support for paediatric palliative care. The inclusion of children's life stories alone provides meaning for paediatric palliative care, emphasising how personal and emotional storytelling functions as a persuasive form of health communication. However, I argue that scenes depicting suffering introduce an added layer of meaning where embodied and affective dimensions strengthen these messages. Through intersubjectivity, viewers respond to suffering holistically, transforming children's pain into a haptic experience that communicates urgency to alleviate their distress and, consequently, reinforces support for paediatric palliative care. With this paper, I aim to contribute to health communication scholarship by demonstrating how affectivity shapes public understanding and advocacy for paediatric palliative care.

HCO01 (Effects of) Representations of Health, Illness, and the Body

PP 0056 More than a body? Insights into the impact of body positivity and body neutrality Instagram contents on female body appreciation and self-objectification

Annemarie Wiedicke[1], Paula Fink-Stehr[2], Lisa-Marie Siml[3]

[1] Chemnitz University of Technology, Institute for Media Research, Chemnitz, Germany
[2] LMU Munich, Department of Media and Communication, Munich, Germany
[3] University of Vienna, Department of Communication, Vienna, Austria

Body image concerns have been identified as a global mental health issue, especially for women. Social media may contribute to this issue by cultivating narrow beauty and body ideals. At the same time, studies point out that body positivity content (which stresses the idea of loving one's body) disseminated through social media can increase body appreciation among female recipients. Still, due to their pronounced focus on the (female) body, these contents have also been shown to lead to higher self-objectification. This indicates an ambivalent impact of the body positivity movement on women's body image and raises the question of whether body neutrality (which emphasizes bodily functionality) might be more beneficial as a concept. However, contrary to expectations raised by activists and researchers, in a first online experiment, there were no differences between young female Instagram users' (N = 144, M = 21.6 years, high education) body appreciation and self-objectification after being exposed to either body positivity or body neutrality Instagram posts. Apparently, body neutrality posts do not necessarily address a common criticism of the body positivity movement—the strong emphasis on the body, frequently reinforced through the use of photographs of female bodies in both forms of social media posts.

Against this background, we chose to test the impact of the self-compassion messages typical for body positivity and neutrality contents in combination with different types of visuals (photographs of female bodies, illustrations of female bodies, body-neutral images) on female body appreciation and self-objectification. Since continuous Instagram use suggests repeated exposure to body-related contents, we are currently conducting a preregistered and ethically approved longitudinal online experiment (three days, three points of stimuli exposure, pre and post measurement of body appreciation and self-objectification). Preliminary analyses (mixed MANOVA, mixed ANOVA, further analyses) based on the current sample (n = 120, M = 24.1 years, high education) suggest that body appreciation has increased over time for participants who saw the self-compassion messages in combination with photographs (group 1) and illustrations of female bodies (group 2), but not for those in the control group (self-compassion messages combined with body-neutral images). No such effect was found for self-objectification.

While data collection for the second study is still ongoing, our findings so far underline the need for repeated exposures in experiments on effects of social media content, as well the critical impact of visuals on body image. More specifically, results of the second experiment indicate that repeated exposure to self-compassion messages, whether body positive or body neutral, can indeed enhance recipients' body appreciation—but only in combination with body-related imagery. However, it currently remains unclear if this goes hand in hand with detrimental effects regarding self-objectification. We hope to gather more insights into the complex interplay between social media contents, body appreciation, and self-objectification when we have reached the full sample size (N = 249 according to a g*power analysis).

(work in progress)

HCO01 (Effects of) Representations of Health, Illness, and the Body

PP 0057 The effects of masculine norms on the persuasiveness of humorous and neutral mental health messages for young men

David Tominski[1], Annemarie Wiedicke[1], Veronika Karnowski[1]

[1] TU Chemnitz, Institute of Media Research, Chemnitz, Germany

In Germany, depressive symptoms have increased substantially among young adult men in recent years, with 15.5% of men aged 18–29 affected, making them the most vulnerable male age group for potentially developing mental disorders. Moreover, traditional masculine norms have been identified as key factors in men's perception of barriers to the disclosure of mental distress, i.e., openly communicating emotional struggles, which is considered a positive coping mechanism for improving mental health. Promoting the disclosure of mental distress in young men, with the aim of breaking through these masculinized barriers, is therefore important; however, this can be difficult, as male audiences have been found to be particularly challenging to effectively address through health communication. Research indicates that utilizing targeted humor appeals may be particularly effective in addressing individuals with high masculine-norm conformity compared to neutral

appeals, yet empirical work on the persuasive effects of these message appeals in the context of young men's mental health remains scarce.

Guided by the Elaboration Likelihood Model, this study seeks to answer (RQ) how conformity to traditional masculine norms shapes young men's attitude formation toward mental distress disclosure following exposure to neutral versus humorous health messages. Specifically moderation of conformity to masculine norms on the relationship between health message appeals and psychological reactance is explored.

Methodologically, a randomized online experiment with a two-group pretest–posttest design was conducted via the platform SoSci Survey. Participants were men aged 18–35 who used social media at least weekly. In both conditions, participants viewed simulated Instagram feeds containing ten posts, including three about mental distress and seven filler posts. In condition one, the posts about mental distress displayed neutral visual appeals (stock images of young men), while in condition two the posts displayed humorous appeals (memes). Measurements included willingness to disclose distress, psychological reactance, elaboration and conformity to masculine norms. The study received ethical approval and was pre-registered before data collection commenced. An a priori power analysis was conducted prior to the start of the study which indicated a required sample size of $N = 278$. Data was collected from July to December 2025. After the exclusion of invalid cases, the final sample consisted of $N = 368$.

Results showed that, in line with previous research, conformity to traditional masculine norms significantly predicted higher psychological reactance toward health messages ($b = 0.60$, $p < .001$). Moreover, moderation analyses revealed a significant interaction between perceived humor and masculinity on elaboration ($b = 0.15$, $p = .021$). While perceived humor was generally positively correlated with elaboration, this interaction indicates that the positive association between perceived humor and elaboration was stronger at higher levels of masculinity.

Overall, the study contributes to a better understanding of how traditional masculine norms shape the persuasive effects of mental health communication among young men. The findings highlight the function of masculinized norms in complicating effective health communication towards this group. Results further suggest that well-matched humorous appeals may be particularly suited for addressing young men with high conformity to masculine norms to enhance their elaboration on mental health information.

HCO02 Actors and Users of Platformed Health Communication

PP 0162 'You are talking about something that a lot of us are feeling right now': Unity of emotional experiences and authenticity contract between audiences and non-expert YouTubers presenting mental well-being content

Anna Barańska-Szmitko[1]

[1] University of Lodz, Department of Journalism and Social Communication, Łódź, Poland

Introduction

The problem of mental health and mental well-being has been increasing for the last few years (American Psychological Association, 2022; World Health Organization, 2022, 2025a, 2025b). Considering the global mental health crisis, the lack of sufficient support (World Health Organization, 2022, 2025b), and the increased use of YouTube as a source of information (Lam et al., 2017; Langford & Loeb, 2019; Harris et al., 2021; Oliphant, 2013), the authenticity of influencers takes on particular significance. YouTube viewers prefer to watch videos that do not appear very professional and contain personal narratives (Oliphant, 2013; Harris et al., 2021). In the digital economy and brand culture (Banet-Weiser, 2012), authenticity and self-commodification have become inherent and necessary attributes of personalized self-branding (e. g. Berryman & Kavka, 2018; Cunningham & Craig, 2017; Hund, 2023; Khamis et al., 2017; Marwick & Boyd, 2011; Raun, 2018). Therefore, the aim of this research was to examine the authenticity of non-expert YouTubers presenting mental well-being content (how is performed and how is received by the followers).

Theoretical framework

The theoretical perspective of mediated authenticity by Gun Enli (2015) is adopted. According to Enli theory mediated communication is treated as a representation of reality and this *authenticity illusion* is possible thanks to the symbolic *authenticity contract* between the main stakeholders (producers, audience, regulatory authority). Regarding social media, these two crucial assumptions concern the pivotal role of the **audience** (Enli, 2015, p.91), which constantly ***negotiates the authenticity contract*** (Enli, 2015, p. 107) and contributes to defining the features of ***performed authenticity*** (Enli 2015, p. 111).

Method

Two popular YouTube influencers, who present mental well-being content, were chosen (Nathaniel Drew and Lana Blakely). The Enli proposition was pinpointed, developed, and restructured by S. Luebke in the analytically useful model (Luebke, 2021). He indicated four dimensions of authenticity: ***consistency, intimacy, ordinariness, immediacy***. Through qualitative and quantitative content analysis of 30 videos of each of these YouTubers (total 60 videos), four dimensions of authenticity of influencers (consistency, intimacy, ordinariness, immediacy) were characterized and compared with the result of the

thematic analysis of the viewers' comments (30 most popular comments below each videos: 30 comments x 30 videos x 2 YouTubers = 1800 comments)

Results

The key finding is that *intimacy*- a substantial feature of YouTubers' authenticity- is not established by describing experiences per se but by creating unity of experiences with their audiences through stories reflecting their followers' mental states. *Ordinariness* becomes less considerable, *immediacy* has the most minor significance. The viewers in the comments below the videos expand on the topics of the videos, express gratefulness, or reveal their experience of parasocial interaction. The examined channels appear to have a therapeutic effect. The audience's expectations of sharing similar emotional experiences are an inherent element of the construction of authenticity negotiation. Thus, the relevance of unity of emotional experiences indicates a new facet of authenticity negotiation in the social media environment. The research contributes to the knowledge about mental well-being-related content on YouTube in times of global mental health crisis.

HCO02 Actors and Users of Platformed Health Communication

PP 0163 Rethinking "health creators". Values and economies of creating first-person accounts of hereditary cancer on social media

Stefania Vicari[1], Hannah Ditchfield[1], Yumeng Guo[1]

[1] The University of Sheffield, Sociological Studies- Politics and International Relations, Sheffield, United Kingdom

"Health creator" is now a common term across academic work (e.g., Avella, 2024) and public parlance. However, as a label, it directs our attention away from matters of *ill* health (e.g., of suffering, treatment), despite the number of users relying on social media to share first-person accounts of illness (e.g., on cancer, see Hodson J., O'Meara, 2023). As a concept, it remains underdeveloped – despite the growing body of research on creator cultures and platform economies of attention and visibility (e.g., Cunningham & Craig, 2021; Florida, 2022) and policy work on the influence of social media communication on lay understandings of health and medicine (e.g., Baker, 2025; Rubinelli, 2025; WHO, 2025).

To address this gap, we focus on hereditary cancer communication. Existing scholarship evidences the role of social media for carriers of hereditary cancer syndromes (Allen et al. 2020; Wellman et al. 2023; Authors, 2025) but overlooks how those sharing first-person accounts of these conditions, as *content creators*, are both exposed to and mobilise platform economies. We ask: How do hereditary cancer creators understand and mobilise values on social media?

We recruited 60 hereditary cancer creators via a preexisting social media dataset, our project social media, Facebook support groups and the newsletter of FORCE advocacy organisation. Interviews took place online between May 2024-February 2025, involving creators across mainstream platforms from five countries. We used prompts to solicit responses related to privacy, moderation and algorithms because of their relevance to platform economies and lived experiences of illness (privacy), gendered expectations and regimes of shame (moderation), and visibility (algorithms, moderation). We analysed data via inductive and deductive coding, with the latter drawing from work on platform imaginaries (Van Es & Poell, 2020) and cancer communication via legacy (e.g., Hawkins, 1999; Lorde, 2020[1980]; Sontag, 1991[1978]) and social media (e.g., Myrick et al., 2016; Pluta & Siuda, 2024; Stage et al., 2020).

Our findings point to three values central to the platform economy mobilised by these creators: of tailored community, controlled truth and modulated visibility. 1) These creators feel responsible towards adapting their content to circles of peers in specific online spaces. This resonates with "curating hope" for self and others (Hodson & O'Meara, 2023) but also discloses entanglements between lived experience of illness and situated knowledge of cultures and values of specific online spaces and communities. 2) Creators of visual content are committed to delivering "authentic" experience and downscaling "toxic positivity", those creating text-based posts focus more on correcting mis/disinformation, while all work towards countering hostile platform moderation (e.g., on nudity). 3) These creators are aware of the potential backlash of exposing personal content that is traditionally understood as private (e.g., pain), nonconventional (e.g., a flat female chest), or ugly (colorectal cancer) so they modulate their visibility based on expected harmful commentary.

Our findings evidence the importance of rethinking and expanding current understandings of "health creators" and further explore how those sharing first-person accounts of ill health develop- or redevelop- relationships and values within existing platforms economies.

HCO02 Actors and Users of Platformed Health Communication

PP 0164 Mere exposure effect of health-related social media content on perceived motivation

Sina Horner[1], Thomas N. Friemel[1], Michelle Möri[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Public debates frame social media as influential environments that make behaviour observable and thereby serving as an important source of motivational impulses and behavioural adoption (Livingstone et al., 2018; Orben, 2020). A substantial share of these social media content depicts everyday health behaviours such as physical activity, nutrition, and mental health. Adolescents, a key user group on these platforms, are still forming beliefs, values, and habits (van der Cruijsen et

al., 2023), raising the question of whether, and under which conditions, they perceive this content as motivating for their own behaviour.

Prior research shows that adolescents perceive health-related social media content (e.g. fitness posts) as motivating when it offers actionable advice, aligns with their own experiences or goals, and is reflectively engaged with (Easton et al., 2018; Frühauf et al., 2024). However, some health-related content primarily depicts behaviour rather than offering explicit guidance or calls to action. Through mere exposure effects (Zajonc, 1968), repeated content exposure may nevertheless increase familiarity, recognizability and desirability of practices. **RQ1** therefore tests the effect of exposure to health-related content on perceived motivation. Beyond that, perceived content-induced motivation is likely shaped by motivational dispositions such as willingness to self-improve, reflecting a general intention to engage with and act upon self-improvement cues (Zawadzka, 2014). Furthermore, social comparison orientation, the tendency to evaluate oneself in relation to others, may condition how strongly observed behaviour affects content-induced motivation (Pasko & Arigo, 2021). **RQ2** therefore asks: Does adolescents' willingness to self-improve and social comparison orientation moderate the association between exposure to health-related social media content and perceived motivational effects on health-related behaviours?

Based on cross-sectional data from 1,981 participants aged 14 to 21, recruited at schools, three health-related domains are compared: sports, nutrition, and mental health. Regression-based moderation analyses were conducted (PROCESS macro for R, v5.0, Model 2; Hayes, 2022). We control for perceived domain importance (sports, nutrition, and mental health), to account for baseline interest and intentions for self-improvement.

Across all domains, exposure to health-related content showed small but consistent positive main effects on perceived content-induced motivation (RQ1; sports: b = .10; nutrition: b = .06; mental health: b = .06). Willingness to self-improve showed stronger and equally robust effects across domains (b = .12–.18), whereas social comparison orientation showed no significant main effects in any model. Neither willingness to self-improve nor social comparison orientation influence the association between content exposure and perceived motivation (RQ2). Only in the nutrition domain a small moderating effect of willingness to self-improve was found to increase the effect of exposure on perceived motivation (b = .04, ΔR^2 = .003). Across all models, perceived importance of the respective life domain emerged as the strongest predictor (b = .25–.34).

Overall, these findings indicate that repeated exposure to health-related social media content is associated with increased perceived content-induced motivation while motivational dispositions play a negligible role in shaping this association. The presentation will discuss implications of these findings for future research and health prevention initiatives, particularly on social media.

HCO02 Actors and Users of Platformed Health Communication

PP 0165 Who tracks what, shares with whom, with what effects? Adolescents' digital health tracking

Michelle Möri[1], Thomas N. Friemel[1], Isa Vos[1]

[1] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

Introduction

The quantification of health through wearable technologies such as smartwatches, sleep trackers, and smart rings has become an integral part of how individuals monitor and engage with their health, particularly among younger populations embedded in digital ecosystems (Lupton, 2021). These technologies translate subjective health experiences into measurable data and, when connected to social media platforms, enable monitoring, comparison, and sharing of health-related information (Chung et al., 2017; Goodings et al., 2024).

Within the m-health paradigm, digital health tracking is understood not only as tools for data collection but as health communication and behavior change environments that integrate social engagement and self-management processes (Silva et al., 2015). Thereby, health tracking practices can be understood as forms of self-surveillance, where the visibility of personal health data regulates behavior and fosters social conformity. Self-tracking technologies normalize datafied bodies and position health discipline as both a moral and social responsibility, reflecting broader societal norms (Millington, 2016). From a theoretical perspective, adolescents' digital health tracking can be seen as a mediated practice in which health data are produced, transmitted, and interpreted according to social norms and expectations (Lasswell, 1948). Following this paradigm, we investigate who (RQ1), tracks what kind of health data (RQ2), and shares them on which channel (RQ3), with whom (RQ4), with what effect (RQ5)?

Method

Adolescents were recruited through schools, and completed a quantitative online survey in a school lesson. Thereby, 1'786 adolescents between 14 and 18 years old (M_{age} = 15.65, SD_{age} = 1.08; 49% male) were surveyed. Participants reported their use of digital health tracking tools, and whether and how they shared tracked data on social media or specialized platforms.

Findings

78% of adolescents reported tracking health data. Among the health-trackers, there were slightly more females (55%), which can be accounted to a widespread tracking of the menstrual cycle (RQ1). Among those who did engage in health tracking (N = 1,389; RQ2), physical activity was the most commonly tracked (60%), followed by sleep (34%), nutrition (27%), physiological indicators such as heart rate (21%), and emotional well-being (19%). Among females, 63% reported tracking their menstrual cycle. Among the health-trackers (RQ3), 23% share their health data on social media platforms (e.g., Instagram), and 24% share it on specialized platforms (e.g., Strava). Among those who share health data (*N* = 711; RQ4), posts were predominantly visible to small audiences (77%), and to people they personally knew (76%). Concerning the effects (RQ5), the majority (77%) reported receiving feedback on health-tracking posts that was similar in frequency and valence to feedback received on other posts.

Discussion

This study examined adolescent digital health tracking and sharing through Lasswell's formula (1948) and the m-Health paradigm (Silva et al., 2015). The findings show that the phenomenon of quantifying-self has become a widespread health behavior among adolescents. These findings highlight digital health tracking as a socially structured, communicatively mediated practice. Through the next data collection with the same participants (Jan/Feb 2026), long-term effects of health tracking on particular health behaviors will be examined.

HCO02 Actors and Users of Platformed Health Communication

PP 0166 Online narratives and institutional communication during the West Nile virus outbreak in Italy, summer 2025

Francesco Gesualdo[1], Virginia Casigliani[1], Veronica Bartolucci[1], Cesare Buquicchio[1], Diana Romersi[1], Caterina Rizzo[1]

[1] University of Pisa, Department of Translational Research and New Technologies in Medicine and Surgery, Pisa, Italy

Background

West Nile virus (WNV) is an endemic mosquito-borne infection in Italy, with recurrent summer outbreaks. In summer 2025, Italy experienced an increase in cases, accompanied by intense media coverage. In such contexts, institutional communication and online information ecosystems play a key role in shaping risk perception and adherence to preventive measures. This study aimed to identify communication gaps and derive practice-oriented recommendations for public health preparedness by analysing social media discussions and institutional social media communication on WNV in Italy during the peak of the 2025 outbreak.

Methods

We conducted a qualitative social media listening study covering 1 July-31 August 2025, within the Behavemod project (CUP I83C22001810007) and guided by the WHO-UNICEF Infodemic Insights Report framework. The study was designed to provide a rapid, practice-oriented understanding of the online information environment during an ongoing outbreak. Data were collected through Pulsar using a two-step keyword strategy to retrieve Italian-language content on arboviral diseases and specifically on WNV. Datasets of posts and news articles were exported for qualitative review; researchers documented recurring narratives, distorted or misleading claims, and user information needs. To include highly visual platforms, we applied an exploratory, content-centered sampling approach on TikTok and Instagram, starting from highly visible WNV-related videos and analysing associated posts and public comment threads. In parallel, we reviewed institutional social media communication at national (Ministry of Health and National Institute of Health), regional (Regione Lazio, Salute Lazio, and the President of the Region's public page), and municipal levels (Latina, Cisterna di Latina, Fondi, Priverno, and the Latina Local Health Authority), focusing on content, timing, engagement, and moderation practices. All data were publicly available and anonymised.

Results

Online discourse on WNV was largely informative and news-driven, focusing on surveillance updates, mosquito control interventions, and general preventive advice. Explicit conspiracy narratives were rare. More salient were critical and sceptical framings where users questioned the timing, coverage, and effectiveness of municipal disinfestation and expressed doubts about personal protective measures. Institutional communication showed a limited presence at national level, with most operational guidance effectively delegated to regional and municipal channels. In Lazio, a substantial share of communication flowed through political leadership pages rather than institutional profiles, with delays in explanatory messaging. At municipal level, communication centred on operational updates but varied in clarity, responsiveness, and moderation; where direct replies were provided, contention appeared more manageable. Across platforms, users requested practical, localised information, including street-level disinfestation details, symptom recognition, transmission routes, and the use of repellents in specific populations.

Conclusions

The 2025 WNV outbreak in Italy shows that a predominantly informative online environment may still expose vulnerabilities in institutional communication, particularly when operational messaging is fragmented across governance levels.

Based on the integrated analysis, the working group developed practice-oriented recommendations, including improving coordination across governance levels, preparing reusable and rapidly deployable communication materials, supporting local authorities through risk communication capacity building and moderation strategies, and systematically integrating social listening into outbreak preparedness. These measures may enhance timeliness, coherence, and public trust in the management of vector-borne disease outbreaks.

HCO03 AI, Datafication and the Future of Health Communication

PP 0494 Use and perceived (dis)advantages of AI tools for health issues

Thomas Friemel[1], Michelle Möri[2]

[1] University of Zurich, IKMZ, Zürich, Switzerland
[2] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

Relevance & Research Questions

Answering health related questions often relies on a combination of interpersonal communication (with health professional, friends and families) and online information seeking (Reifegerste et al. 2020). Today, this triadic setting of health professionals, lay persons and online sources is supplemented by AI tools. Warnings about systematic biases, misleading information, counterfactual content, and hallucinated evidence do not seem to limit the adoption of these tools. Against this background of rapid diffusion, the public debate about risks and opportunities as well as individual user experiences, this study investigates today's health-related AI use and its perceived advantages and disadvantages. It focuses on adolescents, since they are in a critical developmental stage regarding health behaviours (Aira et al. 2021) and are more likely to be among the early adopters and heavy users of digital innovations (Stefan 2024). Beside presenting a theoretical framework for the impact of AI tools on the health information ecosystem, the study empirically investigates the following research questions:

RQ1: How prevalent is the use of AI tools among adolescents for answering health-related questions?
RQ2: What are the health topics AI is used for by adolescents?
RQ3: What are adolescents' perceived advantages and disadvantages of AI use for health issues?

Methods

Adolescents were recruited through schools and completed a quantitative online survey in a school lesson. Thereby, 1'468 adolescents between 14 and 18 years old (M_{age} = 15.57, SD_{age} = 1.05; 54% male) were asked about their use of AI tools for health-related questions. Participants reported the frequency of AI use for health-related questions and specific health issues (days per week, less frequent, or never). Furthermore, approval to various statements on advantages and disadvantages was assessed (1 = "completely false"; 5 = "completely true").

Findings

RQ1: 76% of the study participants indicated using AI to answer questions regarding health issues. To put this into perspective: almost all adolescents use AI for school related tasks (96%) and speak with their parents about health issues (92%) while 75% speak with medical professionals. RQ2: Among AI health users, almost all use it for questions regarding gender/gender identity (97.2%) and sexuality (92.6%) while nutrition (36.0%) and sports/fitness (35.8%) are the least queried health topics, further topics will be discussed in the presentation. RQ3: Given this clear topical focus on rather intimate topics, it may come with some surprise that the most important advantage of AI use is its availability at any time (M = 4.3; SD = 0.94) while the possibility to be more open with AI than with other conversational partners is of minor importance (M = 3.2; SD = 1.34). Perceived disadvantages of AI are that it does not know one's medical history (M = 3.9; SD = 1.26) and reservations regarding data protection (M = 3.8; SD = 1.23). Concerns about receiving incorrect information are rather limited (M = 3.1; SD = 1.01).

Discussion

The empirical findings demonstrate the importance to investigate health related AI use by adolescents with dedicated projects including topics that are important for their developmental stage. The perceived (dis)advantages by adolescents underline the importance of health and AI literacy to support its critical use within the context of additional sources.

HCO03 AI, Datafication and the Future of Health Communication

PP 0495 Defining trust in AI-generated health information: A systematic literature search and conceptual synthesis

Anne Reinhardt[1], Anabel Wächter[1]

[1] LMU Munich, Department of Media and Communication, Munich, Germany

Generative AI systems (e.g., ChatGPT) are rapidly becoming routine information sources, including in health contexts. In this domain, trust is pivotal because it governs whether users rely on and act upon health information (Lu et al., 2018). At the same time, calibrating trust is uniquely challenging for AI-generated health information (AI-HI): generative systems may

produce convincing but incorrect or biased content, undermining informational reliability (Kordzadeh & Ghasemaghaei, 2022). Despite these risks, emerging evidence suggests that public trust in AI-HI in Europe is already moderate (**blinded).

While research is beginning to empirically tackle trust in AI-HI, its conceptualization remains unclear. Relevant insights are dispersed across two adjacent but largely separate research strands: (a) trust in online health information (OHI) and (b) trust in generative AI. Importantly, these strands often approach trust with different emphases and targets. OHI research frequently foregrounds credibility judgments and usefulness perceptions (Johnson et al., 2015), whereas AI trust research more often focuses on system properties such as opacity, explainability, and predictability (Rheu et al., 2021). Without systematically integrating these perspectives, health communication research risks relying on incompatible definitions and measures of trust in AI-HI.

To address this gap, we conduct a systematic two-strand literature search paired with a conceptual synthesis. On November 2nd 2025, we searched *Communication & Mass Media Complete*, *PubMed*, and the *ACM Digital Library* for peer-reviewed articles published since 2010, using two predefined strategies: (1) an OHI-focused search (title: trust* OR trustworth* OR credib*; abstract: "online health information" OR "digital health information" OR "internet health information" OR "eHealth"); and (2) a generative-AI-focused search (title: trust* OR trustworth* OR credib*; abstract: "artificial intelligence" OR "AI systems" OR chatbot* OR "conversational agent*" OR "large language model*" OR "generative AI").

The combined search yielded 181 records; after deduplication and other reasons (paper was not published yet), 179 remained (N_{OHI} = 30; N_{AI} = 149). During title/abstract screening, two coders assessed whether user trust and/or system trustworthiness constituted a central focus; approximately 50% of records were excluded at this stage, resulting in 90 papers for full-text eligibility assessment (N_{OHI} = 22; N_{AI} = 68).

Full-text screening will commence in January 2026, followed by structured data extraction (e.g., construct definitions, operationalizations, and antecedents/cues) and a conceptual synthesis integrating both strands. The synthesis will deliver (1) a domain-sensitive working definition of trust in AI-HI, (2) an integrative framework separating trust (behavioral willingness to rely) from trustworthiness (system/output properties), and (3) a set of core dimensions and cues to inform scale development and future health communication research on trust in the AI era. The review process will be completed in early summer 2026, enabling presentation of finalized results at ECREA 2026.

HCO03 AI, Datafication and the Future of Health Communication

PP 0496 Beyond the algorithm: Public perceptions of AI use in healthcare decision-making

Leonie Westerbeek[1], Ernesto de León Williams[1], Julia van Weert[1]

[1] University of Amsterdam, Amsterdam School of Communication Research/ASCoR, Amsterdam, Netherlands

Introduction

Artificial intelligence (AI) is increasingly integrated into healthcare to support diagnostics, decision-making, and administrative processes, offering potential gains in efficiency, accuracy, and health communication. However, the successful implementation of AI depends not only on technical performance but also on public perceptions of its helpfulness, riskiness, and fairness. These perceptions shape whether AI is viewed as beneficial and equitable or as error-prone and lacking human oversight, and are therefore critical for guiding responsible integration. Understanding these views can help to develop communication strategies that emphasize AI's supportive role while addressing public concerns. This study examines public perceptions of automated decision-making (ADM) in healthcare and investigates how these perceptions relate to potential contextual factors, based on literature, by using structural equation modeling.

Methods

Data were drawn from the first wave of an ongoing six-wave longitudinal survey panel. The final analytic sample consisted of 3,915 respondents (mean age 52.1 years; 52.1% female). Structural equation modelling (SEM) was conducted in AMOS 29. Perceptions of ADM in healthcare as *helpful*, *risky*, and *fair* (1 item) served as endogenous variables, while the contextual factors AI literacy (5 items), familiarity with different forms of AI (5 items), confidence in clinicians' ability to distinguish AI- from human-generated content (1 item), use of conversational agents for health information (1 item), and use of traditional digital health information sources (4 items) were included as exogenous variables (each measured on a 7-point Likert scale). Model fit was assessed using χ^2, RMSEA, and CFI, and improved based on modification indices. The final model demonstrated acceptable fit (RMSEA = .074; CFI = .911).

Results

Perceptions of ADM in healthcare varied systematically with AI-related experience and information practices. Perceived *helpfulness* of ADM was positively associated with familiarity with different forms of AI and confidence that clinicians can distinguish AI-generated from human-generated content, and-to a lower extend- AI literacy and use of conversational agents for health information. Perceived *riskiness* showed a more nuanced pattern: use of conversational agents was associated with lower perceived risk, whereas greater familiarity with AI and greater reliance on traditional health information sources were associated with higher perceived risk. Perceptions of ADM as *fair* were most strongly predicted by confidence in clinicians' ability to differentiate AI- versus human-generated content, with additional small positive associations for AI familiarity, AI

literacy, and use of conversational agents. Overall, familiarity with AI and trust in clinicians' oversight emerged as key factors shaping public evaluations of ADM in healthcare.

Discussion

Public perceptions of ADM in healthcare are shaped by technological familiarity, use of conversational agents, and confidence in human oversight. ADM is more likely to be perceived as helpful and fair among individuals with greater familiarity with AI, higher AI literacy, and, most importantly, confidence in clinicians' ability to critically interpret and manage algorithmic outputs. At the same time, increased familiarity with AI may heighten awareness of potential risks. Overall, perceptions of ADM's helpfulness and fairness depend more on trust in healthcare professionals and clear communication about AI's role than on trust in the technology itself.

HCO03 AI, Datafication and the Future of Health Communication

PP 0497 When first-person deepfakes threaten health agency: Health self-efficacy and resistance-oriented processing of AI-generated narratives

Jiyoung Lee[1], S. Mo Jones-Jang[2]

[1] Sungkyunkwan University, Media and Communication, Seoul, Republic of Korea
[2] Boston College, Communication, Chestnut Hill, USA

As deepfakes are increasingly adopted in health communication to enhance personalization and relevance (Clarke et al., 2023; Lee et al., 2025), they are often assumed to foster engagement and persuasion. Prior research on narrative perspective suggests that first-person framing increases self-relevance and immersion (e.g., Nan et al., 2017; Ratan & Dawson, 2016). In the context of deepfakes, however, first-person perspective carries added significance because it does not merely frame messages as personally relevant but presents them as if originating from the self. By allowing synthetic media to speak from the viewer's apparent standpoint, first-person deepfakes may blur the distinction between personal health judgments and externally provided guidance, raising concerns about perceived agency and control. Yet little is known about when such first-person deepfake messages elicit resistance.

Drawing on social cognitive theory (Bandura, 1997) and psychological reactance theory (Dillard & Shen, 2005), this study examines how first-person deepfake health narratives shape affective and cognitive responses as a function of individuals' health-related self-efficacy. Health-related self-efficacy reflects the perceived ability to understand and regulate health-related decisions (Bandura, 1997). From this perspective, self-efficacy functions as a psychological resource that supports individuals' sense of agency over health-related decision-making. Individuals with higher health self-efficacy are therefore more likely to view health-related judgment as a domain of personal control. When health deepfakes adopt a first-person voice, they are more likely to be experienced as speaking *from* the self rather than merely *about* the self, thereby repositioning the apparent source of judgment from an external advisor to the self. For individuals with higher health self-efficacy, this source ambiguity is more likely to be experienced as an intrusion into personal health agency, triggering resistance-oriented responses.

To address this issue, we conducted a laboratory experiment (N = 210) using a mixed design in which participants viewed two AI-generated deepfake health narratives presented in first-person and third-person perspectives, with presentation order randomized. Health-related self-efficacy was measured at pretest and examined as a moderator. After each exposure, participants reported affective resistance, uncanny valley responses, and psychological distance to capture resistance-oriented reactions. Results showed that first-person deepfakes elicited greater affective resistance than third-person messages. Crucially, this effect was moderated by health-related self-efficacy: participants with higher self-efficacy experienced stronger resistance and greater psychological distancing when exposed to first-person deepfakes, indicating heightened sensitivity to perceived intrusion into personal health agency. These responses were also characterized by stronger uncanny reactions, further supporting a resistance-oriented pattern of processing.

By integrating social cognitive theory with psychological reactance theory, this study incorporates perspective-taking into research on synthetic media to examine resistance-oriented processing in AI-mediated health communication. The findings demonstrate that first-person personalization in deepfakes does not uniformly empower users and may instead undermine perceived agency, particularly among individuals with high health self-efficacy. Practically, the results caution against the uncritical use of first-person framing in AI-generated health messages and highlight the importance of aligning AI design with users' expectations of agency and autonomy.

HCO03 AI, Datafication and the Future of Health Communication

PP 0498 Digital health in practice: A multi-stakeholder survey on organisational roles and responsibilities

Elisabeth Gerling[1], Juliana Raupp[1]

[1] Media and Communication, Organisational Communication, Berlin, Germany

Digital health technologies increasingly rely on forms of collaborative responsibility that cut across patients, healthcare professionals, organisations, and policy actors. In the field of mobile health (mHealth)–based self-management, communicative processes within and between organisations play a central role in shaping how responsibilities are distributed,

legitimised, and coordinated. Yet despite the growing relevance of organisational and networked health communication in times of technological and institutional change, empirical research continues to privilege individual-level effects, leaving cross-sectoral organisational perspectives under-theorised and rarely compared.

Addressing this gap, this study examines how organisational actors across societal sectors interpret their roles, responsibilities, and communicative practices in the context of digital health technologies that promote patient self-management. Drawing on preliminary results from an ongoing cross-sector survey (N = 230) of governmental bodies, health insurers, private businesses, research institutions, interest groups, and civil society organisations in Germany, the analysis investigates perceived responsibilities, value judgements, organisational impacts, readiness for engagement, and positioning within interorganisational networks. The study adopts a health communication perspective that foregrounds normative expectations, trust, and coordination across organisational boundaries in digital contexts.

First results reveal pronounced sectoral differences in responsibility attributions. While some civil society and non-governmental actors acknowledge shared responsibility, the strongest responsibility for mHealth success is attributed to individual users themselves (mean rank = 2.44), followed by healthcare professionals (3.00) and health insurers (3.01). In contrast, governmental actors (4.12), developers and pharmaceutical companies (4.68), research institutions (5.18), and NGOs (5.82) are perceived as comparatively less responsible. This pattern points to a communicative individualisation of responsibility, in which accountability for digital health outcomes is shifted towards patients and frontline professionals, while formal organisational and policy actors remain weakly positioned.

These findings highlight potential gaps in cross-sectoral coordination, normative alignment, and collaborative governance in digital health. The findings suggest that efforts to strengthen collaborative responsibility may be particularly important in bridging the divide between individual and organisational roles, ensuring that digital health technologies achieve their intended impact across societal contexts.

HCO04 Health Information Behaviors and Informational Inequality

PP 0606 Online health activities remain socially and economically stratified: Evidence from the German Microcensus

Marko Bachl[1], Elena Link[2]

[1] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany
[2] Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

Online health information-seeking behaviors (HISB) are essential for modern health communication (https://doi.org/10/gm7v23). Digital services are promising for enhancing interactions with the healthcare system (https://doi.org/10.2196/44024). While earlier work found digital divides even within affluent societies (https://doi.org/10/g5qmt4), demographic and socioeconomic factors became less predictive in more recent studies (https://doi.org/10/gtg7gv; https://doi.org/10/gqx5tf). The conceptual relevance of sociodemographic factors within theoretical frameworks of HISB remains debated (https://doi.org/10/dg36th). Recent studies have relied on online surveys and self-selected participant pools. Evidence on the general population of Internet users from high-quality samples remains sparse. In response, we answer the research questions:

RQ1: How prevalent is online HISB and online booking of medical appointments among Internet users in Germany?
RQ2: How do the prevalences differ by demographic and socioeconomic factors?

Methods

The *Survey on Information and Communication Technologies (ICT) Usage in Households and by Individuals* is part of the German Microcensus 2022. The population comprises all persons in Germany who have the right of residence. A 1% sample is randomly selected from official registries. The ICT survey is administered to a random 4% subsample of participants aged 16–75 years who have used the Internet in the last three months. Participants reported whether they used the Internet during this period for 1) online HISB and 2) making medical appointments, in addition to various sociodemographic characteristics included in the Microcensus: https://www.gesis.org/en/missy.

We analyzed the scientific use file released in 2025. First, we predicted the health-related online behaviors by each factor alone to estimate bivariate relationships and prevalences within the subpopulations. Second, we included all predictors to estimate the unique contribution of each factor.

Results

41.3% (95% CI [40.3, 42.3]) of the population engaged in online HISB. 21.1 % (95% CI [20.3, 21.9]) booked a medical appointment online. We found small but meaningful associations with sociodemographic characteristics. *Education* explained 2.6% and 3.5% of variance, with substantial unique contributions. Higher education was associated with higher prevalences. Consistent with the literature, we found differences by *age* (lower prevalence in older groups, with the exception of 16–20-year-olds), *gender* (higher prevalence among women), *migration background* (lower prevalence), and *income* (higher prevalence in higher-income groups). Further household-related factors, such as *household size* and the *presence of children*, were not important. The results for *health problems* indicated suppression effects. Individuals

with health problems would be even more likely to use the Internet for health-related purposes, but their problems prevent them from realizing this potential.

We provided valuable reference data on the prevalence of online behaviors central to the field of health communication. The results will be discussed in the context of stratified health-related Internet use and its implications for health disparities.

HCO04 Health Information Behaviors and Informational Inequality

PP 0607 Person and situation profiles of health information behaviors and their emotional consequences: Applying multilevel latent class analyses

Elena Link[1]

[1] Johannes Gutenberg-Universität Mainz, Department of Communication, Mainz, Germany

Introduction

Throughout the patient journey, individuals engage in various information behaviors to build adequate understanding, manage uncertainty, and navigate emotional burden (Brashers, 2001). While prior research has provided rich descriptions of seeking, scanning, and avoidance in isolation, today's high-choice information environment requires considering complex patterns of information management. Therefore, this study is guided by the information repertoire approach, which captures the ways in which information behaviors are combined (Hasebrink & Popp, 2006). Supplementing repertoire studies that focus primarily on person-level types of source combinations (e.g., Fisse et al., 2024), the current study integrates strategies, sources, and issues and acknowledges that information behaviors vary across individuals and situations. Accordingly, the study examines situation- and person-level profiles (RQ1a/b) characterizing information repertoires.

Information repertoires also provide explanatory power for health outcomes. The relevance of emotion regulation for navigating health challenges (Savolainen, 2015) justifies examining how information repertoires relate to shifts in discrete emotions. Based on distinct appraisal patterns of emotions as outlined in cognitive appraisal theories (Lazarus, 1991), this study examines shifts in anxiety, worry, anger, and hope. Thus, RQ2a-d asks how the identified repertoires can be characterized by changes in anxiety, worry, anger and hope.

Methods

Data were collected using an experience sampling method (ESM) combined with pre- and post-questionnaires. The sample (N = 504 individuals, N = 17,674 experience sampling forms (ESF)) consists of individuals who reported currently experiencing acute or chronic health challenges recruited via a German commercial online access panel. The ESM captured 3 random episodes of health information behaviors per day over a period of 14 days. In each ESF, a multi-choice item assessed which strategies occurred since the previous ESF. If a strategy occurred, further questions addressed sources and issues. The pre- and post-survey were conducted immediately before/after the ESM phase. In both studies, the discrete emotions were captured by established three-item measures of high internal consistency.

For answering RQ1, multilevel latent class analysis (MLCA) was performed to identify classes at both the situation- and person-level. For RQ2a-d, a mixed ANOVA was computed to test the significant interactions between time (pre-/post-survey) and information repertoires on changes in emotions.

Results and Discussion

The MLCA yielded a six-class solution at both the situation- and person-levels. Situational profiles were dominated by a single strategy. Seeking-related profiles varied along the patient journey, ranging from "active symptom checking", "disease-specific verification" to "therapy-oriented information seeking". Scanning-based profiles covered "symptom monitoring" and "monitoring of disease progression, treatments, and healthcare". Avoidance occurred in relation to symptoms, disease-specific, and general health information.

At the person level, content-related orientations structured information repertoires. Seeking- and scanning-related situations referring to similar issues were particularly likely to co-occur, as reflected in the profiles of "symptom checkers", "disease monitors", and "healthcare-engaged individuals". The mixed ANOVA (RQ2a-d) revealed no significant interaction effects, indicating that changes in emotional experiences over time did not differ by repertoire type.

Overall, the findings highlight the situational variability and multidimensionality of information behaviors and underscore the value of repertoire-based, context-sensitive approaches in health communication research.

HCO04 Health Information Behaviors and Informational Inequality

PP 0608 How health literacy influences health outcomes through information processing: A cross-sectional study of heart failure patients

Selina A. Beckmann[1], Paula Memenga[2], Elena Link[1]

[1] Johannes Gutenberg-University Mainz, Department of Communication, Mainz, Germany
[2] Hanover University of Music- Drama and Media, Department of Journalism and Communication Research, Hanover, Germany

Background

Effective self-management, like physical activity or medication adherence, is central for patients with heart failure (e.g. Chen et al., 2017). To support these behaviors depends on whether the patients acquire and how they process health information on their disease (e.g. Kontos & Viswanath, 2011). Guided by the Integrative Model of eHealth Use (IMeHU) (Bodie & Dutta, 2008), we aim to examine how different modes of information processing contribute to health outcomes. The model assumes that health literacy (HL) is positively related to the reception and processing of health-related information, which in turn affect various outcomes. Building on this, we assume that HL positively affects objective knowledge, subjective knowledge gain, perceived benefits, empowerment, autonomy, and planned behavior. Shedding light on certain modes of information processing, we further hypothesize that cognitive involvement, thematic interest, enjoyment, and ease of cognitive access mediate the aforementioned relationships. Based on Unimodel (Kruglanski & Thompson, 1999), we assume that these modes of processing can vary in intensity during information processing.

Method

We conducted an online survey with 208 German heart failure-patients (age: $M = 64.0$, $SD = 11.6$; 32.7 % female, education: 45.2 % high, 37.5 % medium, 16.8 % low), recruited via a German Online Access Panel. We assessed HL (Kolpatzik & Zok, 2017) prior to showing a video on physical activity in heart failure. Afterward, we measured patients' enjoyment, cognitive involvement, thematic interest, ease of cognitive access (Appel et al., 2002) and health-related outcomes (objective and subjective knowledge, perceived benefits, autonomy, empowerment, and planned behavior; Acuña Mora et al., 2018, Kahlor, 2010; Williams et al., 1996; Wu et al., 2020) using adapted established scales. Sociodemographics and selected pre-measures were included as covariates.

Results

The explained variance of the models ranged between 47.1% (empowerment) and 70.7% (perceived benefits). HL was significantly associated with perceived autonomy ($\beta = .26$, $p < .001$), empowerment ($\beta = .44$, $p < .001$), and planned behavior ($\beta = .31$, $p < .01$). Regarding the hypothesized mediation effects, the association with perceived autonomy was fully mediated by enjoyment ($ab = .048$, 95%-CI[.003, .112]) and thematic interest ($ab = .083$, 95%-CI[.015, .172]). The effect on empowerment was partially mediated by ease of cognitive access ($ab = .099$, 95%-CI[.023, .186]). Further, the effect on planned behavior was fully mediated by thematic interest ($ab = .125$, 95%-CI[.029, .241]). In addition, HL also indirectly affected perceived benefits via ease of cognitive access ($ab = .109$, 95% CI [.051, .178]). Cognitive involvement was not a mediator, and no effects were found for objective knowledge or subjective knowledge gain.

Discussion

The study revealed in line with the IMeHU that health literacy serves as a key antecedent of the processing of health information, facilitating thematic interest, enjoyment, and ease of cognitive access. The most relevant mechanisms were thematic interest and ease of cognitive access. Overall, the findings highlight the need for relevant, engaging, and cognitively accessible information.

HCO04 Health Information Behaviors and Informational Inequality

PP 0609 For many, but not for all. Vaccine information among hesitant or misinformed citizens in Italy

Letizia Materassi[1], Ester Macrì[1]

[1] University of Florence, Department of Political and Social Sciences, Florence, Italy

Introduction

This contribution explores the complexity of vaccine hesitancy, as a constellation of dynamic, opaque, and occasionally inconsistent attitudes, not a simple ideological opposition. The increasing centrality of immunization programs in several Countries has generated a highly polarized debate between adherent and hesitant people, in particular during and after Covid-19 pandemic, often creating contrasts and clashes between supporters and skeptics, shaping both public and scientific debate, as well as media representations.

The research and the RQs. The study is part of the TARAVH (Transdisciplinary Action Research Against Vaccine Hesitancy) project, led by sociologists of communication, social psychologists and physicians with an interdisciplinary and analytical approach. Although part of a wider research activity, in this contribution we would like to focus the attention on the relationship between vaccination behavior and health information attitudes among the population. How do people usually

inform about vaccination? Are they aware of their "vaccination biography"? Which are the perceived obstacles in their informative behaviors on health and, particularly, on vaccines?

Methodology and the sample. An integrated design is adopted, combining a systematic international literature review with a national sample survey. The review phase, conducted from April and June 2023 via the Scopus database, analyzed the state of the art in vaccine communication over the last decade, selecting 114 scientific articles published within sociological and multidisciplinary frameworks, in order to detect, the prevailing narrative frames, the definitions and the roles of "hesitancy" within these informative scenarios. Concurrently, in February 2025, empirical research was conducted on a representative sample of 1000 Italian citizens, with a mixed-method CATI-CAWI in order to maximize response rates and mitigate selection bias. The survey was structured with validated psychometric scales to measure awareness, hesitancy, and the perception of information sources.

The findings. The findings highlight a critical gap in the capacity for autonomous evaluation of health contents delivered outside of direct interactions with professionals, with specific difficulties in making decisions based on online research or media sources. A problematic landscape of "health literacy" emerges: nearly half of the respondents reported never having come into contact with informational materials regarding vaccination campaigns, signaling a fracture in the penetration of institutional messaging. Among those who did access such materials, 31.8% encountered terminological barriers and 27.2% found the texts difficult to understand, underscoring the persistence of inaccessible technical language. As the analysis shows, educational attainment is the most decisive variable in the perception of informational difficulties, with peak criticality recorded among those with only a primary school education. Furthermore, an association is observed between uncertainty regarding one's own vaccination status and high scores of perceived difficulty, suggesting that a lack of personal health memory is associated with greater fragility in navigating the preventive healthcare system. Overall, individuals with the greatest difficulty in managing health information are characterized by low educational levels, limited exposure to news or other informative contents about health related issues and low awareness of their vaccination status. In specific prevention areas, meaningful differences between males and females seem to emerge.

HCO04 Health Information Behaviors and Informational Inequality

PP 0610 Information marginalization and crisis communication: How underserved publics in the Netherlands navigate health information during a health crisis

David Blanco-Herrero[1], Adriana Solovei[2], Bas van den Putte[1], Toni G.L.A. van der Meer[1]

[1] University of Amsterdam, Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands
[2] Wageningen University, Department of Environmental Sciences, Wageningen, Netherlands

Health crises intensify the public's need for reliable and actionable information, what can further expose and deepen existing information inequalities. Therefore, effective health communication must ensure understandability and equitable access across diverse social groups, yet many individuals remain systematically limited in their ability to obtain, interpret, or trust vital health information. These dynamics were visible during the COVID-19 pandemic, when underserved groups faced heightened information needs, together with persistent barriers to accessing trustworthy content.

Despite the recognized importance of audience perspectives, crisis communication research has largely focused on institutional production and dissemination of messages rather than on the lived experiences of marginalized publics and their actual information practices and preferences. This study investigates how underserved groups who experience difficulties in accessing or making sense of public health information navigate communication during a health crisis. We define underserved groups as those affected by low institutional trust, low literacy, or low socioeconomic status, each corresponding to distinct barriers related to skepticism toward institutional messaging, comprehension, and access to communication channels.

To address this gap, the study adopts a publics-centered approach using a mixed-method design. Four focus groups (N = 32) with participants from underserved backgrounds explored experiences during the COVID-19 pandemic, preferred modes of receiving information, and perceived barriers to comprehension and access. Insights from these discussions informed the development of an accessible, in-person survey administered to 1,059 participants, each screened to belong to at least one target group. Questions addressed usage, trustworthiness, comprehensibility and accessibility of different sources, formats and channels during the pandemic.

The findings revealed a diversity of communication choices, although some specific patterns can be highlighted. Interpersonal and community-based communicators (such as family, friends, and local contacts) emerged as frequently used and trusted sources, while healthcare professionals and scientific experts were rated as most trustworthy overall. Notably, governmental institutions and mainstream news media were widely used despite comparatively lower trust.

In terms of format preferences, participants favored in-person conversations and short, visually guided explanations, pointing to the importance of clear and straightforward communication formats. Television and online news were the most commonly used channels.

These findings demonstrate that while mainstream communication remains central during health crises, closer interpersonal sources play a crucial intermediary role, something that aligns with previous literature on information intermediation. Thus,

future strategies to achieve effective and inclusive communication during a crisis should ensure that close interpersonal communication can be used to convey information from mainstream or expert sources in a reliable and comprehensible way to underserved groups. This does not only enhance trust, but also allows an interactive type of communication, in which follow-up questions can be answered, clarifying potential doubts or concerns in a safe and reliable manner.

In total, by foregrounding the perspectives of historically overlooked publics, this study contributes to health and crisis communication research and highlights how source, format, and channel preferences intersect with different dimensions of vulnerability.

HCO05 Health Communication in Clinical and Care Contexts

PP 0717 Empowered, but not necessary health literate? Examining patient types, the role of online health information seeking behaviour and aspects of doctor-patient interaction

Sara Atanasova[1]

[1] University of Ljubljana- Faculty of Social Sciences, Centre for Methodology and Informatics, Ljubljana, Slovenia

This study builds on prior research on the nonlinear relationship between individual empowerment and digital health literacy (Author, 2024). While high digital health literacy is often assumed to foster empowerment, limited research critically challenges this assumption (Schulz & Nakamoto, 2013; Palumbo, 2017; Schulz & Nakamoto, 2022). Evidence suggests that individuals may be empowered despite low digital health literacy, while higher literacy does not necessarily lead to empowerment. For example, some highly digital health-literate individuals may prefer a dependent role in decision-making (Gellerstedt et al., 2022). In addition, doctor–patient communication may fail to accommodate patients' needs for empowerment (Timmermans, 2020), while structural barriers such as limited service access may further constrain empowerment. The widespread availability of online health information, often of uneven quality (Battineni et al., 2020), also raises concerns about "bad health literacy," where misinformation fosters false sense of empowerment, i.e. dysfunctional empowerment, or even disempowerment (Schulz & Nakamoto, 2011; Petrič et al., 2017). A key framework is Schulz and Nakamoto's (2013) model, distinguishing four patient profiles based on levels of health literacy and empowerment: high-need patients, needlessly dependent patients, dangerous self-managers, and effective self-managers. Despite its theoretical value, empirical validation and investigation of these profiles remains limited.

Building on this model, the present study aims to empirically identify patient types based on digital health literacy and empowerment and examine their sociodemographic and health-related characteristics. Extending prior findings (Author, 2024), the study specifically investigates differences between patient types in terms of illness intrusiveness and chronic conditions (comparing individuals with intrusive chronic conditions to those in remission or without chronic illness), online health information-seeking behaviour, and perceptions of the doctor–patient relationship and patients' roles within it.

Data were collected with online survey administered via the Valicon online survey panel. The study used a quasi-representative quota sample of Slovenian adults aged 18–74 years (n = 1,713). The data will be analysed using cluster analysis to identify patient typologies. Bivariate analyses and multinomial regression will be conducted to examine differences among patient types in terms of sociodemographic characteristics, health-related factors, online health information seeking behaviour, and perceptions of doctor-patient interactions.

Preliminary findings indicate distinct patient types consistent with Schulz and Nakamoto's (2013) model. The analysis highlights illness intrusiveness as one of the key factors differentiating these groups. High-need and needlessly dependent patients are more likely to have a chronic condition, with high-need patients more frequently report recently diagnosed conditions with greater intrusiveness in their everyday life, contributing to their lower empowerment and digital health literacy. Patient groups also differ in their online health information-seeking behaviour, where the purpose for seeking online health information (lifestyle interests, curiosity vs. serious health issues) plays an important role. Dangerous self-managers exhibit tendencies toward dysfunctional empowerment, frequently misinterpreting online health information and exhibiting greater scepticism toward their doctors and prefer making health decisions independently, in contrast to other patient types.

The study's findings offer valuable insights for healthcare professionals by identifying distinct patient types and supporting the development of tailored, patient-centred interventions and refining communication strategies to better accommodate diverse patients' needs.

HCO05 Health Communication in Clinical and Care Contexts

PP 0718 Improving diabetes care pathways: From diagnosis to participation in health promotion activities for patients with type 2 diabetes on primary health care level in Slovenia

Tanja Kamin[1], sara atanasova[1], irena bolko[1]

[1] University of Ljubljana- Faculty of Social Sciences, Faculty of Social Sciences, Ljubljana, Slovenia

Health services across primary, secondary, and tertiary care are commonly organised through planned patient pathways that specify what care is delivered, by whom, when and where (Gualandi et al., 2021), including both clinical processes

and supporting activities such as scheduling, communication, and patient guidance (Kinsman et al., 2010; Vesinurm et al., 2024). Health communication is central to the uptake and effectiveness of preventive programmes (Schiavo, 2014), yet it is often insufficiently examined as an integral component of service delivery. Analysing how communication is embedded in pathways is therefore essential for understanding how policy intentions translate into patients' lived journeys through care (Ben. Tovim et al., 2008; Lam, 2018; Liu et al., 2024; Kim et al., 2024).

This study draws on data collected within the Joint Action on Cardiovascular Diseases and Diabetes (JACARDI). Within JACARDI, our work pursues two objectives: (1) to strengthen type 2 diabetes (T2D) care pathways, from diagnosis to participation in health promotion and education activities; and (2) to develop tailored communication interventions with specific focus on marginalised groups in Slovenia, including immigrant communities from former Yugoslavia and the Roma population. By examining how patients are directed into, and supported through preventive and educational services, the study contributes to efforts to build a more equitable and responsive primary health care system, with particular attention to those who face the greatest structural and individual barriers to health care.

We will present the design and preliminary findings of a qualitative study that examines divergences between the intended care pathways and the pathways as experienced in practice by health professionals. Data were collected through semi-structured interviews (n = 22) conducted in two pilot settings with general practitioners, nurses in primary health care teams, clinicians working in clinics for patients without a designated GP, and educators in health promotion centres.

Findings indicate multiple barriers affecting pathway implementation and patient engagement, grouped into seven categories: (1) fragmentation and variability in the patient pathway; (2) coordination gaps and weak feedback mechanisms; (3) inconsistent knowledge of protocols and services; (4) capacity constraints and compensatory coping practices; (5) uneven access to, and quality of patient information and educational materials, alongside a need for standardisation; (6) limited use of digital guidance and gaps in digital content; and (7) constraints of tailoring support to patients' needs (e.g. language, hearing, motivation) due to time and organisational limitations.

These insights inform ongoing work on pathway improvement and intervention development, and contribute to debates on how primary care resources and communication practices can be organised to better support equitable participation in prevention and health promotion among patients with T2D.

HCO05 Health Communication in Clinical and Care Contexts

PP 0719 The use of mobile media in the self-management of Asthma and COPD: A systematic review

Janine Brill[1], Annemarie Wiedicke[1], David Tominski[1], Veronika Karnowski[1]

[1] Chemnitz University of Technology, Chair of Media Communication, Chemnitz, Germany

Mobile health (mHealth) technologies have become increasingly relevant in supporting the self-management of chronic diseases such as asthma and chronic obstructive pulmonary disease (COPD). In Germany, approximately four million people are affected by asthma and COPD respectively. While the potential of mHealth for symptom tracking, medication adherence, and empowerment is widely acknowledged, empirical evidence regarding how patients with asthma and COPD actually use mobile technologies for chronic disease management remains fragmented. Against this background, this systematic review synthesises the current empirical research on mHealth use in the self-management of asthma and COPD (RQ1a) and investigates to what extent extant research accounts for the multiplicity of mobile devices involved (RQ1b).

Following PRISMA guidelines, a comprehensive search was conducted across several databases commonly used in medical, psychological, and communication research. Included were original empirical studies published in peer-reviewed journals between 2007 and 2025 in English. Moreover, studies had to target patients diagnosed with asthma or COPD as primary users of mHealth tools for self-management.

To ensure methodological transparency, we implemented a two-stage screening process combining automated and manual review procedures. After deduplication in Rayyan, records were imported into ASReview LAB for active learning-based screening. Articles classified as relevant were subsequently subjected to independent double screening in Rayyan by three reviewers. Discrepancies between reviewers were resolved by consensus. After excluding duplicates and grey literature, 6,671 records were screened, leading to a final sample of 202 studies included in the review

Data analysis is based on a codebook capturing general bibliographic details, study and sample characteristics, types and features of mHealth technologies, study design and data collection methods, operationalisations of mHealth use as well as detailed study results regarding mobile media use in the context of managing Asthma and COPD.

The coding process follows the principles of manual quantitative content analysis. After coder training, inter-coder reliability between two coders was assessed and found sufficient (Krippendorff's Alpha ≥ 0.7). Currently, we are in the process of data extraction, which will be followed by descriptive statistical analysis using R. After coding 15% of the sample, preliminary findings indicate that studies regularly declare conflicts of interest due to pharmaceutical sponsoring and mainly rely on observational data (such as app log-ins), often in an interventional context. On average, one or two mobile devices are assessed (M = 1.6, SD = 0.62), mostly specific apps. Both frequency as well as adherence are the most common measures of mHealth use, with documenting health data (such as oxygen saturation) and symptoms as the purpose most often focused on.

Our review will provide an integrative overview of empirical approaches to mHealth-supported self-management in chronic respiratory care. By examining both the range of mHealth practices and the consideration of multiple-device usage, the study aims to identify conceptual and methodological gaps in existing research and to inform future development and evaluation of mHealth strategies for people with asthma and COPD.

HCO05 Health Communication in Clinical and Care Contexts

PP 0720 From trust to compliance: How source type and uncertainty shape public health behaviour in a crisis

Sebastian Cole[1], Øyvind Ihlen[1], Rune Karlsen[1]

[1] University of Oslo, Media and Communication, Oslo, Norway

Trust has long been central to research on health communication (e.g., Cairns et al., 2013; Freimuth et al., 2014). Different attempts have been made to measure trust (Holroyd et al., 2021), reach vulnerable groups (Privor-Dumm & King, 2020), and highlight the importance of health literacy (Schuh et al., 2025). Calls have also been issued for institutions to provide high-quality health information that is "accessible, actionable, and trustworthy across different populations" (Ratzan et al., 2025, p. 234). While much of the trust research focuses on this aspect as the dependent variable, we argue that there is a need for more research on trust as a mediating variable for *compliance* with public health advice (Bargain & Aminjonov, 2020; Fox et al., 2025; Wollebæk et al., 2022).

Research has identified numerous factors influencing compliance, such as social pressure and prevailing norms (e.g., Cabrera-Álvarez et al., 2022; Shapiro et al., 2023). Public response can also be conditioned by other factors such as concerns about infection, living conditions, language, culture, work situation, and socioeconomic conditions (Norwegian Official Report, 2021). Trust in science and scientists is also considered a significant factor in the public's acceptance of health advice (Angelou et al., 2023; Breakwell & Jaspal, 2020). In this paper, we address *the relationship between trust, source type, and behavioral compliance under conditions of uncertainty and across national contexts.*

Health crises such as the COVID-19 pandemic are characterized by information overload, competing recommendations, and heightened uncertainty, requiring citizens to evaluate multiple sources to decide what to believe and how to act. Building on scholarship linking trust to compliance, this study examines how trust and perceived trustworthiness—conceptualized as competence, integrity, and benevolence (Mayer et al., 1995)—shape willingness to comply with public health recommendations when messages originate from different sources and communicate uncertainty in different ways.

Following calls for stronger considerations of culture and cross-national comparisons in crisis and risk communication (Kim, 2025), we report findings from a cross-national survey experiment (N = 4,500) conducted in Germany, Italy, and Romania, three countries that vary in institutional trust and political context. Participants were exposed to identical public health recommendations attributed to one of four sources—national public health authorities, personal physicians, independent epidemiologists, or religious leaders—and framed either with categorical certainty or with explicit acknowledgment of scientific uncertainty. Trust is measured both as pre-existing trust in the source and as message-induced perceptions of trustworthiness.

The study addresses three research questions: (1) how trust and trustworthiness of different sources influence compliance across national trust contexts; (2) how uncertainty acknowledgment affects compliance, and whether this effect depends on source type and contextual trust; and (3) how individual-level factors, including media use, education, and ideological orientation, interact with trust and uncertainty communication to shape compliance intentions.

By shifting focus from message resonance to behavioral outcomes, and from trust as an outcome to trust as a conditional mechanism linking source, uncertainty, and compliance, this study advances research on public health and crisis communication and offers comparative, experimentally grounded insights into when trust-based communication is most likely to succeed.

HCO05 Health Communication in Clinical and Care Contexts

PP 0721 Patterns of patient-generated health data in Value-Based Health-Care Frameworks

Lutz Peschke[1], Martin Ernst[2], Nicolo Ferriani[3], Rutger C. Neeleman[4], Franco Chiarugi[5], Laura Pinna[6], Jim Ingebretsen Carlson[7], Seldag Günes Peschke[8], Frans Folkvord[9], Rens van de Schoot[4]

[8] Ankara Yildirim Beyazit University, Faculty of Law, Ankara, Turkey
[9] PredictBy Research and Consulting, EU projects, Barcelona, Spain

Healthcare services and products are rapidly changing due to the development of new technologies, offering relevant solutions to improve patient outcomes. Patient-Generated Health Data and knowledge-sharing across the European Union (EU) have a great potential to make healthcare provision more effective and efficient by putting the patient at the centre of

the healthcare process. While such initiatives have been taken before, a uniting and overarching approach is still missing. Within the EU-funded [*Anonymized*] project, an evidence-based and actual framework to effectively leverage the added value of people-centred integrated healthcare solutions will be developed, using predominantly patient-reported outcome measures (PROMs), patient preference information (PPI), patient-reported experience measures (PREMs), and other Patient-Generated Health Data (PGHD) (Author 2 et al. 2024).

This paper will present concept patterns of PREMs and PPI, focusing on 11 different disease areas and reported in systematic reviews between 2019 and 2024. The research is motivated by the findings that the very most of the patient-generated health data are based on PROMs, while PREMs and PPI are underrepresented. Patient-reported experience measures (PREMs) are psychometrically validated tools used to capture patients' interactions with healthcare systems and the degree to which their needs are being met. Patient-reported experience measures are designed to determine whether patients have experienced specific care processes, rather than their overall satisfaction with the care received. Patient preference information (PPI) is a qualitative or quantitative assessment of the relative desirability or acceptability to patients of features that differ among alternative health states, health interventions, or health services (Russo et al., 2019).

The research is based on an umbrella review where 273 systematic reviews were qualitatively analysed. The data were gathered in four different steps: Four databases (PubMed, Embase.com, CINAHL, and Scopus - search date: 04-04-2024) were searched in the first step using a data limit of publication year 2014 onwards, focusing on literature reviews. With the help of the AI-based tool ASReview, 12,473 records were obtained. In the second step, the titles and abstracts of all records were screened within the so-called Screenathon Review Event (Author 3, 2024; Author 1, 2025). As a result, 4,286 on-topic papers were received, the full text of which was analysed according to the relevance for the project in the third step. The 273 papers obtained were coded in the last step according to the quality of patient-generated health data. It could be understood that less than 10% of the review papers deal with PREMs and PPIs. In the current stage of the research, all review papers dealing with PREMs and PPIs are qualitatively analysed regarding the concept patterns that describe their potential contribution to integrating patient experiences and preferences into healthcare decision-making. Initial results show that the inclusion of PREMs and PPIs in decision-making processes leads to increased patient engagement at an early stage, which improves the quality of value-based health care, especially since PREMs and PPIs take into account the aspect of patient perception and prevent a reduction to post-priori reporting.

HCO06 Qualitative Approaches to Technologies of Care

PN 78 Between care and control: The role of warm experts in digitally mediated ageing

Freja Morris[1]

[1] Lund University, Department of Communication, Lund, Sweden

This presentation critically examines the potentially ambivalent role of "warm experts" in the care of older adults in Sweden. Its main contribution is a critical re-evaluation of the assumption that warm experts necessarily act in older adults' best interests. Warm experts are understood here as non-professional helpers—typically family members, neighbours, or friends—who facilitate older adults' use of digital technologies and digital communication (cf. Bakardjieva, 2005). They are commonly contrasted with "cold experts", such as formal helpdesks, institutional ICT guidelines, and professional trainers. Previous research shows that many older adults depend on warm experts to navigate an increasingly digitalised health and social care system (cf. Hänninen et al., 2021). Critical scholarship has further demonstrated that this reliance is problematic in several respects: for older adults, it risks exacerbating inequalities in access to health and social care services and deepening digital exclusion; for warm experts, it entails performing unpaid tasks that would otherwise fall within the responsibility of healthcare providers, work that is often gendered and disproportionately carried by women (cf. Olsson & Viscovi, 2018)The arguments presented draw on interviews with health and social care professionals in the Swedish health and social care systems. It is argued that warm experts are typically framed as benevolent figures whose emotional proximity ensures trust and digital inclusion. Yet this discourse of warmth risks obscuring conflictual dynamics, uneven care responsibilities, and the possibility that relatives' interests may diverge from those of the older adults. The presentation asks about the ethical implications of a healthcare system that increasingly relies on 'warm experts' for digital facilitation and inclusion. Special attention is given to the impact of new digital technologies, particularly serveillance and monitoring devices, which extend the scope of warm experts' responsibilities and place them in a position as moral arbiters in balancing safety, privacy and autonomy. The presentation illuminates how welfare policies that implicitly rely on familial care labour raises questions about equity, responsibility, and safety within a digitally mediated eldercare. The analysis is theoretically grounded in care ethics and science and technology studies, conceptualising warm experts as relational care actors who mediate between digitally organised welfare systems and older adults' everyday lives. Drawing on feminist and STS care studies, the presentation treats warmth not as an inherently benevolent quality, but as a normative framework that allocates responsibility and moral authority within asymmetrical relationships (Mol, 2008; Mol et al., 2015; Puig de la Bellacasa, 2017). From a domestication perspective, warm experts are understood as translators of sociotechnical arrangements, whose interventions necessarily involve moral judgement and power. The introduction of digital surveillance and monitoring technologies further intensifies this role, positioning warm experts as delegated agents of governance who must balance institutional demands for safety and efficiency against older adults' privacy and autonomy.

HCO06 Qualitative Approaches to Technologies of Care

PN 79 (In)formal approaches to handling frequent use of anonymous mediated helplines

Matilde Nisbeth Brøgger[1], Carsten Stage[1], Trine Natasja Sindahl[1]

[1] Aarhus university, School of Communication and Culture, Aarhus, Denmark

Anonymous helpline services have developed into an increasingly important form of mediated support for people in vulnerable situations related to e.g. illness, suicidal thoughts, grief and mental health problems (Dadfar & Lester, 2021). Helplines began as a telephone-based form of interaction, but today often also include chat and SMS.As specific technologies of care, helplines are characterised by being free, anonymous, and easily accessible, which provides other possibilities of care than the ones within the traditional healthcare system. However, this very accessibility also creates new tensions in the form of frequent use, which is a well-known phenomenon – both among helpline practitioners and in the research literature (Middleton et al., 2016; Mishara et al., 2023; RådgivningsDanmark, 2019). Frequent use has been shown to have significant volume. A study of the Australian crisis line Lifeline (Pirkis et al., 2016) found that 3% of users accounted for 60% of the 735,000 answered calls. Frequent use is often problematised as a practice that blocks access for other users, challenges helpline staff's wellbeing at work, or ultimately fails to provide frequent users with the help they actually need (Kinzel & Nanson, 2000; MacKinnon, 1998; Sercombe et al., 2025). Existing research on frequent use interventions has primarily examined formal strategies aimed at limiting or restricting use (Mishara et al., 2023), often drawing on studies from a single helpline (Pirkis et al. 2016, Hall & Schlosar, 1995). Existing interventions include limiting the number and duration of calls allowed, assigning a specific counsellor or referring the frequent user to other care services. In this paper, we shift the focus to investigating how helplines approach frequent use across a broad spectrum of strategies- not only those designed to minimise use- drawing on data from ten different helplines. Furthermore, we broaden the focus to understanding how such interventions are negotiated,applied, and sometimes invented by responders "on the floor". The study investigates the complex (technological) care work required to support the very diverse group of frequent users while also caring for the responders who provide support. Methodologically, the study uses document analysis of internal documents about frequent use approaches, 21 interviews with helpline responders and observations of conversations and on-site interviews with responders. The paper demonstrates how frequent use is addressed through formal organisational strategies, and how these strategies are subsequently interpreted, renegotiated, and variably enacted by individual responders. Moreover, by illustrating how responders also invent and employ informal, ad hoc communicative practices to navigate frequent use and deliver mediated care, the paper extends the scholarly understanding of intervention practices targeting frequent use. Our findings reveal the considerable complexity involved in communicating and operationalising formal approaches to frequent use within helpline organisations, particularly as many of these rely on volunteer responders. The study underscores that developing formal approaches is not sufficient; it is equally essential to understand how such approaches are interpreted, negotiated, and produced in everyday practice.

HCO06 Qualitative Approaches to Technologies of Care

PN 80 Emoticons as communicative care work in digital therapy with adolescents

Anette Grønning[1]

[1] University of Southern Denmark, Department of Design Media and Educational Science, Odense, Denmark

Digital text-based interaction constitutes a distinctive communicative environment in which care is enacted through written language, temporal flexibility, and digital affordances (Grønning, 2021). In the context of digital mental health services, care is not only delivered through therapeutic content but also negotiated interactionally through ongoing practices of relational and communicative work. Drawing on conceptualizations of care as situated, relational, and inherently ambivalent (Fischer & Tronto, 1990; Bellacasa, 2017), this study examines how seemingly minor communicative resources, emoticons, function as part of the sociomaterial arrangements of technologically mediated care. The study addresses the research question: What communicative functions do emoticons serve in chat-based interactions between adolescents (aged 12–17) and their therapists? The empirical material consists of 18 chat-based therapeutic interactions from an internet-delivered cognitive behavioral therapy (ICBT) program for adolescents with anxiety disorders. The data were collected as part of the CoolMinds project at the Centre for Digital Psychiatry, Region of Southern Denmark, and include both planned and on-demand written therapist guidance delivered asynchronously via a secure digital platform. Methodologically, the study applies Computer-Mediated Discourse Analysis (CMDA) (Herring, 2007) to explore how emoticons operate as contextualization cues within professional care communication. Messages were manually coded using the functional framework developed by Skovholt, Grønning, and Kankaanranta (2014), focusing on emoticons as markers of positive stance, as strengtheners of expressive acts, and as softeners of directives. This qualitative approach foregrounds interactional detail rather than outcome measures, allowing insight into how care is practically accomplished and negotiated in text-based therapeutic encounters. While adolescents employ a limited set of conventional emojis, therapists draw on a wide repertoire to manage affect, structure communication, and maintain relational continuity. Two dominant patterns emerge. First, emoticons are used as presentational and administrative tools that frame interaction, signal availability, and sustain a supportive communicative climate. Second, emoticons function as hedges within care work: as strengtheners when offering encouragement and

affirmation, and as softeners when delivering challenges, instructions, or corrective guidance. Notably, emoticons are not used to mark humor or irony, underscoring the seriousness and ethical sensitivity of the therapeutic context. These findings highlight the ambivalent role of emoticons in digital care practices. On the one hand, they support relational closeness, emotional attunement, and continuity of care across distance; on the other hand, they raise questions about professionalism, interpretive responsibility, and the boundaries of therapeutic communication. By examining emoticons as integral to the communicative labor of care rather than as peripheral expressive devices, this study contributes to a qualitative understanding of how technologies of care reconfigure relational norms, professional roles, and ethical negotiations in digital mental health settings.

HCO06 Qualitative Approaches to Technologies of Care

PN 81 Sleep care: A qualitative inquiry into people's mediated sleep practices

Yukun You[1], Maja Klausen[1]

[1] University of Southern Denmark, Department of Design Media and Educational Science, Odense, Denmark

This paper presents preliminary findings from qualitative data collected in Denmark in 2026 as part of the ToSleep project (funded by The Carlsberg Foundation). Although sleep and media use is clearly an interdisciplinary topic, existing research has been dominated by health sciences, often focusing on smartphones, blue light exposure, or the frequency and duration of phone use and their effects on sleep (Exelmans & Bulck, 2019). This focus has left less room for understanding how individuals meaningfully integrate media and technologies into their nightly routines and how these practices relate to broader questions about care and ethics of care (Fischer & Tronto, 1990). As a contribution from the health humanities to the expanding field of sleep and health communication, ToSleep explores the mediation of sleep and sleep media's potentially decelerative and "rest-making" capacities and argues for qualitative and situated accounts of how people negotiate sleep in everyday life and how technologies participate in relations of sleep care. Sleep is inherently a matter of care: It is labour-intensive, embedded in lifeworlds, attuned to individual rhythms, and shaped by relational dependencies (Bellacasa, 2017). It is also sociotechnically mediated and ethically charged (Protasi, 2025), situated within political debates about rest, vulnerability, productivity, and the pressures of the 24/7 society (Crary, 2013). Combining post-digital theory (Fast & Syvertsen, 2024; Cramer, 2015), existential media studies (Lagerkvist 2022), and critical data studies (Markham, 2018; Pink et al., 2018; Ytre-Arne & Moe, 2020), the study examines the ambivalences arising as self-care and sleep are tied up with digital technologies. Sleep care technologies are not neutral solutions but contested arrangements, entangled in digital infrastructures that produce the very conditions of existence: On the one hand, they have decelerative capacities and can offer ecperiences of slow-down and disconnection. On the other they increase exposure, datafication and commodification of an intimate bodily practice, subtly reconfiguring how individuals inhabit their nights, their bodies, and their possibilities for rest. Our analysis approaches sleep as both a bodily and technological entanglement (Coveney et al., 2023), and as a form of existential media practice (Lagerkvist, 2022). We suggest that sleep media in our digital-material lifeworld act as "companions" with decelerative potential at the limit between wakefulness and sleep. Combining data from qualitative interviews, media-sleep diaries and speculative workshops with Danish citizens, 18+ of age (some of whom track their sleep using digital technologies) we analyse the enteanglements of media in nightly routines and rituals highlighting the ambivalent role of technology in comtemporary practices of sleep. More importantly, our study contributes to understanding sleep as a matter that requires collective forms of care, rather than mere individual optimization, and argues for the cultivation of a "critical sleep literacy". The analysis explores not only participants' mediated sleep practices but also their visions and imaginaires for a better sleep in the future and what role technologies can play in it.

HCO06 Qualitative Approaches to Technologies of Care

PN 82 Practising care elsewhere: Men, chronic illness, and technologies of care

Amanda Karlsson[1]

[1] Aarhus University, School of Communication and Culture, Aarhus, Denmark

Based on 17 individual in-depth interviews with men living with chronic illness, this paper explores how care and self-care (Fischer & Tronto, 1990; Bellacasa, 2017) are practised and communicated in ways and places beyond designated peer-driven health communities on social media. Research has shown that peer-driven communities on social media can serve as central sites for care, support, and knowledge exchange among individuals living with chronic illnesses (Kingod et al., 2017; McCosker, 2018; Tucker and Goodings, 2017). Thesespaces are often characterised by emotionally expressive, verbally articulated, and explicitly caring interactions. However, this dominant framing risks overlooking forms of care that do not centre illness talk or emotional disclosure and that may therefore remain less visible within existing understandings of peer support. Rather than centring illness narratives, the men in this study often engage in care through other forms of shared activities, both online and offline, allowing support to emerge without explicit vulnerability. Care is practised through practices of "doing rather than telling" and engaging in activities that are not necessarily framed as health-related or otherwise connected to their chronic conditions. These practices enable forms of connection and mutual support while avoiding modes of communication that require overt emotionalexpression or the explicit articulation of illness experiences. As such, care is present, but it is enacted in indirect, situational, and often understated ways. These practices contrast with

the emotionally expressive care strategies commonly found in women-dominated health communities on social media, where sharing personal experiences, emotions, and bodily vulnerabilities is often central. The paper does not suggest that men reject care or self-care; rather, it shows how care is reconfigured in ways that align with men's understandings of themselves and their social relations while living with various chronic conditions. Care is thus shaped by ongoing negotiations of masculinity,where expectations of strength, autonomy, and emotional restraint coexist with the need for support and connection (Connell and Messerschmidt, 2005; Bridges & Pascoe, 2014).The paper argues that these negotiations produce ambivalent forms of connection that both enable care and constrain its articulation. While such practices make care possible without threatening masculine identities, they also limit what can be named, shared, or recognised as care by the men themselves. By foregrounding these less visible practices, the paper contributes to a broader understanding of care among men living with chronic illness. It shows that care does indeed exist, but often in forms and spaces that fall outside normative, women-dominated models of care, and therefore risks remaining unrecognised within current frameworks for peer support and health-related care.

HCO07 Misinformation, Credibility and Persuasion in Digital Environments

PP 0930 Understanding psychological misconceptions: The impact of information sources, epistemic attitudes and cognitive abilities

Yasmina Okan[1], Saman Choudary[1], Peter Ayton[2]

[1] Pompeu Fabra University, Department of Communication, Barcelona, Spain
[2] University of Leeds, Centre for Decision Research, Leeds, United Kingdom

Background and objectives

Psychological misconceptions are widely held but scientifically unsupported beliefs about human thought, behavior, or mental processes (e.g., that people use only 10% of their brain power or that only deeply depressed individuals commit suicide), which can negatively affect health and wellbeing (Bensley & Lilienfeld, 2017). Interventions aimed at correcting these beliefs have often been ineffective, potentially due to a limited understanding of the factors driving their endorsement. While previous research has identified some drivers, the relative contribution of environmental determinants (e.g., exposure to inaccurate information across various media), attitudinal factors, and cognitive predispositions remains poorly understood. Moreover, prior research has often relied on student samples, limiting generalizability of findings. The present study addresses these gaps using a nationally representative UK sample, examining how demographic factors, political orientation, reliance on different information sources, attitudes toward psychology, and cognitive abilities predict misconception endorsement.

Methods

We conducted a pre-registered survey to assess the prevalence of psychological misconceptions in a nationally representative sample of UK adults (n = 2,610), recruited via YouGov's online panel. Misconceptions were measured using the 55-item misconceptions test (Gardner & Brown, 2013). Participants also reported their attitudes toward psychology as a science (e.g., belief in its scientific rigour) and the use of nine different sources of information to learn about psychology (e.g., social media, TV series or films, self-help books). Additionally, we measured participants' cognitive reflection (i.e., the ability to inhibit intuitive responses and engage in analytic reasoning) and numeracy. Hierarchical multiple linear regressions were conducted, entering demographics and political orientation first, followed information sources, attitudes toward psychology, and cognitive abilities.

Results

Misconceptions were more common among older adults, women, individuals with lower educational attainment, and those with a right-leaning political orientation. After controlling for demographics and political orientation, greater reliance on celebrity magazines, social media, and self-help books was associated with higher misconception endorsement. Conversely, misconceptions were less common among individuals with more positive attitudes toward psychology as a science and those with higher cognitive reflection and numeracy. Moreover, a higher prevalence of misconceptions correlated with greater willingness to consider wellbeing interventions lacking empirical support.

Conclusions

Our findings suggest that belief in psychological misconceptions is a multifaceted phenomenon shaped by cognitive abilities, epistemic attitudes and reliance on lifestyle-oriented information sources. Consequently, overcoming misconceptions is likely to require interventions that move beyond fact correction by enhancing analytical thinking and fostering trust in psychology as a science. Furthermore, interventions should target sources where misconceptions are prevalent and be sensitive to ideological worldviews to minimize resistance.

HCO07 Misinformation, Credibility and Persuasion in Digital Environments

PP 0931 Combating health misinformation and disinformation on social media: A narrative review of recent research

Anna Sendra Toset[1], Sinikka Torkkola[1]

[1] Tampere University, Tampere University Research Centre for Communication Sciences, Tampere, Finland

The digitalization of healthcare means increased access to health and medical information, including mis- and disinformation (Torkkola & Sendra-Toset, 2026). Particularly prevalent on social media, health mis- and disinformation pose a great challenge for public health (Rodgers & Massac, 2020). While plenty of studies have characterized social media health mis- and disinformation and its impact on public opinion and health behaviors, there is a paucity of research providing empirical evidence on effective interventions against this phenomenon. To better understand how to effectively combat health mis- and disinformation, we conducted a comprehensive search of literature in August 2025. The search was carried out on the Web of Science Core Collection database, and the results were refined by publication year (2021–2025), document type (article) and language (English). Of the 356 references retrieved in the initial sample, only 27 references were included in the final review. Findings show that the studies tested up to 31 interventions, which can be classified into five groups: health promotion activities (n = 9), warnings and fact-checks (n = 7), corrections (n = 7), heuristic and formatting cues (n = 6), and online communities (n = 2). With an average of 1015 participants per intervention, results also reveal that most studies were conducted in the US (n = 15), pursued an experimental design (n = 25), tested the intervention on Facebook (n = 14), and addressed COVID-19 (n = 19) mis- and disinformation – both generally and in relation to vaccines. The variety of social media interventions against health mis- and disinformation supports the idea that combating this phenomenon is a complex task, as different types of mis- and disinformation require different interventions (Larson, 2018). This complexity is also underlined when looking at the efficacy of these interventions individually, which shows that some of the interventions influence health outcomes only partially (e.g., by improving vaccine confidence but not vaccination rates). Similarly, there is a lack of interventions involving closed social media platforms like WhatsApp, which is a particularly troubling finding considering previous research showing this social media platform as the main channel where health mis- and disinformation was distributed during the COVID-19 pandemic (Salaverría et al., 2020). The findings of this review complement those of earlier studies (Walter et al., 2021), in addition to laying the groundwork for further research into social media interventions against health mis- and disinformation.

HCO07 Misinformation, Credibility and Persuasion in Digital Environments

PP 0932 Debunking health misinformation on TikTok: An experimental study on epistemic authority, appearance, and emotional messaging

Daniela Mahl[1], Janine N. Blessing[1], Morgan Wack[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Rationale and conceptual framework

Short-form video platforms such as TikTok have become central sources of science and health information. While they offer low-threshold opportunities for health promotion (Engel et al., 2023), they also facilitate the spread of misinformation (O'Sullivan et al., 2022). At the same time, social media can function as a space for correcting misinformation (Walter et al., 2021). Yet it remains unclear under which conditions debunking efforts are effective—specifically, which debunkers are perceived as legitimate epistemic authorities and how corrective messages should be framed. Prior research provides mixed evidence: experts often outperform other sources in correcting misinformation (Vraga & Bode, 2017), yet users also tend to trust sources they perceive as similar to themselves, such as lay people (Heiss et al., 2024) or (AI-generated) influencers (Sikorski et al., 2026). Moreover, emotional (debunking) messages have been shown to undermine truth discernment (Martel et al., 2020), while simultaneously reducing belief in false claims (Phillips et al., 2025) and eliciting higher engagement than neutral messages (Chao et al., 2021). Against this backdrop, this study examines how different *types* and *appearances of epistemic authorities*, as well as the *emotional framing* of debunking messages, shape the effectiveness of misinformation correction on TikTok.

Method

We conducted a preregistered online experiment in the United States using a 2 (epistemic authority: scientist vs. influencer) × 2 (appearance: human vs. AI-generated) × 2 (messaging style: emotional vs. neutral) between-subjects design. Ethics approval was obtained. A power analysis in R (pwr package) assumed a minimum effect size of Cohen's $f = 0.15$, $\alpha = .05$, and power = .80, indicating a required sample of 648 participants. To account for attrition and failed attention checks, 152 additional participants were added, resulting in a target sample of 800 (100 per cell). Participants are currently being recruited via Prolific using quota sampling.

In a pretest ($n = 75$), five debunked TikTok misinformation claims were evaluated for familiarity and believability. Two topics with relatively high believability and low familiarity—raw milk consumption and sunscreen use—were selected. Based on these topics, we produced 16 TikTok-style debunking videos, with AI avatars generated from videos recorded with human actors using HeyGen's video production tools. Participants first view a misinformation TikTok video, followed by the corresponding debunking video.

Measures

Primary outcomes include perceived credibility of the debunking message, perceived trustworthiness of the epistemic authority, and intention to share the debunking video. Additional measures include deference to scientific authority and AI, emotional involvement, perceived emotions during exposure, perceived misinformation accuracy, prior attitudes, TikTok use and credibility, and media literacy. All items were adapted from prior research (e.g., Greussing et al., 2025; Heiss et al., 2024; Hendriks et al., 2015) and measured on seven-point Likert scales.

Contribution

This study advances science and health communication research by examining how authority cues, AI-generated appearance, and emotional framing jointly shape misinformation debunking on short-form video platforms.

HCO07 Misinformation, Credibility and Persuasion in Digital Environments

PP 0933 Effects of social media source and message labels on perceived message credibility, message engagement, and persuasion of nutrition information

Monique Alblas[1], Kim Verhoeven[2], Veronika Fischer[3]

[1] University of Amsterdam, Communication Science ASCoR, Amsterdam, Netherlands
[2] University of Antwerp, Communication Science, Antwerp, Belgium
[3] Rutgers University, Department of Communication, New Brunswick New Jersey, USA

Social media have become key sources of nutrition-related information (e.g., recipes, weight loss advice, food safety information), but the high prevalence of misinformation about this topic is increasingly concerning (Denniss et al., 2023). This study tests two labeling strategies that may help social media users to distinguish between more vs. less trustworthy content: (1) source verification labels which signal a content creator's nutritional expertise, and (2) message accuracy labels that provide information about the correctness of particular content, either through (a) refutational fact-checks (indicating that the content is judged as incorrect) or (b) general accuracy prompts (warning that social media content may contain inaccuracies). We hypothesize that source labels increase message credibility and in turn, message engagement intentions (liking/sharing the social media post), and persuasion (attitudes and intentions towards the message content), while message labels, especially fact-checks, decrease these outcomes.

An online experiment (preregistered via https://aspredicted.org/x7h2-p7jb.pdf) was conducted using a 2 (source verification label: present vs. absent) by 3 (message label: refutational fact-check message vs. accuracy prompt vs. no label) between-subjects design. The final sample consisted of 275 participants aged 18–29 (M = 24.73, SD = 3.33). Participants first viewed a simulated Instagram profile, and then watched a video post with nutrition advice, which (depending on the condition) contained a source and/or message label. After stimulus exposure, the following dependent variables were assessed: message credibility, message engagement intentions, attitudes and intentions towards following the nutrition advice presented in the social media post.

Manipulation and randomization checks were successful. Preliminary findings using a MANOVA showed that source label did not significantly affect message credibility, message engagement intentions, attitudes toward the nutritional advice, or intentions to follow it (all p values > .05). However, message label type significantly affected message credibility, $F(2, 269) = 4.58$, $p = .011$, n2 = .03, attitudes towards the nutritional advice, $F(2, 269) = 9.25$, $p < .001$, $\eta^2 = .06$, and intentions to follow this advice, $F(2, 269) = 5.00$, $p = .007$, $\eta^2 = .04$, but not message engagement intentions ($p > .05$). As expected, refutational factcheck labels led to the lowest scores on credibility, attitudes, and intentions, followed by accuracy prompts, and then no label. Post-hoc tests showed that differences were most consistently found between the refutational fact check label vs. no label. Finally, no interaction effects between source and message label were found (all p values > .05).

Our preliminary findings suggest that refutational fact-check labels reduce message credibility, as well as attitudes and intentions towards the nutrition advice, compared to no labels (and for attitude, compared to accuracy prompts). Source labels show no significant impact. As no interaction effects were observed either, message-focused interventions seem to be more effective than source verification in addressing nutrition misinformation on social media. Mediation analyses will

be conducted to examine the full moderated mediation model (with message credibility as mediator) and findings will be presented at the Ecrea 2026 conference.

HCO07 Misinformation, Credibility and Persuasion in Digital Environments

PP 0934 For risks and side effects, ask the internet – The effect of online information quality on subjective and objective health informedness

Tobias Scherer[1], Elias Griesbeck-Bachmann[1]

[1] Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

Most people rely on the Internet for health information (Wang et al., 2020), as it enables them to quickly obtain various information on health-related topics (Clarke et al., 2015). Access to high-quality information can support informed decision-making by helping individuals avoid harmful materials or behaviors (Chen et al., 2018). However, there is a risk of encountering incomplete or false information online (Battineni et al., 2020), which can lead to health problems when relying on such information (Swire-Thompson, 2019). Previous studies which measured the effect of online health information on individuals' informedness about health-related topics relied on self-reports (e.g., Thapa et al., 2021), leaving the actual effects of such information under-researched.

Our study used an online assessment consisting mainly of first-year students (N = 456; 48% female) to investigate how using online health information of varying information quality affects individuals' informedness on specific health-related topics. Participants conducted an online search on one of three different health-related scenarios (e.g., health risks of certain ingredients). The scenarios were created in collaboration with experts on these topics. Following the search task, participants were asked to write a statement regarding the respective scenario, additionally indicating which websites they had used. Finally, participants rated their subjective informedness, e.g., having selected relevant information on 4-point scales (4 = very sure).

A quantitative content analysis was conducted to assess the information quality of the websites visited (N = 445). Categories included completeness and correctness. Completeness was measured using a quotient between 0 and 100, based on the amount of scenario-related information found on a website. Correctness was measured based on the scenario-relevant information presented on a website, using a 5-point Likert-scale (5 = exclusively correct). Objective informedness was rated in cooperation with the creators of the scenarios. Up to 6 points were given based on the comprehensiveness and correctness of the participants' statements.

Regression analyses controlling for sociodemographic variables were conducted to examine the influence of the information quality of the websites visited on both objective and subjective informedness. The results showed that both completeness (b = 0.02; F(1, 467) = 49.4; p < .001***; Adj. R^2 = 0.09) and correctness (b = 0.17; F(1, 467) = 13.2; p < .001***; Adj. R^2 = 0.03) had a positive effect on objective informedness, whereas no significant effect on subjective informedness was observed. Furthermore, a correlation test between objective and subjective informedness revealed no significant relationship (Spearman's r = 0.05; p = .30).

Results indicate that using high-quality health information leads to participants being better informed about the respective topic. However, participants do not seem to be able to assess whether the information they used was of high quality and whether they are now better informed. Regardless of the websites' information quality, participants rated their subjective informedness as rather high (M = 2.91; SD = 0.63). Therefore, participants seem to overestimate their informedness and not to deliberately select high-quality information. This indicates the need for further promotion of health literacy for online environments, so that individuals can identify high-quality information.

HCO08 Mental Health on Social Media – Dynamics, User Practices, Representations and Effects

PN 88 Young adults' mental-health-related social media practices and trust heuristics

Katrin Tiidenberg[1], Marius Liedtke[2], Maria Schreiber[2]

[1] Tallinn University, Baltic Film Media and Arts School, Tallinn, Estonia
[2] University of Salzburg, Communications, Salzburg, Austria

This contribution provides an empirically grounded, nuanced analytical account of how young adults make sense of a highly personal yet socio-political issue such as mental health in a "post-truth," platform-capitalist media ecosystem. We draw on data from 98 young adults in Austria, Estonia and the UK generated within the European project XXX. Participants contributed either through social media elicitation interviews (n = 47) or by creating autoethnographic accounts of their social media use (n = 51). Both the interview and the autoethnography prompted participants to specifically consider how and why they trust some health and wellbeing content and interactions on social media while they might distrust others. The project received ethics clearance separately from the three institutions and all participants provided informed consent. We relied on our participants' own interpretations of what counted as everyday health and wellbeing content and as social media. Social media platforms that participants most engaged with were Instagram, TikTok, Facebook and YouTube. Participants brought up a wide variety of health topics, including (but not limited to) nutrition and diet, skincare, fitness, sexual health, specific illnesses, public health messaging (such as Covid-19 advice), vaccination and medical science.

Mental health emerged as a recurring health topic that our participants chose to focus on. We therefore decided to further investigate the data that was coded as mental health-related in a first round of thematic coding. Following a Grounded Theory-approach, we conducted several additional rounds of analytic coding and memoing with this dataset: We first examined what topics and concerns participants perceived and framed as mental health content: Young people invoke a remarkably broad range of issues under the vague umbrella of "mental health"—from affirmations to anxiety and from schizophrenia to self-care. This reflects rising societal awareness and destigmatization of mental illness but also a broader psychiatrization of contemporary society, where psychological vocabularies permeate everyday life and where individual responsibility for well-being is emphasized. In the second step, we investigated users' trust heuristics and their practices of (dis)trusting mental health content and its creators. Trust emerged through the interplay and (mis)alignment of user-, creator-, and content-related dimensions. In the user dimension, trust is shaped by the user's current situation and practice orientations with cognitive, affective and conative layers. In the creator dimension, trust depends on perceived authenticity and motivation—whether expressed feelings appear sincere and whether creators' motives are deemed legitimate. In the content dimension, trust is shaped by how tone, rhetoric, style and factfulness are evaluated. Overall, our contribution illustrates the importance of micro-level analyses of how young people engage with mental health content and creators, showing complex, situated practices that exceed simple causal models. This aligns with critical research emphasizing the social and mediated construction of mental health phenomena.

HCO08 Mental Health on Social Media – Dynamics, User Practices, Representations and Effects

PN 89 The everyday use of mental illness-related social media content: Motives, practices, and user types

Freya Sukalla[1], Anna Wagner[2]

[1] LMU, Communication and Media Studies, Munich, Germany
[2] Radboud University, Department of Language and Communication, Nijmegen, Netherlands

Social media has become an important space for finding information about mental illness, sharing personal experiences, seeking support, and participating in conversations and communities (Naslund et al., 2020). Existing research into mental illness-related social media content (MI-SMC) has largely focused on mental illness portrayals and potential effects of MI-SMC on users (Aydin et al., 2020; Nicomedes et al., 2024; Schaller et al., 2023). Less is known, however, about how and why regular users engage with MI-SMC, particularly regarding their motives, user practices, and the ways these practices are embedded in everyday MI-related communication. Applying a repertoire perspective, which considers how users combine, select, and contextualize content within their broader communication repertoires and communicative routines (Hasebrink & Popp, 2006), we therefore examine how regular users engage with MI-SMC in their everyday lives. We specifically focus on their motives and user practices (RQ1), as well as potentially distinct user types of MI-SMC based on their individual MI-SMC repertoires (RQ2). To address these questions, we conducted two complementary studies recruiting regular users of MI-SMC via Prolific. First, a cross-sectional survey with 298 participants (age: M = 33.2 years, SD = 11.3; 48.7% male, 50.7% female, 0.7% non-binary; 37.3% with prior personal experience of mental illness) assessed frequency of use, motives for reading, sharing, and creating content, engagement in MI-related online conversations, and perceptions of MI-SMC. Findings show that users frequently engaged with different types of content, from self-help and inspirational posts to personal stories and informational content, primarily to gain information and connect with others with similar experiences. Sharing and creation practices were reported by 45.4% of participants, most often motivated by altruistic motives such as providing information, raising awareness, and offering emotional support. Online conversations about mental illness, mostly via social networks and messenger apps, were reported by 56.9% and also mainly driven by other-focused motivations. Second, a qualitative interview study with 15 users (12 female, 3 male; age 19 to 46 years; 12 with personal and 5 with indirect MI experience) explored motivations, user practices and interpersonal communication about MI in context, including repertoire maps illustrating MI-SMC's role in everyday MI-related communication. We developed a typology of user types, comprising three overarching categories with two types each: 1) Advocates include the user types support providers and community activists who engage with MI-SMC to provide help and raise awareness. 2) Observers encompass insight-seekers and monitoring preppers who use MI-SMC for introspection and to prepare for future mental health issues. 3) Copers include comfort-seekers and self-regulators who use MI-SMC to cope with and manage their mental health problems. The studies show that while engagement with different types of MI-SMC is generally high, motivations and user practices differ by user type. Findings emphasize that individual user practices of MI-SMC must be considered in their embeddedness in everyday contexts and their relation to other mental illness-related communication practices.

HCO08 Mental Health on Social Media – Dynamics, User Practices, Representations and Effects

PN 90 Community and unmasking in the autism community on Tumblr

Karin Kuzmanov[1]

[1] University of Salzburg, Communications, Salzburg, Austria

While long stigmatised, public discourse about autism has intensified in recent years, increasingly focusing on deficits and stereotypes. This is partly due to mainstream media representations, which frequently portray autistic people as isolated, dangerous, or inhuman (Ressa, 2021). To circumvent traditional gatekeepers, autistic people have turned to social media,

where autism can be discussed by those with actual lived experiences. Most research so far has focused on Twitter; however, as an ethnography revealed, the micro-blogging platform Tumblr is oftentimes described as "the autism website" by its users. This paper asks why this is and focuses on the intricate ways Tumblr's autism community fosters a sense of belonging and encourages self-acceptance. It argues that due to the site's affordances (e.g. pseudonymity, multimodality, non-linear temporality,…), Tumblr provides unique conditions that allow users to proudly "unmask". Developed by Devon Price, the concept of '(un)masking autism' describes the process of learning to be authentically autistic. Part of this unmasking, as Price (2022, p. 86f.) himself writes, is "finding my 'people' and seeing proof positive that there was nothing wrong with us." Since unmasking is intricately connected to belonging, Döveling et al.'s (2018) concept of Digital Affect Cultures was used to analyse the community's emotional alignment and cultural practices. Methodologically, a months-long digital ethnography served as the basis for interviews conducted with 153 autistic Tumblr users. Adhering to best practices for research with autistic participants (Gowen et al., 2019), the study offered four interview modes: (1) live via video call, (2) live via Tumblr chat, (3) non-time-sensitive via Google Forms, and (4) non-time-sensitive via voice messages. An analysis of the interviews revealed a complex collective understanding of community, yet a clear sense of emotional alignment with other autistic users. In contrast to their offline lives, the interviewees overwhelmingly report being able to unmask and still feel accepted on Tumblr. As Susitna (<18, female) puts it, "Engaging in [the community] makes me feel recognized. I'm not weird, I'm not wrong, I'm not overreacting, but I'm different than neurotypicals and that's okay." This feeling of acceptance is made possible by both the website's functions as well as the cultivated community culture of radical inclusivity, regardless of diagnosis status or support needs. This research demonstrates that, facilitated by Tumblr's affordances, the autism community has fostered an effective counter-narrative to mainstream media representations. Users have created a space characterised by authenticity, low-threshold belonging, and unprecedented acceptance, making it possible for autistic people from all walks of life to take off their figurative masks.

HCO08 Mental Health on Social Media – Dynamics, User Practices, Representations and Effects

PN 91 Mental health on Twitch: Live-streaming, community interaction, and the risks of personalized health discourse

Maria Grub[1]

[1] University of Jena, Communications, Jena, Germany

Live-streaming platforms such as Twitch have experienced significant growth in recent years, particularly during the COVID-19 pandemic (Scerbakov et al., 2022). Initially focused on gaming-related content, Twitch has developed into a multifaceted community space that includes formats such as Just Chatting and IRL (In Real Life), where streamers engage directly with audiences to discuss personal, social, and political topics. Health has become an increasingly prominent subject within these discussions (Kim, 2024). The platform's affordances, including real-time chat and interactive features, facilitate immediate and reciprocal communication between streamers and viewers. These features foster intensified parasocial relationships, as streamers frequently respond to audience input in real time (Kowert & Daniel, 2021; Wulf et al., 2021). As a result, streamers may exert significant influence on audience opinion formation, prompting questions regarding the handling of sensitive topics such as mental health within these communities. This study investigates the prevalence and characteristics of health-related discourse, with a particular focus on mental health, on Twitch. The dataset comprises Just Chatting and IRL content from the 22 most popular German gaming streamers (12 male, 10 female), collected between January and March 2025. A total of 611 stream segments, encompassing 406,489 sentence-based documents, were analyzed using a guided topic modeling approach with BERTopic. Subsequently, health-related topics were examined using a Grounded Theory approach to develop a thematic framework (Charmaz, 2006; Strauss & Corbin, 1996).The results show that lifestyle content constitutes the majority of Twitch discourse (64.26%), followed by gameplay (15.43%) and monetization-related topics (7.81%). Health-related content accounts for a smaller yet significant proportion (2.83%). Qualitative analysis identified physical, mental, and reproductive and sexual health as the most prominent health-related themes. Mental health discussions frequently address conditions such as depression, anxiety, and ADHD. Additionally, streamers share personal experiences with therapy, loneliness, and the effects of "toxic" relationships, a process frequently described as "trauma dumping." Streamers also discuss the use of medications such as antidepressants, ADHD medication, and hormonal contraceptives, describing side effects and perceived impacts on well-being. These discussions are highly personalized and typically based on self-diagnosis and individual experience rather than medical evidence. Substance use is portrayed ambivalently, ranging from explicit discouragement to entertainment-oriented references, for example, with

games such as Drug Dealer Simulator. Mental health topics are typically explored in greater depth than other health issues, which are often mentioned only briefly and in the moment (e.g., headaches or back pain). Across themes, streamers emphasize community exchange, encourage viewers to share experiences, and position Twitch as a platform for discussing mental health and reducing stigma. However, the reliance on personal narratives and limited fact-checking, combined with real-time interaction and strong parasocial cues, raises concerns about misinformation, particularly regarding medication and substance use. Although health content remains relatively marginal within gaming communities, the highly personal and emotional nature of these discussions, along with the seemingly intimate interactions between streamers and viewers, highlights the need to critically examine live-streaming platforms as emerging sites of health communication.

HCO08 Mental Health on Social Media – Dynamics, User Practices, Representations and Effects

PN 92 From social media feeds to real-world beliefs: Intentional and incidental mental illness exposure and adolescents' prevalence estimates

Anne-Linda Camerini[1], Hannah Bauer[2], Alina Danilkow[3], Sophie Mayen[1], Dora Weubel[1], Ruth Wendt[2], Kathrin Karsay[3]

[1] USI Università della Svizzera Italiana , Institute of Public Health IPH, Lugano, Austria
[2] LMU, Institute for Communication Studies and Media Research, Munich, Austria
[3] University of Vienna, Institute for Journalism and Communication Studies, Vienna, Austria

Mental illness is a prominent topic on social media, with posts tagged #MentalHealth or individual disorders like #depression or #anxiety attracting billions of views across Instagram, Facebook, and TikTok. Moreover, in algorithmically curated environments, social media posts discussing mental illness frequently go viral or trend on social media platforms. Although many users aim to destigmatize mental illness and cultivate a sense of belonging, their levels of expertise may vary, and conflicts of interest may emerge, especially when monetary motives are present (Kaňková et al., 2024). Moreover, overgeneralized, inaccurate, or romanticized mental health information on social media may lead to overinterpretation, where milder forms of stress may be misinterpreted as a mental illness that requires labeling and treatment, a phenomenon described in the prevalence inflation hypothesis (Foulkes & Andrews, 2023). Relatedly, recent work on cultivation theory suggests that in the context of mental illness, algorithms play a significant role in shaping users' perceptions of their social realities (Romann & Oeldorf-Hirsch, 2025).In this study, we focused on adolescents, who are avid social media users and rely on social media for health information (Engel et al., 2026). We examined how their intentional and incidental exposure to mental illness content on social media is associated with the perceived prevalence of mental health problems among their peers. As part of the [blinded] project, 1432 adolescents (51.5% girls, Mage = 14.42, SD = 1.80, 12–19 years) from Switzerland (n = 643), Austria (n = 509), and Germany (n = 280) provided consent and valid answers in a school-based online survey between November 3 and December 22, 2025. On average, adolescents estimated that 33 out of 100 students at their school might have a mental illness problem (SD = 25.65). Furthermore, they reported more frequently on incidental exposure to mental illness content on social media (17.1% (very) often) than on intentional exposure (5.6% (very) often). Linear regression analysis revealed that both incidental ($\beta = .132$, $p < .001$) and intentional exposure ($\beta = .169$, $p < .001$) are positively and significantly associated with higher mental illness prevalence estimates, controlling for being female, age, having received mental illness awareness education at school and having obtained a formal mental illness diagnosis in the past, all of which showed to be positively and significantly associated with higher prevalence estimates, too ($F(6, 1269) = 49.47$, $p < .001$, $R2 = 0.19$).The results underscore that adolescents tend to overestimate the prevalence of mental health problems among their peers, which, according to the 2014–2017 KiGGs study, is around 15.4% for 11- to 17-year-olds (Baumgarten et al., 2023). They further provide support for the prevalence inflation hypothesis as more frequent exposure to mental illness content on social media is associated with higher prevalence estimates. Thus, social media may cultivate distorted beliefs about mental illness and contribute to a "medicalization of society" (Conrad, 2007), with possible detrimental consequences associated with the blurred boundaries between what are harmless and common negative mood states and what are severe mental health conditions that require treatment.

HCO09 Health Journalism and Public Health Communication

PP 1039 Threat and efficacy in Dutch newspaper coverage of antibiotic resistance: A quantitative content analysis (2010–2025)

Kato Helsen[1], Heidi Vandebosch[1], Gert-Jan de Bruijn[1]

[1] University of Antwerp, Communication Studies, Antwerp, Belgium

Background

Antibiotic resistance (ABR) is recognised as one of the most urgent public health threats (World Health Organization, 2025). ABR occurs when antibiotics that were once effective no longer successfully treat bacterial infections (Habboush & Guzman, 2023). Because people rarely encounter ABR directly, it often remains abstract to the public (Krockow et al., 2019). In the absence of direct experience, most people encounter health topics through the media (Jung & Brann, 2014). Newspapers, in particular, are widely trusted by the public and influence coverage in other media (Degeling et al., 2021; Johnson et al., 2011). Previous research shows that ABR news coverage often provides a simplified view, emphasising antibiotic overuse as the main cause and focusing on system-level rather than individual solutions, while overlooking consequences and risk

groups (Bohlin & Höst, 2014; Bohlin & Höst, 2015; Capurro, 2020; Liao et al., 2021). As a result, the public may gain only a partial understanding of both the threat of ABR and potential responses.

The Extended Parallel Process Model (EPPM) explains how perceived threat and perceived efficacy interact to influence responses to fear-based messages. Threat consists of severity (how serious the problem is) and susceptibility (how likely it is to affect the individual). Efficacy includes response-efficacy (whether the recommended actions are effective) and self-efficacy (whether the individual is capable in performing it) (Witte, 1992). Although originally developed for message design and evaluation, the model has also been applied to assess threat-and efficacy-related elements in media content (Grimm & Schwartz, 2021; Shim et al., 2021; Shim et al., 2016).

Purpose

This study applies the EPPM to examine how Dutch newspapers portray ABR. While the model has been widely used in content analyses of other health issues (Grimm & Schwartz, 2021; Shim et al., 2021; Shim et al., 2016), it has not yet been applied to media representations of ABR. This leads to the following research questions:

1. To what extent do Dutch newspaper articles about ABR contain references to severity, susceptibility, response-efficacy, and self-efficacy?
2. To what extent are different causes of ABR mentioned in Dutch newspaper articles?

Method

This study conducts a quantitative content analysis of Dutch national and regional newspaper articles published between 2010 and 2025. The sample consists of print and online news articles retrieved from Nexis Uni using the search term “antibiotic* AND resistent*”. Eight newspapers are included: four national (Algemeen Dagblad, NRC, de Volkskrant, de Telegraaf) and four regionals (Noordhollands Dagblad, de Gelderlander, de Limburger, de Stentor). After removing duplicates and articles with less than 35 words (Bohlin & Höst, 2015), the sample consists of 1,708 articles. The EPPM constructs are operationalised through four dimensions: causes, consequences (severity), risk groups (susceptibility), and solutions (response-and self-efficacy) (Shim et al., 2021; Witte, 1992). A detailed coding scheme is currently under development and will be pilot-tested on a sub-sample in January-February 2026, including intercoder reliability assessments using Krippendorff’s alpha. The full sample will be coded from March onwards.

Results

The results will be presented and discussed at the ECREA-conference.

HCO09 Health Journalism and Public Health Communication

PP 1040 From avoidance to engagement – Meaningful media experiences and their de-tabooization potential of death and dying

Christal Bürgel[1], Julia Boettinger[1]

[1] Leipzig University, Department of Communication and Media Studies, Leipzig, Germany

According to Terror Management Theory (TMT, Greenberg et al. 1986), people tend to avoid thinking or talking about death, contributing to the tabooization of the topic in many Western societies (Brass-Rosenfield, 2022). At the same time, audiences voluntarily consume media content addressing mortality. media experiences may therefore offer a less threatening way to approach the topic. Research shows that meaningful and eudaimonic media experiences can stimulate reflection on mortality and facilitate emotional processing (Oliver & Bartsch, 2010; Wong, 2007). Building on these insights, recent extensions of TMT toward meaningful entertainment (TMT-ME) conceptualize such experiences as a way of engaging with mortality beyond anxiety regulation and link them to more accepting attitudes toward death (Das & De Graaf, 2024). However, it remains unclear which kinds of media portrayals encourage the engagement with the topic and may contribute to the processes of de-tabooization.

This study addresses this gap by examining expert perspectives on the de-tabooing potential of death-related media experiences. A total of 42 qualitative interviews were conducted with medical professionals who encounter death and dying in their occupational contexts (e.g. palliative care, geriatric care, general medical care; age: SD = 14.30, range: 16–61; gender: 8 male and 34 female). Experts were selected as a reflexive group with a dual perspective, combining their emotional involvement as human beings with their professional expertise in death, care, and societal taboos. This enables them to assess both informational and meaning-making qualities of media portrayals and their relevance for de-tabooization processes beyond individual audience experiences. For the interviews, participants selected a death-related media best-practice example and reflected on (1) societal and media perceptions, (2) facilitating and hindering portrayals, (3) reflective thoughts and (4) de-tabooization-relevant attitudes and behaviors. Interviews were analyzed using qualitative data analysis (Kuckartz & Rädiker, 2024).

Findings show that death and dying remain as tabooed across professional, societal, private, and media contexts, characterized by conversational and behavioral avoidance. Further, participants frequently associated their media best-practice examples with components of eudaimonic experiences such as feeling emotionally moved and perceiving the content as meaningful and thought-provoking. Engagement seems to be facilitated by portrayals perceived as authentic and coherent.

Participants valued insights into dying and grieving processes, factual and practical knowledge, and non-judgmental depictions of diverse perspectives. Emotional insights into lived experiences seemed to support affective engagement, whereas romanticized, dramatized, incorrect or overly explicit portrayals were perceived as distancing or overwhelming. Meaningful thought processes associated with death-related media experiences included reflections on values and gratitude, emotional and factual learning, relevance to one's own life world, appreciation for coping strategies of depicted individuals, and broader social and cultural implications.

Our results indicate that de-tabooization can be conceptualized as a process of engagement that begins with individual reflection on the topic and may extend to follow-up communication or information-seeking.

By specifying how death-related media content can invite engagement with mortality beyond anxiety regulation, our study advances the TMT-ME framework and highlights the role of media in enabling cognitive and affective engagement with existential topics.

De-Tabooization, Medical Experts, End-of-Life Conversations, Death

HCO09 Health Journalism and Public Health Communication

PP 1041 Health Communication in videos prior and post Covid-19: Decoding anti-vaccine communication to prevent childhood vaccine hesitancy in Spain

Alicia García-Oliva[1], Manel Palencia-Lefler[1]

[1] Universitat Pompeu Fabra UPF, Communication, Barcelona, Spain

Context

Vaccination remains one of the most cost-effective strategies for the prevention of infectious diseases, yet parental vaccine hesitancy continues to challenge global health systems and leads to increased healthcare costs. In Spain, the landscape of anti-vaccine messaging has shifted notably since the COVID-19 pandemic: YouTube previously dominated this space, but Odysee has since become a primary dissemination channel. This study aims to systematically analyse and compare the communication techniques and persuasive strategies employed in pre- and post-pandemic anti-vaccine videos targeting childhood immunisation, addressing a significant evidence gap in public health communication research.

Methods

A total sample of 500 videos was collected, divided equally between two platforms: 250 YouTube videos published prior to the COVID-19 pandemic and 250 Odysee videos published subsequently. To ensure ecological validity, all searches were conducted using clean browsers, without user login, and surfing as a guest, to simulate the experience of the general public searching for childhood vaccine-related content. Identical keywords and collection protocols were used for both samples to minimise selection bias. Quantitative and qualitative content analysis was performed, focusing on the variation in communication techniques, source credibility, video format, channel type, and persuasiveness between the two periods. Comparative statistics and thematic analysis informed the findings.

Previous Results

Before COVID-19, most anti-vaccine videos were lengthy (30–60 minutes) and often recorded at public congresses related to healthy living. Speakers used to be a doctor or a therapist specialised in non-conventional treatments. Videos are shown on public channels owned by companies.

Post-pandemic, Odysee videos against childhood immunisation became significantly shorter and more numerous, with a broader mix of formats (e.g., interviews, documentaries, videoconferences, and online interviews). While healthcare and alternative medicine professionals remained prominent, new actors, including journalists, entered the discourse.

Most channels are private. People curate and redistribute existing content. Cross-posting of videos among private channels increased content reach and repetition.

Conclusions

This analysis constitutes a component of a broader research initiative on decoding anti-vaccine video content and persuasive tactics in the context of childhood vaccination. The findings highlight the evolving nature of anti-vaccine communication and its adaptation to new digital platforms. Our first results allow us to drive into a 'parents'-centric perspective to manage the information disseminated on the internet. This information provides health professionals with tools to deal with parents' hesitancy.

Health professionals can leverage these insights to refine interventions, tailor communications that address parental concerns, and identify persuasive triggers used in online misinformation. Future strategies to promote immunisation should consider both the messaging techniques and the changing media environment, optimising approaches to counteract childhood vaccine hesitancy effectively in Spain.

IIC01 Memory, Culture, and Transnational Cultural Practices

PP 0089 Island memories: Exploring the intersection of local and digital memory practices

Berber Hagedoorn[1], Rieke Böhling[2]

[1] University of Groningen, Research Centre Media and Journalism Studies/CMJS, Groningen, Netherlands
[2] University of Bremen, ZeMKI Centre for Media- Communication and Information Research, Bremen, Germany

This paper explores how cultural memory is constructed and transmitted across generations in small island contexts through the interplay of local heritage institutions and digital media platforms. The main research question guiding this study is: How do local heritage institutions and digital media platforms contribute to the construction and intergenerational transmission of cultural memory in island contexts, and what are the implications of combining analogue and digital memory practices for collective identity formation? The paper examines how analogue memory practices, such as exhibitions, oral history projects, and local museums, intersect with digital practices, and what this combination means for collective identity formation. The study focuses on the North Sea islands of Spiekeroog in Germany and Schiermonnikoog in the Netherlands. These islands function as small-scale lenses on broader social processes of remembering, where the limited number of actors, institutions, and stories makes memory work highly visible and socially embedded.

The study applies a mixed-methods design that combines exhibition analysis, digital ethnography, and media practices research. Institutional exhibitions, local museums, and community-based projects are analysed to examine how island histories and memories are mediated and made accessible to different generations. Particular attention is paid to media practices of collecting, contextualising, and presenting photographs, objects, and oral histories. The digital analysis focuses on Instagram posts, hashtags, and user interactions related to the two islands in order to trace how visual memory objects are created, shared, and circulated beyond the local context. In addition, the study examines the reuse of audiovisual materials from media archives and emerging AI-supported curation practices to understand how they support and reshape island memory practices.

Preliminary findings suggest that heritage institutions and community exhibitions operate as intergenerational spaces of memory transmission. On both islands, older residents contribute lived experience and contextual knowledge, while younger audiences engage with these narratives through exhibitions and mediated forms of storytelling. On Spiekeroog in particular, memory work relies on individual custodians who collect photographs, record oral histories, and provide narrative context to objects displayed in exhibitions and museums. These practices translate personal and family memories into shared public resources. Digital platforms extend these practices by enabling residents and visitors to create and circulate visual memory objects that connect island pasts to present-day experiences and translocal audiences.

The island context highlights how collective identity is sustained through ongoing memory practices rather than fixed historical narratives. With few institutions and limited archival infrastructures, remembering becomes a shared responsibility, and each story carries particular weight. By examining how analogue and digital practices are combined in these settings, the paper shows how islands act as microcosms of cultural memory, offering insight into wider challenges of preserving, mediating, and transmitting memory in contemporary societies shaped by both local heritage work and digital media practices.

IIC01 Memory, Culture, and Transnational Cultural Practices

PP 0090 Learning from kin through documentaries and archival materials: Inuit online engagements with remediated cultural materials

Jonathan Spellerberg[1]

[1] University of Groningen, Arctic Centre, Groningen, Netherlands

This paper examines how Inuit are remediating documentary films and archival materials to social media, many of them with a colonial background, thereby reinserting them into cultural ways of knowing by centering family and kinship relations.

Like many Indigenous groups, Inuit from Nunavut, in what is today Canada, are working to overcome ongoing colonial disruptions to the continuity of cultural knowledge. Projects aimed at revitalizing cultural knowledge are widely seen as key to bolstering Inuit identity, wellbeing, and economic success. In this context, Inuit and their allies increasingly build and maintain online cultural resources, such as social media channels, digital exhibits, and video repositories. When online media are brought in to support learning about cultural knowledge, then what are the associated practices by which Inuit mobilize culturally rooted ways of knowing and being when engaging with these media?

I discussed this question in interviews and digital heritage workshops with Inuit research collaborators in September and November 2025. These were part of a research project conducted in collaboration with Inuit students, educators, and Inuit Heritage Trust (IHT). One of the project's goals is to support IHT's efforts to develop an online platform for the digital

repatriation of material cultural belongings currently held in museums. To do that, this research seeks to understand and document already existing ways of culturally appropriate engagement with heritage online.

Inspired by the Shawn Wilson's Indigenous research principle of relational accountability, which implies that the relationships that form during research are as substantial to the research as question and results, the paper begins with a critical reflection on how the project developed in dialogue with the research collaborators before moving on to a discussion of how Inuit center family and kin relations when engaging with remediated archival materials and documentary films on social media. Research collaborators often did not see film snippets as intended to convey the film's narrative or perspective. Instead snippets were appreciated for featuring relatives as well as the specific sophisticated artistry- such as garments- and cultural practices- such as hunting techniques- that they depict. Circulating within the community, they were described as a source of pride in one's kin and an opportunity to learn from kin who were involved in the production of the films. Drawing on literature on Inuit pedagogy and anthropological film, the paper argues that Inuit are taking up the educational work of their Elders depicted in documentary films and archival materials by reinserting these media in community-based ways of knowing. Beyond reasserting visual sovereignty, then, this practice reinserts relational aesthetics into the materials and reorients them toward Inuit priorities.

PP 0091 Co-cultivating inhabitable commons: Independent bookstores in Chinese-speaking diasporas

Jade Jiewen Deng[1]

[1] University of Massachusetts-Amherst, Communication, Massachusetts, USA

Resurgent independent bookstores have emerged as a significant site and medium for memory preservation and community building for immigrants and citizens. Scholarship has noted the role of independent bookstores in sustaining civic solidarity and activist resilience. However, the tension among frequent mobility, spatial-temporal uncertainty, and intensified internal political fragmentation and independent bookstores in search of sustainable survival in diasporic contexts has yet to be sufficiently researched. This study takes the case of independent bookstores founded by Chinese migrants (including immigrants from mainland China, Hong Kong, and Taiwan) to explore their negotiation between market openness and political commitment as well as the cultivation of a transient but inhabitable commons. Drawing on Rancière's notion of the distribution of the sensible and Anderson's concept of affective atmospheres, this study proposes the term "co-cultivated sensory commons" to theorize independent bookstores as civic infrastructures of ambiguous affective atmospheres embedded in the logic of the marketplace. Bookstore owners as civic cultivators meticulously design sensory, temporal, and curatorial conditions to grow and sustain diasporic publics, rather than simply relying on the identity, political consensus, or institutional engagement of immigrant subjects.

Based on interviews with the operators of five Chinese independent bookstores located in the UK, Europe, and North America, digital ethnography of their social media, and grounded theory, this study compares different tactics of commons cultivation and articulates a symbiotic relationship between bookstore owners, the public, and spaces. Concretely, bookstore operators co-nurture diasporic spaces that are affectively and politically viable with readers and local urban environments through deliberate book selection, the creation of reading atmospheres, the curation of events, and membership systems. While the everyday operations of the different bookstores are not similar, they respectively absorb the economic, socio-political issues, and cultural nourishment of local societies to enable rooted and organic growth; build a refuge community for certain immigrant populations with the preservation of a sense of belonging and cultural memories; and connect the diasporic and non-diasporic audiences with reading and intellectual conversations to translate into an imagined future of a cohabitated life. Despite the persistent tension between market inclusion and political expression, independent bookstore operators aim to counteract the instability of dislocation and economic vulnerability by co-cultivating affective-atmospheric civic ecologies and publics. Thus, this study contributes to imagining the informal political possibilities of a sensible diasporic public sphere and publicness.

IIC01 Memory, Culture, and Transnational Cultural Practices

PP 0092 Digital transnationalism and intercultural family communication across shifting sociotechnical contexts

Anastassia Zabrodskaja[1], Sviatlana Karpava[2]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia
[2] University of Cyprus, Department of English Studies, Nicosia, Cyprus

Intercultural communication in transnational contexts is increasingly mediated by digital technologies that reshape how families negotiate culture, identity, belonging, and care across borders. Responding to the ECC 2026 theme "Shifting Grounds: Paths, Connections, and Futures," this paper examines digital transnationalism as a form of everyday intercultural communication embedded in unequal sociotechnical, linguistic, and political environments. It asks how digitally mediated family interactions both enable intercultural dialogue and reproduce power asymmetries linked to migration regimes, language policies, and digital infrastructures.

Drawing on qualitative interview data with 18 transnational families in Cyprus and Estonia, the study adopts an ecological and intercultural communication perspective (Bronfenbrenner, 1986; Baldassar, 2016; Cabalquinto, 2019) to analyse how multimodal communication practices—video calls, messaging apps, emojis, photographs, online education, and social media—mediate emotional presence, family cohesion, heritage-language transmission, and identity work across distance. Thematic analysis reveals how digital communication functions as a key site of intercultural meaning-making within families navigating multiple cultural repertoires and shifting positionalities.

The comparative design highlights how intercultural communication practices are shaped by context. In Estonia, a highly digitalised governance system positions digital communication as a structural requirement for participation in education, healthcare, and administration. This institutional digitalisation intensifies linguistic asymmetries, often positioning children as intercultural and digital brokers who mediate between family members, state institutions, and dominant language regimes. In Cyprus, where integration is more strongly grounded in interpersonal networks and diasporic communities, digital communication primarily supports emotional closeness, cultural continuity, and transnational care rather than institutional navigation. These contrasting contexts illustrate how intercultural encounters are not only interpersonal but also infrastructural, shaped by macro-level sociopolitical conditions.

Across both settings, families engage in complex forms of multiliteracy and multimodality to sustain intercultural relationships and negotiate belonging. Digital rituals such as shared meals via video calls, online religious practices, heritage-language lessons, and the circulation of images and voice messages function as symbolic resources for maintaining cultural memory and intergenerational solidarity. At the same time, unequal access to digital skills, language proficiency, and technological resources reveals persistent structural inequalities within and across families.

By centring migrants' voices, this paper challenges normative and Western-centric models of intercultural communication that privilege face-to-face interaction or national integration outcomes. It contributes to critical intercultural communication scholarship by conceptualising digital transnational family life as an ethically and politically situated communicative practice, where power, care, and identity are constantly renegotiated. The paper argues that understanding intercultural communication in a digitally mediated world requires attention to emotional labour, epistemic justice, and the everyday strategies through which marginalised actors navigate shifting global conditions.

PP 0194 How peace is discursively constructed: A discourse-theoretical analysis of Russian and Ukrainian news agencies' coverage

David Ongenaert[1], Nico Carpentier[1]

[1] Charles University, The Institute of Communication Studies and Journalism, Prague, Czech Republic

The Russian-Ukrainian war has far-reaching human, political, economic, and environmental consequences and is widely expected to remain protracted, with increasing militarization and fragile prospects for negotiated settlement (Lawrence et al., 2022; Hayoz & Stepanenko, 2024). The war has also generated intense discursive struggles, particularly in media, where meanings of war and peace are negotiated, justified, and contested (Hodges, 2013). While research has predominantly examined war discourses due to their omnipresence in public debate (Van der Linden & Licata, 2012), the discursive construction of peace remains largely under-researched (Möller & Shim, 2019). This gap is salient given the central role of news coverage as hegemonic information sources, especially within neo-authoritarian and semi-free media systems shaped by state power and wartime constraints (Becker, 2004; Boumans et al., 2018; Samahalska, 2023).

This study examines *how Russian and Ukrainian state-owned news agencies discursively construct peace in their English-language coverage of the Russian-Ukrainian war.* The study employs Discourse-Theoretical Analysis (DTA), grounded in Laclau and Mouffe's discourse theory and its later developments (Carpentier, 2017; Carpentier & De Cleen, 2007). The empirical corpus consists of 495 English-language news releases, including 221 images, published by the Russian state-owned agency TASS and the Ukrainian state-owned agency Ukrinform during February 2025.

Our preliminary findings indicate a pronounced dominance of photo-negativistic articulations of peace, in which peace is defined primarily as the absence of war (Galtung, 1969; Webel, 2007). Peace is mainly defined through a strategic peace discourse that constructs peace as a fragile and temporary outcome of state interest-driven strategies rather than a normative, transformative ideal. Across both agencies, peace is constructed as a high-level, institutional, and state-led

process. Bottom-up, everyday, or civil society-oriented articulations of peace are largely absent, reinforcing a narrow, statist imaginary of peace.

Peace is also enacted through fluid and situational identity constructions of the rational, constructive peace-seeking "Us", alongside the evolving "Other". The "Other" is positioned along shifting "Enemy," "Aggressor," "Ally," and "Victim" roles, allowing for both the processes of Othering and strategic de-Othering, likely to facilitate pragmatic negotiations. This flexibility enables peace to be constructed as achievable without fully disarticulating antagonism, thereby maintaining the legitimacy of the ongoing militarization and securitization. Peace-seeking strategies are primarily articulated as intertwined diplomatic, military, and economic instruments. They are facilitated by enabling conditions such as strategic unity, decisive statescraft, and great-power gatekeeping over negotiation processes, and operationalized through methods of transactionality, pressure, enforcement, speed and methodical patience. Peace is thus ultimately justified through pragmatic aims, including state survival, balance of power, cost prevention, addressing root causes, and post-war recovery.

The dominance of the strategic peace discourse is likely shaped by the news logics of news agencies and marginalizes more autonomous articulations of peace related to social justice and social harmony. Given news agencies' agenda-setting power, these findings suggest that discursive constructions and understandings of peace remain closely aligned with hegemonic war logics. As a result, the democratic, emancipatory, and counter-hegemonic potential of peace discourses – central to long-term peacebuilding and participatory culture (Carpentier & Kejanlıoğlu, 2020) – remains largely untapped.

IIC02 Geopolitics, War, and Media

PP 0195 Russo-Chinese narrative alignment in international broadcasting: The case of Russia's invasion of Ukraine

Ilya Yablokov[1], Dani Madrid-Morales[1], Aybuke Atalay[1]

[1] University Of Sheffield, School of Information- Journalism and Communication, Sheffield, United Kingdom

This paper examines narrative alignment between Russian and Chinese state-sponsored international broadcasters in the context of Russia's full-scale invasion of Ukraine, situating this phenomenon within broader debates on authoritarian media cooperation, and the contestation of global information order (Dukalskis, 2021). Since the February 2022 declaration of a Sino-Russian "partnership without limits," scholars have questioned whether this geopolitical proximity has translated into coordinated or convergent mediated communication aimed at international audiences (e.g. Repnikova, 2022). Existing research has documented shared grievances against "Western" liberal hegemony and the promotion of multipolarity, yet systematic, longitudinal evidence on how such alignment operates in practice remains limited (Xu & Zhao, 2025).

Drawing on a mixed-methods design, the study analyses English-language video content produced by RT and CGTN and distributed via YouTube, Rumble and Odysee, including full subtitle transcripts. We compile a comprehensive corpus of all Ukraine-related videos across two one-year periods (January 2022 to January 2023 and July 2024 to July 2025), allowing us to capture both the initial phase of the war and a later period of geopolitical stabilisation. Using computational techniques, we identify the ten most prevalent narratives across the corpus and employ a large language model to classify videos accordingly. These classifications are manually validated, and the temporal evolution of narratives is plotted to assess convergence, divergence, and change over time. To contextualise these dynamics, we introduce a "control group" consisting of France 24, whose coverage, we posit, presents a perspective on the topic that is not embedded in Sino-Russian strategic alignment. To complement the computational analysis of the texts, we identify three critical events where narratives demonstrably converged or diverged across outlets, and we then perform in-depth qualitative and multimodal discourse analysis of videos published during these windows. This approach enables close examination of rhetorical strategies, visual framing, and justificatory logics at moments of heightened narrative salience.

Our findings point to a pattern of asymmetrical alignment. While RT and CGTN remain stylistically distinct, with RT favouring emotive and polarising rhetoric and CGTN adopting a more technocratic and ostensibly balanced tone, we observe a consistent unidirectional transfer of narratives from Russian to Chinese outlets. Specifically, CGTN increasingly amplifies and rationalises Russian-favoured frames concerning NATO's provocation, Ukraine's irresponsibility, and the legitimacy of a multipolar world order, often translating these claims into economic, diplomatic, or pragmatic registers designed to appeal to broader international audiences. No comparable evidence suggests a reverse flow of narratives from Chinese to Russian media. We argue that this pattern exemplifies a new phase of mediated cooperation among authoritarian states, characterised not by full narrative convergence but by selective strategic amplification. This sheds light on how global communication infrastructures contribute to the reproduction and legitimisation of alternative geopolitical orders beyond the West.

IIC02 Geopolitics, War, and Media

PP 0196 The 'Great Game' of media and politics in Africa: How geopolitics and BRICS+ media intervention shape newsroom practices in sub-Saharan Africa - A comparative study in seven African countries

Susanne Fengler[1], William Tayeebwa[2], Sara Namusoga[3], Ngozi Omojunikanbi[4]

[1] TU Dortmund University, Erich Brost Institute for International Journalism, Dortmund, Germany
[2] Makerere University, Department of Journalism and Communication, Kampala, Uganda
[3] Makerere University, Department of Journalism, Kampala, Uganda
[4] Port Harcourt University, Department of Journalism, Port Harcourt, Nigeria

While debates about the "de-Westernization" of communication studies have been ongoing for decades, the field has so far failed to capture the **profound implications of current geopolitical shifts for journalism and media systems worldwide**.

This paper addresses the absence of systematic knowledge on **how BRICS+ actors transform media ecosystems in sub-Saharan Africa** and beyond. Over the last decade, **China, Russia, the Gulf States, Iran, and BRICS+ applicant Türkiye, as well as Qatar,**have emerged as prominent players in African media development.

China complements **massive infrastructure investments** with **content partnerships** and journalism training (Li, 2024; Gallagher, 2025). Russia has opened its first pan-African **journalism training** center, in Namibia in September 2024 (Audinet, 2024). Iran, the Gulf monarchies, as well as Qatar and Türkiye have launched further initiatives in sub-Saharan Africa (e.g., KAS, 2021).

Rhetorically, **these actors frame their engagement as an effort to liberate African journalism from "Western-centric narratives"** (Ezeru, 2021). Yet **case studies from Kenya demonstrate the opposite**: These interventions often seek to impose the geopolitical agendas of BRICS+ countries (Lacher, 2022) on local news coverage rather than enabling autonomous framing of international topics (Madrid-Morales et al., 2021; Umejei, 2018).

In parallel, the **abrupt withdrawal of USAID** from almost all programs in 2025 marks a watershed moment (GFMD, 2025). Its termination effectively **ended decades of U.S. "soft power" investments into media and journalism in the Global South** and the post-Soviet space (Lugo-Ocando, 2020). But also development assistance by most other Western countries shows a sharp decline (OECD, 2025).

Against this backdrop, this paper present first results from a **3-year foundation-funded research project**, started in September 2025. The project investigates how BRICS+ interventions reshape newsroom practices and professional norms (Waisbord, 2025) in fragile African media systems. The project employs a **most-different-systems design** to analyze BRICS+ media interventions across seven diverse sub-Saharan African countries: **Burkina Faso, Ghana, Kenya, Malawi, Nigeria, Tanzania, and Uganda.** The study countries have been selected for their **variation in regime types, press freedom and media systems, colonial legacies, and exposure** to BRICS+ media strategies.

At ECREA 2026, we will present the results of a **comparative context-sensitive meta-analysis** (Card, 2015) in the African project countries, which will be followed by in-depth interviews with local media professionals and media managers in a second empirical step in 2027. **Results from our pilot desk study for Nigeria** show that China exerts the most systematic influence through content syndication (CGTN, Xinhua) and extensive journalism training programs that promote development-oriented and state-centric news frames. Russia complements this presence via digital outlets such as RT and Sputnik, as well as diplomatic briefings that foreground multipolar worldviews and anti-Western interpretations of global politics. But also South Africa operates as a regional hub advancing BRICS+ discourses on media sovereignty, while Brazil and India remain marginal, exerting only selective cultural or infrastructural media influence.

In our ECREA contribution, the African-European research team will present results for all seven study countries and **compare findings across systemic, organizational, professional, and individual levels of journalism** (Shoemaker & Reese, 1996).

IIC02 Geopolitics, War, and Media

PP 0197 To support or not to support: A framing analysis of the Lebanese media coverage of Hezbollah's 2023–2024 supportive war with Hamas against Israel

Tamer Farag[1], Christoph Neuberger[1], Sonja Kretzschmar[2], Annika Sehl[3]

[1] Freie Universität Berlin, Institut für Publizistik- und Kommunikationswissenschaft, Berlin, Germany
[2] University of the Bundeswehr Munich, Department for Journalism, Munich, Germany
[3] Catholic university of Eichstätt-Ingolstadt, Department of Journalism, Eichstätt, Germany

Through a framing analysis of the Lebanese media coverage of Hezbollah's support for Hamas against Israel in 2023 and 2024, this study scrutinizes how media can strategically argue for or against entering a regional war to support an ally. The contemporary media environment led to a transnational diffusion of war content across traditional and digital media (Knüpfer & Entman, 2018). The 7th of October 2023 war exemplifies this change. After Hamas ignited the war in October 2023, its ally in the Iranian 'axis of resistance', Hezbollah, declared a supportive war against Israel. Accordingly, the

Lebanese media debated the necessity of this supportive war. In September 2024, Israel shifted its focus from Hamas to Hezbollah's front.

Building on the rich literature on media's (strategic) framing of conflicts (see seminal studies such as Hallin, 1986; Lee & Maslog, 2005, and the literature review of Knüpfer & Entman, 2018), this study contributes to the literature on the media (strategic) framing of supportive war in the transnational hybrid media system (Arafat & Harb, 2025). The websites of six Lebanese outlets are analyzed: *al-Manar, OTV, al-Jadeed, LBCI, Megaphone,* and *MTV.* The selected outlets differ significantly in their stance toward Hezbollah, ranging from total support (*al-Manar*) to total adversary (*MTV*). From each outlet, its coverage of the war's first month (from 7.10.2023 to 7.11.2023) and the month of escalation (from Israel's pager attack on 17.09.2024 to 17.10.2024) was collected. The summary of the news in the main news bulletin or the daily summary was collected from each outlet; hence, about 60 daily summaries were collected (n = 334). A quantitative framing analysis of the whole sample was conducted in which frames were coded as multi-item constructs based on Entman's (1993) framing elements (problem definition, causal attribution, moral evaluation, and treatment). This quantitative method was followed by a qualitative framing analysis (Scheufele, 2003) of the articles published on the days of exceptional events with the highest news value, such as the pager attack and the assassination of Hassan Nasrallah.

The initial results of the mixed methods show that the pro-Hezbollah media, particularly *al-Manar* and *al-jadeed,* relied on Hamas' videos on social media to frame the axis of resistance as much stronger than Israel. Unsurprisingly, they focused on Israel's killing of civilians in Gaza. In contrast, anti-Hezbollah media, such as *MTV, LBCI,* and even to a lesser degree *Megaphone*, framed the conflict as a one between Iran and Israel, where Lebanon is sacrificed for Iran's interests. The central difference between the pro and anti-supportive war framing was not the moral depiction of Israel, as all the outlets framed Israel as an aggressor, but the power estimation. Our results show that in the current hybrid transnational media system, the media endorsing a supportive war focus on the content of their allies on the Internet to frame them as mighty. Conversely, the media against the war amplify its costs by framing the enemy as strong and the ally as selfish, exploiting the supporting actor in an immoral regional conflict.

IIC03 Journalism and Media in Challenging Contexts

PP 0313 Navigating exile in Germany: How home-country contexts shape journalistic practice

Carola Richter[1], Anna Litvinenko[1], Hanan Badr[2]

[1] Freie Universität Berlin, Communication Studies, Berlin, Germany
[2] University of Salzburg, Communication Studies, Salzburg, Austria

This comparative study examines how the cultural and sociopolitical contexts of journalists' home countries shape their experiences and professional practices in exile in Germany. While Germany provides a common host-country setting, the study demonstrates that exile journalism cannot be understood without close attention to the historically specific trajectories of repression, professional cultures, and political conflict in the home countries from which journalists originate.

Theoretically, the study conceptualizes exile as a condition of political and professional in-betweenness (Arendt, 1943), in which journalistic roles, identities, and norms are renegotiated under conditions of displacement. Building on research on journalism in exile and diaspora journalism (Skjerdal, 2011; O'Loughlin & Schafraad, 2016; Porlezza & Arafat, 2022), the article approaches exile journalism as a distinct transnational mode of practice shaped by the interaction of macro-level contexts, meso-level organizational dynamics, and individual-level experiences. Particular attention is paid to how home-country media cultures, political cleavages, and repertoires of repression continue to structure journalistic work and self-perception in exile.

Empirically, the analysis draws on 50 qualitative, semi-structured interviews with journalists from Afghanistan, Belarus, Russia, Syria, and Turkey residing in Germany. Using a multi-level analytical framework, the study examines how macro-level conditions in the country of origin—such as the nature of the restrictive turn, patterns of political persecution, media system characteristics, and cultural understandings of journalism—interact with meso-level dynamics (media organizations and exile communities) and micro-level factors (personal situation, motivation, and professional role-conception) in the German context.

The preliminary findings reveal pronounced differences across national groups. Journalists from Syria and Afghanistan, shaped by experiences of war, regime collapse, and existential threats, often approach exile as a permanent rupture and articulate journalism primarily as moral witnessing or advocacy, yet frequently disengage from professional practice due to exhaustion, devaluation, and limited prospects. Turkish journalists' experiences are strongly influenced by long-standing political polarization and hybrid repression, resulting in fragmented exile communities that reproduce home-country divisions in Germany. Russian journalists, socialized in comparatively professionalized media environments but confronted with rapid authoritarian escalation, more often frame exile as provisional and continue journalistic work with a strong emphasis on professional autonomy, albeit under conditions of precarity and intensified competition.

Across all cases, the study shows that home-country contexts continue to structure exile by shaping expectations of return, orientations toward activism, patterns of community formation, and as well as their experiences in Germany. By systematically comparing journalists from different sociopolitical and cultural backgrounds within the same host country, the study

demonstrates that exile journalism is a relational and context-dependent practice, deeply embedded in the legacies of the countries journalists leave behind. The findings highlight the analytical value of integrating home-country contexts into research on exile journalism and point to the need for support measures that account for these differences.

IIC03 Journalism and Media in Challenging Contexts

PP 0314 Communicative function and journalistic role performance of poltical satire across cultural contexts.

Andreas M. Kraxberger[1]

[1] University of Innsbruck, Media- Society and Communication, Innsbruck, Austria

Political satire has increasingly established itself as a hybrid genre that blends entertainment, information, and political critique, occupying a contested space at the boundaries of journalism and popular culture. While a substantial body of research documents the democratic relevance of satirical news formats in the United States, comparative research across cultural and media-systemic contexts remains limited. This imbalance is largely attributable to the historical dominance of U.S. late-night satire within both the genre itself and the scholarly literature. As a result, it remains unclear to what extent established findings on political satire's communicative functions and journalistic behavior travel beyond the U.S. case. This study addresses this gap by offering a systematic cross-national comparison of weekly news satire in three distinct media systems: the United States (*Last Week Tonight with John Oliver*), Germany (*ZDF Magazin Royale*), and Austria (*Gute Nacht Österreich*). Building on theories of discursive integration and journalistic role performance (JRP), the study employs a Large Language Model–Assisted Content Analysis (LACA) to code 6,356 sentences from 30 main segments across the three programmes, analyzing thier communicative functions (humorous, informative, evaluative, and complex speech) and journalistic role performance, with particular attention given to the "comedic interlocutor" role as a genre-defining feature of satirical news. The LLM-assisted approach enables fine-grained, scalable analysis while maintaining transparency and reliability through validation against human coding. The findings reveal both shared genre characteristics and meaningful cross-national variation. All three programmes rely heavily on hybrid communicative strategies and consistently perform the comedic interlocutor role, underscoring political satire's transnational family resemblance. At the same time, distinct national patterns emerge. U.S. satire places stronger emphasis on civic education and mobilization, German satire foregrounds watchdog journalism and investigative critique, and Austrian satire leans more toward informative delivery with comparatively fewer evaluative or activist elements. Taken together, these results highlight the importance of media-systemic and cultural context in shaping satire's journalistic role performance. Beyond its substantive findings, the study also demonstrates the methodological viability of LLM-assisted content analysis for comparative research in journalism and political communication, offering a scalable tool for analyzing hybrid genres across linguistic and national boundaries.

IIC04 Identity, Migration, and Intercultural Lived Experiences

PP 0421 From Saporo ramen to Black hair salons: The banal construction of difference in urban spaces

Mélodine Sommier[1], Delia Dumitrica[2]

[1] University of Jyväskylä, Language and Communication Studies, Jyväskylä, Finland
[2] Erasmus University Rotterdam, Media & Communication, Rotterdam, Netherlands

Drawing from racial and ethnic studies, critical nationalism studies, and urban studies, this study explores the symbolic construction of difference in and through cityscapes. Empirically focusing on the case of a multicultural urban center (Rotterdam, The Netherlands), this paper asks: How do commercial spaces in multicultural urban spaces articulate difference?

Under the impetus of Billig's banal nationalism argument, critical nationalism studies have foregrounded the mundane reproduction of the nation in everyday life (Fox & van Ginderachter, 2018). While research on nationalism and on racism tended to develop in separate disciplinary arenas (Rutland, 2022), the emergence of race as a social category has historically been interwoven with the emergence of nationalism (Zantedeschi, 2022). Literature about race, nationality and ethnicity in Europe points to the ambiguity and plasticity of these concepts that are covertly conflated at times (Lentin, 2020). While much scholarship has explored these concepts separately, this study looks at their (banal) entanglements to understand which meanings are stabilized, and how, when the notions of race, ethnicity and nationality are juxtaposed.

We draw from data collected during several datawalks undertaken by both researchers and study participants through Rotterdam in spring 2024 in the area of West Kruiskade, also known as 'China Town' in Rotterdam. These datawalks were part of a larger project exploring the racialization of space and the spatiality of race, generating data - photographs and recorded conversations – centered upon the perceived role of urban infrastructure in making race (in)visible. During these datawalks, the semiotic entanglement of race, nationality, ethnicity, and class, driven by commercial and urban planning logics, emerged inductively as crucial to place-making. In this study, we present an analysis of this semiotic entanglement by focusing on the visual presentation of three exemplary commercial places – an Asian restaurant, an expat shop, and a Black hair salon. Informed by semiotic and discourse analysis, we focus on the way in which the different elements of the shop front (i.e., shop name, logo, promotional text and illustrations, window displays) and the shop location (i.e., immediate surroundings) intersect and create a particular chain of signification through which difference is offered as an object of consumption for various imagined audiences.

Preliminary findings underline the tensions at play in, on the one hand, making race visible where elsewhere it is erased and, therefore, providing spaces of belonging (Joseph, 2014) and, on the other hand, doing so through a consumerism discourse that risks depoliticizing race, ethnicity and nationalism (see also hooks, 1992). Understanding the entanglement of these notions with one another and with commodification discourses offers relevant pointers to further apprehend how these notions may contribute to and/or impede conceptualizing (post-)capitalist cities (see Chatterton Pusey, 2020). Overall, these findings speak back to the different disciplines we draw on and that have typically foregrounded only race, only ethnicity or only nationalism by showing the transdisciplinary implications of exploring the interplay of these notions with one another and in and through everyday discursive and materialities urban realities.

PP 0422 Intersectional identity in liminality: Narrative identity and transnational inequality in the case of asylum-seeker mothers in Hong Kong

Ruiyao Wang[1], Man Mei[2]

[1] Cornell University, Communication, Ithaca, USA
[2] Hong Kong Baptist University, Communication, Hong Kong, Hong Kong

Intersectionality (Crenshaw, 1991) has been extensively applied as a framework for examining marginalization, particularly in the case of women who face multiple layers of oppression. Although existing scholarship has expanded to include a broad range of identities - among which gender, race, and class are the most frequently discussed - current research often falls short of unpacking the complexities of context-identity interactions that produce or reinforce marginalization and shape the lived experiences of marginalized communities. This study argues that this application gap of intersectionality is especially evident in research on forced migrant women, whose lives are marked by *liminality* - a transitional condition in which legal status and social positions are constantly shifting and remain ambiguous across multiple sociocultural and political contexts (Marotta, 2025). Therefore, rather than piling up discussions of gender, race, and other identity categories, this study contends that it is necessary to recognize that the home and host societies these migrant women move through function as relationally entangled contexts that shape their experiences as women, as forced migrants, and as well as other social identities.

To map out these multi-contextual identity complexities, this study proposes a new analytical approach by integrating the *Narrative Identity* and the *Narrative Identity Structure Model* (Dunlop, 2017) with intersectionality, grounding the analysis in various self-aspects - that is, social roles situated in specific contexts - embedded within migrant women's life storytelling. Drawing on the thematic narrative analysis of narrative identity data from 14 asylum-seeker mothers in Hong Kong, this study demonstrates that these migrant mothers' liminal struggles extend beyond categorical identity thinking. Instead, marginalization emerges from a networked form of suppression shaped by relational, social, and personal identities that span from domestic to broader societal contexts. Eight self-aspects are identified in the narrative data: (1) mother; (2) asylum seeker; (3) daughter and female family member; (4) wife or female partner in Hong Kong; (5) religious woman; (6) former domestic helper; (7) woman from an underdeveloped region; and (8) woman of low or middle class. These self-aspects illustrate both the enduring influence of these women's home societies during the post-migration period and the necessity of attending to the domestic context, in which the family operates simultaneously as a site of support and oppression. Moreover, their liminality and marginalization are rooted in exploitative migrant labor structures and in the social differences they encounter along their journeys from labor-exporting or politically turbulent regions to Hong Kong. The case of asylum-seeker mothers in Hong Kong presented in this study calls for future migration scholarship to more closely examine how forced migrants' identities are manifested across contexts, and to recognize personal narratives and life storytelling as a voice-giving channel that positions participants at the center of the intersectionality-guided analytical process.

PP 0423 Withering away from 'westernormativity': Structures and subjectivities of heading toward the West and back again in Central and Eastern Europe

Irena Reifová[1], Lýdie Kárníková[2]

[1] Charles University, Faculty of Social Sciences, Praha, Czech Republic
[2] Czech Academy of Sciences, Institute of Contemporary History, Prague, Czech Republic

Over the past decade, public debates in the Czech Republic have increasingly included hostile reactions to decolonial and antiracist agendas emerging from the West, such as Black Lives Matter or efforts to decolonise cultural institutions. These initiatives are often portrayed as culturally alien, patronising, or irrelevant to local historical experience. This paper

examines why and how such Western-originated emancipatory discourses are rejected in a postsocialist context that, after 1989, was strongly oriented toward Western liberal norms. It asks how this dismissive reception is shaped by postsocialist subjectivities, experiences of semi-peripheral subalternity, and shifting perceptions of East–West hierarchies.

The study is grounded in interdisciplinary theoretical frameworks from cultural studies, postsocialist studies, and postcolonial scholarship. We introduce the concept of westernormativity to describe the early post-1989 dominance of Western liberal democracy, market capitalism, and human-rights discourse as an uncontested normative horizon in Czech society. Drawing on theories of East–West hierarchy (Krastev, Zarycki, Melegh, Todorova, Slačálek), we conceptualise the recent rejection of decolonial agendas as part of a broader erosion of westernormativity. We further engage affect theory to understand how emotions such as irritation, resentment, fatigue, and anger shape popular responses to perceived liberal imperatives and pedagogical pressures.

Methodologically, the paper combines qualitative social media research with narrative interviewing. First, we compiled a corpus of Czech media coverage (2018–2022) addressing antiracist and decolonial topics and identified highly commented articles shared on Facebook. These articles were treated as "trigger points" that elicited affectively charged reactions. From the accompanying comment threads, we selected dismissive or derogatory comments and contacted their authors. In the second phase, we conducted fourteen in-depth narrative interviews with these commenters between November 2023 and February 2024. The interviews integrated biographical, semi-structured, and trace-based elements and were analysed using thematic and nominal coding with a focus on affect, geopolitical belonging, and postsocialist experience.

Our analysis shows that decolonial and antiracist agendas function less as substantive issues and more as symbolic proxies for broader sociopolitical frustrations. Decolonial discourse is perceived as part of an intrusive Western liberal pedagogy rather than as a locally relevant moral project. Anti-"woke" expression subsequently operates as a form of reversed pressure and symbolic dissent, often drawing on memories of socialist authoritarianism. Respondents articulate a strong sense of postsocialist subalternity, shaped by lived experiences of East–West hierarchy and imitation. Emotional responses to decolonial agendas are dominated by irritation, resentment, and a desire to resist perceived moral coercion.

The rejection of decoloniality reflects a broader shift from post-1989 westophilia toward ambivalent or openly westophobic orientations. Together, these findings contribute to understanding how postsocialist affective histories co-shape contemporary culture wars in Central and Eastern Europe.

PP 0424 Between 'Us' and 'Them': Representing Roma communities in Czech and Slovak television news

Renata Sedláková[1], Peter Ivanič[2]

[1] Palacký University CMTF, Communication studies, Olomouc, Czech Republic
[2] Comenius University Bratislava, Journalism, Bratislava, Slovakia

This paper presents a research-in-progress project examining the media representation of the Roma minority in television news in Slovakia and the Czech Republic, with particular attention to the role of public service media in shaping narratives of ethnicity and cultural difference. Focusing on both public broadcasters (STVR, Czech Television) and major commercial stations (Markíza, TV JOJ, TV Nova, TV Prima), the project investigates how news discourse constructs Roma communities as social actors and how these constructions vary across two closely related Central European countries.

The study is theoretically grounded in critical theories of media representation and news discourse. It draws on Stuart Hall's concept of representation as a meaning-making practice, van Dijk's critical discourse analysis of ethnicity and new(s) racism based in othering. These frameworks enable an examination of how ethnic difference is discursively produced, normalized, and circulated through routine journalistic practices, as well as how symbolic distinctions between "us" and "them" are sustained in everyday news narratives. Particular attention is paid to the normative expectations placed on public service media regarding mainly social responsibility and emphasis on compliance with legislative requirements of objectivity, balance, and impartiality.

Methodologically, the project combines quantitative content analysis with qualitative discourse and semiotic analysis of selected television news programmes. These media analyses are complemented by in-depth interviews with journalists, editors, and news producers, alongside interviews with representatives of Roma communities, in order to connect representational practices with both production logics and lived experiences of mediated visibility. The paper outlines preliminary observations and illustrative case studies based on available data from the year 2026, specifically the case of New Year´s Eve celebrations in a Roma settlement. In addition, the project adopts a diachronic perspective by comparing contemporary representations with selected public service news coverage from 2015, for an assessment of continuity and change in dominant representational patterns over time.

The project proceeds from the assumption that media representations play a central role in shaping perceptions of ethnic minorities and in reproducing symbolic hierarchies in society. It hypothesizes that recurrent narrative structures, used visuals, and framing tend to reinforce cultural otherness and negative connotations associated with Roma communities, which are still significantly reported by public opinion research in both countries. The project seeks to contribute to critical

discussions on media responsibility and to formulate empirically grounded recommendations supporting more inclusive and reflexive journalistic practices.

PP 0425 Building confidence in multilingual groups: Student experiences from a short-term mobility program within Higher Education

Lotta Kokkonen[1], Teija Natri[2], Kanako Nishizumi[3]

[1] University of Jyväskylä- Finland, Language Center, Jyväskylä, Finland
[2] University of Jyväskylä- Finland, Centre for Multilingual Academic Communication, Jyväskylä, Finland
[3] Chiba University, College of Liberal Arts and Sciences, Chiba, Japan

The recent waves of political and economic instability, coupled with the global pandemic, have highlighted just how deeply interconnected the world has become—an interconnectedness that is clearly reflected in the operations of higher education (HE) institutions. Within Europe, policymakers increasingly urge higher education institutions (HEIs) to cultivate students' internationalization competences through initiatives such as the European Universities Initiative and the Erasmus+ program. Yet this push toward internationalization extends far beyond Europe. A global survey of 907 HEIs across 126 countries indicates that internationalization has become a worldwide trend. Institutions are now expected to equip students to act as "global citizens" who can collaborate effectively in a world that is both highly connected and marked by uncertainty.

For many students, this expanding internationalization often translates into studying in English, even as numerous scholars argue that the linguistic complexities of higher education deserve far more attention. Despite the extensive research on internationalization from diverse thematic and analytical perspectives, the role of multilingualism and multilingual communication remains relatively underexplored—especially from the viewpoint of students themselves.

There is a growing call for ethical and responsible approaches to internationalization—approaches that, for instance, ensure educational environments are designed to support the needs of marginalized students. Many scholars advocate for institutions to assume greater responsibility in fostering culturally inclusive practices. In line with Burke (2025), we recognize the urgent need to critically examine linguistic hierarchies in academia and to engage more meaningfully with the linguistic repertoires of multilingual students.

The ongoing push toward internationalization in higher education (HE) is often experienced by both teachers and students as a source of turbulence in their daily teaching and learning, bringing issues of equity and participation to the forefront. Students, in particular, frequently report heightened anxiety and stress when studying in multilingual settings or in a language other than their first language (L1).
