In this presentation we present a qualitative study that investigates the experiences of students working in international groups during a short-term mobility program at a Finnish university. Using reflective papers from 15 students and recordings of four group meetings, the study examines how students perceived their confidence and learning in a multilingual environment, as well as how they employed multilingual practices during group discussions. While students noted that becoming aware of multilingual communication encouraged them to reflect on inequalities within diverse groups, actual multilingual practices were less evident in their interactions. The findings indicate that students' learning and sense of confidence were strongly shaped by their relationships with peers. The study highlights the need to further examine and theorize communication competence and confidence as contextual and co-constructed phenomena.

IIC05 Inequalities, Activism, and Social Justice Communication

PP 0528 Structural inequalities in internet access: Digital presence and barriers encountered by people experiencing homelessness

Karolína Kozumplíková[1], Vojtěch Dvořák[1]

[1] Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

The internet, as well as digital presence, has long been linked to community, participation, and the creation of human connections. Nonetheless, this engagement can presuppose users' ability to overcome limitations, inequalities, and barriers associated with the use of digital media. These conditions then divide users into groups with different access to such networks (Castells, 2009). Unhoused people, being one such disadvantaged group, collaborated with university students in open action discussions through participatory action research (PAR), conducted in Brno, Czech Republic.

The project was designed as an open-ended agenda, inviting participants into a dialogue in which the themes of discussion were brought to the foreground by the people experiencing homelessness themselves. This made it possible to identify the key issues they experience when attempting to engage in online environments. Their responses were recorded during six open action group discussions and were examined through thematic analysis, which enabled the identification of recurring patterns as well as shared experiences.

The structural barriers identified in this study form a sequential continuum, ranging from material precarity, through functional limitations and towards institutional exclusion. The first overarching theme of material precarity did not include only the financial liability associated with acquiring a digital device, such as a mobile phone, but predominantly focused

on theft. Participants described the theft of mobile devices as a pervasive and recurring issue among people experiencing homelessness.

The material dimension was closely intertwined with the second theme of functional limitations. Due to limited financial resources, participants frequently relied on prepaid mobile data plans, which were often exhausted quickly, compelling them to seek access to free Wi-Fi networks. However, these access-providing spaces were described as offering unreliable and constrained functionality. Participants reported recurrent issues related to slow network performance, websites crashing due to high user congestion, and the necessity to repeatedly navigate complex login interfaces in order to reconnect to the same network.

These functional limitations involving time-prolonging conditions further intersect with the third theme of institutional exclusion. Participants observed that the extended time required to access the internet in public locations frequently exposed them to increased surveillance and policing. They stated that this often resulted in their eviction from these spaces based on their appearance. Moreover, in locations that initially enabled participants to mitigate some of their digital barriers, which included not only Wi-Fi spots but also electrical outlets, such facilities were subsequently restricted or removed. This process effectively instituted forms of gatekeeping around digital access. In response to repeated exclusion, participants reported deliberately avoiding heavily monitored spaces, a strategy that further intensified their social and spatial isolation.

By analysing these main themes, the paper demonstrates structural barriers to digital participation among people experiencing homelessness as not isolated, but cumulative and structurally produced. Such results emphasise how access to the internet is embedded in broader social, economic, and spatial conditions (Helsper, 2021) that systematically disadvantage unhoused populations. Understanding digital exclusion in this way offers a basis for developing inclusive digital policies that address the structural conditions under which digital participation becomes more accessible.

IIC05 Inequalities, Activism, and Social Justice Communication

PP 0529 Communicative practices of the Brazilian agroecology movement: Ancestrality, joy, and care in 'reforesting' the world

Fernanda Favaro[1]

[1] Malmö University, K3, Malmö, Sweden

While media narratives of ecological crises offer a widespread sentiment of despair and paralysis, several collectives have been working outside the spotlight of Western(ized) realms to recreate eco-social connection, community and care. In Brazil, the agroecology movement has been offering a powerful counter-narrative to the "end of the world" tale through its communicative practices rooted in ancestrality, joy/celebration, and reaffirmation of the commons. In this paper, I explore how agroecology in Brazil, beyond being a sustainable mode of food production, constitutes a social movement and a communicative field that challenges disconnection, apathy, fear, and ecological grief by fostering embodied, collective, insurgent and interspecies forms of care. Drawing on Indigenous and Afro-diasporic epistemologies, I analyze how movement's *agrifood* practices - such as garden classes, communal cooking, collective food-growing, talk circles, and feasts – appear as communicative practices that prefigure new (agrifood) futures.

Inspired by Brazilian philosopher Ailton Krenak's assertion that "the future is ancestral" (2020), Muniz Sodré's conceptualization of the entity *Exú* as a communicative category (2017), and Geni Nuñez ideas around "reforestation of the imaginary" (2017, 2021), among other emergent scholars, I argue that agroecology's communication practices operate through relationality and messiness, challenging hegemonic, linear, and necropolitical narratives of progress. Through its rituals, diverse movement actors construct networks of care that dissolve the human-nonhuman binary, repositioning nature/culture as an active communicative agent. Thus, they disrupt the crisis-driven framing of environmental discourse, "composting" despair into radical práxis.

By situating agroecology within post-colonial and post-human communication frameworks, the paper highlights its potential to reframe environmental/climate and other "polycrisis" not as endpoints, but as cracks from which collective coexistence and eco-social transformation are flourishing. It aligns itself with broader decolonial movements that envision futures not predicated on extraction, exploitation and destruction, but on concrete interventions based on reciprocity, diversity and mutual care. Agroecology's communicative dimensions thus serve as a vital lens for thinking a planet beyond the Western paradigm, offering possible paths toward regenerative, "reforested" worlds.

IIC05 Inequalities, Activism, and Social Justice Communication

PP 0530 #GiveCredit as intercultural digital activism contesting traditional textile appropriation in global fashion

Oana-Maria Calin[1], Camelia Cmeciu[1]

[1] University of Bucharest, Department of Journalism, Bucharest, Romania

Cultural appropriation in global fashion has become a critical field of debate, raising ethical, economic, and intercultural concerns in an increasingly digitized and interconnected world. The #GiveCredit campaign-initiated by the Romanian cultural platform La Blouse Roumaine-provides a relevant case study for examining how digital activism challenges asymmetrical

power relations in cultural production and questions the boundaries between inspiration, appropriation, and intellectual property. This research situates the campaign within the broader debates on cultural appropriation, digital participation, and ethical accountability in the creative industries.

While previous studies have documented numerous cases of textile plagiarism and misappropriation by major fashion brands (Sadaba et al., 2020; Jankowska & Sorokowska, 2023; Turok, 2021), Romanian examples have been largely absent from global mappings of cultural exploitation. Between 2012 and 2019, over forty cases of textile plagiarism were recorded globally (Turok, 2021), yet the Romanian "*ia*"-a traditional hand-embroidered blouse symbolizing local heritage and identity- only entered the international conversation through the Give Credit campaign launched in 2017. Using hashtags such as #GiveCredit, #RespectOrigins, and #SupportCommunities, La Blouse Roumaine built a visual counter-narrative on social media, juxtaposing images of luxury fashion items from Dior, Louis Vuitton, Tory Burch, Valentino, and Mango with authentic Romanian garments from museum archives and artisan collections.

This research explores how La Blouse Roumaine redefines intercultural communication by transforming social media into a space of transnational dialogue and resistance. Through a qualitative content analysis of Instagram posts and user interactions (2017–2023), the study identifies recurrent themes such as authenticity versus imitation, heritage as shared responsibility, community-based authorship, and the ethics of inspiration. The findings reveal how La Blouse Roumaine successfully mobilized a dispersed digital audience into a cohesive advocacy network that acts as a "cultural watchdog," exposing appropriation while simultaneously educating global publics about intangible cultural heritage. The campaign exemplifies how intercultural encounters unfold in digital environments, as online spaces become arenas of negotiation between Western fashion systems and Eastern European cultural producers historically marginalized in global creative hierarchies (Kaneva & Popescu, 2011). The Give Credit movement also challenges neoliberal narratives of national branding that commodify identity for global visibility (Brown, 1998; Turok, 2021), reclaiming instead an ethics of reciprocity and acknowledgment rooted in local craftsmanship and collective authorship.

By situating La Blouse Roumaine within the dynamics of "call-out culture" (Gerrie, 2019) and digital resistance (Corradini, 2024), this paper contributes to ongoing discussions about how online activism can foster epistemic justice and reshape intercultural power relations in the creative industries. It argues that campaigns like #GiveCredit mark a paradigmatic shift in how cultural dialogue occurs-no longer mediated solely by institutions or brands, but co-created by communities asserting ownership over their narratives.

Ultimately, this study illuminates how grassroots digital activism from Eastern Europe not only contests cultural extraction but also reimagines the paths, connections, and futures of intercultural communication in the era of algorithmic visibility, global fashion flows, and the search for ethical cultural exchange.

IIC05 Inequalities, Activism, and Social Justice Communication

PP 0531 Hybridization or homogenization? Saudi women fashion entrepreneurs as intercultural mediators on Instagram

Nadine Jitan[1]

[1] Univeristy of business and technology, Jeddah College of advertising, Jeddah, Saudi Arabia

This paper examines how influential Saudi women fashion entrepreneurs negotiate cultural identity on Instagram within the context of global branding and advertising practices. As digital platforms intensify transnational cultural flows, scholarly debates continue over whether globalization promotes cultural homogenization or enables hybrid identity formations. Positioned within International and Intercultural Communication research, this study asks: How do Saudi women fashion entrepreneurs balance cultural heritage with global marketing logics in Instagram advertising content, and what forms of intercultural negotiation emerge? The study employs a qualitative content analysis of Instagram posts and reels produced by six influential Saudi women fashion entrepreneurs between 2022 and 2025. The analysis focuses on visual representation, captions, and branded advertising content, examining how fashion, self-presentation, and commercial collaborations function as sites of intercultural meaning-making. By analyzing recurring patterns in dress practices, aesthetic choices, brand localization strategies, and cultural references, the study explores how global fashion narratives are adapted, negotiated, or reinterpreted within the Saudi context. Findings reveal three interconnected patterns. First, fashion emerges as a cultural product delivered through advertising, where global brand campaigns are selectively localized to align with Saudi cultural values, modesty norms, and national identity markers. Rather than reproducing standardized global marketing scripts, influencers actively adapt visual and textual elements to maintain cultural legitimacy. Second, fashion functions as a tool of cultural storytelling through which Saudi women entrepreneurs challenge stereotypical or negative representations of Saudi women. Through curated content, they present modern Saudi femininity as entrepreneurial, confident, and globally engaged while remaining rooted in cultural continuity. Third, the growing global interest in the Saudi market positions these women as key intermediaries who bridge international brands and local audiences, simultaneously promoting Saudi fashion and culture on a global stage. Overall, the findings suggest that intercultural communication in this context is characterized by selective hybridization rather than cultural homogenization. Saudi women fashion entrepreneurs do not simply adopt Western fashion or branding norms; instead, they act as intercultural mediators who translate global commercial culture into locally meaningful forms. By foregrounding a non-Western, platform-based entrepreneurial context, this paper

contributes to intercultural communication scholarship by demonstrating how digital advertising spaces become arenas of cultural negotiation, agency, and identity transformation under conditions of globalization.

IIC06 Digital Media, Platforms, and Political Participation

PP 0739 Manufacturing moral panic: How local incidents fuel populist mobilisation – A qualitative network discourse analysis of Germany and Malaysia

Melanie Radue[1], Gayathry Venkiteswaran[2]

[1] University of Passau, Communication Studies, Passau, Germany
[2] Nottingham University Malaysia, Media- Languages and Cultures, Kuala Lumpur, Malaysia

This paper presents a comparative investigation of polarised media discourses and their political instrumentalisation in Germany and Malaysia – two countries characterised by rising populist sentiments, multi-ethnic social tensions, and a shift toward conservative-right political narratives. Adopting a cross-national, relational perspective, the study examines how localised incidents escalate into national populist panics. It focuses on the "Berlin Public Pool Riots" in Germany and the "KK Mart Halal Mockery" in Malaysia, analysing how these events triggered moralised and polarising debates that transformed isolated occurrences into platforms for populist mobilisation and identity politics.

Despite profound structural differences between the two countries, both cases reveal convergent discursive dynamics. Following a Most Different Systems – Similar Outcomes research design, the analysis demonstrates how single incidents are absorbed into broader narratives of cultural threat, producing high-stakes moral conflicts in which social groups are positioned as fundamentally incompatible. In Germany, conservative and far-right actors – most prominently the AfD – mobilise fears surrounding youth violence and migration by framing public pool incidents as evidence of a broader breakdown of social order. Media narratives frequently portray refugees and migrants as existential threats, thereby normalising exclusionary interpretations. These discursive dynamics coincide with tangible political consequences, including the AfD's rise to become the second-largest party in the 2025 Bundestag elections (20.6% of seats) and a marked increase in xenophobic violence.

In Malaysia, incidents such as the KK Mart sock scandal – where socks bearing the word "Allah" were sold – are mobilised by Malay-Muslim political elites to intensify ethnic and religious divisions. Within a multilingual and segmented media environment, such events are framed as moral transgressions against Islam, casting Chinese non-Muslims as disrespectful or morally deviant. These dynamics align with the broader "Green Wave," through which the PN coalition strategically mobilises ethnic-religious grievances. In both contexts, media narratives converge in constructing the nation as under siege, legitimizing calls for stricter control, exclusionary policies, and strong leadership.

The study is grounded in moral panic theory (Cohen, 1972; Goode & Ben-Yehuda, 2009) and extends it by integrating contemporary research on modern hate propaganda and populist mobilization frameworks (e.g. hate spin) to analyse mechanisms of discursive polarization (Brüggemann & Meyer, 2023). We argue that populist actors deliberately exploit moments of social uncertainty and perceived anomie to manufacture polarized moral panics. Through emotionally charged narratives, claims of victimhood, and "us versus them" framing, local incidents are reframed as existential threats to national identity, public order, or sacred values. These dynamics are amplified by media logics shaped by digital attention economies and platform-driven outrage.

Methodologically, the study advances qualitative discourse analysis by combining inductive qualitative network analysis (QNA) with discourse network analysis (DNA; Leifeld, 2017). This relational, qualitative mapping approach allows us to remain sensitive to cultural and contextual asymmetries.

The findings show that polarized moral panics follow a self-reinforcing cycle: discursive moralization deepens perceived social anomie, increases receptivity to populist leadership, and further intensifies polarization. Media do not merely reflect these dynamics but actively structure them by amplifying marginal incidents and privileging moral binaries over contextualized reporting.

IIC06 Digital Media, Platforms, and Political Participation

PP 0740 Live-streaming platforms, celebrity influencers, voter political participation in the Czech's 2023 Presidential election: A text mining study of media discourses, social media sentiment analysis, and voters' reflective narratives

Kenneth C. C. Yang[1], Yowei Kang[2]

[1] The University of Texas at El Paso, Communication, El Paso, USA
[2] Auburn University at Montgomery, Communication and Theatre, Montgomery, USA

Introduction

Livestreaming platforms have emerged as important players in the streaming media ecosystem, in which real-time audio and video are broadcast via social media (Burroughs 2015), mobile (Garcia-Pineda et al., 2018), and video game (Johnson & Woodcock 2019,; Ruberg et al., 2019) technologies. This study examined the rise of live-streaming platforms and celebrity influencers in the Czech Republic to study their implications for political campaign activities and effectiveness. Situated in

the context of the Czech Presidential Election in January 2023. This mixed-method study employed a text mining approach of media discourse analysis, opinion mining of public sentiment on social media, and voters' reflective narratives on their political participation behaviors. The study was based on an integrated framework of influencer marketing and voters' political participation behavior literature to address these crucial phenomena by empirically testing the relationships of study variables derived from this theoretical framework. The objectives of the study are as follows: 1) to provide an overview and assessment of these increasingly important tools for various political campaign activities in the Czech Republic; 2) to evaluate the roles of the live-streaming platforms and celebrity influencers in the Czech 2023 Presidential Election as an example by collecting media discourse, social media sentiment, and voters' reflective/post-election narratives data to explore the relationships among live-streaming platforms and celebrity influencers, media framing and social media sentiment, and voter political participation behaviors.

Objectives of the Study

Findings from this study will provide communication scholars with a more thorough understanding of the roles of live-streaming platforms and celebrity influencers in the Czech Republic. Past political communication research has empirically proven the substantial effects of new media on the effectiveness of political campaigns (Owen, 2018). The recent emergence of live-streaming platforms and celebrity influencers offers scholars an excellent opportunity to investigate the impact of celebrity influencers on voter political participation. Academic research on live-streaming platforms in political communication has been sparse. Studies on live-streaming influencers as a source of persuasion in political campaigns are even rarer in the setting of the Czech Republic.

This study also addressed a significant yet less investigated trend with a growing number of Gen Z voters who rely on live-streaming platforms and celebrity influencers to make political decisions (Citarella, 2021). Most extant research has examined social media celebrities as a source of influence that affects consumer behaviors (Hughes et al., 2019; Sun et al., 2020). Our study filled this research gap by focusing on live-streaming influencers in political campaigns by examining the relationships between live-streaming influencers and voter political participation.

This study would make significant methodological contributions by applying a computational text mining technique to analyze media discourses, social media sentiment, and voters' reflective narratives about the 2023 Presidential Election in the Czech Republic. It could offer an innovative approach to understanding voter political participation through a lens of media framing and social media sentiment data. Methodologically speaking, the extracted insights from mining mainstream and social media discourses will provide better interpretive foundations.

IIC06 Digital Media, Platforms, and Political Participation

PP 0741 Negotiating Europe online: Platformed publics challenging power asymmetries in the EU-BiH intercultural communication

Jelena Gakovič[1], Camilla Folena[2], Gea Ducci[2]

[1] University of Sarajevo, Department of Philosophy- Faculty of Sociology, Sarajevo, Bosnia and Herzegovina
[2] University of Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

Digital platforms have become pivotal arenas for cultural diplomacy, identity construction, and citizen participation (Carta & Higgott, 2020; Cull, 2019; JRC, 2024; Somers, 1994), particularly within the evolving supranational European social space (Balibar, 2016). This study investigates the dynamics of platformed publics within a multi-scalar international communicative ecosystem, focusing on the European Union's (EU) digital communication at central and local levels, alongside Bosnia and Herzegovina's (BiH) national and sub-state actors during the country's attainment of EU candidate status.

Theoretically, the paper draws on the concept of the platform society (van Dijck et al., 2018) and adopts post-Western perspectives (Bhambra, 2023) to frame EU–BiH relations and online public opinion as embedded in cultural, historical, geopolitical, and identitarian dynamics. In this configuration, post-socialist and post-war societies such the Balkans (Todorova 1997; 2018) are often positioned as subaltern (Imre, 2014) or perpetual learners in processes of cultural translation (Buden, 2006) that mask enduring structural power asymmetries.

The study examines how platformed publics engage with EU-BiH official narratives on social media during two key moments: the granting of EU candidate status (2022) and the Europe Day celebrations (2023). Methodologically, a preliminary mapping identified the main public actors involved in these intercultural communication processes, including EU bodies (European Council, Commission, Parliament, EU in BiH, Europe House) and BiH national and sub-state institutions (Office of the High Representative, Ministry of Foreign Affairs, Directorate for European Integration, Federation of Bosnia and Herzegovina, Republika Srpska). A sample of 191 posts (out of 1,792) published on X and Instagram was selected based on two criteria: (1) explicit references to the EU accession process and (2) symbolic constructions of European belonging. For each post, the six most visible user comments were qualitatively coded to analyse public attitudes toward the "West" and the EU-BiH relationship.

Findings show that citizen responses are predominantly negative and mildly polarised. Public engagement frequently expresses distrust in institutions, political disillusionment, incivility, and symbolic opposition to Western hegemonic narratives. Platformed publics often accuse the EU of hypocrisy, neocolonialism, and treating BiH as a subordinate geopolitical

subject, mobilising historical trauma and, at times, conspiratorial frames. Visual and affective practices play a central role: provocative memes, emojis, and war-related references transform intercultural communication into a contested terrain around Eurocentric ideas of Europeanness. Despite outreach efforts, engagement remains limited, with many posts receiving few comments, reflecting both platform affordances and the constraints of top-down communication. The Office of the High Representative, a supranational-local authority imposed through the Dayton Agreement, emerges as a key site of decolonial contestation. Transnational traces- comments in German, Swedish, Albanian, and Slovenian- point to diasporic publics negotiating Europe from multiple positionalities.

Overall, the study shows that on digital platforms publics do not passively receive EU-related content: they recontextualise it through memory, irony, and affect, amplifying contestation rather than dialogue, opening future shifts and reflections over cultural and communication processes as symbolic repositories steeped in history, socio-technical cultural worlds, economic models and collective memory processes (Bartoletti 2011; Boccia Artieri et al. 2023; Couldry, Mejias 2019).

IIC06 Digital Media, Platforms, and Political Participation

PP 0742 A cross-cultural analysis of user responses to social media advertising in China and Spain

Yating Wang[1], Leila Mohammadi[1]

[1] Universitat Autònoma de Barcelona, Department of Advertising- Public Relations- and Audiovisual Communication, Barcelona, Spain

Social media advertising (SMA) has become widespread across the globe. Individuals from different cultural backgrounds may exhibit distinct responses to SMA. Examining the commonalities and differences in how audiences from various countries respond to social media advertising is essential for understanding the moderating role of culture and for informing the application of differentiated strategies in SMA.

Combined with Ducoffe's Web Advertising model, Theory of Planned Behavior, the theoretical model of SMA impact on Consumers' attitude, engagement, and Purchase intention and hypothesis have been constructed. The survey was conducted with Structural Equation Model (SEM) analysis and MGA analysis of 417 questionnaires between Spain and China to compare the relationships of SMA and user response and gain a deep understanding of how culture affects users' responses to SMA, based on 2 types of SM (ins VS Rednote; TikTok VS Douyin) .

The SEM analysis identified several consistent relationships in both samples. Information (IN) and Social Interaction (SI) were positively related to Attitude toward SMA (AT), supporting the universal importance of utility and connectivity. Furthermore, a positive Attitude (AT) was found to be a significant predictor of user Engagement (ENG). Regarding the final behavioral outcome, Social Norms (SN), Perceived Behavioral Control (PBC), and Engagement (ENG) all showed significant correlations with Purchase Intention (PI) in both countries. However, the drivers of a positive Attitude (AT) toward SMA, varied significantly between the two cultures. In the Chinese sample, Entertainment (EN) and Credibility (CR) positively predicted AT. This indicates that Chinese consumers' attitudes are positively shaped when SMA provides not only useful information and social features but also enjoyable and trustworthy content. Conversely, Irritation (IR) was not a significant predictor of AT in China. In the Spanish sample, a different pattern was observed. While IN and SI remained positive drivers, Credibility (CR) and Entertainment (EN) were not statistically significant. Instead, Irritation (IR) was a significant negative predictor. This suggests that Spanish consumers' attitudes are more sensitive to personalized relevance and are adversely affected by perceived irritations in SMA, while entertainment value and general credibility play a less decisive role. MGA analysis indicated that the attitude->engagement path was significantly different statistically between China and Spain. Other paths (IN-> AT, EN>AT, IR->AT, SI-> AT, CR-> AT, SN->PI, PBC->PI, ENG->PI) were not statistically significant.

This study fills the gap in comparative research that combines the two theories and offers practical implications for international marketing and global advertising communication across culturally distinct markets. Providing useful information and social interaction triggers in SMA is crucial to affect users' attitude, no matter cultural contexts. In addition, irritation has a negative relationship with AT in Spain, so marketers should avoid this to enhance user experience and trust.

ICS01 Interpersonal Questions of Identity, Culture, and Agency

PP 0755 Theory of motivated information management: A narrative review

Kai Kuang[1], Fangdan Zhang[1], Liming Liu[1]

[1] Tsinghua University, Journalism and Communication, Beijing, China

Since its initial introduction in 2004, the theory of motivated information management (TMIM; Afifi & Weiner, 2004) has been widely employed to explain how individuals experience, interpret, and respond to uncertainty in interpersonal contexts and beyond. At its core, TMIM conceptualizes the mechanism through which uncertainty discrepancy motivates information management decisions. Specifically, individuals assess the discrepancy between their desired and actual levels of uncertainty, evaluate the emotional and efficacy-related consequences of addressing that discrepancy, and ultimately decide whether and how to seek, avoid, or cognitively reframe information. Over the past two decades, TMIM has become a prominent theoretical framework for examining information management processes across a broad range of applied communication domains, including family communication, health communication, and discussions of sensitive or stigmatized topics in close relationships.

Empirical research grounded in TMIM has demonstrated substantial explanatory and predictive utility. Studies have shown consistent support for the theory's central propositions, particularly the role of uncertainty discrepancy in shaping emotional responses, outcome assessments, and information management strategies. TMIM has been used to examine communication surrounding topics such as illness disclosure, genetic testing, sexual health, organ donation, relational uncertainty, and end-of-life decision-making, among others. Recent meta-analytical work by Kuang and Wilson (2021) synthesized findings from nearly two decades of TMIM research, offering robust quantitative evidence for the associations among core TMIM constructs and identifying theoretical extensions and boundary conditions. This synthesis also underscored the methodological approaches adopted in the TMIM literature, including cross-sectional surveys, longitudinal designs, and experimental studies.

Despite its extensive application, TMIM scholarship has largely been developed and tested within WEIRD (White, educated, industrialized, rich, democratic) populations. As a result, the theory's cultural assumptions, contextual boundaries, and global applicability remain underexamined. Communication processes related to uncertainty, efficacy, emotion, and information management are deeply embedded in sociocultural norms, relational expectations, and structural constraints, all of which may differ substantially across cultural contexts. For example, collectivistic orientations, power distance, relational obligation, and culturally specific emotion norms may alter how individuals perceive uncertainty discrepancy, evaluate potential outcomes, or decide on information-seeking and avoidance behaviors.

In this manuscript, we first provide an overview of TMIM's theoretical foundations and key propositions. We then review contemporary applications of the theory, with particular attention to studies conducted in non-WEIRD contexts, including research in East Asia, the Global South, and culturally diverse communities. Through this review, we highlight emerging patterns, conceptual challenges, and methodological innovations that extend or complicate TMIM's original assumptions. Finally, we discuss critical considerations for advancing TMIM in international and culturally diverse settings, including the need to incorporate culturally grounded constructs, attend to structural and relational constraints on information management, and adopt comparative and mixed-methods research designs. By foregrounding cultural diversity and global applicability, this paper aims to contribute to the continued development of TMIM as a theoretically robust and culturally responsive framework for understanding motivated information management across contexts.

ICS01 Interpersonal Questions of Identity, Culture, and Agency

PP 0756 Being seen without a watcher: Discursive self-regulation in anonymous digital interpersonal communication

Ferit Mehmet Eren[1]

[1] Social Science Institute, Interpersonal Communication, İstanbul, Turkey

Digital interpersonal communication is increasingly shaped by a paradoxical condition: individuals communicate under conditions of anonymity while simultaneously experiencing a strong sense of being seen, evaluated, or misunderstood. This study examines how this internalized sense of visibility manifests itself discursively in everyday digital interpersonal interaction, focusing on anonymous confession practices. Drawing on Communication Privacy Management Theory (Petronio), the study conceptualizes online confessional discourse not as spontaneous self-disclosure but as a process of negotiated boundary management. Individuals do not simply "confess"; they actively regulate what to reveal, how much to reveal, and under which imagined conditions of audience reception. Uncertainty Management Theory (Brashers) is used as a secondary framework to illuminate how communicative uncertainty—particularly moral, social, and interpretive uncertainty—motivates these discursive strategies. The empirical material consists of six selected posts from the r/Confessions subreddit on Reddit, sampled across three consecutive years (2023–2025). Methodologically, the study employs a qualitative discourse analysis focusing on meta-communicative markers within interpersonal language. The analysis examines expressions of hesitation, self-censorship, anticipated judgment, and boundary negotiation embedded in the

posts. Rather than treating confessional content itself as the primary object of analysis, the study focuses on how speakers linguistically regulate their communicative acts prior to and during disclosure. The findings indicate that even in environments characterized by anonymity and lack of direct surveillance, individuals reproduce a communicative discipline shaped by imagined observation. Phrases expressing doubt, revision, deletion, and concern about interpretation reveal a form of "self-surveillance" embedded within interpersonal language. Over time, the analysis also suggests a subtle normalization of this discursive self-regulation, pointing to a shift from explicit anxiety toward routinized communicative caution. By situating anonymous digital confessions within interpersonal communication theory, this study contributes to ongoing discussions on digital interaction, privacy management, and the transformation of everyday communication practices. Rather than framing digital confession as liberation or exposure, the article argues that it represents a negotiated communicative space where visibility is internalized, managed, and linguistically enacted—without the presence of an explicit watcher.

ICS01 Interpersonal Questions of Identity, Culture, and Agency

PP 0757 Constructing professional identities in co-teaching: An oppositional discourse analysis of teacher team communication

Karoliina Salojärvi[1], Tessa Horila[1], Leena Mikkola[1]

[1] Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Co-teaching has become increasingly common in higher education. It ranges from joint classroom instruction to collaborative planning and curriculum development and is associated with benefits such as improved student learning and teachers' professional development. At the same time, teacher collaboration can be inefficient and challenging, with a central issue being the negotiation of teachers' professional identities. These identities may be challenged by questions of autonomy, ownership, and power (Minett-Smith & Davis, 2020).

Identity work involves dialectical tensions that have been studied little in interdisciplinary teacher teams, where teachers must reconcile different perspectives to produce pedagogically coherent study modules. This study investigates how professional identities are constructed through the communication of interdisciplinary teacher teams designing multilingual phenomenon-based courses at a Finnish university. Based on 4.9 hours of transcribed planning meetings, we apply Fairhurst and Putnam's (2019) integrative methodology to identify oppositional discourses and their management. Our analysis focuses on contrasting identity repertoires, i.e., discursive clusters through which teachers position themselves and enact agency.

Preliminary findings indicate eight contrasting identity repertoires: (1) *collaboration and community*, (2) *individual agency and expertise*, (3) *team structures and agency*, (4) *organizational demands*, (5) *pedagogical ideals*, (6) *equality*, (7) *hierarchies and norms*, and (8) *incompleteness*. For example, *organizational demands* clash frequently with *team structures and agency* in meeting discussions, generating tensions as teachers negotiate and balance shared pedagogies with organizational structures.

By examining these dynamics, the study contributes to scholarship on interpersonal communication and organizational discourse by showing how macro-organizational discourses manifest in micro-level team interaction and how these micro practices construct broader organizational conditions. Understanding identity (re)construction in teacher team communication can support flexible transitions between different identities and, in turn, enhance high-quality collaboration and teaching.

ICS01 Interpersonal Questions of Identity, Culture, and Agency

PP 0758 Listening without resonance: Inclusion performed, agency withheld

Sanna Ala-Kortesmaa[1]

[1] Tampere University, Department of Communication Sciences, Tampere, Finland

In knowledge-intensive workplaces, inclusion is often equated with opportunities to speak. Yet voice does not guarantee agency: contributions may be invited but remain unacknowledged, exposing a critical gap between participation and influence. In practice, inclusion is frequently operationalized as access to speak, with far less attention to how contributions are received or taken up. This paper addresses the research problem of why listening has not been recognized as a constitutive force of professional communication. To explore this, it asks how listening shapes the relationship between voice and agency, how it influences responsibility and institutional power, and how professionals experience inclusion and exclusion through being heard or ignored.

The study draws on a qualitative survey with narrative reflections from 25 professionals in higher education, public-sector expert organizations, and policy-oriented institutions. Participants described experiences of inclusion, participation, being heard, and being ignored. Reflexive thematic analysis, informed by the Theory of Ethically Resonant Listening (TERL) and following Braun and Clarke's (2006) six phases, identified patterns of resonance, refusal, and responsibility redistribution, highlighting the interpersonal dynamics through which listening mediates agency. Written reflections gave participants space to speak candidly about difficult experiences and produced diverse accounts across institutional settings. This method complemented TERL's emphasis on vulnerability and interpretive risk, allowing participants to narrate how listening shaped their sense of agency.

Three central findings emerge. First, inclusion is frequently organized around access to speak, while agency is mediated through listening: opportunities for voice do not automatically translate into recognition or actionable uptake. Second, listening redistributes responsibility asymmetrically, shifting interpretive and emotional labor onto speakers while shielding institutions from accountability. Third, listening without uptake serves as a mechanism of control, allowing critique to surface yet stripping it of consequence, maintaining organizational stability while constraining change.

These findings challenge dominant assumptions in interpersonal and organizational communication that equate voice with participation and participation with agency. They demonstrate that inclusion cannot be evaluated solely through opportunities to speak but must be assessed in terms of the ethical quality of listening: whether contributions are taken up, ignored, or burdened with unequal responsibility. Because inclusion has been predominantly defined through voice, listening has been treated as secondary and overlooked in theory. This study demonstrates that listening is in fact constitutive: it is the practice through which agency, responsibility, and dissent are negotiated. Theoretically, this reframes listening as an ethically resonant practice rather than a supportive skill. Empirically, it reveals how non-resonant listening redistributes responsibility and stabilizes institutional power. Practically, it indicates that inclusion efforts must extend beyond opportunities to speak, encompassing the ways contributions are received, affirmed, or disregarded. This perspective opens new directions for research on agency, responsibility, and recognition in professional communication, showing that the most consequential effects of interaction arise not from speaking, but from the relational and ethical dynamics of being heard.

ICS01 Interpersonal Questions of Identity, Culture, and Agency

PP 0759 Embodied accounts of physical work – A ventriloquial analysis of cleaners' break interactions

Malgorzata Lahti[1], Margarethe Olbertz-Siitonen[1], Mitra Raappana[1]

[1] University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

This study aligns with the material shift in organizational research by examining how physical bodies exert agency in constructing occupational identity and organizing. Prior research has addressed embodied identity work among high-skilled workers such as professional mothers (Turunen et al., 2025), minority entrepreneurs (van Merriënboer, 2025), and creative gig workers (Alacovska et al., 2025). Cleaning work literature has considered materiality but focused on the material quality of dirt to be cleaned rather than the body as the medium of menial labor (e.g., Hughes et al., 2017). Our study deepens the discussion by exploring the body's role in the communicative constitution of cleaning work.

We adopt a communicative constitution of organization perspective, which illuminates non-human agency and the body as materialized in interaction. Specifically, we investigate how cleaners ventriloquize their bodies (e.g., Cooren, 2012) during break interactions. Breaks represent a unique interface between personal and organizational spheres, serving as spaces for community building, coping, and voicing concerns away from managerial oversight (Holmström, 2025). Data comprises video recordings of 21 authentic breakfast and lunch breaks (≈45 minutes each) among cleaners in a large Finnish organization, collected in 2021.

We analyze the recordings using a ventriloquial framework (Nathues et al., 2021), identifying, grouping, relating, and showing ventriloquial effects. We seek to understand what happens when the cleaners let their bodies speak and what implications mobilizing the body has for the construction of the cleaning occupation and the organizing process. Initial findings reveal cleaners invoking figures of the aching, tired body needing care; working conditions induced ill health requiring management; and physical ability tested by cleaning tasks. Cleaners act as dummies for contradictory ideals: employer responsibility, occupational wellbeing and physical vulnerability versus individual resourcefulness, resilience and efficiency. We argue that navigating body talk constitutes an important dimension of shared occupational expertise in blue-collar work.

ICS02 Communicating in the Public Sphere: Rhetoric, Argumentation, and Narratives

PP 0864 The use of insulting as a rhetorical strategy in Dutch election debates

Menno Reijven[1]

[1] University of Amsterdam, Speech Communication- Argumentation Theory and Rhetoric, Amsterdam, Netherlands

Election debates are important events in democracies. Standpoints on policy are presented to the public; and as different candidates appear, citizens can compare them. Yet, this arena is not just about exchanging arguments for differing positions. Political discourse is also characterized by what Tracy called "reasonable hostility" (2008), which can be expressed through insults. Through an insult, contempt is expressed over another party, and has 'being insulted' as perlocutionary effect and is considered face-threatening (Jucker & Taavitsainen, 2000).Here, insults are analyzed in Dutch election debates from 2021, 2023 and 2025 based on work by Jucker and Taavitsainen (2000), who characterized insults as a speech act and connected it to face-work. We also look at how insults are taken up by the opponent.

Some insults pertain to the ideology of the candidate. Farid Azarkan (multiculturalist party) accuses Geert Wilders (far-right) of having a "fascist and racist ideology". Wilders then calls this scolding, showing disapproval, and claims next that he has a right to respond as he was insulted. Wilders articulates the importance to deal with the statement, and shows he has a right to defend himself. Then, Wilders stresses that he just raises facts and accuses Azarkan of just ranting and that he should reconsider his own ideology as it is against all Western values regarding women, queer people, apostates, and Christians. Azarkan responds by saying that Wilders personally does not uphold his standard regarding women, as he defended a party member who was accused of sexual assault. To the ideology insult, Wilders responds by annulling the criticism and attacking his opponent's ideology instead. Azarkan, instead, insults Wilders back as someone who personally condones it and has no right to speak.

We also see character insults (accused of being a bad person), motive insults (accused of not being sincere), ability insults (accused of being incapable) and discussion insults (accused of being unreasonable). Sigrid Kaag (Democrats) was insulted as traitor as she wore a headscarf when visiting Iran as minister of foreign affairs. Wilders was accused adhering his policies only because he started a new party and needed voters. Rutte was metaphorically insulted as a pyromaniac to argue he cannot solve the problems he caused. Wilders is accused of using voodoo-statistics. Insults are dealt with in different ways. Sometimes they are returned; but they can also be downgraded through an acknowledgement or denied through argumentation.

The goal is to show which types of insults are used in election debates and how these insults are embedded in a turn, as well as how these insults are picked up by the opponent. Based on the analyses, it is shown how insults are used to manage the interaction, and how they are an essential component of a study of interactional rhetoric.

ICS02 Communicating in the Public Sphere: Rhetoric, Argumentation, and Narratives

PP 0865 Understanding without agreeing: DemoSlam as a contextual intervention for depolarization in Germany

Anna Litvinenko[1]

[1] Freie Universitaet Berlin, Institute for Media and Communication Studies, Berlin, Germany

In times of deepening political polarization, democracies face an urgent challenge: how to restore mutual recognition and rebuild trust among citizens who increasingly perceive political opponents as illegitimate or morally flawed. In Germany polarization manifests not only as ideological distance but as affective hostility, undermining the shared symbolic space of

the public sphere (Mau et al., 2024). While a substantial body of research has examined online communication as both a driver and amplifier of polarization through platform-specific discourse architectures (Freelon, 2015; Esau et al., 2017; Yarchi et al., 2021), comparatively little attention has been paid to offline and hybrid formats that deliberately redesign the conditions of public communication to counter these dynamics.

This study investigates DemoSlam, a curated dialogue format developed by the German NGO MAGNET – Workshop for Understanding. DemoSlam brings together pairs of individuals with differing views who, after intensive preparatory workshops, present short joint "slams" to a wider audience. The format combines personal storytelling, performative elements, and moderated audience dialogue, aiming to foster "understanding without agreement." Rather than pursuing consensus or persuasion, DemoSlam aligns with the normative ideal of agonistic pluralism (Mouffe, 1999), which conceptualizes democratic conflict as a respectful struggle among legitimate adversaries and recognizes emotions as constitutive rather than disruptive elements of democratic life.

Empirically, the study draws on ethnographic research conducted between 2024 and 2025 in four German municipalities: Dunningen and Rottenburg in Baden-Württemberg, and Meerane and Zittau in Saxony. These sites capture significant regional, socio-political, and historical variation. The data corpus includes participant observation of DemoSlam events, 134 audience feedback surveys, 22 in-depth interviews with slammers, 36 interviews with audience members and moderators, and reflexive field notes. Quantitative data were analyzed descriptively; qualitative material was coded thematically using grounded theory principles.

The analysis conceptualizes DemoSlam as a deliberate intervention into speech context (van Dijk, 2015). Building on a multi-layered contextual framework, the study sconceptualizes DemoSlam as a meso-level communicative infrastructure mediating between micro-level interpersonal encounters and macro-level sociopolitical discourse. Findings indicate that DemoSlam consistently produces relational depolarization, supporting research on deliberative and dialogic formats that emphasizes emotional safety, storytelling, and facilitation as key conditions for depolarizing effects (Fishkin, 2018; Caluwaerts et al., 2023; Nakazawa et al., 2024). Participants rarely change their substantive political positions but frequently report shifts in perception, empathy, and recognition of the other as a legitimate interlocutor. Regional differences reveal that baseline trust and historical experiences condition the depth and fragility of these effects, particularly in post-socialist contexts marked by cynicism and collective memory of rupture. Overall, the study argues that depolarization operates here not through persuasion but through recontextualization: by redesigning the communicative situation itself, DemoSlam demonstrates the democratic potential of curated offline discourse architectures in polarized societies.

ICS02 Communicating in the Public Sphere: Rhetoric, Argumentation, and Narratives

PP 0866 Arguing by asking: The quasi-polar path to evaluating presumptive reasoning

Roman Růžička[1]

[1] University of Hradec Králové, Department of Philosophy and Social Sciences, Brno 2, Czech Republic

When does a respondent in a dialogue know that they have asked enough critical questions to accept a presumptive argument? In the realm of interpersonal communication, where arguments are often defeasible and context-dependent, this "Completeness Problem" poses a significant challenge to the study of persuasion. While Critical Questions (CQs) serve as vital heuristic tools for testing the quality of reasoning in social interactions, current theory lacks a systematic method to determine when this questioning process has been exhausted. This leaves interlocutors trapped between the practical need for a decisive conclusion and the open-ended nature of conversational nuance.

Recent scholarship attempts to resolve this tension through two distinct frameworks. The logical-substantive approach (Yu & Zenker, 2020) emphasizes a binary evaluation suited for strict logical coherence, where any flaw leads to rejection. Conversely, the formulational approach (Baumtrog, 2021) favors a scalar evaluation, weighing the cumulative strength of communicative moves without enforcing a rigid cutoff. This paper argues that viewing these methods as opposing alternatives fails to capture the complexity of actual argumentative exchanges.

To address this, the study introduces the concept of "quasi-polarity" as a mechanism for understanding evaluation in social contexts. It posits that while the final decision to accept or reject an argument in a dialogue is binary (a "quasi-polar" outcome), this decision is grounded in a scalar assessment of the interlocutor's credibility and the content's plausibility. Crucially, the threshold for satisfaction is not fixed by logic alone but is negotiated through the interpersonal relationship and the specific epistemic standards of the interaction (e.g., a casual conversation versus a formal debate).

Building on this, the paper proposes a Procedural Model that integrates these approaches to better map the dynamics of social persuasion. This model employs binary checks to ensure the structural integrity of the argument while using scalar assessment to weigh substantive objections raised during the interaction. By aligning the evaluation process with the natural flow of interpersonal influence, this "quasi-polar" path offers a robust method for determining when the burden of questioning has been fulfilled, ensuring that argumentation schemes can effectively guide rational persuasion in diverse social settings.

ICS02 Communicating in the Public Sphere: Rhetoric, Argumentation, and Narratives

PP 0867 How to persuade without backlash on social media: Message framing and reactance in influencer communication

Antonia Drexel[1], Fabian Mayer[1], Amelie Glas[1], Christina Wagner[1], Eva Wendel[1]

[1] Julius-Maximilians-Universität Würzburg, Institute Human-Computer-Media, Würzburg, Germany

Social media influencers (SMIs) have established themselves as digital opinion leaders on various public-interest issues, such as environmental and health topics, due to their wide reach and perceived closeness to audiences (Dekoninck & Schmuck, 2022; Gupta et al., 2022). However, persuasive messages on such sensitive areas can easily elicit psychological reactance: recipients may resist or reject the intended message because they feel that it is being imposed on them and restricting their freedom (Brehm et al., 1966; Ma & Hmielowski, 2022; Reynolds-Tylus, 2019). Against this backdrop, for SMIs, messages formulation is crucial in order to address such issues without scaring off followers.

In persuasive communication, message framing theory provides a good starting point: A common distinction is made between gain framing, which emphasizes positive consequences of a behavior, and loss framing, which highlights negative consequences of inaction (Rothman et al., 2006). Research on gain vs. loss frames is extensive but results remain ambivalent: some studies show that gain frames reduce reactance and increase attitude and behavior change (Reinhardt et al., 2007; Xu, 2019) while others find opposite effects (Hong & Kim, 2024; Ratcliff et al., 2019). Moreover, little is known about how framing effects transfer to SMI communication, which is heavily based on informal, fast-paced messaging. An exemplary study in this field by Olbermann et al. (2024) shows that gain frames tend to evoke positive emotions, while loss frames are associated with negative emotions. However, more research is required, also with regard to intervening personality factors and diversity of topics.

We conducted three online experiments on how gain and loss framing influence perceived reactance, attitudes, and behavioral intentions. Study 1 examines how message framing on vegan nutrition and health affects reactance, considering self-esteem as a moderator (N = 136). Study 2 focuses on vegan nutrition and environmental consequences, with trait reactance as a moderator (N = 134). Study 3 examines framing on vegan nutrition and plastic use regarding health outcomes (N = 206) (Stimuli and questionnaire: https://osf.io/z4rqk/overview?view_only=67c3b68001f34ecdabb683a0edb92fb5).

Moderated mediation analyses (Hayes, 2018) show that loss framing leads to more reactance across all studies than gain frames (Study 1: b = -.72, p < .01, Study 2: b = -.74, p < .01, Study 3: b = -.61, p < .05). Reactance, in turn, has a negative effect on environmental attitudes (Study 2: b = -.32, p < .001, Study 3: b = -.26, p < .001) and environmentally friendly behavioral intentions (Study 1: b = -.43, p < .001; Study 2: b = -.55, p < .001, Study 3: b = -.43, p < .001). Significant indirect effects were found across all studies, indicating that gain framing, compared to loss framing, increases attitudes and behavioral intentions via reactance (all 95% CIs exclude zero). No moderating effect of the topic was found in Study 3 (b = .04, p = 92). The moderators trait reactance (Study 2: b = -.26, p = .29) and self-esteem (Study 1: b = .15, p = .52) also play no role in the relationship between framing and reactance.

These findings suggest that SMI should rely on gain frames in their communication because of their ability to reduce reactance to messages. This effect is independent of the topics examined. Individual traits seem to have no influence. Further implications and limitations will be discussed in detail during the presentation.

ICS02 Communicating in the Public Sphere: Rhetoric, Argumentation, and Narratives

PP 0868 City as a nonlinear narrative: Inhabitant experience in a posthuman communication environment

Ida Daiva Povilaite[1]

[1] Kauno Kolegija HEI, Faculty of Arts and Education, Kaunas, Lithuania

The contemporary urban experience already now resists linear modes of explanation. Rather than being encountered as a coherent, chronologically ordered whole, the city is lived through fragments, interruptions, repetitions, sensory encounters, technological mediations, and interactions with both human and non-human agents. This paper approaches the city as a **nonlinear narrative**, arguing that urban communication emerges not primarily through institutional messages or official discourses, but through everyday relational experiences of inhabitants and historical curves.

The study is situated at the intersection of interpersonal communication, narrative theory, and posthumanist communication studies. While interpersonal communication research has traditionally focused on human-centered interactional processes, this paper extends the field by examining how interpersonal meaning-making unfolds within a posthuman urban environment shaped by infrastructures, objects, rhythms, and material agencies. Drawing on posthumanist theory and contemporary narratology, the city is conceptualized as a communicative environment in which inhabitants function as narrative nodes rather than passive receivers of messages.

The **aim of the research** is to explore how urban inhabitants construct meaning through nonlinear narrative processes embedded in everyday social interaction with their environment. The central research questions address: (1) how daily urban experiences become structured as nonlinear narratives; (2) how non-human agents (architecture, technologies, urban objects) participate in interpersonal meaning-making; and (3) how narrative fragmentation influences social interaction, orientation, and communication in the city.

Methodologically, the study adopts a qualitative and interpretative approach combining **walking methodology**, **narrative interviews**, and **autoethnographic reflection**. Empirical material is drawn from urban experiences in Kaunas as the primary case, with selected comparative insights from Vilnius. These methods allow for the analysis of interpersonal communication as it unfolds in movement, co-presence, and sensory engagement with urban space.

The paper contributes to the Interpersonal Communication and Social Interaction section by reframing interpersonal communication as a **distributed, nonlinear, and posthuman process**, extending beyond face-to-face interaction to include spatial, material, and technological agencies. By conceptualizing the city as a nonlinear narrative environment, the study offers a novel framework for understanding how social interaction, identity, and meaning are co-produced in contemporary urban life. This approach opens new perspectives for communication research concerned with everyday interaction, urban experience, and the evolving boundaries of the communicative subject within posthuman environments.

ICS03 Constructing Well-Being In and Through Communication

PP 0970 Conflicts and coping of dilemmas of the "good patient" role in interpersonal communication networks of people with chronic diseases

Doreen Reifegerste[1], Anna-Lena Esser[1], Rebecca Kammerer[2], Claudia Riesmeyer[2]

[1] Bielefeld University, School of Public Health, Bielefeld, Germany
[2] LMU München, Institut für Kommunikationswissenschaft und Medienforschung, München, Germany

The role model of a "good patient" with a chronic disease is a highly motivated person who continuously self-manages their disease, e.g., with the support of digital media. However, patients with chronic diseases such as diabetes or asthma are often challenged to adhere to these role expectations (Borgetto, 2023). Chronic diseases with their unpredictable but ongoing trajectories, which move from diagnosis (onset) through stable, unstable, acute, crisis, and eventual decline or recovery phases, often require social support by professional and private contacts in interpersonal networks (Schaeffer & Haslbeck, 2023). These challenges to fulfill the expectations may lead to role conflicts (Dahrendorf, 2006) and the need to cope not only with the chronic disease, but also with the resulting dilemmas between the (unrealistic) expectation of others "to become healthy" and the need "to survive on a daily basis" (Jellen, Ohlbrecht & Winkler, 2018). Although these dilemmas are known, there is a lack of research on the resulting social interactions and processes of (non)disclosure of patients in their interpersonal networks with private contacts and physicians. Thus, we aim to analyze the patients' perceptions and (non)disclosure of role conflicts and strategies to cope with them.

Therefore, we conducted 2025 in-depth interviews with N = 64 patients with diabetes type 1 or 2, asthma, or Chronic Obstructive Pulmonary Disease in Germany. The interviews were part of two research projects within a research unit on (digital) self-management of chronic diseases. The studies followed strict ethical guidelines to ensure participant protection. The IRB approved the project in terms of ethical aspects. Before participating in the in-depth interviews, participants were informed about the study as well as the legal basis for data processing and were asked to give informed consent about study participation, data analysis, and publication. The data was collected anonymously. The interviews were based on an interview guideline, which covers the following topics: Barriers and opportunities of (digital) self-management, perceptions of self- and external expectations, physician–patient relationship. They were transcribed verbatim and analyzed based on a theory-driven approach.

Results show how challenging the role dilemma between self-responsibility for health, the continuous confrontation with one's chronic condition, the need for social support, and adherence to physicians' treatment recommendations, as well as family members' expectations, can be in the patients' everyday lives. Strategies to cope with those dilemmas include nondisclosure, which often results in a vicious circle, in which physicians, family members, and patients feel frustrated and powerless, which can complicate and even hinder the management of chronic diseases.

Consequently, the "unattainable" role of the "good patient" can interfere with the treatment plan and use of digital media for chronic disease self-management. Ideas for disclosure and discussion of role conflicts in interpersonal networks as part of the disease management will be discussed.

ICS03 Constructing Well-Being In and Through Communication

PP 0971 The "good communication" between children and professionals within child welfare – A scoping review

Reetta Kettunen[1]

[1] Tampere University, Communication Sciences, Tampere, Finland

The study aims to synthesize conceptualizations of good communication in studies of communication between children and child welfare professionals. Social work is constituted in social interaction and thus, interactions between a child

and professionals are a central concern in child welfare. Consequently, social interaction and practices aiming at good encounters in social and child welfare work have been studied largely, e.g. from the perspectives of challenges emerging in interactions, professionals' roles in supporting the child and relationships between professionals and children.

Good encounters and practices in child welfare have been researched in fields outside communication studies, yet research on these themes from the perspective of communication theory remains limited. Our approach on "good communication" relies on Graves' (2021) ideas of good communication, defining it as the situated ideals that communicators possess of communication, and how they approach them in discourse, while managing tensions and dilemmas. In child welfare work, these situated ideals may differ or even contradict each other among children and professionals.

This study has one research question: how is good communication portrayed explicitly and implicitly in research of social interaction between children and child welfare professionals? Mapping out research on interactions between children and professionals constructs a synthesis of characteristics of good communication in child welfare. The study utilizes the scoping review method to identify gaps in earlier research and to connect existing findings. We draw from a methodological framework of Arksey and O'Malley (2005) for scoping studies. The articles were retrieved from interdisciplinary databases of EBSCO with various keywords describing interactions between children or young people and professionals working in child welfare.

Preliminary literature search yielded 143 articles, resulting in 136 articles after removing duplicate records. Of the 136 records, abstracts were viewed according to the relevance of the research question. After the screening process, 34 articles were included in the review. The analysis is performed manually and inductively.

Preliminary findings according to the ongoing analysis show that most studies present good communication implicitly, while focus is usually on collaboration between professionals and children. Communication seems to be deemed "good" when the child feels heard and is able to and given a chance to influence the outcomes of the interactions. Professionals specifically view communication with the child as successful when they are equipped with enough understanding of the child's situation and communication skills to encounter the child as expected and in accordance with their own professional ethics.

This study aims for a two-fold contribution. First, it provides an integrated understanding of good communication practices in child welfare through a communication theoretical lens. Second, this integrated understanding can be utilized as a guide for both theoretical and empirical future research.

ICS03 Constructing Well-Being In and Through Communication

PP 0972 "Along the way, I've come to see where my strength ends and my vulnerability begins": Dialectical discourses of exhaustion and recovery

Jonna Leppäkumpu[1], Johanna Salmela[1], Malgorzata Lahti[1]

[1] University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

Burnout is often portrayed as an individual phenomenon, centered on personal resilience and responsibility. In this study, we challenge that perspective by examining meanings embedded in burnout discourse. Instead of focusing solely on individual coping, we explore the interpretations and narratives that emerge in discussions among people who have experienced burnout. Drawing on focus group interview data, we analyze these discourses to understand how meaning-making processes shape experiences of exhaustion and recovery.

We apply qualitative contrapuntal analysis informed by Baxter's (2011) Relational Dialectics Theory 2.0 (RDT 2.0), which views meaning as emerging through discursive struggles rather than individual needs, emphasizing the interplay of competing discourses and their power asymmetries (Malhotra et al., 2022). Using this lens, we position individual accounts within organizational and societal contexts to reveal tensions between individualized and collective interpretations of burnout. The data for currently consists of two focus group discussions (approximately four hours of recorded conversation) with individuals engaged in Finnish working life, either actively employed or on sick leave, representing a diverse range of occupations. Additional data collection is ongoing.

Our preliminary findings indicate that discursive struggles between individualism and structural level discourses construct the meaning of burnout and are also intertwined with how people exhausted by work define self, workplace relationships, and work in their discussions. On the individual level, burnout is often framed as a matter of personal responsibility and self-management. It is constructed as a challenge to one's competence and identity, accompanied by feelings of inadequacy and fear of stigma. Recovery narratives tend to be narrow, emphasizing individual solutions such as career changes,

retraining, or extended absence from work. Coping strategies frequently involve distancing or trivializing the experience, yet underlying these narratives is a sense of powerlessness and the perception that exhaustion reflects personal failure.

At the structural level, burnout is linked to organizational and societal structures that shape work practices and expectations. Workplace norms often valorize endurance and discourage vulnerability, while empathy and support mechanisms remain limited. Organizational practices lack clear procedures for reintegration after absence, and guidelines for workload and availability are inconsistent. Broader cultural narratives reinforce ideals of perseverance and collective sacrifice, while access to support varies according to privilege and systemic constraints. These dynamics can be further organized into three tension-filled relationships: individual agency vs. structural constraints; organizational vs. personal responsibility and professional vs. "sick person" identity.

Our findings indicate that burnout arises where individual responsibility meets structural constraints. Addressing these tensions requires shifting from individual fixes to systemic solutions that transform organizational practices and cultural norms.

ICS03 Constructing Well-Being In and Through Communication

PP 0973 Communication competence of First Aid Service personnel in frontline dialogue with traumatized combatants: Strategic language choices for emotional co-construction

Olesia Liubashenko[1]

[1] Taras Shevchenko National University of Kyiv, Teaching Methodology of Ukrainian and Foreign Languages and Literatures, Kyiv, Ukraine

Current and emerging armed conflicts in Europe and worldwide create conditions in which the communication competence of frontline personnel increasingly determines the resilience of societies and their capacity to withstand aggression. In such contexts, First Aid Service (FAS) personnel — including paramedics, medevac teams, physicians, and military chaplains — must rely on interpersonal communication as a core professional resource alongside their medical and operational duties.

In frontline practice, professional communication competence is realised through carefully selected language choices that help regulate emotional intensity, maintain interpersonal contact, and prevent interactional breakdown at the moment when dialogic contact with a traumatized combatant is first established. These initial exchanges are often brief but decisive, shaping the conditions under which assistance can be provided and emotional escalation avoided.

This study approaches frontline communication from the perspective of language in action in professional settings (Schnurr, 2024) and its interpersonal impact (McGlone & Giles, 2011) in high-stakes encounters. The empirical material derives from a long-term qualitative research project conducted between 2017 and 2025. Earlier phases of the study involved 82 structured questionnaires mapping communicative challenges in frontline care (Liubashenko, 2024). The present analysis focuses on 18 in-depth interviews collected through direct fieldwork in war zones in Ukraine.

The interviews were designed as testimonies (Curling, 2005) and included both First Aid Service personnel and combatants. Participants were invited to recall concrete moments of verbal interaction during initial encounters and to describe what was said, how it was said, and how this affected their emotional state, including memories of specific words, pauses, or shifts in tone that helped establish dialogic contact.

The qualitative thematic analysis identifies a set of dialogic strategies oriented toward emotional regulation and interactional stability during first contact. These strategies include the explicit naming of emotional states, controlled repetition of stabilising expressions, resonance with positive affect, and other interactional moves recalled by participants as effective. Taken together, they demonstrate the ability of First Aid Service personnel to make appropriate language choices in managing emotional co-construction as an interactional process. This supports the view that linguistic choices play a constitutive role in shaping emotion perception and professional dialogic interaction (Lindquist & Gendron, 2013).

The findings provide evidence that First Aid Service as a profession requires systematic communication training grounded in empirical experience of direct dialogic interaction at distribution points, frontline hospitals, and during evacuation from the first line. More broadly, the study suggests that a growing scholarly focus on interpersonal communication practices in workplaces located in zones of armed conflict is likely to become a defining research trajectory in the coming decades.

ICS03 Constructing Well-Being In and Through Communication

PP 0974 Developing a communication resilience intervention for interprofessional health teams

Elizabeth Hintz[1], Leena Mikkola[2]

[1] University of Connecticut, Communication, Storrs, USA
[2] Tampere University, Faculty of Information Technology and Communication, Tampere, Finland

Drawing on ongoing pilot research, this abstract details a novel, theory-driven communication resilience intervention in the context of interprofessional health teams in Finland. Although resilience is often characterized as an individual trait or psychological capacity, communication theorists (Buzzanell, 2010) instead assert that resilience is a relational process constituted in everyday interpersonal interactions. Health care workers can cultivate resilience through everyday interactions with their interprofessional health teams (e.g., social services, pharmacists, nurses).

According to communication theory of resilience (CTR), engaging five specific communication processes can cultivate resilience and support well-being over time, including: (a) crafting normalcy, (b) affirming identity anchors, (c) maintaining and using communication networks, (d) putting alternative logics to work, and (e) foregrounding productive action while backgrounding negative emotion. CTR asserts that strengthening these communicative processes can facilitate adaptation and transformation, enabling interprofessional health teams to coordinate action while enduring strain. However, communication scholars have yet to translate CTR theorizing and research into a resilience-based intervention.

Healthcare and social service professionals are poised to benefit from a communication resilience intervention, as they face myriad stressors threatening their individual well-being, the functioning of the interprofessional team, and the quality of health care delivery (Nykänen & Mikkola, 2020). Our ongoing pilot research with hospital and social service workers has enabled us to tailor the theorized CTR resilience processes to the Finnish cultural context. For example, we have drawn connections and distinctions among resilience and the Finnish cultural construct of "sisu," characterized by perseverance, grit, goal achievement, and self-reliance.

The proposed intervention will be delivered in interprofessional health team-based formats and will integrate multiple communicative components, including facilitated dialogue, reflective exercises, scenario-based discussions, and skills-based training. Rather than prescribing uniform coping strategies, the proposed intervention will cultivate structured communicative spaces in which interprofessional health teams can negotiate meanings of stress and care across specializations.

Drawing upon a mixed-methods design, this study will evaluate quantitative outcomes, alongside measures assessing team communication quality and perceived social support. Qualitative data, including feedback on the intervention and reflections on the applicability of the resilience processes in clinical practice, will be used to examine how participants enact resilience through their interprofessional communication over time. We will examine how resilience processes are co-constructed across professional roles and organizational contexts within the Finnish integrated healthcare and social services system.

Understanding resilience as a communicative accomplishment rather than an individual trait advances the field of interpersonal communication and communication resilience theorizing by translating sensitizing concepts into a practical intervention. The proposed intervention is scalable, offering a communication-centered model intended to catalyze resilience in interprofessional teams. More broadly, this study demonstrates how communication theory can inform intervention designs addressing systemic stressors while simultaneously honoring the relational and constitutive theorizing of resilience in care-oriented professions**.**

PP 1070 From crosstalk to being ignored: The communicative challenges of strategizing in hybrid team meetings

Daniel Wolfgruber Bakk.phil. MA[1]

[1] University of Southern Denmark, Department of Culture and Language, Odense, Denmark

The longevity of an organization depends heavily on the decisions and actions of its top management team (TMT), widely regarded as the "primary shaper" of an organization's strategic direction (Finkelstein et al., 2009). From a strategy-as-practice (SAP) standpoint, this "shaping" is strategizing—an inherently communicative process. Strategizing highlights that strategy is not static, but something done through "actions, interactions, and negotiations of multiple actors, along with the

situated practices that they draw upon to accomplish that activity" (Jarzabkowski et al., 2007, pp. 7–8). While strategizing occurs across various sites, formal meetings remain a central arena (Jarzabkowski & Seidl, 2008), increasingly in hybrid formats where some participants are co-located, and others join remotely.

Hybrid meetings offer advantages such as reduced travel and greater flexibility, but they also introduce communicative challenges. Online participants often have limited access to non-verbal cues, face a higher risk of being overlooked, and encounter more distractions (Ellis et al., 2022). Research by Janssens and Van de Mieroop (2025) shows that remote participants are disadvantaged because they cannot fully access embodied (inter)actions among co-located members, making it difficult to interpret gaze, gestures, and other multimodal signals essential to participation.

Against this backdrop, we ask: *How is strategizing performed in hybrid TMT meetings, and what communicative challenges emerge in the process?* To explore this question, we analyze video recordings of twelve hybrid meetings held by the TMT of a boutique consulting firm in France. Drawing on Janssens and Van de Mieroop (2025), we conduct a multimodal interaction analysis that examines the interplay between human actors (co-located and remote) and "other-than-human" actors (Cooren, 2020), such as screens and shared documents. This approach enables us to capture how strategizing is accomplished across hybrid interactional spaces.

Preliminary findings indicate that the number of remote participants significantly shapes strategizing practices. When only one or two participants join remotely, they are more likely to go unnoticed. Conversely, meetings with a more balanced distribution of co-located and remote participants exhibit a fairer allocation of "airtime" and more even participation. These early observations show how hybrid formats can intensify communicative challenges during strategic decision-making. More detailed findings on the multimodal strategizing interactions would be presented at ECC 2026.

ICS04 Talking With, Through, and About Communication Technologies and AI

PP 1071 Generative AI in adolescents' everyday lives: A qualitative network analysis of social contexts shaping diffusion and adoption

Janina Hagner[1], Melissa Sacher[1], Amelie Bauer[1], Wendt Ruth[1], Larissa Leonhard[1]

[1] Ludwig-Maximilians-Universität München, Department of Media and Communication, München, Germany

The rapid diffusion of generative artificial intelligence (AI) tools such as ChatGPT has fundamentally altered young people's everyday media practices, particularly in educational and peer-related contexts. While existing research has largely focused on individual use and attitudes toward generative AI, less is known about how such technologies are embedded within adolescents' social networks and how social relationships shape both usage practices and perceptions of competence. This study addresses this gap by examining the diffusion, use, and meaning-making of generative AI within the close social networks of adolescents.

Using a qualitative network analysis, we explore (1) how generative AI spreads within adolescents' social networks, (2) how and in which contexts generative AI is used, (3) who is perceived as competent regarding generative AI, (4) adolescents' attitudes toward generative AI and how these are shaped by social influence, and (5) what the discourse on generative AI looks like and in what context it takes place.

Data were collected through semi-structured interviews with six adolescents (average age: 14 years), one parent and one close friend for each adolescent, resulting in a total sample of 18 participants. During the interviews, participants also created a social network map with generative AI placed at its centre. Adolescents, parents and friends were positioned around the centre according to their perceived relevance for AI adoption. The interviews were analyzed using qualitative content analysis with a relational focus, allowing for the examination of both individual perspectives and network-based dynamics.

The findings suggest that adolescents usually encounter generative AI for the first time at school or through classmates and friends, whereas parents appear to adopt this technology at a later stage. Adolescents reported a regular use of generative AI, primarily ChatGPT, with a particular focus on support for school-related tasks. They and their friends often described

themselves as highly competent, perceiving generative AI as largely self-explanatory and acquiring skills through learning by doing. Overall, adolescents showed a rather positive attitude towards generative AI and were aware of its potential benefits and risks, whereas parents tended to underestimate their children's awareness of the latter. Interestingly, adolescents' attitudes resembled those of their friends who were interviewed, and in some cases negative views held by parents seem to be transferred to their children. Communication about generative AI mainly happened usage-related. Furthermore, the topic did not seem to be a major subject of conversation between parents and children at home.

In summary, the findings highlight the importance of considering generative AI use not only as an individual practice but as a socially embedded phenomenon shaped by relationships and discourses within adolescents' close social networks.

ICS04 Talking With, Through, and About Communication Technologies and AI

PP 1072 Changing work and leadership needs of public communication professionals in the age of AI

Tessa Horila[1], Jonna Koponen[2], Pekka Isotalus[1]

[1] Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland
[2] University of Eastern Finland, Faculty of Social Sciences and Business Studies, Kuopio, Finland

The introduction of artificial intelligence (AI) in organizations is rapidly changing work across sectors and professions. For communication professionals, AI has been envisioned to improve efficiency, facilitate information management, and support creative processes. However, concerns include the robotization of content, spreading of misinformation, and the erosion of interpersonal communication and collaboration. Communication experts have a dual role: they must make sense of AI in relation to their own work and explain it within their organization and to diverse stakeholders. Despite these responsibilities, the effects of AI on communication work remain underexplored, particularly in the public sector, where communication is expected to be reliable and ethical, yet bureaucratic structures may hinder or slow down AI adoption.

This case study examines experienced changes in work and leadership needs for communication professionals in a public city organization in Finland. We ask (1) How do public sector communication professionals perceive the impacts of AI integration on their work characteristics? (2) What leadership needs do public sector communicators identify in relation to AI's impact on work characteristics? Data, collected in autumn 2025, comprises three focus group interviews with communication experts and managers, two individual interviews with the director of communications, and supplementary materials including internal guidelines, strategic documents, and website content. Analysis followed phronetical-iterative qualitative content analysis (Tracy et al., 2024), combining inductive, data-driven analysis with theory-driven interpretation, using the work characteristics model (Morgeson & Humphrey, 2006) as a sensitizing framework.

Our analysis identified key work characteristics relevant to AI adoption across task, competence, social, and organizational-cultural dimensions. Leadership needs included providing time, space, and concreteness for AI learning, balancing obligation and voluntariness, facilitating team-based reflection and learning, and acting as a front-runner of expected AI use. While interviewees considered much of their pre-AI communication expertise transferable to post-AI work, new tasks and competence requirements have emerged. Monitoring the ethical and appropriate use of AI in communication across the organization was described as a particularly burdensome and time-consuming new task that requires communication professionals' understanding of high-quality communication content and tone. Although AI was primarily described as a tool with little relational or collegial attributes, its adoption had been perceived to reduce human interpersonal contact, such as collegial questioning, especially in remote work. Relatedly, communication professionals emphasized a need for leaders to enable and facilitate collaborative reflection and learning of AI use in interpersonal communication. Cultural and organizational characteristics of public sector work were evident in concerns about communication content generated with AI, especially in regards to the pervasive "Americanization" of content, and the possible decrease in trustworthiness of public sector communication.

In sum, our findings suggest that the successful leadership of AI adoption in public communication requires (1) acknowledging and nurturing the expertise of communication professionals that persists from pre-AI to post-AI work (2) facilitating collaborative and reflective integration of AI and (3) encouraging AI use and learning while supporting professionals' autonomy. We will further discuss theoretical and practical implications in our presentation.

ICS04 Talking With, Through, and About Communication Technologies and AI

PP 1073 Voice, presence and alliance: Towards a theoretical framework for voice-based human–AI communication in mental health support

Maximilian Zhang[1]

[1] University of Tübingen, Institute of Media Studies, Tübingen, Germany

It is estimated that around 1 in 7 people worldwide are affected by a mental health condition, yet most of these individuals do not have access to effective treatment (WHO, 2025). This is one of the main reasons why people experiencing temporary or long-term mental health issues are turning to modern AI technologies for alternative solutions. For example, over a million people use ChatGPT every week to engage in conversations that show clear signs of potential suicidal intent or planning

(Zeff, 2025). AI chatbots are increasingly being used around the world to access mental health support (Rousmaniere et al., 2025).

Many countries predominantly utilise interpersonal communication, such as talking to friends or family, when addressing anxiety and depression. Globally, this approach is employed by 78.0% of individuals, including 77.7% in Europe, 77.5% in Asia, and 80.4% in North America (Dattani, 2023). In more than two dozen countries, this figure exceeds 85% (Dattani, 2023). This highlights the crucial role of interpersonal communication in addressing and managing depressive symptoms. However, while most research on the use of AI for mental health support focuses on text-based communication with AI systems, voice-based communication is largely overlooked.

Current studies in the field of interpersonal communication often focus on the role of AI systems as 'digital interlocutors' (Edwards & Edwards, 2017, p. 487), setting them apart from the traditional role of machines as a medium. However, intrapersonal communication, also known as self-communication, which always exists alongside interpersonal communication, tends to be overlooked. In this context, I propose that AI systems fulfil multiple roles. One of these is facilitating deep interpersonal communication between humans and AI systems by promoting self-communication, a technique frequently employed in psychotherapy and life coaching. Therefore, AI systems could also act as 'promoters' of self-communication within the sphere of interpersonal communication.

Anthropomorphism plays an important role in this communication process. When we talk about it, we tend to think of things that we can see and perceive. However, we often forget that language — both written and spoken — is also a form of anthropomorphism. Language is not the domain of machines or AI. Rather, it is a human ability that we impart to them. This is why users tend to develop trust and an emotional connection with AI chatbots, especially when they interact with them regularly over a long period of time. I call this 'invisible anthropomorphism'.

This interdisciplinary research paper presents a framework that explains the mechanisms of voice-based communication between users and AI systems. It integrates classic theories of interpersonal, intrapersonal, and computer-mediated communication, as well as various cross-disciplinary theories, such as the media equation, parasocial relationships, social presence, and interaction research. This includes Goffman's theory of interaction order and affective prosody. The paper situates these theories within the context of the voice medium to demonstrate the potential of communication with AI systems to provide mental health support, and to what extent this support is effective.

ICS04 Talking With, Through, and About Communication Technologies and AI

PP 1074 Conversations with machines: Introducing the "CAT Technology Equivalence Model (CAT-TEC)"

Caja Thimm[1]

[1] University of Bonn, Media Studies, Bonn, Germany

Due to the increasing capacity of AI-based chatbots to engage in human-like interactions, exchanges between humans and technologies are becoming increasingly frequent. Despite this growing relevance, our understanding of how machines can participate in verbally productive and socially meaningful interactions remains limited. Building on the premise that contemporary AI systems are capable of adapting to human users across multiple domains—including agency attribution, verbal interaction, and emotion recognition—this paper introduces a theoretical framework for the systematic analysis of human–machine verbal communication. We propose the CAT Technology Equivalence Model (CAT-TEC), which adapts Communication Accommodation Theory (CAT) to interactions involving artificial conversational agents. Originally developed as Speech Accommodation Theory and later expanded into Communication Accommodation Theory, CAT explains how individuals adjust their communicative behavior to that of their interaction partners. Accommodation processes operate at linguistic levels such as lexical choice, syntax, and speech rate, as well as with respect to social categories including status, age, and gender. While CAT has been extensively applied to human–human communication, its application to human–technology interaction remains comparatively recent (Giles et al., 2023). CAT-based analyses typically focus on linguistic styles and communicative behaviors within specific interaction contexts. In interpersonal communication research, accommodative behavior is often interpreted as a means of fostering recognition or social acceptance. However, interpersonal communication extends beyond verbal exchange, encompassing role negotiation, social attribution, and relational positioning. These dimensions become particularly relevant when humans interact with technologies that display increasingly adaptive and socially responsive behavior. Drawing on existing CAT research, the CAT-TEC model extends the theory to human–machine interaction by introducing categories especially salient in this context. These include anthropomorphization, trust versus distrust, speech alignment, responsiveness, and parasocial orientation. The model assumes functional equivalence between human and technological interaction partners with regard to accommodation processes, while acknowledging asymmetries in agency and intentionality.

The Study

To empirically explore the CAT-TEC model, we conducted an experimental study in a Human–Robot Lab using GPTo, a spoken version of ChatGPT. The study addressed three guiding research questions: (a) which verbal accommodation strategies emerge in human–machine interaction, (b) how trust is constructed or challenged, and (c) how emotional relationships develop during interaction. Participants engaged in conversations on (1) lovesickness and (2) a moral dilemma involving

a friend's car accident. The conversations (n = 10) were video-recorded, transcribed, and followed by a post-experimental questionnaire. The analysis focused on semantic alignment, morphosyntactic structures, responsiveness, speech acts, self-disclosure patterns, and parasocial expressions. Results revealed clear patterns of accommodation, including both convergence and divergence. Observed strategies included reduced speech rates, reformulations, politeness strategies, and semantic alignment, alongside moments of distrust toward machine-generated information and occasional disengagement. Overall, the findings support the CAT-TEC model as a concise theoretical framework for analyzing verbal accommodation in human–machine interaction and contribute to a deeper understanding of social dynamics in AI-mediated communication.

ICS05 At the Core of Interpersonal Relations: Questions of Closeness, Loneliness, and Dislike

PP 1171 Factors determining bystanders' attitudes towards and reactions on online hate speech

Sara Pabian[1], Eefje van Moorsel[1], Jennifer van Zon[1]

[1] Tilburg University, Communication and Cognition, Tilburg, Netherlands

OHS can be defined as the expression towards an individual or group of "hatred or degrading attitudes toward a collective" (Hawdon et al., 2017, p. 254), aimed to devalue and demean them collectively. Central here is the shared characteristic of the collective, such as race, ethnicity, gender identity, sexual orientation, or other characteristics (Johnson et al., 2019). OHS can have severe negative mental health and well-being outcomes for those who are exposed to OHS, both victims and bystanders, including feelings of depression, anxiety, self-doubt, and insecurity (e.g., Dreißigacker et al., 2024).

In order to find ways to reduce or discontinue OHS, researchers have indicated the potential of bystander interventions. Bystanders are social media users who witness OHS directed to other(s) (groups) on social media. Bystanders can discourage perpetrators from spreading OHS by reporting and reacting. By indicating their disagreement, victims might feel supported. However, studies indicate that most of the bystanders remain passive when witnessing OHS (Rudnicki et al., 2022).

A growing body of research has focused on personal characteristics, contextual factors, and content-related factors that shape bystander perceptions (Bormann et al., 2021; Schmid et al. 2024). Multiple factors have been found to be associated with attitudinal (someone's evaluation of OHS) and behavioral (someone's reaction on OHS) components of bystanders' perceptions, relying on experimental and cross-sectional data. However, bystanders' personal experiences or interpretations of how these perceptions are exactly formed remain unclear. To fill this gap, this research project wants to contribute to the growing body of research on perceptions of bystanders. By extending the knowledge on how bystanders' perceptions are formed, more effective campaigns can be developed to promote bystander interventions.

To this aim, in-depth interviews were conducted among 25 young social media users (aged 19–25). Data were analyzed by using a thematic analysis approach. First, the results indicated that bystanders define OHS in different ways and that these definitions differ from those used by, for instance, researchers, platforms, and policy makers. Our findings stress the importance of considering social media users' perceptions of OHS as substantial variations in defining OHS could have regulatory implications. For instance, a bystander might not perceive an incident as OHS and, therefore, does not report the incident, while the speech is violating the social media platform's community standards according to the platform's definition of OHS. Second, our findings indicated that attitudes and reactions are formed, according to bystanders, by a diverse set of personal, contextual, and content-related factors. Perceptions on OHS cannot be traced back to a few factors and there seems to be large individual differences in which factors determine eventually one's attitude towards OHS and subsequent reactions. However, what bystanders seem to have in common is their perception of the normalcy of OHS in the online discourse. They perceive this type of speech as 'normal', but are at the same time also aware of potential negative outcomes on the individual and societal level. At the conference, a critical discussion of the results in terms of theoretical and practical implications will be presented.

ICS05 At the Core of Interpersonal Relations: Questions of Closeness, Loneliness, and Dislike

PP 1172 What activates people to react to hate speech on social media? Evidence from a survey experiment

Nicoleta Corbu[1], Andreea Stancea[1], Raluca Buturoiu[1]

[1] SNSPA National University of Political Studies and Public Administration, Communication, Bucharest, Romania

The persistence of online hate speech directed at different minorities raises central theoretical questions about how digital publics negotiate (online) social norms, as well as about the effectiveness of regulatory, platform-based, and community-level interventions designed to reduce hate speech. Although policy responses primarily focus on platform regulation and content moderation, the research community has initiated a debate regarding bystander activation as a micro-level mechanism for disrupting cycles of hate speech (Obermaier et al., 2023; Rudnicki et al., 2022; Zapata et al., 2024). However, findings remain limited regarding the types of counter-speech that might generate prosocial behavior and under what conditions bystanders are likely to intervene.

Against this background, this study aims to isolate the mechanisms through which different types of counter-speech affect engagement, as well as to conceptualize user responses based on two lenses: (1) normative influence theory and (2) bystander intervention theory. It argues that online bystander action emerges when counter-speech communicates two elements simultaneously: a clear moral stance (what is right to do) and a perception that "others like me" endorse this stance.

To test its assumptions, this study uses a pre-registered 2x4 survey experiment (N = 830), with a focus on LGBTQIA+ community in Romania where the rights of people belonging to this minority are highly contested and hate speech is widespread. Participants viewed a hateful Facebook post targeting two gay men and were randomly assigned to counter-speech conditions that varied in type (educating the perpetrator, abusing them, showing empathy for the victim, or diverting conversation) and normative strength (one vs. three comments), alongside a control group. Dependent variables captured behavioral intentions reflecting positive engagement (reporting, counter-arguing, supporting LGBTQIA+ people) and negative engagement (liking, sharing, endorsing the hateful post).

Findings indicate that the only successful strategy to make bystanders act against hate speech is to have a clear wave of empathy towards the victim, but the strategy only works for people whose general opinions about LGBTQIA+ people are not strongly negative. This suggests that counter-speech does not have uniform effects across audiences, but is conditioned by pre-existing orientations toward the targeted group.

ICS05 At the Core of Interpersonal Relations: Questions of Closeness, Loneliness, and Dislike

PP 1173 The impact of co-present smartphone use on the quality of face-to-face social interactions, closeness and loneliness in everyday life

Aurelio Fernández[1], Netta Weinstein[2], Timon Elmer[3], Javier García-Manglano[1], Charo Sádaba[1], Mariek Vanden Abeele[4]

[1] University of Navarra, Institute for Culture and Society, Pamplona, Spain
[2] University of Reading, School of Psychology and Clinical Language Sciences, Reading, United Kingdom
[3] University of Zürich, Department of Psychology, Zürich, Switzerland
[4] Ghent University, imec-mict-UGent, Ghent, Belgium

Smartphones are ubiquitous in face-to-face social interactions, yet their implications for interaction quality, social connectedness, and loneliness in everyday life remain contested. This research investigates how smartphone use during in-person encounters – particularly the degree of attention directed toward interaction partners – shapes perceived interaction quality, subsequent feelings of closeness, and momentary loneliness.

Across three complementary studies, we examine these relationships using both observational, experimental, and intensive longitudinal methods to examine these processes in daily life. Study 1 employed experience sampling with more than 150 Spanish emerging adults, yielding more than 10,000 momentary reports of face-to-face interactions. Participants provided both subjective reports and objective logs of smartphone use, allowing us to disentangle perceived from actual device use. Study 2 extended this approach by observing real-world conversations in public cafeterias with 100 Spanish dyads, combining objective and subjective measures of smartphone use to replicate and broaden the findings. Study 3 implemented an incremental intervention designed to reduce smartphone use and enhance attention to partners during in-person interactions, drawing on another experience sampling study with over 250 participants and 20,000 momentary questionnaires completed. The study employed an ABCA' design: A = a 10-day baseline period; B = an 11-day intervention period; C = a 14-day break; and A' = a 7-day follow-up. The intervention progressively encouraged participants to give their full attention to interaction partners by: (1) prompting them in daily life to consider whether smartphone use during a face-to-face interaction was worthwhile; (2) providing a smartphone wallpaper image as a visual reminder of this question; and (3) sharing a brief video recorded by the first author outlining the pros and cons of smartphone use in face-to-face contexts.

Study 1 showed that self-report smartphone co-present use (b = -0.04, 95% CI [-0.07, -0.01], p = 0.009), but not smartphone-logged co-present use (b = 0.01, 95% CI [-0.04, 0.05], p = 0.800), was negatively associated with the quality of face-to-face interactions. Study 2 confirms the same findings showing that perceived, rather than objectively observed, smartphone use was associated with poorer interaction quality. In Study 3, compared to the control group, participants in experimental conditions reported significantly higher quality on their face-to-face interactions (b = 0.03, 95% CI [0.01, 0.05], p = 0.006), with effects increasing as participants progressed through the full intervention (b = 0.15, 95% CI [0.09, 0.22], p < 0.001). Notably, those completing the full intervention (Group 3) also showed sustained improvements during the follow-up period after the break (b = 0.29, 95% CI [0.13, 0.45], p < 0.001).

Taken together, these three studies underscore the beneficial effects of fostering mutual attention in everyday social encounters and demonstrate that theory driven, low-cost, realistic, and scalable smartphone interventions can meaningfully enhance the quality of face-to-face interactions, strengthen social bonds, and mitigate loneliness if they are clearly oriented to a specific and beneficial objective.

ICS05 At the Core of Interpersonal Relations: Questions of Closeness, Loneliness, and Dislike

PP 1174 How different types of social media use relate to loneliness compared to offline social interactions: Preliminary findings from a longitudinal study

Vojtěch Mýlek[1], Dědková Lenka[1]

[1] Masaryk University- Faculty of Social Studies, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Social media have become deeply integrated into adults' everyday lives, making it essential to understand how their use relates to wellbeing. In this study, we examined the associations between different types of social media use (SMU) and loneliness, a key indicator of social wellbeing. While the effects of SMU are thought to depend on specific types of use and individual susceptibility variables such as personality (Valkenburg & Peter, 2013), most research has focused on either general SMU or the active-passive distinction (Zhang et al., 2022), which proved too crude to yield consistent and meaningful associations with wellbeing (Valkenburg et al., 2022). Thus, we extend previous work by distinguishing four types of SMU: direct messaging, social engagement (e.g., liking or commenting on others' posts), self-presentation (e.g., posting content), and content consumption (e.g., scrolling through feeds). We expect the more social dimensions of SMU, that is, direct messaging and social engagement, to be negatively associated with loneliness. We also consider offline social interactions (i.e., offline communication and social activities), whose effects may serve as a crucial reference point when evaluating the relative impact of SMU on loneliness (or vice-versa). Furthermore, since online interaction can be less demanding for socially anxious individuals (McKenna et al., 2002), we investigated whether social anxiety moderates the effects of direct messaging and social engagement, as well as their offline counterparts. Using structural equation modeling, we analyzed Time 1 data from an ongoing longitudinal survey among a general population sample of 3,460 Czech adults (aged 18–59, M = 39.18, SD = 11.74; 49.8% men, 0.4% other), collected in April–May 2025. Although we present cross-sectional findings here, Time 2 data (to be collected in April-May 2026) will be included for the conference presentation. Our results show that, after accounting for offline social interactions, social anxiety, and demographics, SMU is only weakly associated with adults' loneliness. The type of use also matters: direct messaging was linked to lower loneliness (β = –.05), social engagement and content consumption to higher loneliness (β = .09 and .08, respectively), and self-presentation was unrelated to loneliness. In comparison, the association of offline communication with loneliness was larger (β = –.18) while, surprisingly, participation in offline social activities was unrelated to loneliness. Social anxiety had the largest effect of all included predictors, with more anxious adults reporting higher loneliness (β = .43). It also moderated the effects of social engagement on SMU, which was associated with higher loneliness among adults with average or high (+1 SD) social anxiety but not among less anxious adults (–1 SD). Moreover, offline social activities predicted lower loneliness only among less anxious adults. The interactions between social anxiety and direct messaging or offline communication were not significant. Among demographic variables, only financial security negatively predicted loneliness (β = –.13), whereas gender, age, and education showed no significant effects. Overall, our findings underscore the importance of differentiating types of SMU and considering their conditional effects, while suggesting that their relationship with social wellbeing among adults is relatively weak.

ICS05 At the Core of Interpersonal Relations: Questions of Closeness, Loneliness, and Dislike

PP 1175 Beyond the family unit: Developing an individual parent measure of family communication for post-secondary students

Cori Howard[1], Nicola Byrom[1], Rebecca Upsher[1]

[1] King's College London, Institute of Psychiatry Psychology and Neuroscience, London, United Kingdom

The Revised Family Communication Pattern instrument (RFCP) assess two dimensions of family communication: conformity and conversation orientations. Although widely used with adolescents and post-secondary students, the RFCP was developed and primarily validated for adolescent populations. However, compared to adolescents, most post-secondary students adapt to new academic demands, social environments, and increased independence. This raises the question about whether the RFCP adequately captures family communication processes for post-secondary students. Additionally, our research on parental relationships with students suggests that communication patterns may differ between parental figures, reflecting differences in relational roles, emotional closeness, and communication norms. Therefore, instruments that require respondents to group parental communication perceptions together may obscure meaningful differences. An individual-parent approach offers the opportunity for greater clarity and improved measurement accuracy. This paper presents the mixed-methods, multi-study approach utilized to develop and validate the new Individual Parent variation of the RFCP (RFCP-IP) for use with post-secondary students.

Three studies were conducted. Across all studies, participants were over 18 years of age and actively enrolled in a post-secondary institution in the U.K., U.S., or Australia. Participants were recruited via Prolific, an online recruitment platform, and were monetarily compensated for their time. In Study One, a total of 23 students completed an online cognitive interview examining item interpretation and response processes to the original RFCP. Participants identified difficulty responding to items that grouped parents together, leading to the adaptation of the RFCP to reference individual parental figures, the RFCP-IP.

In Study Two, 644 students completed an online survey of the RFCP-IP. This new variant's factor structure was evaluated by a confirmatory factor analysis for mothers and fathers separately. Model fits were modest: $\chi^2(298)=1235.13$, $p < .001$; CFI = .866; TLI = .854; RMSEA = .070 (90% CI .066–.074); SRMR = .065 and $\chi^2(298)= 838.03$, $p < .001$; CFI = .884; TLI = .873; RMSEA = .067 (90% CI .062–.073); SRMR = .068. for mothers and fathers respectively. Although RMSEA and SRMR values fell within acceptable ranges, CFI and TLI values were below conventional thresholds, suggesting that the model did not adequately capture the observed covariance structure, particularly for mothers. Further SEM testing indicated the measurement invariance was supported across both groups via equivalent fit indices for configural, metric, and scalar models. These overall model fits were also modest, again slightly better for fathers (CFI = .864, RMSEA = .071) than for mothers (CFI = .839, RMSEA = .075). These results suggest that the constructs were measured similarly across parental figures, allowing for meaningful comparisons of RFCP-IP subscales.

For Study Three, approximately 50% of students returned to complete a second point-in-time survey after one year. The relationship between the RFCP-IP (Study Two) and depression, anxiety, and resiliency were examined for predictive validity.

Results support the use of the RFCP-IP as a developmentally appropriate measure of family communication for post-secondary students across all three countries. Despite modest overall model fit, full measurement invariance underscores the scale's utility for parent-level analyses. The RFCP-IP offers researchers a more precise tool for examining family communication processes from a post-secondary student perspective and should be considered when working with this population.

JOS01 Perceived Influences on Journalistic Work in Central and Eastern Europe: Economic and Political Challenges

PN 01 Journalistic labor condition and precarities: Evidence from Central and Eastern Europe in the worlds of journalism study

Anda Rozukalne[1], Antonia Čuvalo[2], Igor Vobič[3], Boris Mance[3]

[1] Rīga Stradiņš University, Faculty of Social Sciences, Riga, Latvia
[2] University of Zagreb, Faculty of Political Science, Zagreb, Croatia
[3] University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

Over the past two decades, the media ecosystem has been profoundly reshaped by technological change, introducing new actors, cross-professional collaboration, and diverse business models. These developments coincide with high stress levels and persistent work–life imbalance (Lukan & Čehovin Zajc, 2022), placing journalism's professionalization on increasingly uncertain terrain (Rick & Hanitzsch, 2023) and reviving core sociological questions about who journalists are (Deuze, 2005) and what journalistic work means today. Using data from the third wave of the Worlds of Journalism Study (WJS3) (Lauerer et al., 2025), this paper examines journalists' working conditions in 17 Central and Eastern European (CEE) countries. While these conditions partly reflect global transformations of journalism shaped by media-system and economic change, they are also influenced by region-specific socio-political factors. Focusing on legal, social, and financial dimensions of journalism as a profession, we analyze employment status, income, working hours, workload, and membership in professional associations. Although permanent contracts remain the dominant form of employment, journalists face insecurity due to relatively low remuneration and high workloads. Low pay drives 39% of CEE countries respondents to seek additional income, while freelance journalism accounts for 16% of journalists in the region. Union membership is generally lower in CEE countries (39%) than in the overall WJS3 sample. The analysis also reveals significant cross-national variation, with notable differences in freelancing and multiple jobholding across countries. By comparing CEE countries data of WJS3, this paper explores how journalists' job profiles and labor conditions intersect, offering a comparative assessment of the ongoing transformation of journalistic work in Central and Eastern Europe.

[6] Charles University, Faculty of Social Sciences, Prague, Czech Republic

Journalists in the Central and Eastern European (CEE) region face numerous challenges and are increasingly targeted by powerful political and economic actors (Peruško, Harro-Loit & Lauk, 2024). Their work is further constrained by worsening access to information sources, insufficient funding for investigative reporting, and a growing emphasis on the commercial aspects of media production. This shift has contributed to the transformation of journalistic output into "media products" governed by economic logic (Němcová Tejkalová et al., 2025). Moreover, journalists in several CEE countries are operating in contexts marked by democratic backsliding (Bermeo, 2016; Carothers & Hartnett, 2024).These developments are reflected in our findings, although national political and economic contexts continue to shape the specific circumstances in

each country. This paper first provides a theoretical framework for analyzing perceived political, economic, organizational, and social influences on journalism. It then examines relevant sections of the third wave of the Worlds of Journalism Study (WJS3) conducted between 2021 and 2025, in which journalists assessed and ranked the perceived influences on their professional work. As most of the countries included in WJS3 also participated in the second wave (WJS2, conducted between 2012 and 2016), the study adopts a longitudinal comparative perspective. The paper identifies and explains changes over time by comparing CEE-specific findings with aggregated results from WJS2 and WJS3.The timing of the research presents a unique opportunity to explore the shifting dynamics of journalistic influences amid two major disruptions, the global COVID-19 pandemic and escalating geopolitical tensions in the CEE region. These developments have intensified political securitization, contributed to economic decline, and generated new social challenges. Recent trends reveal a steady perceived influence of political and economic factors, with only Kosovo indicating higher mean on a 1–5 Likert scale (where 1 indicates the least important influence and 5 the most important) compared to the overall WJS3 results regarding the political influence (2.58), and Albania (2.94), Moldova (3.03) and Poland (3.13) exceeding the total average scores for economic influences on journalistic work. Procedural and organizational factors remain the most influential dimensions shaping journalistic practice in CEE, with average scores of 3.68 and 3.09, respectively. The paper contextualizes the detailed findings and interprets cross-national variations within the region.

JOS01 Perceived Influences on Journalistic Work in Central and Eastern Europe: Economic and Political Challenges

PN 03 Trends in the perception of journalistic autonomy and media freedom in CEE countries

Deimantas Jastramskis[1], Agnieszka Węglińska[2], Katarzyna Konarska[3], Antonija Čuvalo[4], Sandra Labova[5], Anda Rozukalne[6]

[1] Vilnus University, Faculty of Communication, Vilnius, Lithuania
[2] Institute of Journalism and Social Communication, University of Wrocław , Wrocław, Poland

[4] University of Zagreb, Faculty of Political Science, Zagreb, Croatia
[5] Charles University, Faculty of Social Sciences, Prague, Czech Republic
[6] Riga Stradiņš University, Faculty of Social Sciences, Riga, Latvia

Creating conditions for media freedom should form a favourable environment for editorial autonomy, which defines both the independence of the journalistic profession as a whole (external autonomy) and the freedom of an individual journalist to perform their daily work (internal autonomy) (Nygren, 2012). Both levels of editorial autonomy (external and internal) are related, and scholars emphasize the importance of autonomy at both levels, explaining that a shared understanding of professional identity and institutional independence is developed (Hamada et al., 2019). This is widely recognized as an essential requirement for the professional practice of journalism and is generally seen as a defining feature of journalism in terms of professional commitment (Deuze, 2005). Journalists in CEE countries, to varying degrees, face limitations on their professional autonomy in choosing topics and highlighting them. The study results show that journalists in the region report some of the highest levels of internal autonomy worldwide but relatively low levels of external autonomy. Tai visiškai priešinga tendencija palyginti su Šiaurės Vakarų Europos šalimis, kurios pagal Hallin ir Mancinį (2004) priskiriamos demokratiniam korporaciniam modeliui. Four CEE countries (Lithuania, Kosovo, Bulgaria, and Latvia) rank in the top 5 out of 75 countries surveyed in the WJS3 study for their internal journalists’ autonomy. However, when journalists rate their countries’ media freedom, only one CEE country – Estonia – is in the top 5. Among the 17 CEE countries, only Estonia has a marginal difference in the average perceptions of journalists on editorial autonomy and media freedom, with the largest differences in these perceptions being recorded in Hungary, Serbia, and Bulgaria. A comprehensive assessment of media freedom in a country is quite a complex matter when it comes to generalizing the situation across the entire media system, where there may be both editorial offices with complete autonomy and those where journalists are constantly obliged to comply with prevailing political, economic, and other interests. Thus, the freedom of CEE media systems with more contrasting levels of editorial autonomy may be assessed much more critically than those where the levels of autonomy of different editorial offices are perceived as more equal.

[4] University of Ss. Cyril and Methodius in Trnava, University of Ss. Cyril and Methodius, Trnava, Slovakia
[5] University of Bucharest, Faculty of Journalism and Communication Studies, Bucharest, Romania

This paper examines journalists' perceptions of and experiences with safety threats across 17 Central and Eastern European (CEE) countries, focusing on four dimensions of safety: physical, psychological, digital, and financial, in line with the conceptual framework developed by Slavtcheva-Petkova et al. (2023). Journalists' safety has become an increasingly pressing issue globally, particularly in regions characterised by democratic backsliding, political polarisation, and growing hostility towards the media. In the third wave of the Worlds of Journalism Study (2021–2025), safety-related questions were included for the first time, allowing for a systematic and comparative assessment of journalists' safety conditions across diverse media systems. Using survey data from the Worlds of Journalism Study, this chapter ranks the 17 CEE countries according to journalists' reported experiences across the four safety dimensions, as well as their overall safety scores. The analysis documents the prevalence and forms of safety threats encountered by journalists, ranging from physical intimidation and psychological harassment to digital attacks and financial insecurity. In addition, the chapter examines journalists' coping mechanisms, perceptions of freedom of expression, assessments of impunity for crimes committed against journalists, and individual and collective forms of resilience. The findings reveal significant cross-national variation, shaped by political, economic, and institutional contexts, while also pointing to shared regional patterns of vulnerability. Safety threats are shown to be closely intertwined with broader constraints on media freedom and professional autonomy. By foregrounding journalists' own experiences and perceptions, the chapter highlights safety as a foundational condition for the practice of independent journalism. Overall, the paper contributes to a deeper understanding of the complex dynamics of journalistic safety in CEE and underscores the need for strengthened legal, institutional, and professional support mechanisms to safeguard press freedom and ensure the long-term sustainability of journalism under challenging conditions.

JOS02 Public Service Media

PP 0029 Between values and logics: Public service journalism in the age of platform-oriented content creation – the case of "funk"

Mirco Liefke[1], Katja Schupp[2]

[1] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany
[2] Johannes Gutenberg Universität Mainz, School of Journalism, Mainz, Germany

"We're always kind of asking ourselves: do we go for a really wild statement — like some TikTokers do […] kick it off with some rage bait and then I react to it […] or do we do it the way I learned it in journalism […]." ***[1]***

Across national and international research findings, the shift from linear to non-linear news consumption on platforms is one of the defining trends in contemporary journalism. Public broadcasters seeking to remain relevant must therefore venture beyond the confines of their traditional media environment and fully confront the consequences of new media logics. More diverse distribution strategies require not only technical transformation but also challenge long-established routines and a professional ethos grounded in objectivity and neutrality. While these journalistic "god-terms" (Zelizer, 2004) have often been misused e.g., to marginalize certain perspectives (Lünenborg & Medeiros, 2021) platform logics and recommender systems have turned demands for plurality into a marketing resource. This paper examines the processes and consequences for everyday work of so-called content creators producing for funk, the online network jointly operated by German public service broadcasters ARD and ZDF. It also analyzes how this form of creative practice reshapes notions of journalistic quality and professional self-understanding.

The study draws on semi-structured interviews with funk's commissioning editors and all ten newly recruited content creators. Using thematic analysis, we examine how creators make sense of their identity in the hybrid space between institutional journalism and creator culture. Although many had substantial editorial experience, interview data show that journalistic competence was not the decisive hiring criterion. Instead, funk prioritized applicants who "had their own vibe[2]", a distinct, memorable presence.

We conceptualize this orientation through van Zoonen's (2012) notion of "*I*-pistemology," which captures a shift toward personality-infused modes of knowledge production aligned with new media logics (Chadwick, 2017). Within funk's environment, *I*-pistemology becomes a productive resource enabling creators to build relational proximity with audiences accustomed to influencers offering subjective framing rather than traditional journalistic detachment.

However, this approach also generates friction. Creators who see themselves anchored in journalism must navigate a delicate balance between platform-native performance cues and the journalistic expectation to produce accurate and relevant

information. Several creators described the constant challenge of staying visible within algorithmic recommendation systems while upholding the journalistic values emphasized during their training.

We argue that these tensions reflect a broader transformation of public service media within platformized media ecologies. Funk's strategy does not signify a break with journalism but rather its reconfiguration under platform conditions. By analyzing how creators articulate and negotiate their hybrid roles, this paper contributes to debates on platformization and the future of PSM. The case of funk demonstrates that maintaining relevance increasingly requires navigating and partly adopting the logics of the creator economy, thereby reshaping professional identity and institutional practice within contemporary digital publics.

2. "Vibe" is not a translation but the original phrasing used in the interview conducted in German.

JOS02 Public Service Media

PP 0030 Reporting on populists as challenge for Public Service Media: The audience perspective

Johanna Wolleschensky[1], Annika Sehl[1]

[1] Catholic University of Eichstätt-Ingolstadt, Department of Journalism, Eichstätt, Germany

Reporting on populists poses a challenge for Public Service Media (PSM). Unlike commercial media, PSM are mandated by their public service remit to ensure diversity of opinion and impartiality (European Broadcasting Union, 2014). When confronted with actors whose ideology challenges liberal-democratic principles (Mudde, 2007), the public service remit becomes difficult to reconcile: the obligation to represent all relevant voices may directly conflict with the duty to safeguard democratic and pluralist discourse. This creates a "democratic dilemma" (Hien & Norman, 2023, p. 1162) requiring PSM to balance inclusivity, pluralism and impartiality with the protection of human dignity.

Against this background, the question arises as to how PSM should deal with populist parties. Research has just begun to address how PSM journalists navigate this dilemma and understand their role in this context (ANONYMIZED). However, there is still limited knowledge about how the public – as PSM are meant to serve them as the audience – perceives this issue. Therefore, drawing on the theoretical concept of journalistic roles and extending it to the coverage of populism, this study takes an audience's perspective and asks what role the public expects PSM to adopt in reporting on populist parties.

The study draws on a cross-national survey in an online access panel conducted in Germany, France, Poland and the United Kingdom – four large European media markets differing in media systems (Hallin & Mancini, 2004) and in their political treatment of populist parties (Wettstein et al., 2018) – using quota samples of 1,000 respondents per country.

As this study is a work in progress, by the time of the conference, initial results will be available. The study will contribute empirically and theoretically to the field of PSM and populism research by providing empirical evidence on the audience perspective including different groups within the countries (e.g., political orientation, age, gender, media use) as well as international comparisons; by applying the concept of journalistic roles to audience expectations regarding PSMs' coverage of populism; and by advancing debates on the public service remit in heterogeneous and politically divided societies.

JOS02 Public Service Media

PP 0031 Public expectation, evaluations, and satisfaction with public service media in the Czech Republic

Klára Smejkal[1], Marína Urbániková[1]

[1] Masaryk University, Department of Media Studies and Journalism, Brno 15, Czech Republic

Public service media (PSM) are created, funded, and controlled by the public and for the public. However, current research on PSM still focuses primarily on policy regulations and innovation strategies. On the contrary, the public perspective remains neglected, even though in recent years we have seen calls from researchers for a shift towards the audience (Swart et al., 2022). Furthermore, we argue that the legitimacy of PSM cannot be understood solely as a top-down process, but

rather as a perception that is co-constructed in interaction with other stakeholders, including the audience (Fehlmann, 2023).

The aim of this study is to address this gap in research and explore PSM perception from the public perspective. The research focuses primarily on the concept of media satisfaction and expands its traditional conception as a post-consumption evaluation of content (Patwardhan et al., 2011) towards a more general affective attitude of citizens towards PSM as a public institution, which can arise independently of direct media experience and is closely linked to the perceived fulfillment of the role of PSM.

The study draws on data from a representative survey of the adult population in the Czech Republic (N = 1700), where PSM are, on the one hand, a stable and successful part of the local media system and, on the other hand, face increasing criticism from populist politicians and their voters. Using a combination of descriptive analysis and multiple linear regression, the study examines the public's expectations of normative role of PSM, evaluations of the normative role fulfillment, and factors contributing to overall satisfaction with PSM, including not only aspects related to normative role fulfillment but also so-called cohesive role fulfillment—their capacity to represent and defend in-group identities (Smejkal et al., 2022).

The results show that, in the view of the public, the most important normative roles of PSM are to provide impartial and accurate information, educate the audience, and promote national culture. In contrast, paying attention to various minorities was considered one of the least important normative roles of PSM. The greatest discrepancy between expectations and evaluation appears in relation to the provision of accurate and impartial information. In contrast, the discrepancies for entertainment, educational, and cultural roles are much smaller, which suggests that PSM normative role fulfillment connected to non-news content is perceived more positively. Finally, regression analysis indicates that overall satisfaction with PSM is mainly influenced by the perceived fulfillment of its information, entertainment, and public forum roles. When broader societal satisfaction and socio-psychological characteristics were included in the model, normative and cohesive role fulfilment, together with PSM consumption, remained the strongest predictors, with broader societal satisfaction contributing only weakly. The study thus shows that public satisfaction with PSM is built primarily through the perceived quality of their performance, rather than through the political attitudes of individuals.

JOS02 Public Service Media

PP 0032 Negativity pays – even for public service media: Engagement and sentiment patterns of news posts and user comments on TikTok

Julian Maitra[1], Daniel Gräßer[1]

[1] Freie Universität Berlin, Institut für Publizistik- und Kommunikationswissenschaft, Berlin, Germany

As journalism becomes increasingly embedded in short-video platforms such as TikTok, news organizations face a fundamental dilemma: how to translate established news values into environments where algorithmic engagement logics structure visibility and relevance. *Negativity* is among the most robust news values in classic and revised accounts of what counts as "news" (Harcup & O'Neill, 2017), and recent large-scale evidence shows that negativity reliably drives online news consumption (Robertson et al., 2023). Yet we still know little about how negativity operates in platformed news publics shaped by algorithmic curation and interest clustering (Gerbaudo, 2024) – and especially how it structures audience interaction in comment spaces. Building on journalism's "emotional turn" (Wahl-Jorgensen, 2020), this study examines negativity as an affective resource for engagement on TikTok, with special attention to public service media (PSM) and the platform pressures that may challenge their public value-driven, audience-facing performance in digital environments (Sehl, 2020).

Empirically, the study analyzes a multilingual dataset of TikTok news content from 21 prominent publishers across Germany, France, the UK, Switzerland, and Austria, including PSM outlets (e.g., BBC News, Tagesschau, Franceinfo) and private news organizations (e.g., GB News, *Süddeutsche Zeitung*, *Le Monde*). The dataset comprises 10,341 news posts and 509,759 user comments published between 10/2024 and 09/2025 and collected via the TikTok Research API. Negativity is operationalized as affective polarity in both posts (captions and voice-to-text transcripts) and user comments using transformer-based multilingual sentiment classification, leveraging open-source large language models designed for social media sentiment analysis (Barbieri et al., 2022). Multilevel models account for comments nested within posts and publishers and estimate associations with engagement outcomes while avoiding causal claims about editorial intent.

Results show that negativity is pervasive (63.7% of PSM and 65.0% of private posts are negative; among scored comments, 57.0% are negative). Negativity is particularly pronounced in English-language posts and comments, compared to more neutral French and German news posts. Negative posts are associated with markedly higher engagement: compared with non-negative posts, negative news videos receive about +47% views, +49% likes, +62% shares, and +47% more comments (log models; exp(β)−1). Crucially, this pattern is stronger for PSM than for private media: the estimated negativity–views association is +61.8% for PSM versus +26.3% for private outlets, indicating that platform visibility incentives discipline engagement strategies across ownership models. Comment dynamics mirror this affective logic. Negative comments receive slightly more likes (+3.4%) but substantially more replies (+8.8%), and endorsement is conditional: negative comments

are especially liked when they align with the post's sentiment (comm_neg × post_neg interaction, $p < .001$), suggesting a process of affective *sentiment matching* as a mechanism of audience participation.

A limitation is that publisher-level comparisons are based on a modest set of outlets (N = 21), so results should be interpreted as platform-conditioned associations rather than definitive institutional effects. Overall, the study shows how TikTok's algorithmic interest clustering and engagement metrics convert negativity into a cross-organizational and cross-linguistic visibility resource, tightening platform constraints on journalistic autonomy – including within public service media.

JOS02 Public Service Media

PP 0033 The challenge of strategic dis-integration: How fact-checkers are adapting to platform retreat

Lucas Graves[1], Irene Larraz[2], Victoria Moreno-Gil[1]

[1] Carlos III University of Madrid, Communication and Media Studies, Getafe, Spain
[2] University of Navarra, Department of Journalism, Pamplona, Spain

The abrupt end of Meta's US fact-checking partnerships in early 2025 was only the most dramatic step in what fact-checkers see as an ongoing, systematic "retreat" by platform companies from anti-disinformation efforts (e.g. Drobnic Holan 2025; Jiménez Cruz 2025). This disengagement by the major platforms — especially Meta and Google — that have profoundly shaped the field's evolution raises basic questions about how fact-checking organizations are adapting to a rapidly shifting strategic landscape, and how their mission and identity will evolve to reflect those changes.

Direct and indirect funding from Meta, Google, TikTok and other tech firms been a primary engine of the field's expansion over the last decade, with Meta's partnership alone providing more than $100 million to fact-checkers since its inception in 2016 (Leingang 2025). Beyond financial incentives, the partnerships have helped fact-checkers achieve impact and scale in addressing disinformation, strengthen accountability and governance regimes for platform companies, and draw greater public attention to their work. At the same time, the alliance with Meta and other platforms has had well-known drawbacks for fact-checkers, ranging from online harassment and attacks by major public figures to imposing constraints on who and how they check. Practitioners have understood these relationships as providing essential leverage while limiting their autonomy (Belair-Gagnon et al. 2023; Vinhas and Bastos 2023).

This study examines the consequences of the cessation of Meta's pivotal program and the strategies developed to navigate a wider landscape of diminished funding, heightened political attacks, and strategic retreat by key institutional stakeholders. Drawing on a qualitative analysis of 27 in-depth interviews across five continents, we explore how fact-checking organizations are adapting to a post-platform context. While the Meta partnership remains in effect for now outside of the United States, our interviews confirm that fact-checkers around the world are actively reconfiguring day-to-day efforts as well as long-term strategies for a world in which platform companies are no longer primary strategic allies.

In this way, the paper analyzes what happens when an emerging field becomes institutionalized around a central axis — the reach and resources of major platforms — and those defining relationships begin to erode. We suggest that the set of challenges faced by fact-checking organizations today can be understood as platform dis-integration: in a very literal way, reversing the tight integration with these firms that has profoundly shaped the mission and practices of individual fact-checkers as well as field-wide norms and governance mechanisms (Lauer and Graves 2025).

Our findings point to four ongoing strategic shifts which fact-checkers understand as marking a return to foundational principles: 1) An editorial agenda stressing new formats and a public service focus (e.g. deeper investigations, political fact-checking, exposing scams); 2) community-building strategies to "reconnect with our community" (newsletters, membership programs, etc.); 3) public branding campaigns to directly counter the "censorship" narrative; and 4) wider avenues of impact (e.g. accountability audits, policy work, etc.). We analyze these shifts in light of the specific socio-political context different organizations face and conclude with recommendations for future research.

PP 0034 How do users perceive AI news? The effects of AI authorship cues on credibility perceptions and message selection likelihood

Hannah Schmid-Petri[1,2], Daria Kravets[1]

[1] Bidt Bayerisches Forschungsinstitut für Digitale Transformation, Communications, Munich, Germany
[2] University of Passau, Science Communication, Passau, Germany

News organizations around the world are increasingly incorporating artificial intelligence (AI) into various stages of the news production cycle. While generative AI offers clear benefits—such as reducing errors, supporting fact-checking, personalizing content, expanding topic diversity, and saving time—it also raises significant concerns. These include dependency on tech platforms (e.g., OpenAI), risks of algorithmic bias, misinformation (e.g., hallucinations), and reduced opinion diversity (Simon, 2022).

Against this background, the question arises: How do audiences respond to the use of AI in journalism—particularly when AI is presented explicitly as the (co-)author of news content? Of particular interest in this context is how AI authorship cues shape perceived credibility and, in turn, influence news selection. Over the past decade, researchers have conducted

various experiments to compare audience perceptions of AI- vs. human-written news. However, findings remain mixed: while several studies show a preference for human authors (e.g., Zoizner et al., 2025) others suggest that AI-generated content can, under certain conditions, be seen as equally or even more credible (Cloudy et al., 2022). One explanation for these contradicting results lies in the activation of the machine heuristic—a mental shortcut suggesting that computers, software, or other machine agents are inherently objective, neutral accurate, and free from ideological bias. When activated, or present, this heuristic can lead users to perceive AI-generated content as more credible than human-written news, due to the assumption that machines lack hidden agendas or self-interest (Sundar, 2008). This trust in machine-generated content may have important consequences for user behavior, particularly among individuals who are generally skeptical of traditional journalistic sources or who tend to avoid content that contradicts their existing attitudes (Cloudy et al., 2022). Since most people rely on heuristics during news consumption (Metzger & Flanagin, 2013), AI authorship cues that activate the machine heuristic could enhance perceived credibility and increase selection likelihood.

In this paper, we thus investigate how different types of authorship cues (human, AI, and AI-assisted) affect the likelihood of selecting a journalistic news item, to what extent perceived credibility of the author and the message mediates this process, and how attitudes toward generative AI (dispositional machine heuristic) influence these relationships. To do so, we conducted seven parallel pre-registered between-subjects online experiments (N = 6,000) in Germany with three experimental conditions regarding authorship cues accompanying a news headline (human journalist vs. AI vs. human journalist with help from AI) for seven different media brands (*ARD-Tagesschau, Die Welt, taz, SZ, Focus Online, BILD, FAZ*). Results show that positive attitudes toward generative AI significantly increase perceived credibility of AI-generated content and its selection likelihood, whereas negative attitudes reduce both. These findings underscore the significance of preexisting attitudes toward generative AI in the selective exposure to AI-authored news, offering implications for the integration of AI into journalistic practices.

PP 0035 Reading the algorithmic zeitgeist: Epistemic shifts and post-trust journalism in the age of AI

Ana Marta Moreira Flores[1]

[1] Universidade NOVA de Lisboa, Faculdade de Ciências Sociais e Humanas, Lisboa, Portugal

This paper theorises the impact of Artificial Intelligence (AI) on journalism as an epistemic transformation rather than a purely technological or organisational one. Situated within a broader condition of post-trust, the study argues that AI intensifies and stabilises existing crises of credibility, authority, and meaning-making that already characterise contemporary media ecosystems (Bennett & Livingston, 2018). At this moment of shifting grounds, journalism is confronted not merely with new tools, but with a reconfiguration of how knowledge is produced, validated, and recognised as legitimate in the public sphere.

Drawing on cultural diagnostics and trend studies (Gomes et al., 2018; Dragt, 2017), the article conceptualises AI as part of an "algorithmic zeitgeist": a constellation of cultural logics, affective regimes, and epistemic assumptions shaping journalistic practice and audience interpretation. Rather than treating AI as an external disruptor, the paper examines how its integration into newswork exposes latent tensions between speed and verification, automation and judgment, scale and accountability (Carlson, 2015; Diakopoulos, 2019).

Methodologically, the paper is grounded in a qualitative trend-mapping process structured through the Trend Research Kit (Flores, 2024), which combines desk research, focus groups, and participatory workshops. The desk research synthesised academic literature, innovation reports, and media lab outputs to identify recurrent signals of change at the intersection of AI, journalism, and digital culture. These signals were subsequently interpreted and stress-tested through focus groups with journalists, editors, and media professionals from diverse organisational contexts, allowing professional experience to confront and refine emerging patterns. Finally, workshops translated these insights into speculative scenarios and conceptual prototypes, enabling the identification of underlying epistemic tensions rather than predictive claims. This triangulated approach positions trend analysis as a form of epistemic inquiry, attentive to weak signals, contradictions, and meaning structures that often elude conventional empirical measurement.

As one of the the results, four interrelated epistemic trend narratives structure the analysis. (1) *The age of post-trust* describes a shift from institutional credibility to fragmented, affect-driven, and algorithmically mediated forms of belief, where trust is negotiated through platforms, identities, and recommendation systems rather than professional authority. (2) *The paradox of efficiency* captures how AI-driven productivity promises coexist with increased cognitive load, editorial fatigue, and a redistribution of epistemic labour onto journalists tasked with supervising automated outputs. (3) *Alpha + Ctrl+Z audiences* highlights generational modes of sense-making marked by volatility, irony, and aesthetic coding, challenging journalism's traditional claims to coherence, linearity, and factual closure. Finally, (4) *the syndrome of technosalvation* interrogates dominant narratives that frame AI as a remedy for journalism's legitimacy crisis, obscuring the political, ethical, and structural conditions underlying epistemic erosion (Morozov, 2013).

The paper contributes to Journalism Studies by reframing AI as an epistemic actor that reshapes norms of truth, authorship, and responsibility, rather than a neutral instrument of innovation. It connects post-trust theory with newsroom realities and

positions trend studies as a reflexive, interdisciplinary methodology capable of informing journalism research, professional practice, and media policy.

JOS03 AI and Audiences I.

PP 0036 Where do citizens draw the line in their support for AI in journalism? Evidence from a survey experiment in Norway and the U.S.

Erik Knudsen[1], Hallvard Moe[1]

[1] University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

In line with the notion of technological development, journalism and journalism studies have seen a massive surge in commentaries, advice, warnings, and discussions of AI. A general sentiment seems to be that journalism needs to "brace for the impact of artificial intelligence" (Møller et al., 2025, p. 1373). With that as a starting point, scholars have covered normative and ethical aspects, researched what journalists and others think about AI, analysed the actual news coverage of AI, and studied how different technologies using AI have been tested and used by news companies (see Sarısakaloğlu, 2025, for a recent review).

In this situation, amid rapid innovation, public support for AI applications in journalism remains understudied. While there is a growing literature providing audience perspectives on AI in journalism (e.g., Newman et al., 2025; Mitova et al., 2024; Hong et al., 2025; Toff & Simon, 2024), we still know little about the extent to which audiences want AI in journalism and where they draw the line between acceptable and unacceptable use of AI in journalism. We extend the growing literature in journalism studies on AI by using a comparative survey experiment with nationally representative data (online quota sampling) in Norway (N = 1040) and the United States (N = 1500) to provide comparative evidence on public support for AI in journalism. Through a between-subject 2 (news provider) x 6 (type of AI application) design, we test the relative effects of six AI applications in journalism that vary from widely used AI applications (e.g., text summarization) to more controversial ones (e.g., synthetic news anchors). Our dependent measure is an item measuring support for the implementation of an AI application on a scale from 1 (Do not support at all) to 5 (Fully support).

We find that audiences remain skeptical about adopting various AI applications, including those already widely used in journalism. Public support for AI applications in news production is generally low in Norway and the US (i.e., the highest mean is 2.68 on the five-point scale of our dependent measure of support), though AI applications for summarization and translation receive statistically significantly greater support than general front-page personalization, political front-page personalization, image generation, or synthetic anchors.

We also find Norwegians being statistically significantly more supportive of summarization, image generation, and synthetic anchors compared with Americans. One possible explanation for these differences may relate to a generally optimistic, if not deterministic, belief in the upside of exploiting new technologies in the Norwegian context. Research into Nordic media systems has underlined how established media companies have been seen as trusted keepers of publicist ideals at home, while utilizing cutting-edge technologies and new market opportunities in their different markets to support their news activities (e.g., Syvertsen et al., 2014, with Schibsted as a main example).

Taken together, our findings indicate that, while AI is increasingly important in journalism, audiences across the two countries studied are skeptical about adopting various AI-driven news services.

JOS03 AI and Audiences I.

PP 0037 Audience perceptions of the objectivity of fully automated, automated post-edited, and human-written news articles: Evidence from a population-based survey experiment

Xinyue Zhao[1], Florian Stalph[2], Sina Thäsler-Kordonouri[2], Neil Thurman[2]

[1] Center for Advanced Internet Studies CAIS, Research Data & Methods, Bochum, Germany
[2] Ludwig Maximilian University of Munich, Department of Media and Communication IfKW, Munich, Germany

In a world where increasing amounts of information have made capturing audience attention more difficult, news organisations have sought to produce content more quickly and at lower cost. Automated journalism has emerged as one approach to do this and is increasingly adopted by newsrooms and media organisations worldwide. While its implementation can increase the speed, scale, and efficiency of news production, it has also reignited debates, particularly regarding the journalistic norm of objectivity.

The proponents of automated journalism often invoke the promise of *algorithmic objectivity*. They claim that computational systems may reduce human bias and produce more neutral, factual news content. In contrast, critical scholarship has argued that automation algorithms are programmed and trained by humans and therefore prone to reproducing existing biases. Despite this theoretical debate, empirical evidence on how audiences perceive the objectivity of automated news remains mixed and fragmented. This may be a result of factors including divergent conceptualisations of objectivity, the experimental use of evaluation criteria developed for traditional media, and how comparisons have been made across different news genres.

This study investigates how machine authorship affects audience perceptions of objectivity in news articles. The research addresses three primary issues: (1) how machine authorship influences perceptions of objectivity; (2) whether this influence varies across different news topics; and (3) the relationship between the level of automation and the likability of an article, as mediated by objectivity perceptions.

The study uses data from a large-scale, between-subjects online survey experiment carried out in the United Kingdom (N = 4,734). Participants were exposed to one news article without its authorship revealed. The experiment used 36 articles in total, comprising fully automated, automated post-edited, and human-written versions of 12 stories. Audience perceptions were measured using criteria specifically developed—in a focus group study—for data-driven news. In this set of perception criteria, objectivity is operationalised as a multidimensional construct, measured through five dimensions: balance, accuracy, source credibility, factuality, and sensationalism.

The findings show that machine authorship does not have a uniform effect on perceived objectivity. Overall, minor but significant differences were found in respondents' perceptions of the articles' factuality and source transparency. Specifically, higher levels of automation increased audience satisfaction. However, the effects varied in magnitude and focus depending on the news topic. Regarding article likability, a mediation analysis reveals that although audiences generally find fully automated articles less appealing, they do recognise and appreciate aspects of objectivity in them.

This study provides a closer examination of audience perceptions of automated journalism through a new set of lenses. It addresses potential confounds that may have contributed to inconsistent findings in previous research and includes automated post-edited articles in the comparison—a form that is widely used in practice but largely overlooked in scholarship. The findings reveal how automation can impact aspects of objectivity but that those impacts vary across news topics. For practitioners, the results suggest automation practices may need to be tailored topic-by-topic. For researchers, the study underscores the multidimensional nature of objectivity and the importance of using reasonably large sets of experimental stimuli.

PP 0038 Investigating the impact of AI-rewritten news articles on reader engagement, comprehension, and interest across six countries

Richard Fletcher[1], Felix M. Simon[1], Rasmus Kleis Nielsen[2]

[1] University of Oxford, Reuters Institute for the Study of Journalism, Oxford, United Kingdom
[2] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Public interest in news has declined in many countries in the last 10 years, inequality in news use has grown, and news avoidance is increasingly common. While low news use is often the result of structural inequalities in access (e.g., due to formal education, social class, etc.), many news avoiders also cite factors associated with the style and character of news content: news can feel boring, confusing, or hard to understand. We test whether large language models (LLMs) can serve as a scalable accessibility intervention by rewriting existing reporting to be clearer and more engaging for readers, while keeping the underlying information constant.

We conducted a preregistered online survey experiment fielded by YouGov in June-July 2025 across six countries and five languages (UK, USA, France, Argentina, Denmark, and Japan, N ≈ 2,000 per country). Participants were randomly assigned to read either an original newswire article about global financial stability risks or an AI-rewritten version of the same article produced with ChatGPT o3. The rewrite prompt targeted readers who typically find news 'boring or confusing' and imposed strict constraints aiming to alter the presentation rather than the content: the rewritten text had to match the original length, preserve direct quotes verbatim, simplify vocabulary and sentence structure, break down complex concepts and causal chains, and explicitly state why the story matters, without adding new information or changing the meaning.

The outcomes we measured were time spent on the article page and immediate post-reading ratings of perceived ease of understanding and interest. In all countries and languages, the AI-rewritten article was rated as: (i) significantly easier to understand and (ii) more interesting than the original, with (iii) broadly similar positive effects across participants with higher versus lower education and higher versus lower prior interest in news. Contrary to our preregistered hypothesis, the rewrite did not increase time spent reading. However, exploratory mediation analyses using a structural equation model suggest the null effect on reading time reflects two countervailing pathways: the rewritten article was quicker to read because it was easier but also held attention longer because it was more interesting, with the two effects cancelling each other out.

Overall, our findings provide cross-national evidence that LLM-based rewriting of news, which is distinct from summarisation or fully AI-generated news, can improve the perceived accessibility and interest of hard-news reporting at scale across countries and languages, with no decrease in engagement among avid news consumers. Thus, AI may be able to help address some of the most pressing challenges facing news and democracy in the coming years.

JOS04 Trust and Journalism

PP 0048 Expressive distrust: Rethinking what it means to distrust the news

Peter Jakobsson[1], Fredrik Stiernstedt[2]

[1] Uppsala University, Informatics and Media, Uppsala, Sweden
[2] Södertörn University, Culture and education, Flemingsberg, Sweden

Research on media trust has long grappled with conceptual and empirical puzzles, such as why distrust does not necessarily reduce news consumption and why trust and distrust often appear ambivalent. This paper introduces the concept of expressive distrust to address these challenges and expand current theorization. Drawing on qualitative interviews with Swedish social media users who publicly criticize news media, we argue that distrust should not be understood solely as an attitudinal stance but also as a performative practice embedded in identity work, group belonging, and political strategy.

Expressive distrust refers to signals of distrust that serve purposes beyond evaluating journalistic performance – such as signaling cognitive virtue, reinforcing social ties, or influencing public discourse. Our findings reveal that individuals often articulate nuanced and even respectful views of journalism in private, while performing categorical distrust in public arenas. This performative posture functions as symbolic capital: it marks independence and critical sophistication, fosters community belonging, and operates as a strategic tool in struggles over media policy and political hegemony. Importantly, these performances coexist with continued news use, resolving the paradox of the "distruster-consumer" documented in previous research.

Conceptually, the paper challenges linear models that treat trust and distrust as opposite ends of a continuum. Instead, we propose a framework that incorporates a performative axis cutting across existing typologies of skepticism and cynicism. Methodologically, our analysis underscores the limitations of survey-based measures that treat self-reports as transparent indicators of trust. We suggest multimethod approaches that combine interpretivist analysis with behavioral data and designs sensitive to audience and context.

By theorizing expressive distrust, this paper contributes to a more nuanced understanding of media skepticism in the current conjuncture – one shaped by platformized attention economies, populist epistemic repertoires, and identity-driven signaling practices. Recognizing the performative dimension of distrust is crucial for explaining why distrust persists despite high news use and for designing research that captures the complexity of trust-talk in contemporary media environments.

JOS04 Trust and Journalism

PP 0049 Highly trusted yet still threatened: Journalistic responses to fake news and disinformation in Norway and Iceland

Jón Gunnar Ólafsson[1]

[1] University of Iceland, Political Science, Reykjavík, Iceland

Concerns about fake news, disinformation, and the erosion of truth have become central to contemporary debates about journalism and democratic public spheres. Existing research on these challenges has commonly focused on polarized political environments, low-trust media systems, or contexts where journalism is institutionally weakened. Far less attention has been paid to how journalists operating in high-trust media systems, with strong professional norms and comparatively robust public support, understand and respond to post-truth pressures. This study addresses this gap by examining journalists in Norway and Iceland, two Nordic media systems that combine high public trust, extensive traditions of professional journalism, and high levels of traditional news consumption, yet differ markedly in market size, media structure, and funding regimes. As such, these cases constitute analytically valuable "least-likely" contexts for examining journalistic responses to disinformation and fake news.

Empirically, this study draws on sixteen semi-structured interviews with journalists in Norway and Iceland, conducted between late 2023 and early 2024. The interview sample spans a range of media organizations, professional roles, beats, and seniority levels, enabling systematic comparison across national contexts while remaining sensitive to institutional and market-specific differences. The interviews focus on journalists' experiences with fake news and disinformation, their definitions of these phenomena, perceived sources and threats, and their assessments of appropriate professional and institutional responses. The qualitative design allows for in-depth analysis of journalistic norms, professional self-understandings, and boundary work in a post-truth context.

The findings reveal a high degree of convergence in how journalists across the two countries conceptualize and respond to disinformation, despite important differences in media system structure and economic conditions. Journalists consistently distinguish between misinformation as unintentional error and disinformation as deliberate deception, though Norwegian journalists tend to emphasize intentionality, while Icelandic journalists place greater weight on the news-like appearance of false information. Social media platforms are widely perceived as the primary arenas for dissemination, with foreign actors frequently highlighted as key sources. At the same time, journalists openly acknowledge that professional journalism itself can function as a vector for both deliberate disinformation and accidental misinformation, particularly under conditions of time pressure, high workload, and limited resources.

Rather than advocating technological fixes or fundamentally new professional paradigms, journalists in both countries overwhelmingly emphasize a renewed commitment to core journalistic principles, accuracy, contextualization, ethical accountability, and rigorous fact-checking, as the most effective response to post-truth challenges. Fact-checking initiatives are viewed primarily as resources for strengthening everyday journalistic practice rather than as standalone solutions, underscoring the continued legitimacy of traditional professional norms.

This study contributes to journalism studies by demonstrating that post-truth pressures are not confined to lower-trust or highly polarized contexts, and by showing that professional journalistic ideals remain resilient in analytically "least-likely" cases. By foregrounding journalists' own interpretations and practices, the study extends existing research beyond platform-centered or audience-focused approaches. Societally, the findings highlight that maintaining public trust in journalism depends not only on combating disinformation externally, but also on safeguarding the institutional conditions that enable journalists to uphold professional standards.

JOS04 Trust and Journalism

PP 0050 Great expectations? What happens to media trust when audiences' journalistic role expectations are violated

Edson Tandoc[1]

[1] Nanyang Technological University, Wee Kim Wee School of Communication and Information, Singapore, Singapore

Scholarly research on journalistic roles has largely examined journalists' role orientations and performance, and yet calls are growing to also analyze audience role expectations and their implications for journalistic trust (Hanitzsch et al., 2019; Banjac, Juarez-Miro, & Hanusch, 2024). This study responds to that challenge. Anchored in the theoretical lenses of role theory and expectancy violations theory (EVT), which differentiates positive and negative violations and anticipates attitudinal consequences when expectations are breached (Burgoon & Jones, 1976), this study examines whether Singapore news audiences' expectations for four journalistic roles (monitorial, collaborative, interventionist, accommodative) are met or violated, and whether violations are associated with news media trust. This complements comparative work linking audience expectations to journalists' orientations (Riedl & Eberl, 2020) and extends prior Singapore evidence on audiences' journalistic role expectations (Tandoc & Duffy, 2016).

Adopting validated journalistic role measures from the Worlds of Journalism Study (Hanitzsch et al., 2019), we conducted an online national survey of 600 adult Singapore residents (average age = 43.94, SD = 13.86; 48.9% female; 48.1% with bachelor's degree). The respondents rated how much journalists *should* perform each role (expectations) and how much journalists *perform* each role (performance). Then, we computed gap scores (expectation – performance) to operationalize expectancy violations consistent with EVT (Banjac et al., 2024). Trust in local media and journalists (based on two items) is the dependent variable, controlling for traditional, online, and social news use.

Paired samples t-tests show role-specific violations: Monitorial expectations exceeded perceived performance (Mexp = 3.41; Mperf = 3.28; $t = 4.169$, $p < .001$), indicating a negative violation. The collaborative role was overperformed relative to expectations (Mexp = 3.43; Mperf = 3.62; $t = -5.309$, $p < .001$), a positive violation. The interventionist role showed a small overperformance (Mexp = 3.33; Mperf = 3.38; $t = -1.851$, $p = .032$), while accommodative expectations were met (Mexp = 3.51; Mperf = 3.51; $t = 0.00$, $p = .500$).

Next, we sought to predict trust in the news media, controlling for media use and accounting for gaps between journalistic role expectation and performance. The regression model is significant, $F(7, 593) = 21.49$, $p < .001$, accounting for 19% of the variance. Traditional and social media news use were both positively related to news media trust. Focusing on the expectation-performance gap, the collaborative role gap was positively related ($b = .126$, $p = .002$) while the accommodative role gap was negatively related ($b = -.132$, $p = .004$). Gaps in monitorial and interventionist role were not related.

This study demonstrates the value of modelling role expectations as relational, context-dependent constructs and treating their violations as antecedents of media trust (Banjac et al., 2024). We also show that not all role violations carry the same trust consequences: in Singapore's context, marked by high levels of government trust and a history of state regulation of the media, collaborative overperformance appears to bolster legitimacy, whereas accommodative underperformance undermines it. These results enrich comparative role scholarship and offer a template for expectation-based analyses in other media systems.

JOS04 Trust and Journalism

PP 0051 When researchers open up to journalists: How learning and reflective practices can bridge the theory-practice divide in journalism

Ornella Porcu[1], Timon Ramaker[2]

[1] University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands
[2] Ede Christian University of Applied Sciences, Research Group on Journalism and Communication, Ede, Netherlands

This presentation shows the first findings of two journalism scholars who seek to address the theory-practice divide in journalism (studies) by actively engaging in learning and reflective activities with professionals in the Netherlands, when sharing

the findings from their dissertations. Both authors, each with their own focus on creativity and innovation in journalism, and each with their own methods, actively engaged with journalists when communicating the results of their research. The journalists where stimulated to contemplate and verbalise their potential 'next steps' or possible solutions to the issues and challenges at hand as presented.

This is a qualitative, exploratory study on research dissemination in journalism. The authors used different forms of interactive workshops (first author), and training sessions and guided reflection practices (second author) to disseminate their research findings on different occasions in the course of 2025. All journalists' comments, feedback, and reflections on these dissemination activities – including also the reflections of the researchers on these activities - have resulted in two qualitative datasets, one per author. Both were analysed in search of patterns, using an inductive thematic analysis approach (Braun & Clarke, 2006).

The first findings show that this active engagement appears to be fruitful as a result of at least four factors: the practice-based orientation of the research, journalists' immediate recognition of the findings, active and collective learning in the here and now, as well as the facilitated time and safe space outside the workplace. Journalists, it appears, are quite eager to discuss the research findings.

By actively exploring new ways to address the much debated theory-practice divide in journalism, we answer to the call of Wilner et al. (2025) to start "the continued cooperation of academics and journalists, as we strive to fulfill our joint purpose of strengthening journalism" (2025: 1620). By pursuing this cooperation in a "responsive and reflective" fashion, we also follow Lewis (2020: 681). Seeking to bridge this divide appears more relevant than ever as journalism worldwide has multiple crises and challenges to meet. Only those news media which are resilient enough, we argue, will survive as news organisations in the long term.

The first findings seem to indicate that the theory-practice divide is not necessarily always there. This may be the result of adopting a different role as a researcher than usual. Instead of telling professionals what their world looks like, researchers can also opt to open up more, creating a dialogue from which can be learned. That way new knowledge can arise, benefitting both journalists and researchers.

JOS04 Trust and Journalism

PP 0052 Protecting academic reputation under the risk of a scandal: How researchers disconnect from affective reputation-threatening experiences of digital harassment in their interactions with journalists

Stinne Bach Nielsen[1]

[1] Aarhus University, Communication and Culture, Aarhus, Denmark

Researchers are increasingly exposed to digital harassment when they communicate their knowledge to the public through different media, which make them turn to self-censoring practices and withdraw from media engagements (Olson & Lapoe 2018; Celuch et al. 2021). Previous research shows that researchers are particularly affected by severe forms of digital harassment aimed at compromising their personal security (e.g., through digital death threats or stalking) (Ferber, 2017; Gosse et al., 2021).

However, this paper argues instead that researchers are primarily affected by forms of digital harassment in which their professional reputation has been undermined by journalists, politicians, or online debaters in a public media debate shaped by dissatisfaction with authorities (Branford et al., 2019), rumors and gossip (Hammarlin & Jönsson 2017), and politicization of research (Donois, 2025). Such experiences particularly include digital rumor-spreading causing researchers to feel misrepresented, humiliated or lacking control over their academic reliability. Thus, the harmful aspect of digital harassment is linked to the experience or threat of being placed at a focal point of a potential mediated scandal (Hammarlin 2021; Thompson 2008), thereby undermining the very foundation of researchers' work- namely, their research integrity.

In an effort to sustain their obliged engagement in public outreach without having their academic reputation misrepresented, misunderstood, or scandalized, researchers are increasingly required to navigate how they communicate their knowledge to journalists. Based on interviews with 28 Danish researchers across seven research fields (health, gender, religion, nature/environment, communication, agroecology, political science), the paper examines how researchers interact with journalists to simultaneously 'connect' to the public and 'disconnect' (Light, 2014) from the threat of digital rumors.

The paper's analysis argues that researchers use three journalistic engagement strategies of dis/connection to do so: 1) connecting to/disconnecting from specific media formats- and situations (e.g., by opting out of specific media debates), 2) connecting to/disconnecting from certain words or formulations (e.g., by framing an expert statement that consider

both sides of a political debate), 3) connecting to/disconnecting from certain journalists or public media (e.g., by making in-depth collaborations with selected journalists and avoiding others). In that way, the paper unfolds how researchers' interactions with journalists constitute a form of 'affective (media) labor' (Hochschild, 1983; Hardt, 1999). More specifically, researchers increasingly feel that they must constantly try to disconnect from affective consequences of misrepresented, uncontrollable rumors in journalistic media as an embedded part of their everyday work and attempts to contribute to public debates.

The paper further argues that, as part of their affective and dis/connective work, researchers rarely choose to fully withdraw or 'break' connections with journalistic media completely. Instead, researchers' disconnection from potentially harmful experiences often involves both breaking some ties and strengthening or redirecting others, with the overarching aim of maintaining their expert role. Indeed, researchers seem to strive to find new ways to connect with journalistic media to foster nuance, responsiveness and constructive dialogue through these encounters.

JOS06 Russo-Ukrainian War and Journalism

PP 0137 Citing the Kremlin: How mainstream Romanian media label Russian state media sources in their coverage of the 2022 Russian war against Ukraine

Ioan Suhov[1]

[1] Dublin City University, School of Communications, Dublin, Ireland

Scholarship on Russian disinformation has extensively documented how Kremlin-affiliated outlets produce and disseminate propaganda (Szostek, 2015; Deverell, Wagnsson and Olsson, 2021; Beseler and Toepfl, 2024). Yet this focus on propaganda production leaves a critical question underexplored: how do mainstream news organisations in frontline states engage with Russian state media as sources? This study shifts attention from obvious Kremlin-tied outlets to high-reach, professionally-oriented newsrooms, examining whether and how Romanian journalists critically label Russian state sources when citing them.

The study draws on fourteen Romanian outlets selected primarily through audience-based ranking. The core sample comprises the most-read online news platforms in Romania according to the Reuters Institute Digital News Report (2024), supplemented through purposive sampling to include a pro-Kremlin fringe outlet and an independent investigative platform. Of these, twelve outlets contained sufficient citations of Russian state sources for systematic analysis. Drawing on a corpus of 51,883 articles published between November 2021 and December 2024, I extracted 5,596 instances where outlets cited four Kremlin-affiliated sources: TASS, RIA Novosti, RT, and Sputnik. Building on framing scholarship (Entman, 1989; De Vreese and Lecheler, 2012) and approaches to journalistic stance (Hunston and Thompson, 2000; Biber, 2006), I employed LLM-assisted qualitative coding- validated against manual coding (Cohen's $\kappa = 0.76$)- to classify each citation as either critically contextualised (e.g., "Russian state agency TASS") or neutrally attributed (e.g., "according to TASS").

Findings reveal that approximately two-thirds of citations across the corpus employed neutral attribution, with critical labelling varying substantially across outlets: from 22% to 49%. Notably, journalists distinguished between source types: EU-banned outlets RT and Sputnik received critical labelling in 69% and 54% of cases respectively, whereas wire agencies TASS and RIA Novosti - despite equivalent Kremlin affiliation - were labelled critically in only 34% and 38% of instances. This suggests that mainstream Romanian media treat Russian wire services as legitimate news sources rather than state propaganda instruments.

These findings extend disinformation scholarship beyond propaganda outlets to mainstream journalistic practice, demonstrating that the circulation of Russian state media content operates not only through fringe channels but through the sourcing routines of high-reach newsrooms.

JOS06 Russo-Ukrainian War and Journalism

PP 0138 Journalistic autonomy renegotiated: A Bourdieusian exploration of wartime journalism in Ukraine

Vladyslav Alforov[1]

[1] Uppsala University, Informatics and Media- Institute for Russian and Eurasian Studies IRES, Uppsala, Sweden

Journalistic autonomy is widely characterised as a core professional principle, yet its enactment remains inherently precarious and contingent upon relations with external social forces. Existing research has primarily examined technological, market and audience pressures, source dependence and political interests as key constraints on journalistic autonomy. These analytical emphases largely reflect the dominant conditions of Western liberal-democratic media systems, where research is predominantly conducted and where formal media freedoms tend to be comparatively robust. Considerably less attention has been paid to how autonomy is renegotiated and performed within heteronomous journalistic fields exposed to extreme socio-political pressures, such as war. To address this gap, the paper examines how autonomy is enacted in the wartime journalistic field of Ukraine, a context characterised by intensified political, military, economic and technological influences. In doing so, it proposes a conceptual framework for analysing journalistic autonomy that moves beyond binary distinctions between autonomy and control, professionalism and non-professionalism, or journalism and non-journalism.

Drawing on Pierre Bourdieu's field theory, the study conceptualises journalism as a heteronomous field in which autonomy is not simply preserved or eroded, but continuously renegotiated between dominant actors and their challengers. The Ukrainian wartime media environment offers a valuable case of traditional journalistic actors coexisting with increasingly prominent platform-based media actors, including Telegram channels, YouTube analysts and war-related content creators. These emergent actors often operate outside established professional institutions and normative frameworks, raising questions about how journalistic boundaries are redrawn and how claims to autonomy are articulated under wartime conditions.

Methodologically, the study employs a two-step mixed-methods design. First, correspondence analysis is applied to a broad range of wartime news producers, including legacy media and platform-based analysts and commentators. The resulting field map identifies actors' relational positions based on organisational, economic and professional indicators, such as ownership structures, revenue models, audience reach and platform followership, professional background and source orientation. This exploratory bird's eye view of the main positions in the field in turn informs case selection for the second step: a comparative discourse analysis of journalistic content produced during selected war-related events. Integrating concepts of boundary work, epistemic contests and critical incidents, the analysis operationalises autonomy as a relational and situational practice, examining how different actors discursively articulate journalistic autonomy across field positions. Particular attention is paid to discursive performances of objectivity as a symbolic resource through which journalistic actors claim autonomy, revealing tensions between assertions of independence and structurally constrained positions within the field.

Forgoing a conventional analysis of wartime media representations, this paper shifts the analytical focus away from platform-driven disruption and toward autonomy renegotiation under external constraints. Furthermore, it offers a non-Western, crisis-ridden case that challenges assumptions derived from liberal-democratic media systems and advances a Bourdieusian approach that reconceptualises autonomy as an enacted, relational practice rather than a stable professional attribute. Methodologically, it demonstrates the value of combining quantitative field analysis methods with in-depth discourse analysis to study professional power relations under conditions of national existential threat.

PP 0139 Reconciling patriotic pressures and professional ethics in war journalism: Finnish editors and journalists' reflections on the coverage of the Russo-Ukrainian war

Joonas Koivukoski[1], Markus Ojala[1]

[1] University of Helsinki, Faculty of Social Sciences, Helsinki, Finland

In wartime, journalists tend to express solidarity with their national community, leave the political elite's interpretations unchallenged and avoid conveying "the enemy's" point of view (Ginosar 2015; Robinson et al., 2009). This type of "patriotic journalism" has been identified in the coverage of various conflicts around the world and is usually seen as undermining professional ideals of objectivity, neutrality and truth-seeking (Ginosar & Cohen, 2019). It thus seems that patriotic journalism constitutes a threat to professional norms and identities. This study questions those assumptions by positing that journalists defend their professional identity even in the conditions of severe patriotic pressure. This takes place through discursive strategies that successfully negotiate the twin responsibilities of defending national unity, on one hand, and upholding professional standards, on the other.

Patriotic journalism is usually analysed in contexts where the studied country is at war. There are some indications, however, that patriotic pressures may take hold of reporting even in situations where journalists' own country is not directly involved in the fighting (Springer et al., 2022). We claim that one such case is the coverage of the Russo-Ukrainian war in Finland. Due to Finland's traumatic history with its eastern neighbour, Russia's 2022 invasion of Ukraine was instantly framed as a national (and European) security threat, leading to overwhelming public support for Ukraine among Finns. In these circumstances, Finnish journalism faced a strong call of duty to align with the public sentiment and express support for Ukraine's war effort. Our study explores how Finnish journalists experienced this pressure and how their newsrooms responded to it. Building on semi-structured interviews with 23 journalists and editors working for major national news outlets, we ask how Finnish journalists made sense of their practices of partisan, pro-Ukraine reporting. How did they identify the presence of patriotic pressure in their work, and how did they reconcile partisan reporting with journalistic ethics to uphold their professional identities?

Based on a qualitative analysis of the data, to be conducted between January and April 2026, we identify various discursive strategies that journalists employ to mitigate the tension between the practices of patriotic journalism and traditional journalistic ideals. Our initial observations suggest that these include at least the following discourses: (i) serving the public (by aligning with the general sentiment); (ii) defending liberal values (as the essential precondition of journalism); (iii) separating fact and opinion (guaranteeing objective reporting of events); (iv) information war (remaining skeptical of all accounts); and (v) critical independence (reporting news that challenge official framing of events). The study contributes to research on war journalism by facilitating a greater understanding of how patriotic pressures are experienced and dealt with in newsrooms. In so doing, it adds significant nuance to the field and questions simplistic normative assumptions about the threat of patriotism to journalism ethics.

JOS06 Russo-Ukrainian War and Journalism

PP 0140 Newsroom-led membership communities in wartime Ukraine: A comparative analysis of editorial practice

Andrii Ianitskyi[1]

[1] National University of Kyiv-Mohyla Academy, Mohyla School of Journalism, Kyiv, Ukraine

After Russia's full-scale invasion in 2022, Ukrainian news organizations have expanded newsroom-led membership communities. Although these initiatives are regularly discussed as tools for diversifying revenue and building trust, their impact on the day-to-day newsroom work remains understudied. Moreover, empirical research on media communities in the context of armed conflict is limited.

This article presents preliminary results of a comparative study of such communities in wartime Ukraine. It examines how such communities are created, structured, and managed, how they relate to everyday editorial practice. This includes the division of roles between editorial and community work, and perceived changes in content and media-audience relations.

The study is based on 30 semi-structured in-depth interviews (60–90 minutes) with editorial managers and staff responsible for community development. The strategy was designed to cover media outlets from all over Ukraine, except the occupied territories, due to access restrictions. The interviews are supplemented by a systematic analysis of publicly available materials on membership, including structures and pricing, onboarding processes, community rules and moderation practices, as well as regular communications with members.

The article is based on the analysis and comparison of media communities. To compare their structure, an original theoretical model is used, consisting of the following components: the value proposition and shared practices (Wenger, 1998), the level of formalization and interaction (Ostrom, 1990; Arnstein, 1969), the expected contribution of members (Jenkins et al., 2009), value-emotional factors of engagement, and practical and cognitive benefits for members (Katz et al., 1973; Papacharissi, 2015). In addition, the analysis codes membership program design variables, including benefit bundles and pricing tiers, communication channels and frequency, tone of voice, key performance indicators, experimentation approaches, and perceived impacts on financial sustainability, editorial work, and journalistic roles.

Preliminary results suggest that Ukrainian newsrooms build membership communities through distinct combinations of incentives, participation formats, and platform infrastructures. Segmenting supporters into multiple tiers and/or parallel community formats is common. Early evidence indicates that effectiveness (as defined by respondents in terms of retention and engagement) is associated less with price points and more with a coherent value proposition combined with affective identification and regular interaction routines. The analysis identifies three recurrent configurations: benefit-oriented, mission-oriented, and editorial participation-oriented. The article proposes (1) a typology of editorial-led membership communities in wartime Ukraine, (2) a recurring comparative toolkit linking community theory to editorial practice, and (3) empirically grounded conclusions about audience engagement and retention in conditions of prolonged crisis.

JOS06 Russo-Ukrainian War and Journalism

PP 0141 Between old stereotypes and future projections: Danish journalism and the reframing of Ukraine

Karen Ornat[1]

[1] The Hebrew University of Jerusalem, Noah Mozes Department of Communication and Journalism, Jerusalem, Israel

Journalism is often tasked with documenting the present, yet it also mediates between inherited narratives and emerging geopolitical realities. This paper examines how Danish journalism positions Ukraine within a changing European horizon, where inherited stereotypes encounter newly charged political meanings and require reinterpretation in practice. Following Russia's full-scale invasion in 2022, Denmark's media—like its political establishment—aligned strongly with Ukraine and its European partners. Yet this alignment unfolded within a longer narrative history that had depicted Ukraine through a repertoire of stereotypical images portraying it as peripheral and unstable. The article therefore explores how Danish editors and journalists negotiate the tension between these inherited images and forward-looking identifications as Ukraine is reframed from post-Soviet periphery to European partner. The analysis conceptualises this process as the intersection of implicit collective remembering and collective projecting: how journalists draw on established representational repertoires while simultaneously participating in the anticipatory work through which new geopolitical alignments and identities are imagined. Earlier depictions, shaped by West/North European cultural memory, persist as background frames that coverage must navigate when Ukraine is reimagined as a resilient democracy and potential member of a shared European "we." Journalism, in this sense, functions as a site where inherited stereotypes and mnemonic patterns are reactivated, reframed, and reoriented toward imagined futures. Empirically, the study combines qualitative interviews with Danish foreign editors and correspondents with close readings of selected news and feature coverage. The interviews illuminate how journalists perceive their role vis-à-vis political discourse and shifting notions of alliance and belonging. The textual analysis traces how these orientations manifest in narrative framing and lexical choice, showing how editorial reasoning reconciles enduring stereotypes and cultural associations with new political imperatives, and how coverage redefines Ukraine's image through selective emphasis, narrative reorientation, and symbolic upgrading. Preliminary findings indicate that this process involves both continuity and transformation: journalists rely on familiar interpretive repertoires but gradually adapt them to

accommodate Ukraine's new political and moral significance. This makes visible journalism's dual role as both a reactive and constitutive force in moments of geopolitical transformation. By situating Ukraine's repositioning within both contemporary discourse and longer-standing representational habits, the article clarifies how journalistic storytelling accommodates abrupt political change while remaining shaped by implicit collective remembering. It argues that journalism operates as a hinge between remembering and projecting, linking inherited repertoires to emergent trajectories of European identity and security. In this sense, projection in journalism is understood as a form of outward-facing identity work—a means by which Denmark rehearses its own moral and geopolitical self-understanding through the narration of the Other.

JOS07 AI in Journalism I.

PP 0142 Election disinformation in Eastern Europe: Foreign influence and AI use

Viorela Dan[1], Mihnea Simion Stoica[2], Eugen-Ionuț Potra[2]

[1] University of Innsbruck, Department of Media- Society and Communication, Innsbruck, Germany
[2] Babeș-Bolyai University, Department of Communication- Public Relations and Advertising, Cluj-Napoca, Romania

Foreign-led disinformation has emerged as a central threat to electoral integrity. Such interference can be examined by focusing on false or misleading political content that has crossed a threshold of public visibility and attracted journalistic scrutiny. Empirically, this approach relies on content analysis of fact checks—and of the claims they seek to debunk—published around elections.

Focusing on fact checks is particularly informative under conditions of low structural noise, such as low-scrutiny languages, smaller media markets, and cross-language media use. In these settings, attempts at electoral interference tend to be more visible and concentrated, and fact checkers can issue clearer verdicts than in the saturated media environments of mature democracies.

Against this backdrop, this study examines how foreign-led disinformation manifests during two recent elections in Moldova, a small Eastern European country. We focus on content characteristics, provenance, and on the extent to which AI-based tools are integrated into these operations. We apply LLM-assisted content analysis to fact checks (N = 247) published in connection with Moldova's October 2024 presidential election and constitutional referendum and the September 2025 parliamentary election. The sample includes all election-related fact checks published from six months before to one month after each election by leading Moldovan fact-checking organizations (StopFals.md, Veridica, Ziarul de Gardă). Studying Moldova is theoretically informative and responds to longstanding calls to de-Westernize communication research (Ronzani, 2025; Waisbord & Mellado, 2014).

The study is grounded in journalism research that conceptualizes fact-checking as a form of boundary work (Carlson, 2018; Carlson & Lewis, 2015) and interpretive journalism (Amazeen, 2015; Graves, 2016). From this perspective, fact checks are not merely corrective interventions but institutional practices through which journalism delineates legitimate political information, and signals threats to democracy and public discourse (Graves et al., 2016). Fact-checked content thus constitutes a meaningful indicator of salient foreign interference. We further situate fact-checking as journalism's professional response to strategic disinformation and foreign information operations (Bennett & Livingston, 2018; Humprecht, 2020; Zilinsky et al., 2024), enabling analysis from a gatekeeping perspective (Freelon & Wells, 2020; Waisbord, 2018). Indeed, fact checks capture not the full universe of disinformation but that content that has crossed thresholds of visibility and perceived risk (Shoemaker & Vos, 2009).

Each fact check was coded for foreign alignment; dominant narratives; communicative and emotional strategies; and production and diffusion infrastructures. Coding followed a pre-specified LLM-assisted procedure and was validated against human-coded benchmarks, with LLM–human agreement exceeding Krippendorff's α = .80 across all variables.

Results indicate that 90.3% of election-related disinformation reflected Russian-aligned anti-EU/anti-NATO narratives. Evidence of AI involvement was limited: 3.6% of cases showed explicit indicators of AI-generated or AI-assisted content, more frequently in the 2025 election than in 2024, primarily through templated text, recycled multimodal materials, and rapid dissemination patterns.

Our findings suggest that fact-check data provide a valuable bridge between macro-level research on information operations and micro-level effects research. They also indicate that Russian disinformation strategies are beginning to adapt to AI-enabled environments, raising new challenges.

PP 0143 Associations between journalists' use of AI and their editorial autonomy and time-allocation satisfaction: Findings from a representative survey

Lydia Unterstrasser[1], Neil Thurman[1], Sina Thäsler-Kordonouri[1]

[1] LMU Munich, Department of Media and Communication, Munich, Germany

More and more news brands are adopting artificial intelligence (AI): by the end of 2024, 60% of UK journalists said that AI has been integrated into their main newsroom to some extent. In this context, questions about how AI affects journalists'

experience of meaningful work are important to consider. This study examines how the use of AI shapes UK journalists' experience of meaningful work. Based on a quantitative survey of 1,016 UK journalists, we use a deductive approach to test hypotheses derived from the Job Characteristics Theory (Oldham & Hackman, 1976) and more recent models of meaningful work (Bankins & Formosa, 2023). Although the literature on meaningful work includes a range of factors, such as task significance, skill variety, and belonging (Hackman & Oldham, 1976; Lips-Wiersma & Wright, 2012; Allan et al., 2019), this study focuses on autonomy and task-related satisfaction as particularly salient under conditions of AI-driven change in journalism. In communication and journalism research, the concept of meaningful work is still relatively underused, and only a few studies explicitly address the question of how meaning is constructed and experienced in journalistic work (Olsen 2025a; Olsen, 2025b). By using this framework, we hope to provide insights into how AI transforms tasks and workflows and affects the sense of value and fulfilment that journalists derive from their work. The results show that more frequent AI use is associated with significant decreases in satisfaction with the time spent on routine, repetitive tasks, as well as on creative, complex tasks. This suggests that the use of AI does not increase job satisfaction by automating routine or time-consuming tasks and allowing journalists to focus their time on more cognitively demanding tasks. This contrasts with some previous studies, which suggest that such delegation can improve overall satisfaction by freeing up time for creative and strategic work (Law & Varanasi, 2024; Palla & Kostarella, 2025). Furthermore, we find the use of AI isn't associated with higher levels of perceived editorial autonomy. Among our respondents, perceived editorial autonomy is mainly influenced by journalists' rank. While higher-ranked journalists reported higher freedom to select stories and emphasise certain aspects of stories, lower and middle ranked journalists reported less autonomy. Autonomy is an important contributor to meaningful work. Overall, our study provides quantitative evidence that AI might not be increasing how meaningful journalists find their work. The results also confirm that other factors, such as rank, play an important role in this regard. To increase the meaningfulness of journalists' work, it is not only the integration of AI that may need to change, but also other aspects of their employment conditions, such as inequalities in job control across hierarchical levels.

JOS07 AI in Journalism I.

PP 0144 Domesticating GenAI. Practices and imaginaries among Italian journalists

Marco Rosichini[1]

[1] Università Cattolica del Sacro Cuore, Department of Communication, Milan, Italy

This paper examines how generative artificial intelligence has become a shifting ground for negotiated practices within contemporary journalism. GenAI is conceived as a critical moment of choice and encounter in which journalism's core professional features, social legitimacy, and future trajectories are actively reconfigured. It reconstructs the path dependencies that highlight how global AI developments and imaginaries of digital future (Hepp et al., 2023) are filtered through local professional contexts. The paper argues that GenAI's domestication represents not merely technological adoption but a continuous renegotiation of journalism's social legitimacy under conditions of deep mediatization (Couldry & Hepp, 2016; Hepp, 2020). This process is shaped not only by technological affordances, but equally by the co-construction between users and technology (Pinch & Oudshoorn, 2005). Ultimately, these dynamics remain entangled in long-standing politico-institutional configurations related to the characteristics of the Mediterranean Model (Hallin & Mancini, 2004).

These shifting grounds become empirically visible within national journalistic fields, where global technological discourses are appropriated and reworked through local professional cultures (Arora & Natale, 2025). Analyzing the Italian journalistic field as a paradigmatic site of struggles over journalism's future, the study examines how GenAI is embraced, negotiated, and resisted in everyday work (Pink, Berg, Lupton, & Ruckenstein, 2022) and how these processes reshape the core understanding of journalism and public communication (Lewis, Guzman, Schmidt, & Lin, 2025). Moving beyond teleological narratives, the paper offers an empirically grounded account of how media communities - including journalists, pioneer practitioners, content creators, and media managers- navigate AI adoption while defending and redefining their professional boundaries and epistemic authority (Carlson, 2023). It foregrounds the plurality of competing "algorithmic imaginaries" (Bucher, 2018) and is theoretically informed by domestication theory (Silverstone, Hirsch, & Morley, 1992).

Empirically, the study adopts a discourse-analytical approach (Jørgensen & Phillips, 2002) to capture the discursive struggles shaping GenAI as one of the shifting grounds within journalism. Specifically, it draws on 25 semi-structured interviews spanning generations, entry routes, organizational roles, and media-outlet types. The findings show that GenAI integration is neither uniform nor predictable. Generational divisions are evident yet operate in paradoxical ways. Rather than reproducing a simple generational divide, younger journalists- socialized within increasingly flexible labour markets- position themselves as emerging pioneers (Hepp & Loosen, 2019) vis-à-vis more traditional colleagues and tend to adopt a business-oriented pragmatism. By contrast, established practitioners, defending an elite corporatist professional model, engage in tactics of resistance. However, these generational patterns are cross-cut by deeper ideological fault lines. Techno-optimistic actors frame GenAI as a productivity tool aligned with accelerationist imaginaries, reframing the notion of an "epistemic crisis" as an "epistemic opportunity" (Perreault, Lewis, & Ely, 2025) and thereby reasserting the journalist's role as gatekeeper of information. This reassertion takes place within a reconfigured, digitally mediated gatekeeping environment (Cools, 2025). Critical actors, conversely, draw on labor-oriented assumptions to underscore how GenAI erodes epistemic authority,

reduces journalists' contractual bargaining power with editors, and accelerates precarity - framing it as an intensifier of entrenched power asymmetries within the journalistic field.

JOS07 AI in Journalism I.

PP 0145 Efficiency or quality? Segmenting Swiss journalists to understand AI-driven transformations

Silke Fuerst[1], Daniel Vogler[2], Sara Pfeuti[1], Colin Porlezza[3], Quirin Ryffel[1]

[1] University of Zurich, IKMZ – Department of Communication and Media Research, Zurich, Switzerland
[2] University of Zurich, fög – Research Center for the Public Sphere and Society, Zurich, Switzerland
[3] Università della Svizzera italiana USI, Institute of Media and Journalism IMeG, Lugano, Switzerland

State of Research and Study Objectives

The rapid diffusion of generative artificial intelligence (AI) marks a critical moment for journalism, raising fundamental questions about how news production is organized and valued (Simon et al., 2025; Thurman et al., 2025). Across public and academic debates – and echoed in journalists' statements in interview studies – AI is commonly considered a technology that may enhance both the efficiency of journalistic workflows and the quality of news (e.g., Amigo & Porlezza, 2025; Cecil, 2024; Cools & de Vreese, 2025; Diakopoulos et al., 2024). Yet whether – and under what conditions – these two goals can be achieved at the same time remains empirically unclear, especially in light of ongoing staff cuts and growing time pressure in newsrooms across the world (Newman et al., 2025; Simon, 2024; Trappel & Tales, 2021). This study addresses these issues by examining journalists' experiences of AI-related efficiency and quality gains in news production, identifying distinct types of journalists based on these experiences, and situating them within their professional and organizational contexts.

Method and Data

Drawing on data from an online survey of Swiss journalists conducted between April and July 2025 (N = 588), the study combines a descriptive analysis with a hierarchical cluster analysis using Ward's method. Journalists reported their perceived gains in efficiency (producing more content, saving time, coping with time pressure) and news quality (improving article quality, spending more time on research, including diverse opinions) from AI use in news production, alongside individual- and organizational-level characteristics.

Findings and Implications

The findings show that, while AI is firmly embedded in the everyday work of most Swiss journalists, perceived efficiency and quality gains remain moderate overall.

However, the cluster analysis reveals substantial heterogeneity, identifying five clearly distinguishable types of journalists. "Dual Achievers" experience both efficiency and quality gains from AI use, whereas "Minimal-Gain Users" report very low levels of both. Three additional clusters display more selective patterns, benefiting primarily in specific areas such as increasing opinion diversity in reporting ("Diversity Enhancers"), coping better with time pressure ("Time Pressure Mitigators"), or gaining substantially more time for research ("Deep-Dive Gainers"). These types differ in terms of individual factors (e.g., age, working conditions, AI-related knowledge) and organizational conditions (e.g., newsroom size, newsroom norms, media company AI strategies).

By focusing on journalists' reported experiences in their everyday work rather than on expected or potential impacts (e.g., Cecil, 2024; Cools & de Vreese, 2025; Rinehart & Kung, 2022), this study adds empirical evidence to ongoing debates about AI in journalism. It shows that perceived efficiency and quality gains vary considerably among journalists and often do not coincide. Instead, different patterns emerge depending on journalists' professional backgrounds, working conditions, and the organizational contexts in which AI is implemented. In this sense, the results speak directly to journalism's current "shifting grounds," illustrating how journalists' backgrounds, the integration of AI into newsroom routines, and organizational structures shape whether AI is experienced as a tool for enhancing journalistic quality, increasing efficiency, or creating new tensions between these goals.

JOS07 AI in Journalism I.

PP 0146 Shifting grounds for newsroom AI: Journalistic values and governance in Swiss newsrooms after the generative turn

Laura Pranteddu[1], Colin Porlezza[1], Laura Amigo Weinberger[1]

[1] Università della Svizzera italiana IMeG, Comunicazione, Lugano, Switzerland

As generative AI becomes embedded in everyday newsroom routines, the key question is no longer whether AI can be used, but under which editorial rules and governance arrangements it should be used. While newsroom automation was often confined to specialist teams and bespoke systems, after the advent of ChatGPT experimentation with AI became widely accessible to non-technical staff, intensifying debates about responsibility, transparency, and editorial oversight. Against this backdrop, this paper examines how journalistic values are articulated, negotiated, and operationalized in the governance of AI-enabled newsroom tools.

Grounded in Value Sensitive Design (VSD), the study focuses on the relationship between professional journalistic values (e.g., accuracy, accountability, transparency, and editorial autonomy) and the organizational arrangements through which AI tools are developed, evaluated, and overseen. This study examines how practitioners in Swiss news organizations envision journalists' roles and modes of participation in the design of AI-enabled newsroom tools, and the extent to which they believe such involvement strengthens the ethical governance of these tools.

We do so by adopting a two-wave qualitative design that captures a paradigm shift over a short period. In 2022, we conducted problem-centered, in-depth interviews with practitioners leading newsroom AI and automation initiatives, including editorial managers and technical actors involved in product and data work. In late 2024, we conducted four focus groups with journalists across Switzerland's main language regions (German, French, Italian), reflecting the broadened accessibility of generative AI and its diffusion beyond specialist innovation units. Data were analyzed via inductive thematic analysis, with VSD guiding attention to how value claims translate into requirements, constraints, and oversight routines.

Findings indicate a marked shift from tool- and efficiency-centric narratives toward governance-centric rationales. Journalists' participation is most often framed not as coding or model building, but as defining purposes and limits, stress-testing prototypes, evaluating outputs against editorial standards, and sustaining human-in-the-loop decision points. Participants also highlight trust concerns and "half-knowledge" risks around generative AI that can undermine verification, prompting calls for clearer responsibility allocations, documentation and disclosure practices, and ongoing feedback loops between editorial, product, and data teams. This study is important because it provides a longitudinal lens on a paradigm shift in newsroom AI, capturing how governance expectations evolved as generative tools moved from specialist-led innovation to newsroom-wide experimentation. This is particularly valuable in a small media market such as Switzerland, where a limited number of organizations and key actors makes it possible to examine this accelerated transition in close detail.

JOS08 Local Journalism

PP 0157 Developing participatory methodology for the reinvention of local journalism: An experiment in a Southern Brazilian city

Andressa Kikuti Dancosky[1], Jacques Mick[2], Samuel Pantoja Lima[1]

[1] Federal University of Santa Catarina, Journalism, Florianópolis, Brazil
[2] Federal University of Santa Catarina, Journalism/ Political Sociology, Florianópolis, Brazil

Ensuring quality information for cities depends not only on the existence of journalistic media but also on whether these media are focused on locally relevant events, connected to the information needs of their audiences, and have independence, transparency, and financial sustainability (Nielsen, 2015). A renewed relationship with audiences may enable local journalism to preserve its social relevance in a context of fragile audience ties, declining revenues, and competition with digital content that is less costly to produce and more prone to engagement. In Brazil, the challenge of strengthening local journalism is even greater, as the country faces social and political repercussions from the circulation of large volumes of misinformation, with 61 million people (29% of the population) in news deserts or near-deserts (Atlas da Notícia, 2023), and local media are predominantly dependent on economic or political interests.

This paper presents a methodological proposal for building local journalism models with audience participation (bottom-up), an ongoing project in Florianópolis, the capital of the state of Santa Catarina (Brazil). The methodology is based on creating communities of practice involving researchers and different audience segments and is replicable in other regions.

The study began in 2023 and has already completed two empirical phases that provided insights into the type of journalism important to audiences: a representative population survey (N = 604) and a representative survey of civil society organizations (N = 260), both covering topics of interest, consumption habits, most-used information sources, characteristics that make media and news trustworthy, willingness to pay for journalistic content, desired forms of participation, among other themes.

The methodology also includes three ongoing phases. The third is the co-creation of alternative institutional frameworks to traditional corporate models: transparent and self-sustainable, better suited to local journalism as a public service. The fourth is the laboratory development of formats and languages tailored to each audience type, validated through focus groups. The final phase is the application of innovations developed together with audiences in a journalistic media outlet to be created for this purpose.

The study aims to contribute to strengthening journalism in local contexts, connecting to other research efforts worldwide concerned with more effectively including local communities in journalism (Wenzel; Crittenden, 2021), recognizing and recovering other dimensions of proximity and locality (Císařová, 2023; Svith, 2023), and addressing the critical information needs of a population (Friedland et al., 2012; Stonbely et al., 2015). We also aim to expand the repertoire of organizational alternatives and governance models beyond commercial journalism, addressing challenges reported in recent studies on local journalism (Jerónimo, 2024; Radcliff, 2023), specifically regarding sustainability and governance (Mick; Tavares, 2017; Ferruci; Alaimo, 2020; Cagé, 2015) and the role of state and non-state public services in a transforming media ecosystem (Camargo, 2020).

JOS08 Local Journalism

PP 0158 Audience analytics makes the difference—the change of news values in Finnish regional and local media

Visa Noronen[1], Ville Manninen[1], Lauri Haapanen[1]

[1] University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

This paper investigates how news values in Finnish regional and local newspapers have transformed between 2013 and 2023, a decade characterised by widespread implementation of audience analytics systems. Drawing on semi-structured interviews with 37 journalists across 11 newsrooms, the study contributes to debates on the datafication of journalism and the shifting normative foundations of newswork in small-market European contexts.

The findings indicate a marked reorientation toward news values centred on proximity, relevance, and exclusivity. Journalists described a substantial expansion of locally focused content, driven both by audience demand and by the need to differentiate regional titles from national digital outlets. Relevance has become strongly associated with personalised and community-specific topics, while exclusivity has emerged as a strategic asset for sustaining subscription value and ensuring competitive distinctiveness within a crowded digital ecosystem.

A major development is the rising importance of identification as a guiding news value. Interviewees consistently reported a shift toward person-centred storytelling, with emotional resonance and relatability becoming key criteria in story selection and framing. This transformation has also influenced ethical reasoning: for example, journalists increasingly view interviewees with direct economic interests as acceptable contributors when their stories enhance narrative accessibility. These developments reflect broader European trends toward human-interest framing and audience-engagement logics in local news production.

The data further show strengthened roles for conflict and sensationalism. Increased crime coverage was frequently attributed to high performance in analytics dashboards, and conflict was described as enhancing the visibility and shareability of local political coverage. Yet journalists simultaneously expressed concern that overreliance on emotionally charged content might erode the credibility of titles heavily dependent on subscription income and long-term trust.

In contrast, several traditional news values—most notably timeliness, negativity, celebrity, and shareability—appear to be losing prominence. The diminished significance of timeliness reflects the limited competitive pressure many newspapers face within their local markets, where they often serve as primary information providers. The absence of celebrity news values aligns with the Finnish media system's subscription-based revenue model. Meanwhile, the limited emphasis on shareability highlights the relatively early stage of data maturity in many regional newsrooms, where basic metrics are used but advanced KPIs remain marginal.

Overall, the study demonstrates how audience analytics are reshaping news values and editorial priorities in Finnish regional and local journalism. The findings show a broader transition toward audience-centred, emotionally resonant journalism, with significant implications for professional norms, newsroom ethics, and the democratic role of small-market local media.

PP 0159 The value of local news: The community integration hypothesis revisited

Adam Shehata[1], Bengt Johansson[1]

[1] University of Gothenburg, Department of Journalism- Media and Communication, Gothenburg, Sweden

The idea that local media help citizens "imagine themselves as part of a community" is a long-standing assumption in research and public debates on local journalism (Neilsen, 2015). Originating from early classic work conducted in the United States (e.g., Park, 1929; Janowitz, 1952), the so-called *community integration hypothesis* holds that local media serve a critical social function by strengthening community ties and bringing citizens residing in the same geographical area together. This notion has long motivated policy efforts to secure citizens' access to local media. Accordingly, the current decline of local news media – marked by shrinking audiences and revenues – is widely assumed to weaken community ties and, consequently, threaten local democracy.

But is this really the case? To summarize the current state of knowledge, this paper reviews and synthesizes extensive research on the community integration hypothesis. More specifically, we first review and discuss the theoretical foundations of the community integration hypothesis, focusing on conceptual properties and the key causal argument behind this assumption. Second, we present a systematic review of empirical studies addressing the community integration hypothesis, clarifying what we know – and don't know – about this causal relationship. Third, based on this empirical review, we propose an updated theoretical synthesis focusing on how local media contribute to community integration in today's fragmented and polarized high-choice media environments.

In sum, the review identifies three historical traditions of research on local media and community integration. The first emerged between the 1930s and 1950s. Rooted in mass society theory and increased urbanization, studies linked newspaper circulation to social cohesion and considered local media a driver of integrating individuals into local life. The second tradition (1980s and 1990s) focused on declining social capital as a point of departure and studied the integrative role of

local media. During this period, the conceptualization of community integration developed together with a more nuanced discussion about causal claims. The third and most recent tradition (2010s and 2020s) focuses on how the changing (local) media environment influences community ties, examining hyperlocal media, social networks, and digital platforms.

More importantly, despite extensive research, the review shows that convincing empirical support for the causal argument still remains limited. This is due to the fact that (1) few studies address the multidimensionality of community integration – including affective, cognitive and behavioral outcomes – and that (2) the field is heavily reliant upon cross-sectional research designs and correlational evidence, significantly preventing analyses of causal effects and longitudinal dynamics.

In light of this, the paper proposes an updated theoretical model of local media and community integration in contemporary media environments as well as a research agenda addressing limitations in previous studies.

JOS08 Local Journalism

PP 0160 Local journalism and beyond: Mapping the diversification of local information sources in today's media ecosystem

Leyla Dogruel[1], Wiebke Moehring[2], Jakob Henke[3]

[1] Universität Erfurt, Communication, Erfurt, Germany
[2] TU Dortmund, Journalism, Erfurt, Germany
[3] U Erfurt, Communication, Erfurt, Germany

This paper focuses on the diversification of access to local information within contemporary media ecosystems. Traditionally, local information was primarily provided by journalistic outlets such as newspapers, radio, or television (McLeod et al., 1996; Stamm et al., 1997). Digital transformation has destabilized this model and expanded the range of sources through which citizens obtain locally relevant content (Usher, 2019; Gulyas & Hess, 2023). In today's local information environment, audiences increasingly rely on non-journalistic sources, including official municipal channels, as well as community-based outlets or neighborhood groups often accessed on social media platforms (Watson & Cavanah, 2015; Park et al., 2025). These non-journalistic sources often satisfy immediate informational needs but operate outside of professional journalistic norms.

In our contribution, we aim to examine how citizens navigate and categorize these diverse sources of local information and what type of information as well as sources build today's media repertoires. Specifically, we explore two research questions:

RQ1) Which sources of information are identified by users as local sources of information?
RQ2) In which specific usage situations do they resort to which type of source?

Empirically, we employed a mixed-methods approach conducted in Germany in 2025. This includes four guided online focus groups (n = 21) and a representative survey among N = 2,069 German citizens. The focus groups provide in-depth perspectives on how residents construct their local information repertoires across both journalistic and non-journalistic sources. To validate the types of sources relevant to local information among the larger population, we examined the use of four source types—journalistic, institutional, community-based, and interpersonal. In the representative survey, we further included a situational approach to analyze source preferences across three hypothetical scenarios: local elections, road construction, and community festivities. This allows us to assess how context, demographics, and rural-urban locations influence specific information-seeking behaviors.

Preliminary findings suggest that local information repertoires are highly hybrid and pragmatic, driven by accessibility and personal preference rather than source type. Respondents utilize a fluid mix of traditional newspapers, social media, messenger groups, personal networks or even flyers and brochures, often blurring the lines between professional journalism and community-driven content. While users frequently lack clarity regarding the institutional origins of their information, they continue to value the functional depth of journalism, often accessing paywalled professional content through "work-arounds" shared within informal digital networks. This is highlighted by the survey which shows that local news is viewed as less important than digital networks and official municipal sources in all three scenarios. While this trend holds regardless of gender and education, it is particularly pronounced true for younger participants. We may conclude that while the demand for local information remains rooted in traditional motives like social orientation and identity formation, the process of assessing local news has shifted toward "news-finds-me" patterns, where social media and interpersonal contacts act as the primary gateways to local relevance.

JOS08 Local Journalism

PP 0161 The hyperlocal moment in the UK: Failure and the limits of citizen-led media

David Harte[1]

[1] Birmingham City University, Department of English and Media, Birmingham, United Kingdom

In the late 2000s and early 2010s, hyperlocal journalism in the UK attracted substantial attention from research and policy actors as a potential response to the perceived crisis of local public service media. Defined as "online news or content services pertaining to a town, village, single postcode or other small, geographically defined community" (Radcliffe 2012), hyperlocal sites were framed as citizen-led, participatory, and socially embedded alternatives to declining commercial local news. Initiatives such as Nesta's Destination Local and Talk About Local sought to "anticipate, assemble and animate" a hyperlocal media space through funding and coordination (Rodgers 2017). At its height, this moment appeared to offer a reconfiguration of local journalism around proximity, participation, and everyday community life.

This paper revisits that moment from the perspective of its aftermath. It asks to what extent the attempt to animate a hyperlocal journalism space in the UK between approximately 2008 and 2016 can be understood as failure, how it is recognised and articulated by both practitioners and intermediaries, and what this reveals about the conditions under which citizen-led media can be sustained. The analysis draws on interviews with former hyperlocal publishers and with funding and policy intermediaries, alongside analysis of closure statements on hyperlocal sites and relevant grey literature including reports by Nesta, Ofcom, and the Carnegie Trust. The paper develops two conceptual lenses. First, following Karin Wahl-Jorgensen's (2017) call to take failure seriously in the study of digital journalism, it treats hyperlocal not simply as an innovation that did not scale, but as a marginal and poorly resourced form whose struggles are analytically revealing. Second, drawing on work that frames hyperlocal journalism as a media subculture or scene, it explores how practices of participation, identity, and value were shaped by relatively homogeneous social networks, affective commitments, and shared normative assumptions.

The findings suggest that hyperlocal journalism functioned less as a stable alternative news sector and more as a temporally bounded subcultural formation. While it created meaningful spaces for local representation and participation, it was also vulnerable to economic precarity, demographic narrowness, and over-reliance on project funding and volunteer labour. Closure statements and interview accounts frame stopping not only as economic necessity, but as emotional loss and the loss of a valued social role, often articulated through normative discourses about journalism's public value. The paper argues that the hyperlocal moment in the UK should be understood as a failed but instructive attempt to reimagine local journalism as citizen-led media. Its failure does not negate its democratic ambitions, but highlights the structural and institutional limits of sustaining such projects, and the importance of attending to marginal and short-lived forms within journalism studies.

JOS09 Gender and Journalism

PP 0241 Seeing war, doing gender: Visual practice and gendered experiences of male and female photojournalists in the war in Ukraine

Barbora Součková[1]

[1] *Charles University- Faculty of Social Sciences, Institute of Communication Studies and Journalism, Prague, Czech Republic*

Although gender has become an established perspective in the research on war reporting, its implications for photojournalistic practice and visual production in conflict coverage remain less systematically examined. This is particularly evident in debates about whether and how gendered experiences shape the visual representation of war, including the production of news photographs, themes, motifs and visual approaches. This study, therefore, examines how male and female photojournalists navigate gender in their work and how gendered experiences, shaped by working conditions, social context and self-perception, influence journalistic practice and visual production in coverage of the war in Ukraine.

Unlike other forms of conflict reporting, war photojournalism remains a male-dominated field in which professional norms and everyday practices are shaped mainly by masculine perspectives (Mitra et al., 2022). However, there is a growing number of female photojournalists in the field who are making a significant contribution to the coverage of armed conflicts. Nevertheless, stereotypes and bias persist regarding the work of female photojournalists, for example, whether their coverage of war is more empathetic and compassionate, as opposed to the "hard" angles of their male counterparts, who focus on the military and weapons. At the same time, persistent gender structural bias, resulting from editorial hierarchies and divisions of labour, is reflected in practice (Somerstein, 2021).

This study builds on a thematic analysis of semi-structured interviews with 12 photojournalists covering the ongoing war in Ukraine, supplemented by photo elicitation based on photographs that the photojournalists themselves select as most representative of their own work in the war zone. By combining interviews with reflexive discussions of participants' own images, this study captures both professional routines and the gendered assumptions that form the visual practice.

Preliminary results suggest tension between denial and experience of gender bias in war photojournalism. While some men and women reject the idea that war reporting is subject to gender bias, others acknowledge it and describe aspects of gender discrimination as well as stereotypical beliefs about male and female roles in war and conflict photojournalism. It also appears that female photojournalists still experience devaluation of their work, not only from editors but also while working in the field. However, some acknowledge that their gender, specifically in the context of the war in Ukraine, can be an advantage in establishing contact with locals, which is then reflected in the motifs and themes of their visual production.

The findings suggest that gendered differences in war photojournalism cannot be reduced to distinct "male" or "female" perspectives in visual representation. Instead, they emerge from the interplay of structural hierarchies, social environment and individual self-perceptions within a professional culture shaped by persistent masculine dominance.

JOS09 Gender and Journalism

PP 0243 Covering gender on risky ground: Online harassment and journalistic decision-making in Italy

Claudia Capelli[1], Chiara Gius[1]

[1] University of Bologna, Department of Social and Political Sciences, Bologna, Italy

As media and communication intersect with society's most pressing challenges, journalism finds itself on shifting ground, particularly in relation to gender, digital violence, and professional vulnerability (Posetti & Shabbir, 2022). Female journalists are disproportionately exposed to online harassment (Miller & Lewis, 2020; Davis Kempton & Connolly-Ahern, 2022; Tandoc, Sagun & Alvarez, 2023), yet the structural, cultural, and professional conditions under which such abuse emerges remain insufficiently explored. This paper examines the gendered dynamics of online harassment in journalism by focusing on the Italian context, where long-standing issues of professional precarity, weak institutional protections, and persistent gender inequalities intersect with the rapid platformization of news production (Comunello, 2015; Splendore & Iannelli, 2022). Italy thus offers a critical case for understanding how journalism navigates moments of ethical choice, encounter, and transformation in an increasingly polarized and digital public sphere.

The paper presents and discusses findings from ten in-depth interviews with Italian women engaged in news production. The sample includes professionally recognized female journalists as well as women who work for digital news media but are not formally acknowledged as journalists or do not necessarily have a journalistic background. This methodological choice reflects the fragmented nature of the journalistic field – in Italy as well as globally – characterized by high levels of freelance work and blurred boundaries between journalism, activism, and digital content creation (Sorrentino & Splendore, 2022; Negreira-Rey *et al.*, 2023). These conditions often result in uneven access to editorial support, legal protection, and organizational responses to online harassment.

Drawing on feminist journalism studies (Carter *et al.*, 1998; de Bruin & Ross, 2004) and research on digital violence (Hall *et al.*, 2023; 2024), the analysis explores whether Italian female journalists perceive a heightened likelihood of being targeted when covering sensitive issues, particularly gender-related topics and technology-facilitated gender-based violence (TFGBV). It investigates how such perceptions influence editorial decisions, self-censorship practices, and the inclusion- or marginalization- of gender issues within news agendas. The findings suggest that online harassment operates not only as an individualized experience of abuse but as a structural mechanism that shapes journalistic visibility and silencing of certain issues, especially in a digital environment where topics relating to gender and feminism are frequently contested.

The paper further examines strategies of resistance and coping adopted by Italian women journalists, ranging from personal risk management and informal peer networks to public denunciation and strategic withdrawal from specific platforms or beats. It critically assesses the role of Italian news organizations in providing protection and institutional backing, highlighting significant gaps, particularly for freelancers and digitally based workers operating outside traditional newsroom structures.

By situating gendered online harassment within the Italian journalistic ecosystem, this paper argues that such dynamics have broader implications for research on public discourse surrounding TFGBV. Online harassment emerges as a key site of encounter and transformation, revealing how journalism's shifting grounds affect both the production of news and the conditions under which gender-based violence becomes visible, debatable, or silenced in contemporary public life.

PP 0244 Reinforcing inequalities or empowerment? Understanding gendered dimensions of AI use in journalism

Tobias Rohrbach[1], Sina Thäsler-Kordonouri[2], Andreas Riedl[3]

[1] University of Fribourg, Department of Media and Communication Research, Fribourg, Switzerland
[2] Institut für Kommunikationswissenschaft und Medienforschung, LMU München, München, Germany
[3] Communication Research, University of Augsburg, Augsburg, Germany

The rapid integration of artificial intelligence (AI) into journalistic work has transformed established professional routines and raised new questions about power, expertise, and equality within the field. While early research has documented how AI technologies disrupt newsroom practices and redefine journalistic labor, less attention has been paid to how these changes intersect with existing gender inequalities. For women journalists in particular, the rise of AI may represent both an opportunity for empowerment—through access to new tools and visibility in technologically mediated domains—and a potential reinforcement of structural disadvantages, if adoption and literacy remain unevenly distributed. This project investigates how AI is being used by journalists in Germany and whether patterns of adoption differ by gender. Drawing on data from a large-scale survey of German journalists (N = 1116), we ask two key questions: (1) for which professional tasks do journalists employ AI, and (2) to what extent do gender and other sociodemographic or contextual factors explain variation in AI use?

Using a comprehensive measurement approach, we identify four distinct clusters of ai use: (a) text processing, (b) audio-visual content creation, (c) investigative work, and (d) management and marketing-related applications. We then estimate a structural equation model to test which characteristics predict AI adoption across these clusters. Contrary to concerns that emerging technologies might amplify existing gender inequalities, our findings reveal no overall relationship between gender and AI use. In one notable exception, women journalists are even more likely than men to employ AI tools for marketing-related purposes. These differences are not mediated by disparities in AI-related training opportunities or self-perceived AI literacy, suggesting that women's engagement with AI may reflect strategic adaptation within specific professional niches rather than differences in skills or access.

Taken together, our findings indicate that AI's impact on journalism is not monolithic. While AI may indeed empower women in some areas, such empowerment tends to occur at the margins of the journalistic field—particularly in roles oriented toward communication management and audience engagement rather than core reporting or investigative work. The study thus highlights how the integration of AI simultaneously opens and constrains opportunities for journalists, underscoring the need to situate technological adoption within broader gendered structures of professional practice.

JOS09 Gender and Journalism

PP 0245 Unveiling how journalists' digital visibility shapes news output and hateful reactions

Teresa García De Alcaraz Ruiz[1], Alejandro Buitrago López[2], José Antonio Ruiperez Valiente[2]

[1] Universidad de Murcia, Department of Communication- University of Murcia, Murcia, Spain
[2] Universidad de Murcia, Information and Communications Engineering- University of Murcia, Murcia, Spain

As social platforms increasingly shape how news are discovered and discussed, journalists' online visibility may be associated not only with the reach of their work but also with the tone of audience feedback. Building on this premise, we examine links between journalists' social media visibility, their news output, and the prevalence of hateful comments in the digital editions of Spain's leading general-interest newspapers.

The study draws on the Hatemedia dataset, which compiles news articles and user comments published by five Spanish generalist outlets (ABC, El Mundo, El País, La Vanguardia, and 20Minutos) between January 2021 and June 2022, totaling more than five million news items and comments. Within Hatemedia, hateful comments are identified through automated algorithms followed by a manual validation stage performed by trained professionals. We extend this corpus by adding journalist-level metadata not originally included in Hatemedia: journalists' accounts on X (formerly Twitter), follower counts, gender (male, female, undefined), and the thematic section where they publish (e.g., politics, sports). To protect subjects, journalist identifiers (including X accounts) and personal data are anonymized prior to analysis and reporting. We aggregate the data at the journalist level. From Hatemedia, we derive for each journalist the total number of authored news articles, the total number of comments received across those articles, and hate exposure measured both as the number of hate-labeled comments and as the percentage of hate-labeled comments among all comments received. Social media visibility is operationalized via follower counts on X.

We address three research questions: (RQ1) whether follower-range is associated with journalists' publishing activity and with both the volume and share of hateful comments received; (RQ2) whether gender is associated with differences in follower-range; and (RQ3) whether publishing section is associated with follower-range.

Methodologically, we discretize key variables into interpretable bands. In particular, follower counts are grouped into ranges defined after inspecting the empirical follower distribution in the sample, and hate exposure is represented using hate-percentage bands alongside volume measures. We then analyze relationships using contingency tables and chi-square

tests of independence, reporting effect-size statistics (e.g., Cramer's V) to quantify association strength, and conducting outlet-stratified analyses to account for heterogeneity in commenting environments.

By connecting journalists' platform visibility with publication activity and audience hostility in comment sections, this work provides a large-scale empirical basis for characterizing how attention and exposure to hateful feedback may concentrate across journalistic profiles. The results can inform discussions on visibility-related risks in digital journalism and support the development of evidence-based measures for newsroom training and professional support.

JOS10 War and Journalism

PP 0246 Domestication of the War in Ukraine by Irish, Portuguese and Spanish media: A comparative analysis of the coverage by The Irish Times, El País and Público

Pedro Maia Martins[1], Luís António Santos[1]

[1] University of Minho, Communication and Society Research Centre CECS, Braga, Portugal

Ever since February 24th, 2022, the war in Ukraine has been one of the dominating issues of worldwide media agendas. Due to the recent inexistence, since the second half of the 20th century, of armed conflicts involving most Western countries, war has become a foreign reality for most Occidental audiences. Therefore, every single piece of war journalism ends becoming a piece of international journalism, and every piece of international journalism requires a certain degree of domestication, i.e., of framing an international event in order to create some proximity with a national audience (Alasuutari *et al.*, 2013; Huiberts & Joye, 2017). Given the near inexistence, except for Ji *et al.* (2024), of research focused on the domestication of Wars in general and of the Ukrainian conflict in particular, one is led to inquire: how has the War in Ukraine been domesticated by the media of warless countries?

To answer said question, one must take a look into the case of three European warless countries, Ireland, Portugal and Spain, through a comparative quantitative analysis of the pieces published in the websites of their main newspapers of record, *The Irish Times*, *Público* and *El País* in the first three weeks of the conflict in question (from February 24th to March 14th of 2022). The present work introduces the concepts of weak domestication methods (when the predominant framing elements belong to the country under coverage, such as appeals to emotion or to solidarity with allies or sending correspondents to the field) and strong domestication (when framing elements related to the country of the audience predominate, such as the consequences of the conflict for said country or the declaration and actions of national actors). Using descriptive statistics, one measured the adoption of different modes of weak (appeal to emotion/appeal to solidarity with allies/presence of correspondents/actions of compatriots present in Ukraine/actions of Ukrainian immigrants) and strong domestication (specialists as sources/aid-driven coverage/declarations or actions of national actors/consequences for country of the audience), also quantifying, for correlation purposes (through Chi-square and Fisher's exact tests), the representations (*positive*/*negative*/*neutral* and as *victim*/*perpetrator*/*none*) of Ukrainian and Russian actors.

The results point to a predominance of weak domestication modes, especially the *appeal to emotion* (45.6%), the *appeal to solidarity with allies* (32.1%) and the *presence of correspondents* (19.1%) in all the outlets, with a strong correlation with the *positive* representation of Ukrainians actors (as *victims*) and a *negative* representation of Russian ones (as *perpetrators*). Additionally, only slight differences between the three newspapers appeared.

JOS10 War and Journalism

PP 0247 Seeing, telling, and positioning war: Multimodal framing and photojournalistic roles in World Press Photo (1955–2025)

Yi Xu[1], Stephanie Geise[2]

[1] Lancaster University Leipzig, Management School, Leipzig, Germany
[2] Universität Bremen, ZeMKI, Bremen, Germany

The number of conflicts worldwide has escalated sharply. In an era of increasing global instability, war and conflict are highly mediated experiences. Most audiences lack direct exposure to warfare and instead rely on visual and textual representations to understand violence, suffering, and political struggle (Seeger & Sellnow, 2016). In this context, photojournalism plays a pivotal role in shaping how conflicts are perceived, evaluated, and emotionally processed (Dimitrova & Strömbäck, 2008; Sheafer et al., 2014). News frames in conflict reporting emerge from the interplay of text and image, which audiences process simultaneously to construct meaning, assign responsibility, and navigate war's moral and political dimensions (Dan,

2018; Geise & Baden, 2015; Geise & Xu, 2024). Multimodal framing therefore shapes not only visibility, but also valuation. Against this backdrop, the *World Press Photo Award* (WPP) serves as a central reference point that reflects and reinforces the dominant aesthetic, narrative, and representational standards within professional photojournalism (Godulla et al., 2021; Solaroli, 2015). By legitimizing certain visual forms, it actively contributes to the cultural and political framing of conflict, shaping public perception and the criteria of journalistic excellence.

However, comprehensive multimodal framing analyses of war and conflict remain rare (e.g., Jungblut & Zakareviciute, 2019; Powell et al., 2015). This study this provides a longitudinal examination of how war and conflict have been represented and framed in WPP coverage from 1955 to 2025, following three research questions:

RQ1: How are war and conflict worldwide represented in the WPP over time?
RQ2: How do textual and visual frames interactively construct multimodal war frames in the WPP?
RQ3: How are viewer-depicted relationships configured in war coverage of the WPP?

Methods

A quantitative longitudinal content analysis was conducted on **494** war-related items awarded or nominated in the WPP contests between 1955 and 2025. Each unit of analysis comprised both textual descriptions and photographic representations. The codebook included formal variables (e.g. conflict type, geographical location, photographers, media organizations). Deductive textual and visual frames were coded, including violence of war, military conflict, human interest, anti-war protest, and political negotiation. Viewer-depicted relationships and photojournalistic roles were identified through direct, averted, and closed eye-gaze types. Intercoder reliability tests indicated high agreement.

Results

The analysis reveals a stark geographical bias in conflict coverage, with Africa, Asia, the Middle East, and Central America overwhelmingly represented—underscoring persistent global inequalities in media visibility. While textual frames predominantly framed conflicts through narratives of blame and victimhood, visual frames emphasized human suffering and the immediacy of violence. Crucially, multimodal framing shows that text and image do not simply align but dynamically co-construct meaning: they simultaneously assign responsibility and personalize trauma, shaping moral and emotional responses. The dominant photojournalistic roles—objective storyteller and mediated dialogist—reflect an enduring institutional commitment to professional objectivity, even as visual storytelling increasingly mediates empathy and political engagement.

Future research should combine longitudinal content analysis with qualitative and reception studies to examine how multimodal frame configurations shape audience interpretation, emotional engagement, and moral judgment—especially in contexts of unequal visual economies of suffering.

JOS10 War and Journalism

PP 0248 The victim and the oppressor – Affective storytelling in news coverage of the Gaza war

Vilja Hautamaa[1], Karoliina Talvitie-Lamberg[1]

[1] University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

In this PhD research, I focus on affective storytelling in news coverage of the Gaza war. Emotions have always occupied a significant role in crisis reporting, even if their role as a part of journalism has been challenged. Reporting on issues, such as the conflict between Israel and Palestine, requires a journalist to balance between the roles of a distant observer and an involved actor, to both control one's emotions and use emotions in order to tell impactful stories. It is through affective storytelling, or *"storytelling with a moral purpose"*, that journalism is able to engage its audience and make them both understand and care about the topics of news (Wahl-Jorgensen 2013). In this research, affective storytelling references the sort of narrating used in news articles that includes affective features, grounding the topic on a personalized story and emotional experience in dramatizing an issue.

I understand affective storytelling in relation to affective epistemology, the idea that emotions work as a means of knowing. A war correspondent Martin Bell (1998) proposed that emotions could have value in the context of war reporting, as journalism shouldn't "stand neutrally between good and evil, right and wrong, the victim and the oppressor". Affective storytelling, therefore, is seen here as a way for journalism to construct the roles of victims and oppressors – and thus, not only cover the issue but also guide audience to understand it a certain way. This relates to what Kotišová and van der Velden (2025) called a moral judgment of a story; an understanding of who's right from a journalist's perspective.

To understand how affective storytelling constructs moral judgment in crisis, I will be analyzing affective storytelling in news coverage of the Gaza war. In this research, affective storytelling is analyzed in news articles published in Finnish news media, using critical discourse analysis. Approximately 50 to 60 news articles are collected from two nationwide news media, Helsingin Sanomat and Yle Uutiset, and from two different timeframes, one from the beginning of the current war in Gaza (7th of October 2023 to 7th of February 2024), and the other one from the months prior to all participants agreeing to the first phase of the peace plan (9th of June 2025 to 9th of October 2025). The research questions are:

RQ1: Whose emotions are expressed in news coverage of the Gaza war?

RQ2: How is victimhood affectively constructed in news articles of the Gaza war?
RQ3: How has moral judgment, by naming of victims, changed when comparing the two timeframes of data collection?

This PhD research article is a work in progress. Currently, I'm in the process of collecting data.

PP 0249 Between journalism and "reasons of state": German media coverage of Israels war on Gaza and its occupation of the West Bank, 2023–2025

Christian Strippel[1]

[1] Weizenbaum Institute, Weizenbaum Digital Science Center, Berlin, Germany

Since Israel began its war on the Gaza Strip in response to the Hamas attacks on October 7, 2023, many Western media outlets have faced continuous scrutiny for allegedly biased and one-sided coverage of the events. German news outlets, in particular, have been criticized for failing to adhere to journalistic standards and instead submitting to the German "Staatsräson" ("reason of state"), a state policy that considers Israel's security a fundamental German interest and responsibility after the Holocaust (Marwecki, 2020). Allegations against the German news media include, for example, the uncritical adoption of information and wording provided by the Israeli army, the dehumanization of Palestinians, the underrepresentation of Palestinian voices, and the interpretation of criticism of Israeli politics and warfare as antisemitism.

While initial analyses have shown that such criticism is justified (Goldmann, 2025), extensive content analyses are still lacking. To address this research gap, this study examines the main criticisms of the German media coverage on Israel's war on Gaza and its occupation of the West Bank in the aftermath of October 7, 2023. To this end, we analyze the reporting of nine leading news outlets in Germany, including daily newspapers (Bild, FAZ, SZ, taz, Welt), weekly newspapers and magazines (Spiegel, Zeit), and public broadcasting stations (ARD Tagesschau, Deutschlandfunk). Using artificial week sampling. the study covers the period from October 2023 to December 2025.

Following the three types of media bias, distinguished by D'Alessio & Allen (2000), we translated the criticism of the German media coverage into three hypotheses assuming (H1) an imbalance in cited sources ("visibility bias"), (H2) prioritization of the Israeli state perspective ("agenda bias"), and (H3) double standards when reporting on Palestinian and Israeli casualties ("tonality bias"). Additionally, we hypothesized the counterposition to this criticism, according to which (H4) German media reporting was biased in favor of Israel, if at all, only in the first few months after October 7, 2023, and was balanced or even biased against Israel later.

To test these hypotheses, we drew on existing codebooks from previous content analyses to operationalize the relevant constructs. Regarding H1, we coded up to three quoted sources for each analyzed media piece (Maurer et al., 2024). To test H2, we coded the occurrence of up to five deductive frames, each referring to a certain (partisan) perspective on the events in Gaza and the West Bank (e.g., terror/self-defense, antisemitism/Holocaust, expulsion/Nakba/colonialism/resistance, international law/human rights; see Turner, 2025). Finally, H3 was tested by coding the framing of Palestinian and Israeli casualties (e.g., human interest, victimization, justification, condemnation, credibility; see Grimm et al., 2025). After conducting mandatory coding trainings in December 2025, we began coding in early January 2026 and expect to conclude by the end of March 2026.

PP 0250 Who gets to decide, and when? Human-in-the-loop boundary work in AI-age fact-checking

Yanshu Sybil Wang[1], Tomás Dodds[1], Lucas Graves[2]

[1] University of Wisconsin-Madison, School of Journalism and Mass Communication, Madison, USA
[2] Universidad Carlos III de Madrid, Department of Communication, Community of Madrid, Spain

As newsrooms worldwide integrate artificial intelligence (AI) into journalistic work, "human in the loop" has become a normative reassurance that professional judgment remains in control (de-Lima-Santos et al., 2025). Yet we still know surprisingly little about how this promise is enacted in daily practice: What does that human in the loop actually do? Existing research rarely follows how fact-checkers operationalize oversight across workflows, how they draw boundaries between journalistic judgment and algorithmic processing, and how those boundaries shift as AI tools evolve. This study addresses that gap through two contrasting cases of AI adoption in fact-checking organizations, Factchequeado and Maldita.

Comparing a public-facing chatbot and an internal narrative-detection system, we examine who is authorized to intervene in AI workflows, when intervention is triggered, and which decisions fact-checkers treat as non-negotiably human.

Theoretically, the study builds on boundary-work theory, which conceptualizes professional authority as something actively negotiated through discursive practices rather than inherently given (Gieryn, 1983; Carlson, 2016). It also draws on scholarship on epistemic cultures, which emphasizes that what counts as valid knowledge depends on tacit routines, interpretive norms, and shared judgments that resist formalization (Knorr Cetina,1999; Ekstrom et al., 2022). Together, these frameworks allow the paper to conceptualize human-in-the-loop practices as ongoing efforts to demarcate what AI is permitted to do, what only humans may decide, and who is accountable when hybrid systems produce public knowledge. Empirically, we draw on interviews and internal documentation to examine how these boundaries are constructed across data selection, output interpretation, and user-facing communication in two AI systems in active use.

Preliminary results show that in ChatMigrante, boundary work concentrates at the limits of the system's epistemic scope. Fact-checkers deliberately restrict the model to a manually curated database of official sources and refuse open-ended retrieval, positioning human judgment as essential for determining what information counts as authoritative, current, and safe to circulate. Human intervention is reintroduced when the system fails or expresses uncertainty, while disclaimers, source attribution, and refusals to answer certain questions communicate the limits of algorithmic knowledge and responsibility.

In contrast, Maldita's Narratives Dashboard embeds human authority at the interpretive core of the workflow. Although the AI continuously proposes clusters of misinformation claims, editors decide whether these clusters constitute meaningful narratives, how they should be labeled, and whether they should be used at all. This work relies on contextual sensitivity and narrative judgment that cannot be reduced to formal rules. When human validation is absent, the system quickly produces unusable output, revealing the extent to which automation depends on embodied expertise.

Fact-checking organizations offer a particularly revealing site for examining human-AI boundaries because their work centers on explicit truth claims, the reputational costs of error are high, and they have long experimented with automation (Graves, 2013). In this setting, boundary work is not merely symbolic but operational and consequential. Our preliminary findings show that human-in-the-loop is best understood as a boundary-setting practice that specifies where oversight sits in the pipeline, when it is triggered, and how responsibility is allocated in hybrid human-AI knowledge production.

PP 0251 AI and journalistic authority: Audience views on responsible AI use in news

Amy Ross Arguedas[1], Felix M Simon[1], Richard Fletcher[1], Rasmus Kleis Nielsen[2]

[1] University of Oxford, Reuters Institute for the Study of Journalism, Oxford, United Kingdom
[2] University of Copenhagen, Department of Communication, Copenhagen, Denmark

As newsrooms continue integrating AI into news production and distribution, a growing body of work has begun to explore how audiences think about and respond to these uses. In this study, we qualitatively examine what audiences view as legitimate uses of AI in journalistic practice. Building on Carlson (2017), we approach AI as a technological disruption that reshapes journalistic authority. Like other technologies preceding it, AI invites a (re)negotiation of journalistic authority because of its transformational impact on how news is produced, presented, and distributed. Significantly, this technology may blur certainty around who is responsible for news outputs and what they are based on. In light of this, we ask: What do audiences understand as responsible AI use in journalism? To answer this question, we conducted a qualitative study with 45 participants from Mexico, the US, and the UK in early 2024. Based on two rounds of interviews and a series of elicitation tasks completed over the course of a week, we identify four key conditions raised by audiences for the use of AI in journalism. (1) First, they highlight that accountability must remain human and institutional, with rigorous oversight of news outputs (i.e. answerability). (2) Second, they require clarity around the provenance of news, whereby AI-generated content remains anchored in visible and verifiable sources (i.e. traceability). (3) Third, they emphasize the importance of specific, task-level disclosures of what AI has done, especially when it comes to uses they are least comfortable with, such as content generation (i.e. legibility). (4) Fourth, some ask for a degree of control over the amount and types of AI-generated content they are offered, including the ability to opt out of applications they are uncomfortable with (i.e. choice). These conditions assert boundaries around legitimate AI uses in journalism that concern both the epistemological basis of news production, as well as the relationship between audiences and journalism. They suggest that in online media environments with already weakened journalistic authority and high levels of skepticism, for audiences, responsible AI use is not only about enforcing particular journalistic practices and procedures, but also about supporting their ability to evaluate and scrutinize journalistic work and exercise agency over their news use—including the choice not to use it at all.

PP 0252 Do human journalists prevail? Futures of editorial AI in Nieman Lab predictions 2023–2025

Juho Ruotsalainen[1], Jaana Hujanen[1], Leo Leppänen[2], Carl-Gustav Lindén[3], Stefanie Sirén-Heikel[1]

[1] University of Helsinki, The Swedish School of Social Science, Helsinki, Finland
[2] University of Helsinki, Department of Computer Science, Helsinki, Finland
[3] University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

In recent years, no other theme or technology has dominated the discourse on the futures of journalism quite like generative artificial intelligence (Gen AI). While managerial narratives promise enhanced newsroom efficiency and a new era of augmented journalistic creativity, critics fear that the news ecosystem will be overrun by low-quality 'AI slop' (Cools & Diakopoulos, 2024). In this volatile environment of alternative futures, the journalistic field is engaging in intense future-oriented sense-making that draws on collectively constructed, yet contested, expectations about the profession's potential trajectories (Brennen et al., 2020).

Among the most influential sites of this anticipatory discourse is the annual Nieman Lab Journalism Predictions series. At the end of each year, Nieman Lab gathers predictions on the year ahead from over 200 journalists, journalism experts, media practitioners, and media scholars (Perreault & Nelson, 2025). These reflections function as a key arena in which both short-term forecasts and long-term journalism futures are imagined, debated, and normalised. As a forum for digital journalism's vanguard, the predictions produce authoritative "futures knowledge"—shared, reasoned, and normative conceptions of the future that guide strategic decision-making and resource allocation in the present (Pouru et al., 2019). Such futures knowledge delineates what kinds of futures are seen as plausible, desirable, or inevitable, while marginalising alternative trajectories (Van Lente, 2012).

This paper examines how the futures of editorial (Gen) AI are discursively constructed in Nieman Lab predictions from 2023 to 2025—a period spanning initial hype, early newsroom experimentation, and the subsequent phase of normalisation and critical reassessment. Using inductive thematic categorisation, the analysis identifies recurring perceptions and collectively shared expectations about the field's development (Konrad, 2006; Strauss & Corbin, 1990). The resulting thematic categories are then subjected to critical discourse analysis to examine the interests, imaginaries and power relations underlying and shaping Gen AI expectations (Fairclough, 2003). Particular attention is paid to how contributors position AI in relation to core journalistic values such as editorial autonomy and public service (Deuze, 2005).

The analysis answers the following research questions (RQs):

RQ1. What collective expectations regarding Gen AI emerge within Nieman Lab predictions, and how do these expectations evolve over the study period?
RQ2. What sociotechnical imaginaries and normative considerations shape these predictions, giving them broader meaning and legitimacy?

While the application and potentials of newsroom Gen AI are a prominent topic in journalism studies, research that explicitly addresses representations and expectations of AI futures remain scarce (Perreault & Nelson, 2025). This study addresses this gap by critically analysing the production of expert futures knowledge regarding editorial AI. In doing so, it illuminates the collective expectations and imaginaries of what journalism could—and should—become in an AI-infused media landscape.

PP 0253 United they stand in face of AI, divided they are in projecting audience demand: How experts evaluate the future of news consumption

Linards Udris[1], Florian Meißner[2], Daniel Vogler[1], Mark Eisenegger[1]

[1] University of Zurich, fög - Research Center for the Public Sphere and Society / Department of Media and Communication Research, Zurich, Switzerland
[2] Hochschule Darmstadt – University of Applied Sciences, Fachbereich Media, Darmstadt, Germany

Journalism and media use research are inherently future-oriented fields, if only because technological innovations shape debates about possible implications for future audience demand for journalism (Ruotsalainen, 2018). Since journalism is a field shaped by high uncertainty and confronted with a "troubled 'now', the ability to demonstrate a viable 'later' is especially important" (Lowrey & Shan, 2018, p. 133). Despite this future orientation, there is little academic research that explicitly and systematically addresses the future of news consumption (e.g., Newman, 2024), and there is even less research which goes beyond short-term predictions (e.g., Feher et al., 2024).

This study is based on a qualitative content analysis of expert interviews. In our presentation, we focus on future scenarios in the field of news consumption envisioned by experts in media and journalism, as gathered through 15 guided interviews. These scenarios can be considered social constructs based on current expectations and are therefore "more or less predictable spaces of possibility and their potential for development" (Hepp et al., 2025).

In selecting the experts, we took into account both practical and academic perspectives and were interested primarily in democratic-corporatist systems from German-speaking countries, i.e. Germany (5) and Switzerland (2), and the Nordic countries, i.e., Sweden (2), Norway (1), Denmark (1), and Finland (1), comparing them with more market-oriented media systems such as the US (2 experts) and the UK (1) . Categories for the interviews were formed deductively based on long-term studies on media use (e.g., Espeland, 2024; Newman et al., 2025) (e.g., news avoidance). In the analysis, they were supplemented inductively based on thematic linkages and new aspects raised by the experts (e.g., community building, media literacy) (e.g., Guest et al., 2012). Overall, we gave the experts room for reflection and specifically asked them about a longer time horizon of roughly ten years. .

The analysis of the interviews showed that experts hardly introduced any new topics but relied on established issues such as media trust. Despite the interview focus on long-lasting consequences rather than a possible overemphasis on novelty and change, experts expressed a strong "path dependence" (Lowrey & Shan, 2018) and present orientation (Hepp et al., 2025) shaped by external factors such as recent technological upheavals and the current market power of large tech companies. Still, strong disagreement was found regarding future audience demand, with expectations ranging from stable needs and substantial demand to a growing divide between a shrinking group of well-informed users and a group of non- or occasional news users. In contrast to that, experts largely agreed regarding the transformative impact of AI on news – a topic which experts mainly link to the issue of media trust (e.g. regarding the significance of high-trust media brands in an environment increasingly shaped by synthetic content). Based on these three highlighted topics (media trust, AI, audience demand), thematic links and their consensual or diverging projections, our presentation will outline the envisioned scenarios for the future of news consumption.

PP 0254 Fixing a broken connection: Re-imagining the relationship between journalism and dissatisfied news audiences using conversational AI

Renée Van Der Nat[1], Sophie Duvekot[1], Nynke Brandsma[2], Alka Goos[3], Yael De Haan[1], Koen van Turnhout[2]

[1] University of Applied Science Utrecht, School for Journalism, Utrecht, Netherlands
[2] University of Applied Science Utrecht, School for Design, Utrecht, Netherlands
[3] Fontys University of Applied Sciences, School for Journalism, Tilburg, Netherlands

Over the past two decades, audience studies have revealed growing dissatisfaction with news among diverse audiences. Interest and trust in news are at an all-time low worldwide, even in traditionally high-trust societies. Research demonstrates that news dissatisfaction entails more than distrust or disinterest in the news, but is driven by lack of recognition, feeling overwhelmed, or perceived complexity of the news. This growing dissatisfaction has serious consequences for journalism's societal and economic relevance. In response, news organisations increasingly seek to strengthen their relationships with diverse news audiences and experiment with technologies, such as conversational AI applications, to better understand audience needs and experiences.

Existing research largely examines dissatisfaction among audiences and journalists separately. While some studies suggest that both groups share similar expectations of journalism, it remains unclear where and why these expectations fail to align in practice. This project addresses this gap by (1) examining news dissatisfaction as a shared experience between journalists and audiences, (2) identifying ways news organisations can engage dissatisfied news users, and (3) exploring how conversational AI can support more reciprocal relationships between journalists and news users.

We used a 'research by design' methodological approach, favouring creativity, connection and co-creation between participants and allowing for inductive understanding of the shared experience of journalists and audiences. Between November 2024-June 2025, we organised six full-day sessions with 24 journalists from local, regional, and national public broadcasters in the Netherlands and 23 audience members who are dissatisfied with news.

During each session, participants engaged in creative activities – such as letter writing, games and brainstorming – designed to stimulate in-depth conversations between journalists and audience members about news discontentment, after which the group co-created potential solutions for this discontentment. The sessions were facilitated by one researcher, while three other researchers played an active role by systematically documenting outcomes through notes, photos, and audio recordings and reflecting individually and collectively after each session. Together, researchers, journalists and AI-developers used the data gathered during these sessions was used to develop concepts for AI applications.

The results indicate that dissatisfaction among both audiences and journalists stems from a shared sense of powerlessness in the face of information overload. Audiences struggle to see their own realities reflected in news coverage that tends to privilege extreme or simplistic views over more nuanced perspectives. Meanwhile, the speed of news production leaves little room for journalists to engage in in-depth reporting, and the tone of online interactions makes it hard to build meaningful relationships with the public.

Looking forward, both journalists and audience members advocate to make journalism more approachable by making the news in such a way that it contributes to a society in which people feel heard and taken seriously. By adopting various roles, conversational AI can support news organisations in making the news more accessible, include more diverse perspectives, build reciprocal relationships with communities and mitigate the emotional load of news.

JOS12 Climate and Journalism

PP 0270 Shifting journalistic frameworks in climate coverage: Norms, values and responsibility in Portuguese newspapers (1973–2023)

Gisiela Klein[1]

[1] University of Coimbra, Faculty of Arts and Humanities, Montemor-o-Velho, Portugal

Climate change and environmental breakdown represent a defining moment of "shifting grounds" for journalism, confronting the profession with ethical dilemmas that challenge long-standing normative frameworks based on neutrality, detachment, and balance. Within this context, climate journalism emerges as a critical site where journalistic norms, values, and professional roles are being renegotiated in response to increasing societal expectations for relevance, responsibility, and public service. This paper examines how Portuguese newspapers have navigated these shifting grounds over the past five decades, focusing on the evolution of journalistic frameworks in environmental and climate-related coverage.

The study is based on a longitudinal content analysis of environmental news published between 1973 and 2023 in three national newspapers representing distinct journalistic cultures: the popular daily *Correio da Manhã*, the reference weekly *Expresso*, and the reference daily *Público*. An original analytical grid is employed to capture both structural and normative dimensions of news texts, including journalistic genres, authorship and sourcing patterns, headline and lead strategies, dominant news frames, and the representation of responsibility, efficacy, and collective action. The analysis further identifies the dominant journalistic role enacted in climate coverage, distinguishing between neutral dissemination, interpretative mediation, and more engaged or advocacy-oriented approaches.

The findings point to a gradual yet fragmented transformation of journalistic frameworks. While early coverage is largely characterised by event-driven reporting and risk or techno-scientific frames, later decades show increased interpretative depth, greater visibility of institutional and political responsibility, and a broader ethical framing of environmental issues. Nonetheless, the persistence of neutral dissemination as the dominant professional stance reveals the resilience of traditional journalistic norms, even in the face of a growing climate emergency. Explicitly engaged journalism remains limited and uneven, suggesting that normative change occurs more through subtle reconfigurations of framing and role performance than through a clear break with professional orthodoxy.

By situating climate journalism within a long-term perspective, this paper contributes to debates on changing journalistic frameworks in times of democratic, ecological, and epistemic crisis. It argues that climate coverage illustrates journalism's struggle to balance professional resilience with normative adaptation, highlighting the tensions between inherited values and emerging demands for ethical responsibility and collective futures. In doing so, the study demonstrates how journalism research can inform ongoing reflections on professional standards, ethical guidelines, and the future role of journalism in addressing global crises.

JOS12 Climate and Journalism

PP 0271 Who's up for constructive climate journalism? Audience preferences, habits, and exposure to a real-world campaign

Morten Skovsgaard[1], Dominika Betakova[1], Kim Andersen[1]

[1] University of Southern Denmark, Centre for Journalism- Department of Political Science and Public Management, Odense, Denmark

Despite widespread public concern about the climate crisis (Ogunbode et al., 2022), news outlets struggle to sustain audience attention on the topic (EBU, 2023; Newman et al., 2023). One explanation lies in the dominance of negative events and a lack of progress, which can evoke negative emotions and leave audiences feeling worn out and disempowered (Ejaz, 2022). Such coverage may weaken connections between climate journalism and everyday lifestyle or resource decisions, reduce motivation to follow environmental news, and ultimately contribute to selective avoidance (Newman et al., 2023; Smith, 2005).

In response, journalists and scholars have increasingly advocated for a constructive approach to climate journalism that emphasizes solutions and agency (EBU, 2023).

Although constructive climate journalism has been shown to positively affect attitudes and behaviors (e.g., Baden et al., 2019; Li, 2021), these effects assume that audiences actually encounter and engage with such coverage. Yet, little is known about audience preferences for constructive over negative news, and whether these translate into real-world exposure when such content is freely available.

We address these gaps by examining the preferences for constructive climate journalism, and whether interested people engage with it when it is available.

The study is based on a two-wave panel survey conducted in the Danish region of Funen, where two dominant regional news outlets—*Fyens Stiftstidende* and the public service broadcaster *TV 2 Fyn*—collaborated on a two-week constructive climate journalism campaign. The campaign focused on sustainable transportation and climate-friendly mobility solutions, such as commuting by bicycle or public transport. News was distributed across television broadcasts, news websites and apps,

and social media. Using a representative sample of the adults in Funen, we measured participants' preferences prior to the campaign and their exposure to and evaluation of the campaign afterward. Data collection for Wave 3, covering a second constructive campaign on sustainable consumption, is completed, and will be included at the time of the conference.

Results from the two waves show that a stronger perception of negativity in climate coverage is predicted by higher education, higher selective avoidance of climate crisis news, stronger beliefs that the media exaggerates the climate crisis, and lower climate worry. A preference for solutions-oriented climate coverage is also predicted by higher education, but by younger age, lower selective avoidance, lower beliefs of exaggeration, and higher climate worry.

Crucially, however, these preferences did not translate straightforwardly into exposure. Fewer than half of those who expressed a preference for solutions-oriented climate journalism followed the constructive campaign. Paradoxically, the audience group disliking both negative and solutions-oriented climate coverage was the most exposed. Campaign exposure was only predicted by older age and higher regional news use, indicating that existing news use patterns condition who encounters constructive climate journalism in practice.

These findings highlight a challenge for environmental journalism: even when constructive climate reporting is distributed through dominant news channels, it disproportionately reaches audiences with lower demand for it. By examining audience preferences and actual exposure in a real-world campaign, this study contributes to research on climate journalism and emerging journalistic practices.

JOS12 Climate and Journalism

PP 0272 Scrolling past catastrophes? Testing constructive climate journalism in a platform-based field experiment

Dominika Betakova[1], Kim Andersen[1], Simon Bækgaard[1], Morten Skovsgaard[1]

[1] University of Southern Denmark, Centre for Journalism- Department of Political Science and Public Management, Odense, Denmark

The dominance of problem-oriented news is a well-documented phenomenon rooted in evolutionary biology, culture, and journalistic news values (Shoemaker, 2023). Although negative news may capture audience attention in the short term (e.g., Robertson et al., 2023), prolonged exposure reduces news enjoyment and can foster news avoidance (Vandenplas et al., 2021; Vettehen et al., 2008). This is particularly problematic in climate journalism, where coverage often emphasizes catastrophic events and a lack of progress rather than potential or existing solutions (Ejaz et al., 2023; Hackett et al., 2017). Fear-inducing climate narratives are widespread, and especially prevalent in mainstream news coverage (Andersen et al., 2024). Such narratives quickly lose impact and leave audiences feeling overwhelmed and demotivated (O'Neill & Nicholson-Cole, 2009). Accordingly, climate news is among the most selectively avoided topics globally (e.g., Newman et al., 2023), with stress being positively associated with climate news avoidance (Ejaz et al., 2025).

In response to problem-oriented reporting, newsrooms have increasingly experimented with constructive journalism. Constructive journalism as an umbrella term refers to practices integrating positive psychology and solution-oriented reporting while maintaining journalism's core functions (McIntyre & Gyldensted, 2017; McIntyre & Lough, 2023). Audiences seem to be interested in such approaches, with 55% of news avoiders reporting interest in positive news and 46% in solutions-oriented coverage (Newman et al., 2023). Empirical findings, however, remain limited and mixed. While short-term exposure to constructive journalism has been shown to positively affect emotional responses (e.g., Baden et al., 2019; van Antwerpen et al., 2023, 2025), evidence regarding self-efficacy and behavioral intentions is inconsistent (e.g., Baden et al., 2019; van Antwerpen et al., 2025; Schäfer et al., 2025). Importantly, existing studies predominantly rely on one-shot survey experiments and self-reported intentions rather than actual behavior (McIntyre & Lough, 2023). This is a problem, as news is increasingly encountered via online platforms (Newman et al., 2024), and we know very little about audiences' actual long-term behavior.

To address these gaps, we designed a pre-test post-test between-subjects Instagram field experiment in Denmark (N = 1,024). Participants are to be randomly assigned to follow either a constructive or a problem-oriented climate journalism Instagram account, allowing us to assess the effects of journalistic content as it is encountered in everyday platform-based news use. Over one week, participants will be exposed to posts, stories, and reels focused on overconsumption, including food waste, fast fashion, and e-waste.

Outcome measures include both self-reported attitudes and direct behavioral measures on the platform. These comprise (a) engagement- and emotion-related outcomes, such as content engagement and evaluation, and emotional responses, and (b) climate-related behaviors and behavioral intentions, including petition signing, donations, and pro-environmental intentions.

We are in the pre-registration and stimuli development phase, with data collection planned for spring 2026. This experiment enables the assessment of intensive exposure to constructive climate journalism within a natural media environment where news competes with non-news content for attention. By incorporating direct behavioral measures, the study offers insights into the potential of constructive journalism for climate reporting under contemporary platform conditions.

JOS12 Climate and Journalism

PP 0273 Reporting energy injustice: Indigenous land claims and the "green" shift in local news

Eli Skogerbø[1]

[1] University of Oslo, Media and Communication, Oslo, Norway

This paper investigates how local journalism mediates energy justice in the context of the "green" transition, through a case study of media coverage of the Øyfjellet wind power conflict in Norway. The conflict concerns a wind power plant licensed by Norwegian state authorities, and its impacts on the Sámi reindeer herding district Jillen Njaarke Sijte, whose traditional pasturelands and migration routes were disrupted by the project. While renewable energy expansion is commonly framed as environmentally necessary, this case highlights how the distribution of benefits and burdens of the green transition remains profoundly uneven.

The paper asks: *How did the local newspaper Helgelendingen report the Øyfjellet conflict, and in what ways did its coverage articulate—or obscure—key dimensions of energy justice?* It examines how questions of distributive, recognitional, and procedural justice were framed in local news reporting, and how Indigenous Sámi knowledge and land-based expertise were positioned relative to industrial, legal, and economic rationales for wind power development.

The study is grounded in energy justice scholarship, which conceptualises the green transition not only as a technical shift in energy systems but as a social process shaped by power, inequality, and historical injustice. This framework is combined with work on green colonialism and internal colonisation in the Nordic Sámi context, as well as theories of epistemic injustice and strategic ignorance. These perspectives enable an analysis of how journalism participates in defining whose knowledge counts as relevant and credible in debates about "just" energy futures.

Empirically, the paper draws on a qualitative close reading of approximately 200 news articles and opinion pieces published between 2011 and 2024, with a focus on the newspaper's coverage of the District Court case held in Mosjøen in May–June 2024. The analysis attends to framing, sourcing practices, language use, and journalistic reliance on information subsidies supplied by corporate and legal actors during both the planning phase and the court proceedings.

The findings show that while reporting prior to the construction of the wind power plant (2019–2022) presented the conflict as involving multiple stakeholders, the coverage of the 2024 court case was characterised by pronounced asymmetries. Journalistic dependence on the wind company's legal framing and communicative resources foregrounded economic efficiency, regulatory compliance, and climate mitigation, while marginalising Sámi claims as rights holders and knowledge bearers. Indigenous understandings of land, mobility, and cumulative encroachment were rendered vague or unintelligible, resulting in forms of testimonial and recognitional injustice. Procedural energy justice was similarly weakened, as unequal communicative capacities were normalised rather than critically interrogated.

Local journalism plays a consequential role in shaping public understandings of energy justice in the green transition. When Indigenous peoples are primarily framed as obstacles to development rather than as rights holders affected by unjust energy regimes, local media risk reproducing colonial logics under the banner of sustainability. The study contributes to energy justice and journalism scholarship by demonstrating how injustices are not only produced through energy policy and infrastructure, but also through everyday news practices that legitimise particular energy futures while silencing others.

JOS12 Climate and Journalism

PP 0274 What happens after the storm? Exploring the long-term impact of hashtag activism on social issue careers for sexual abuse (#MeToo), climate change (#FridaysForFuture) and racism (#BlackLivesMatter): A ten-year time-series analysis

Sofie Beisemann[1], Svenja Boberg[1], Saïd Unger[1], Thorsten Quandt[1]

[1] University of Münster, Department of Communication, Münster, Germany

Hashtag activism, i.e. protest on social media curated by a hashtagged phrase or word (Bonilla & Rosa, 2015), has repeatedly succeeded in drawing attention to social issues. Notable examples include #MeToo, #BlackLivesMatter and #FridaysForFuture, which have attracted attention from traditional media worldwide. Such media attention enables hashtag activism's causes to spill-over into mainstream discourses.

However, hashtag activism has been criticised for lacking long-term impact: While it generates vast short-term media attention, this allegedly fades quickly. Studies have investigated such short-term attention peaks, conceptualized e.g., as media storms (Boydstun et al., 2014). Yet, investigations of long-term dynamics of media attention towards social issues, so-called social issue careers (Waldherr, 2014), remain scarce. The question arises whether hashtag activism-induced media attention storms can change media attention dynamics towards social issues sustainably.

This study addresses this research gap by investigating how the hashtag debates #MeToo, #BlackLivesMatter and #FridaysForFuture impacted the social issue careers of sexual abuse, racism and climate change in Germany over a decade. To capture the hybrid logic of the modern media ecology, we collected n = 28,027 news articles posted by 10 German media outlets' Facebook accounts between 2014 and 2024. First, BERTopic modeling was used to structure the datasets

and identify topics within the German media discourse on the three social issues. Second, we applied interrupted time series analysis (ITSA) using generalized additive mixed models (GAMM; Beard et al., 2019) to identify whether the hashtags changed media attention dynamics towards social issues.

ITSA revealed stark differences for long-term social issue careers post hashtag debates: After an immediate surge following #MeToo, media attention to sexual abuse remained at a moderately increased level, containing further peaks. Media attention towards racism significantly waned after an explosive outburst following #BlackLivesMatter. While there was no immediate attention storm triggered by the first use of #FridaysForFuture regarding climate change, a delayed substantial change in attention dynamics was found.

The differences between the social issues highlight the importance of reactivating established hashtags: #MeToo and #BlackLivesMatter were already established hashtags, in contrast to #FridaysForFuture. Movement and resonance structures for the social issue of climate change first had to be created, which is why #FridaysForFuture had no immediate impact on media attention dynamics.

Based on our findings, we cannot confirm that media attention towards a social issue generally fades away after a brief storm of attention sparked by hashtag activism. Rather, the longevity and dynamics of social issue careers depend on the specifics of social issues and previous hashtag activism, paving the way for societal resonance.

PP 0353 Whose voices matter? Source distribution and structural hierarchies in Finnish news stories by immigrant-background journalists

Reetta Nousiainen[1]

[1] Tampere University, Journalism, Helsinki, Finland

This study contributes to the growing field of research on news diversity (Joris et al 2020, 1895), which often emphasizes the presence of various sources in journalistic content (Heft et al 2024, 240). There is a wide consensus that journalism should include a variety of voices (Núñez-Mussa 2022, 277) and being quoted in the news media legitimizes individuals as participants in public discourse and thus as actors within societal power structures (Seuri et al 2024, 194).

Research on news sources commonly distinguishes between *elite* sources and *citizen* sources (Kleemans et al. 2017, 468). In Western contexts, journalism has traditionally privileged elite sources: mainstream media have often been characterized as echo chambers for establishment perspectives and elite voices (Maeseele & Raeijmaekers 2017).

This article examines 131 articles produced during internships for journalists with immigrant backgrounds in seven Finnish newsrooms. Between September 2023 and February 2024, thirteen journalists produced these stories. The analysis examines both the distribution of sources and the interpretative frames assigned to them. Research questions are: *What do immigrant-background journalists bring to Finnish journalism, and who gets a voice in the stories they produce?*

The study uses a mixed-methods approach. A quantitative analysis maps the distribution of personal sources, while qualitative content analysis explores the framing and roles assigned to these voices within the articles.

The analysis draws on principles of Critical Discourse Analysis (CDA), which has frequently been employed to uncover how political rhetoric, news texts, and other forms of elite communication sustain dominant groups while marginalizing others (Crawford 2011, 625).

The data includes 364 personal sources. Of these, 75% (274) are framed as non-native Finnish. This marks a significant departure from mainstream journalism, where immigrants struggle to enter the news arena (Masini et al 2017, 2339) and tend to have low visibility as actors (Núñez-Mussa et al 2022). However, deeper analysis reveals that nearly 90% of non-native Finnish sources were framed as sources of lived experience, which are often defined as authentic, but lacking credibility (Vodanovic 2024, 574). I categorized these sources into four roles: *minority of a minority*, *voice of the voiceless*, *unreliable storyteller*, and *enriching element*.

In contrast, 72% of native Finnish sources were framed as experts. According to the analysis, these expert sources typically oppose, validate, or look down upon the lived experiences of non-native Finnish sources. Only twice were Finnish experts challenged within the stories, suggesting a persistent hierarchy of credibility.

Most of the stories focused on themes related to immigration or immigrants. Notably, political voices were almost entirely absent (only one politician was quoted), even though political sources typically play a central role in Finnish journalism (Seuri et al 2022). This absence is particularly striking given the highly politicized nature of immigration discourse in Finland.

These findings suggest that immigrant-background journalists contribute to diversifying Finnish journalism by amplifying voices of non-native Finns. Yet, the framing exposes structural barriers that limit non-native Finns' full participation and influence within mainstream Finnish journalism.

JOS13 Migration and Journalism

PP 0354 Marginalizing the migrants and framing the problems – Migration coverage in German online newspapers between 2015 and 2025

Anni Lehmann[1], Benjamin Allig[1], Friedrich Hausmann[1], Vanessa Groß[1], Kira Tabea Lange[1], Julia Straube[1], Jessy Birgit Schrödter[1], Jason Peschke[1], Janis Brinkmann[1]

[1] Hochschule Mittweida FH - University of Applied Sciences, Fakultät Medien, Mittweida, Germany

The paper presents findings from a long-term quantitative content analysis of 2,117 opinion-based online articles of leading German newspapers' migration coverage between the years 2015 and 2025. From the theoretical perspective of news value, news bias, agenda-setting, and framing theory the findings shows that domestic political issues dominate the opinion journalism. The positions of German politicians as central actors are prominent in the sample, while the perspectives of migrants were marginalized. Although German online newspapers address the international dimension of migration, German politics are evaluated negatively. In addition, the issue of migration is framed negatively (e.g., using frames of incompetence or risk), while positive interpretations (e.g., frames of opportunity or integration) were used less frequently by the online newspapers in Germany in the last ten years.

1. State of the research and theoretical approach

While migration coverage remains a controversial topic, journalism studies has researched the topic comprehensively in the past. The findings show a variety of biases, e.g., the marginalization of migrant voices (Fengler & Kreutler 2020; Hestermann 2020), the dominant perspectives of politics (Haller 2017), and an overlying focus on (negative) key events (Arendt et al. 2017; Zerback et al. 2020). While international research on migration coverage focuses the first years on the European "refugee crisis" (Arlt & Wolling 2016; Berry et al. 2016; Chouliaraki & Zaborowski 2017; Conrad & Aalsteinsdóttir, 2017; Eberl et. al. 2018), the paper raises the question (RQ), how German mainstream media have reported on migration in the long term.

From the perspective of an established set of journalism studies' middle range theories like news value, news bias, agenda setting, and framing (Goedeke et al. 2016; Greck 2018; Eberl et al. 2018; d'Haenens et al. 2018; Heidenreich et al. 2019; Kelm et al. 2021; Czymara & van Klingeren 2022) the paper asks, which topics, actors, and frames shaped the reporting on migration in leading German media in the ten years between 2015 (the beginning of the so-called "refugee crisis") and 2025 (the federal elections in Germany).

2. Methodological design and empirical findings

Since previous studies have focused on overall (news) reporting (Maurer et al. 2019; 2021) and to consider the long-term research approach the quantitative content analysis (Rössler 2017) focuses opinion-based articles (e.g., commentary, editorials, essays) in leading German online newspapers that report the topic of migration. This leads to a full survey of eight leading German online newspapers and a total of 2,117 online articles (Reliability test according to Holsti: 0.82).

Findings shows that domestic politics issues dominate the reporting (48.4%), while German politicians were the main actors in 49.7% of the articles; migrants appeared as main actors in only less than one in ten articles. In addition, migration is framed negatively (e.g., using frames of incompetence or risk), while positive interpretation of migration (e.g., frames of opportunity or integration) were used less frequently by the newspapers. Using quantitative data and qualitative examples from the sample, the paper shows how leading German newspapers have shaped the migration discourse over the past ten years.

JOS13 Migration and Journalism

PP 0355 Migration Coverage with a human rights approach: How trainings transform the norms and ethics for Ecuadorian migration journalism

Martina Lapo Robayo[1], Tania Orbe[1]

[1] Universidad San Francisco de Quito, Journalism, Quito, Ecuador

In 2024, Ecuador faced a wave of violence and insecurity driven by organized crime. This, combined with limited job opportunities, motivated 94,767 Ecuadorians to emigrate, making it the year with the second-highest migration balance since 2017. Migration is a core theme in Ecuadorian journalism, but covering it is challenging due to scarce resources and knowledge. A study by the foundation Periodistas Sin Cadenas shows that 39.6% of journalists earn below the $470 monthly minimum wage and 46.7% lack social security. In this context, the results of trainings on migration coverage with a human rights

approach are critical to practice a humanized journalism that redefines the norms and ethics that shape the profession and solidify democracy.

This proposal examines the transformative effects of specialized journalism training on migration reporting through a human rights approach, based on the outcomes of the 2024 course "Migration Coverage to the United States: The Myth of the American Dream?" Organized by Universidad San Francisco de Quito (USFQ), the U.S. Embassy in Ecuador, and the Border Center for Journalists and Bloggers (BCJB), the six-week program attracted 70 participants nationwide. Of these, 40 pitched in-depth U.S.-Mexico border stories, scored on originality, feasibility, sources, and impact (84–96/100 points); 10 fellows were selected to produce warning narratives on irregular migration risks like extortion, abuse, and mental health deterioration, published in major Ecuadorian outlets including Ecuavisa (3.6M Facebook followers) and TC Televisión (3.9M Facebook followers).

The research used a mixed-methods approach: semi-structured interviews with fellows and content analysis of their work before and after the course. Interviews revealed that 80% of the fellows had little to zero knowledge of migration terms and human rights. For example, seven admitted to have said and written "illegal migration" instead of "irregular migration". They also showed profound human and professional shifts. Before the course, one fellow prioritized numbers and hard data over human stories; afterward, she created empathy-building narratives, confirmed by comparing her pre-course work to a U.S.-Mexico border story she developed.

In total, 17 journalistic pieces in three formats demonstrated how the course shaped fellows' understanding of human rights and coverage responsibility. Pre-course, they used six sources per story on average, often tragedy-focused; post-course, eight sources with accurate terminology, diverse voices, and warnings beyond drama. Notably, the training enabled the TC Televisión journalist to deliver his story on Ecuador's first recorded case of artificial intelligence used to extort a missing immigrant's family.

This research bridges local insights to global discourse by showing how targeted training transforms migration coverage in high-emigration, high-risk settings, offering a replicable model for Latin America and beyond, where violence and policy shifts—like Trump's 2025 U.S. restrictions—heighten the need for ethical reporting. Centering fellows' perceptions, it evidences training's role in fostering democracy through humanized information that deters risky migration and transforms the journalism profession towards a human rights approach. Presented at the 11th European Communication Conference, it advocates scaling similar programs internationally, enhancing journalism's societal role in rights advocacy and informed publics.

JOS13 Migration and Journalism

PP 0356 Europe as a mirror: A discourse analysis of the European migration crisis in Japanese major newspapers (2015–2025)

Jun Oguro[1], Weiwei Ding[2]

[1] Doshisha University, Department of Media- Journalism and Communications, Kyoto, Japan
[2] Doshisha University, Journalism and Media Archives Research Center- Doshisha University, Kyoto, Japan

Since the outbreak of the "Refugee Crisis" in 2015, migration issues in Europe have transcended regional boundaries to become a global media event. In Japan, a nation geographically distant and ethnically homogeneous, coverage of European migration is not merely a report on foreign affairs but functions as a critical lens through which domestic anxieties regarding a hyper-aging population, severe labor shortages, and the preservation of national identity are projected. This study investigates how the European migration crisis has been constructed, framed, and "domesticated" in the Japanese media landscape over the past decade.

This study analyzes a corpus of approximately 3,000 articles published between January 2015 and November 2025 in four major Japanese newspapers: *The Asahi Shimbun* and *The Mainichi Shimbun* (liberal), *The Nikkei* (financial/center-right), and *The Sankei Shimbun* (conservative). Utilizing a mixed-methods approach combining quantitative text mining with qualitative critical discourse analysis, we examine chronological trends in media attention and competing frames.

Our quantitative analysis reveals "asymmetric waves of attention" across four phases. First, coverage exploded in 2015, accounting for nearly 30% of the total dataset. Initial humanitarian sympathy rapidly shifted toward security concerns following the Cologne attacks and Paris terror attacks. Second, attention plummeted between 2017 and 2021 as the crisis normalized. During this period of silence, coverage focused narrowly on "economic integration"—specifically Germany's vocational training—as a potential model for Japan's own policy reforms. Third, the Russian invasion of Ukraine in 2022 triggered a massive resurgence. Notably, the term "refugee" (*nanmin*), used for Middle Eastern arrivals, was replaced almost entirely by "evacuee" (*hinanmin*) for Ukrainians, correlating with a highly positive tone that highlighted an implicit racial hierarchy. Finally, recent coverage (2023–2025) has increased, focusing on the rise of right-wing populism and the "Fortress Europe" narrative.

Qualitatively, the study identifies three dominant frames correlated with ideological stances: the "Humanitarian Frame" (liberal papers) criticizing border policies as a retreat from human rights; the "Security Frame" (conservative paper)

employing metaphors of natural disasters (e.g., "influx," "waves") to validate strict border controls; and the "Economic Frame" (financial paper) adopting a utilitarian perspective that weighs labor needs against social costs.

The core argument is that Japanese media utilizes Europe as a "mirror" to negotiate Japan's own identity. Through "strategic domestication," newspapers translate European events into lessons for Japan. Furthermore, media engage in the "politics of terminology" to construct "othering." While newspapers unhesitatingly use the word "immigrant" (*imin*) for Europe, this term is taboo in domestic political discourse, where foreign workers are euphemized as "technical interns." By confining the label of "immigrant" to the European context, the media reinforces a cognitive boundary: "Immigration" is framed as a European problem of chaos, whereas Japan deals only with managed foreign labor.

This study concludes that Japanese coverage of European migration is instrumentalized to navigate the national dilemma of needing foreign labor while fearing social change.

PP 0357 "Through the eyes of a stranger." Contradicting journalistic epistemology in German immigrant society

Christina Haritos[1], Margreth Lünenborg[1]

[1] Freie Universität Berlin, Institute for Media and Communication Studies / Journalism Studies, Berlin, Germany

In recent years, questions about the legitimacy of journalistically produced knowledge have grown more urgent, often focusing on how positionality intersects with established forms of knowledge production. While many of these debates are centered on new technological possibilities, this contribution asks how the position of the "stranger" was strategically used by journalists who immigrated to Germany in the 1960s. For this, we foreground the work of the first two non-white female journalists in German television: Navina Sundaram and Roshan Dhunjibhoy. Both journalists began work simultaneously and remained singular as figures in television up until recent decades. However, they have been almost completely memory-holed in German research. Coming from India and Pakistan, respectively, they worked as foreign correspondents and also reported on German immigration policy, often foregrounding their personal position in reporting. For instance, in one of her first programs for German television, entitled "Through the eyes of a stranger," Dhunjibhoy states that she is wearing a Sari to show how Germans stare at "strangers" in public.

In our study, we ask how this position of the "stranger" shaped practices of contradicting within and against journalism during the emergence of immigration as a contested topic in German society. For this, we offer a theoretical framework that integrates practices of contradicting into journalistic epistemology. We expand Carlson's (2025) conceptualization of epistemic contests with a praxeological lens that foregrounds the processual and relational nature of contradicting. Practices of contradicting are dependent on the position of the journalist, and we show how this position is used to challenge existing epistemologies (Smeenk et al., 2025). Positionality here functions as a core element contesting journalistic notions of objectivity. Finally, we use postcolonial and feminist theoretical approaches to show how unequal power structures play into the revealing or obfuscation of positionality.

To illustrate this theoretical framework and add historical context to previous research about positionality and objectivity, we provide early examples of reporting by Sundaram and Dhunjibhoy. For this, we conduct a discourse analysis of the earliest four programs (1964–1967) by Sundaram and Dhunjibhoy that aired on North German (NDR) and West German Broadcasting (WDR) as well as a document analysis of archived press reporting and correspondence that accompanied this reporting. This enables us to reconstruct practices of contradicting alongside the reactions they elicited from and directed towards journalists. We show that in both analyzed cases, positionality was an integral rather than incidental element of reporting. For instance, both journalists often directly related their position to the subjects of their reporting, either to directly contradict interview partners with their experience (Dhunjibhoy) or by allowing interview partners to interrupt them and take an active role in interpreting knowledge (Sundaram). In our discussion, we reflect on the applicability of this historical context to current discussions of journalistic epistemology.

JOS14 AI and Journalists

PP 0358 Human after all: Frame building practices among Dutch AI journalists

Jessy De Cooker[1], Danielle Arets[1]

[1] Fontys University of Applied Sciences, Journalism, Tilburg, Netherlands

Journalists are key actors in translating and making sense of complex subjects, such as the societal implications of Artificial Intelligence (AI), for a broad audience. The study at hand examines the level of autonomy journalists experience in covering

AI-related issues and, more specifically, addresses the choices they make – both consciously and unconsciously – during the reporting process.

When covering topics such as AI, journalists select and process information according to established professional norms, values, and routines, including assessments of newsworthiness and topical relevance (Löffelholz & Sarısakaloğlu, 2024; Deuze, 2005). Previous research has consistently shown that these selection processes are not neutral but involve framing practices through which journalists select and highlight certain aspects of issues, while downplaying others and often without explicitly reflecting on claims of objectivity or neutrality (Lecheler & De Vreese, 2019; Hänggli, 2011; Matthes, 2009; Scheufele, 1999; Shoemaker & Reese, 1996).

Framing research traditionally focuses on analysing media content and identifying dominant frames in news coverage. The relationship between news production itself and the process of frame production – where frames are negotiated, anticipated and preconfigured – are often overlooked (Guenther et al., 2023; Borah, 2011; Matthes, 2009; Scheufele, 1999; Entman, 1993). However, recent research shows that frame building plays a key role in news production processes. Brüggemann (2014) conceptualises frame building as a multi-level process shaped by interacting individual, organisational-professional and broader societal factors, such as role conceptions, beat-related expertise and issue cultures, such as elite consensus and polarisation around a topic. This conceptualisation has been applied in studies of news coverage on topics as climate change and healthcare and was the theoretical basis of semi-structured interviews and focus groups to explore journalists' perceptions of framing practices (Verleyen et al., 2025; Kirchner et al., 2024; Brüggemann & Engesser, 2014).

To date, these factors have not been systematically applied as a methodological framework for semi-structured interviews on the production of AI journalism. The study at hand applies Brüggemann's factors in semi-structured interviews with nine journalists covering AI at five national Dutch newspapers. Our preliminary findings suggest that journalistic framing practices in AI coverage are shaped by the interplay between individual factors, such as journalists' personal views on AI and organisational-professional conditions, most notably the absence of formal editorial guidelines. While some journalists demonstrate an explicit awareness of framing – occasionally adopting reflexive strategies, such as positioning themselves as the devil's advocate – most interviewees describe their framing practices as an implicit outcome of routinised work rather than the result of deliberate editorial choices. These practices are embedded in everyday newsroom conditions, including uneven levels of AI expertise within newsrooms, beat-related routines and news values that prioritise negative or risk-oriented AI developments.

In line with Brüggemann's (2014) framework, our findings show that the combination of high individual expertise and the absence of formal guidelines mean that framing choices are largely made by individual journalists rather than collectively negotiated within newsrooms. Together, these findings contribute to understanding journalists specialising in AI as an interpretive community (Zelizer, 1993).

JOS14 AI and Journalists

PP 0359 At the forefront and open, but cautious: How Danish reporters view and use pioneering AI built for newsrooms

Carolyn Nielsen[1]

[1] Western Washington University, Journalism, Bellingham, USA

The 2022 launch of ChatGPT prompted questions from many news organizations about how generative AI might be useful and/or harmful to the field. Meanwhile in Denmark, one of the country's largest media companies had been developing in-house newsroom AI tools for more than three years, putting Danish news organizations at the forefront of generative AI (Adami, December 20, 2024). JP/Politikens Hus developed its own tools to avoid Big Tech and maintain control over its intellectual property (Gupta, July 12, 2024). In spring 2025, JP/Politikens Hus launched newsroom chatbot MAGNA, which can transcribe interviews, write headlines and fact boxes, learn to mirror a reporter's writing "voice," scan a press release to suggest interview questions, and write news articles (J. Skov Andersen, personal interview, April 7, 2025). Previous studies examining journalists' reception of new digital technologies in the newsroom have found that journalists express skepticism, view technologies as a threat to journalists' professional control and job security, and ignore the tools (Carlson, 2017; Lewis, 2012; Powers, 2012; Singer, 2024; Usher, 2025).

This ethnographic study explored Danish reporters' uses and opinions of generative AI during the key inflection point when MAGNA launched. It drew on semi-structured in-depth interviews with a purposive sample of 31 reporters who covered different beats (sports, health, culture, government, business, etc.). The sample stratified reporters based on time in field (from digital-native interns and early-career reporters to mid-career journalists who had been in the newsroom during the rise of social media, to veteran journalists whose careers predate newspaper websites). The Hierarchy of Influences Model (Reese & Shoemaker, 2016), theories of Social Construction of Technology (Gane & Beer, 2008; Mitchelstein & Boczkowski, 2009) and new institutionalism (Sparrow, 2006) informed the interview questions.

Thematic analysis (Lindlof & Taylor, 2017) of the data found, across beats topics and experience levels, that journalists were mostly using generative AI to do things they did not enjoy, such as transcriptions and writing headlines; or in ways that saved time, such as searching through volumes of documents for specific information they would then verify. In this

way, they viewed AI as helpful, like a research assistant. Culture reporters found the least use for AI, emphasizing the need for creativity in their work and a desire to practice and grow as writers. Investigative reporters found the most use for generative AI in searching through large reports. In terms of time in field, the newest reporters were the most strongly opposed to AI use, saying it felt like "cheating." None of the participants said they used AI to write articles. Reporters did not express concern about AI replacing their jobs because they did not trust it to be accurate or to replace critical thinking. This study showed three key differences from what previous studies have found. This work showed journalists' being open to using new technology, digital natives as the most skeptical of new technology, and a lack of concern the new technology would harm journalism.

JOS14 AI and Journalists

PP 0360 Let data speak: Data storytelling in the era of big data and AI

Tomáš Hána[1]

[1] Aalborg University, Department of Electronic Systems, Copenhagen, Denmark

The emergence of artificial intelligence (AI)-based tools is beginning to change data-driven work in journalism, particularly in investigative reporting (Bradshaw 2025). With the advent of AI, new powerful tools enable the extraction of knowledge from large datasets more effectively, identifying ideas for newsworthy topics quicker, and supporting journalistic investigations (de-Lima-Santos and Ceron 2021; Thäsler-Kordonouri and Koliska 2025). At the same time, it is essential to understand how big data and AI interact with each other in these contexts, as it poses epistemological consequences in terms of creating new stories. This study offers an analysis of their impact on data-driven stories in terms of sourcing, newsgathering, processing, and subsequent presentation.

Working with data has been part of journalism for decades (Anderson, 2018) yet the adoption of AI in the newsroom and newswork is likened to "a new journalistic paradigm" (Biswal and Kulkarni 2024). In this study, we examine the main characteristics of stories created using big data and AI-based tools using a sample of 22 projects from the 2025 Sigma Awards for data journalism. Using the grounded theory methodology (GTM) (Bryant and Charmaz 2019), the study first identifies the salient characteristics of the projects, then develops them in more detail, and analyses them. The characteristics are associated with three categories – sources, newsgathering/processing and appearance, which reflect the entire process of creating a data story (Garreton et al. 2024). The findings indicate that artificial intelligence tools are transforming data stories in both the creation process, where the authors often used the tools to identify new topics, and possibly follow-up action in the field, and their visual form, yet data visualisations are not the only means to reveal findings.

The study discovered that the amount of processed data enables newsrooms to develop new participatory interfaces, where every reader can explore data themselves, bringing more engagement towards the message in the story. There is an observable trend to employ self-developed AI tools, which were the most frequently used type of tools in these projects, also enabling journalists to increase the transparency of their data gathering and analysis procedures, supporting earlier evidence (Weber et al. 2018). The performed analysis confirmed previous statements (Salaverría and de-Lima-Santos 2020; Dowd 2025), that the availability of data and unrestricted access are necessary prerequisites for new, data-driven investigations, that can cover wider ranges of topics than before.

The results clearly showed that new developments in AI are changing the way not only journalistic content is presented, but they could also serve as a suitable basis for further research on audience needs to better understand the impact and understanding of data stories (Appelgren 2018; Swart et al. 2022), potentially leading to interdisciplinary approaches about the impact of data-driven storytelling and interfaces for public discussions and political 'ramifications' of data-driven investigations (Hamm 2022).

PP 0361 Different types of AI user profiles in German journalism: The advanced all-rounder, occasional user, and selective strategist

Florian Stalph[1], Sina Thäsler-Kordonouri[1], Andreas Riedl[2], Jonah Wermter[3], Wiebke Loosen[3]

[1] LMU Munich, Department of Media and Communication, Munich, Germany
[2] University of Augsburg, Division Public Communication, Augsburg, Germany
[3] Leibniz Institute for Media Research, Hans-Bredow-Institut, Hamburg, Germany

AI tools in journalism are often heralded as rapidly spreading and fast-paced auxiliary applications that pervade numerous aspects of journalistic practice. A recent survey among journalists based in German-speaking Switzerland (Fürst, 2025) found that 86.7 per cent use AI tools daily.

To explore the current state of journalists' AI usage in Germany, we conducted a representative survey with *N* = 1,171 professional journalists following the definition set forth by the Worlds of Journalism Study (Hanitzsch et al., 2025). Besides collecting data on socio-demographics, professional roles, and organisational aspects, this study focused on the usage intensity (scale from *never* to *always*) of AI tools across 13 different application domains (e.g., research and topic

identification, fact-checking, translation & transcription, text production, proofreading, editorial review and revision, and format adaptation and repurposing).

Using a *Latent Profile Analysis* (LPA) we identified three distinct AI usage profile types among journalists in Germany:

The results of the LPA show three AI usage profiles: (1) The 'advanced all-rounder' profile, which comprises those journalists that scored highest on the intensity of their AI usage across most application domains. These individuals demonstrate maximum scores in the usage of AI tools in the application domains research and topic identification, fact-checking, text production, proofreading, and editorial review and revision. (2) The 'occasional user' profile, which comprises journalists that remain reluctant in their AI use. Our data suggests similar patterns to the intensive user profile group but with lower intensity—between 'never' and 'rarely'—for the usage of AI tools across all application domains. (3) The 'selective strategist' profile, which shows maximum scores in intensity for translation & transcription, while following closely the intensive user profile pattern regarding research and topic identification, fact-checking. These journalists seem to apply AI tools only for selected application domains that represent productive tasks of traditional reporters vis-à-vis more editorial tasks of the intensive user profile.

While statements of widespread usage of AI tools in journalism hold true on the surface, they forgo incremental nuance—our findings show that AI usage in newsrooms is largely driven by a smaller group of intensive users, while occasional and selective groups remain restrained. To better understand motivational patterns of German journalists and their adoption of a "wait-and-see stance" (Salvador-Mata et al., 2025), further research is necessary.

PP 0362 The synthetic image as an editorial dilemma: Ethics and editorial practices of AI-generated image use in Czech newsrooms

Sandra Lábová[1], Barbora Součková[1]

[1] Faculty of Social Sciences- Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

Recent years have presented numerous challenges and dilemmas for journalism, including the increasing use of generative artificial intelligence, which is becoming an integral part of journalistic practice, whether for generating texts, analysing data, or producing visual materials. While photography in journalism has traditionally been perceived as a window onto events, it operates through symbolic schemas and institutional conventions. Generative AI systems amplify this constructed nature of news imagery. The photorealistic generated images appear credible precisely because they replicate the aesthetic cues of deeply rooted cultural stereotypes that trigger affective responses.

Especially for journalism, whose credibility is built on ethical standards of content, the use of AI-generated images poses significant challenges that raise questions not only about bias, stereotypes, or even discriminatory representations, but also point to a broader reconsideration of the role of images in journalism. It also raises questions about everyday editorial practices and the rules that regulate and legitimate journalistic work in individual newsrooms. This study examines the application of generative photorealistic imagery in journalism, specifically within the realm of illustrative photography. Therefore, it focuses on the normative, aesthetic, and epistemological implications of synthetic visual representations.

To investigate the practice of using AI-generated images in journalism within Czech newsrooms, we are employing a qualitative approach based on 12 semi-structured interviews with photo editors from both commercial and public Czech news media. Subsequently, we supplemented them with photo-elicitation based on AI-generated photorealistic illustrative images for news content. The perspectives of photo editors provide important insights into editorial practices. Some of them even produce generated images themselves. However, those who do not directly participate in image production have significant decision-making power over whether a given image will be published, and they also determine and control the editorial standards and ethical principles that generated images must adhere to.

Preliminary results highlight that the use of generative tools varies significantly across the newsrooms. While some refrain from using such technologies altogether, others express keen interest but are constrained by the current limitations of generative models, particularly in terms of visual coherence and the time-intensive process required to produce convincing photorealistic outputs. Nonetheless, there is a consensus that generative images are used primarily as illustrative material, rather than as documentary content. The primary motivation for their use lies in the desire to produce original visual assets that differ from widely circulated stock imagery and, conversely, provide content created specifically for the needs of a given newsroom.

However, the results of our study also show that the preparedness of newsrooms and their ethical rules regarding AI-generated images vary among Czech media outlets. Some have systematic guidelines in place, while others lack any internal policies. Such differences raise questions about the consistency of ethical standards across the Czech media landscape, with potential risks for the overall credibility of journalism.

JOS15 Economy and Journalism

PP 0363 Funding journalism's future. The pivotal role of innovation funds

Lola Van der Made[1], Frank Harbers[1]

[1] University of Groningen, Media and Journalism Studies, Groningen, Netherlands

This paper scrutinizes the role of innovation funds – which distribute a substantial portion of the scarce financial resources for innovation within the journalistic field – as important catalysts of journalistic innovation, emphasizing its necessity for journalism's survival (Lowrey et al., 2022). These funding organizations, often including training and supervision pertaining to innovation as well, perform a pivotal role in setting journalism's innovation agenda and shaping journalism's future (Creech & Nadler, 2018). Without disregarding some recent attention for their impact, (Noster, 2025), including specific innovation funding schemes (Kammer & Blach-Orsten, 2025; Zambelli, 2025), Lowrey et al.'s (2019) call for more scholarly attention and scrutiny for these crucially understudied "ancillary organizations" remains pertinent.

Our contribution addresses this need for more research into the way intermediary organizations shape journalism's innovation agenda as well as steer the direction in which journalism is developing. Through an in-depth case study of the Dutch Journalism Fund (DJF), a pivotal, state-funded Dutch journalistic innovation intermediary, this paper critically interrogates how the DJF understands and envisions journalistic innovation and promotes specific narratives about journalism's future. Moreover, it scrutinizes how the specific understanding of journalistic innovation is translated into specific selective funding schemes, including coaching and training trajectories.

In doing so, we offer a much needed interrogation of the idea that journalistic innovation is inherently good- an idea that seems to have become almost self-evident (Bossio & Nelson, 2021; Godin, 2015). Instead, this paper starts from the idea that innovation is a socially constructed concept, often operating within rather utopian and techno-solutionist discourses about journalism's future, which is strategically exploited by different actors with diverging interests (Harbers, 2024). Despite some US-centered research criticizing the entrepreneurial values and the techno-solutionist, market-oriented perspective on innovation that these innovation intermediaries herald (Creech & Nadler, 2018; Creech & Parks, 2022), the notion of innovation and its utopian promises are rarely problematized (Harbers, 2024). Moreover, a precise inquiry into the diverse contexts in which these 'innovation intermediaries' operate, the diverse roles they perform, or the impact they have on journalism as a practice and field remains wanting.

Our case study combines a discourse analysis of internal and public documents about their funding schemes (e.g. annual reports, policy papers, funding calls and guidelines), 10–15 semi-structured interviews with employees (ranging from managers and policy advisors and coordinators to jury members selecting innovative initiatives and innovation experts coaching the innovation teams) of the DJF, with participant observation of the different journalistic actors participating in specific funding schemes. As such, it offers a rich, multifaceted analysis of the ways in which innovation intermediaries shape "which kinds of futures for journalism people can imagine and what they can reasonably expect" (Ruotsalainen et al., 2021), subsequently determining but also restricting which innovation initiatives are worth funding to bring about these futures (Willemsen et al., 2021).

JOS15 Economy and Journalism

PP 0364 From platform support to field reconfiguration: Fact-checking and the changing boundaries of journalism

Luca Serafini[1], Mauro Bomba[2], Laurens Lauer[3]

[1] University of Florence, Political and Social Sciences, Florence, Italy
[2] Sapienza University of Rome, Communication and Social Research, Rome, Italy
[3] University of Zurich, Sociology, Zurich, Switzerland

Over the past decade, fact-checking has consolidated as a professional hybrid field, whose institutionalization has been deeply shaped by economic and infrastructural dependence on digital platforms, most notably through Meta's Third-Party Fact-Checking (3PFC) program (Graves et al., 2023; Cazzamatta, 2024; Shin et al., 2025). The suspension of the program in the United States, alongside growing uncertainty about its future in Europe and the Global South, marks a critical moment to examine how fact-checking organizations are renegotiating sustainability, professional identity, and public relevance beyond platform support.

The paper is grounded in Journalism Studies and field theory, drawing on Bourdieu's theory of fields (Bourdieu, 1993; 2005) and its emphasis on tensions between autonomy and heteronomy, as well as scholarship on boundary work and professional identity (Gieryn, 1983; Carlson, 2016; Graves, 2018), and the hybridization of journalism (Deuze, 2007; Waisbord, 2013; Graves, 2016). We conceptualize fact-checking as a *hybrid and contested subfield* whose boundaries have been partially

shaped by platform-driven economic arrangements, and which is currently undergoing a process of redefinition triggered by changing market conditions.

The paper addresses two research questions: (RQ1) How are fact-checking organizations reconfiguring their business models in response to declining or uncertain platform support? (RQ2) How do these economic strategies reshape fact-checking's professional identity and journalistic boundaries?

Empirically, the study adopts a qualitative, comparative research design based on thematic analysis (Braun & Clarke, 2021) and combines two integrated methods (Creswell & Poth, 2018). First, we conducted semi-structured interviews with representatives of fifteen fact-checking organizations across three regions: the United States (where the 3PFC has ended), Europe, and South America (where it remains active but increasingly fragile). Second, we carried out ethnographic fieldwork at the 2025 Global Fact-Checking Summit, including participant observation of panels and community meetings, as well as informal interviews. Analytically, this combination allows us to link organizational perspectives with field-level processes: interviews capture initiatives' viewpoints within specific organizational and national contexts, while ethnographic fieldwork sheds light on collective sense-making and boundary formation.

Findings reveal a structural tension at the core of current transformations. On the one hand, many organizations are expanding business-to-business models, consultancy services, data and technology-based products, reframing fact-checking as a form of *verification expertise* operating upstream in information production and governance. This shift enhances economic sustainability and positions fact-checkers as specialized knowledge actors beyond journalism. On the other hand, interviewees simultaneously articulate—often explicitly—a discursive and practical "return to journalism," emphasizing investigative reporting, political accountability, explanatory formats, and journalistic autonomy, particularly as they distance themselves from platforms.

Crucially, this reconfiguration raises a visibility dilemma. While B2B and expert-oriented models may secure financial stability, they risk reducing public-facing visibility and, consequently, the capacity of fact-checking to counter disinformation in the public sphere. The paper argues that these strategies represent not only a search for new revenues but an ongoing struggle over the field's boundaries, legitimacy, and democratic role. Overall, the study contributes to Journalism Studies by showing how changing business models actively reshape professional identities, practices, and visibility regimes in hybrid journalistic fields.

JOS15 Economy and Journalism

PP 0365 Journalistic independence dies in acquisition? Ownership and editorial shift at The Washington Post after Jeff Bezos

Rahel Winter[1], Cornelius Puschmann[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

The growing influence of large U.S. tech companies and their founders and CEOs on the news media has given fresh impetus to inquiries into the role of media ownership (Weitz et al., 2019). Tech company founders have taken on the role of media owners, shaping a news industry beset by economic challenges (Archer & Clinton, 2018; Wagner & Collins, 2014). The entanglement of vested interests with ownership raises important questions for a free press and its ability to function as an independent public watchdog.

We investigate one such takeover: In August 2013, Amazon founder Jeff Bezos purchased the financially ailing *Washington Post* from private owners for US$250 million (Weitz et al., 2019). While Bezos' approach was initially described as being "hands off" regarding interaction between him and the paper's management, specific instances of editorial interference caused backlash, leading to resignation of senior *Post* staff and the cancellation of a large number of subscriptions.

We focus on *how* and *to what extent* the influence of Bezos' ownership is detectable within the editorial practices of the *Washington Post*. Specifically, we are interested both in *direct* effects on the paper's coverage of specific events and statements connected to Bezos and his companies, and in *indirect* long-term effects, i.e. changes that may reflect individual journalists' anticipation of its new owner's preferences. To test these assumptions, we formulate a series of preregistered hypotheses (see https://osf.io/gwse3/overview?view_only=17bd226a6d4c49438425c475ca12e45d) on changes in the volume of coverage of Bezos and his companies, shifts in the tonality regarding Bezos and his competitors and changes in generic frames related to opportunity, risk and responsibility, that reflect an increasingly neoliberal view of economics (Chan et al., 2024). We test our hypotheses through a large-scale semi-automated comparative content analysis that compares the *Post*'s coverage of technology (e.g. risks and benefits of artificial intelligence, ecological costs of cloud computing) and economics (e.g. tech regulation, market concentration, trade policy), as well as issues relating to Bezos and his competitors, relying on a corpus that covers the period from 2001 to 2025. We combine open-source LLMs (Llama, Qwen), topic modeling and manual validation to connect issues, actors and frames.

Early results suggest that an increase in coverage is indeed correlated with the takeover, though a change in sentiment is not. In a next step we will test whether individual journalists at the *Post* adjusted their editorial stance in response to the takeover, comparing junior and more senior editorial staff.

JOS15 Economy and Journalism

PP 0366 Media capture risk map: A multidimensional framework for mapping systemic risks in the platformized age

Rita Marchetti[1], Roberto Mincigrucci[1], Anna Stanziano[1], Paolo Mancini[1], Marco Mazzoni[1]

[1] Università degli Studi di Perugia, Political Science, Perugia, Italy

This contribution addresses the concept of media capture, highlighting its theoretical limitations and offering a new empirical operationalization that enables comparative analysis across countries and contexts. It presents the results of a comparative research project mapping the risk of media capture across 32 European countries, including the 27 EU Member States, Western Balkan candidate countries, and Türkiye.

Originally rooted in regulatory capture theory (Stigler, 1971), the concept was developed to describe collusion between political elites and media owners in transitional democracies (Besley & Prat, 2006; Mungiu-Pippidi, 2008) and later expanded to include economic instrumentalization in consolidated democracies (Corneo, 2006; Petrova, 2008). While this literature effectively identified the subordination of newsrooms to vested interests, we argue it is insufficient for capturing the complexity of the contemporary media ecosystem.

Our critique identifies two primary limitations. First, from an epistemic perspective, the notion often implies a binary ideal of complete independence that rarely exists. Second, from an ecosystemic perspective, the platformization of society has shifted the locus of control. The focus can no longer remain solely on "media" as traditional outlets, but must extend to "information" more broadly, as algorithms and tech giants mediate visibility and the spread of disinformation.

This paper proposes a redefinition of the concept that define capture not merely as ownership control, but as a structural condition in which particularistic interests—political, commercial, or technological—override the universal normative function of the media to inform citizens. However, treating capture as a static, binary outcome—where media are either "free" or "captured"—is theoretically slippery and empirically elusive. Since media institutions operate within complex webs of interaction rather than in a vacuum, proving definitive capture is often impossible. Consequently, this study shifts the analytical lens from detecting capture to mapping the *risk* of capture. We conceptualize risk not as an event, but as the presence of environmental and structural vulnerabilities that make it more likely for particularistic interests to prevail over the public interest in an informed citizenship.

To evaluate this risk empirically, we distinguish three interdependent spheres: a) Media System, b) Political System, c) Societal Context. Within these spheres, we identify specific risk indicators — ranging from political and business influence and editorial professionalism to information disorder and the rationality of legal authorities — constructed through the aggregation of measures taken from established international datasets such as the Media Pluralism Monitor, Euromedia Ownership Monitor, International IDEA, Freedom House and others. The application of this framework reveals a stark contrast between the high resilience of Nordic countries and the critical risk levels observed in contexts like Hungary and Türkiye. However, beyond these extremes, results indicate that significant vulnerabilities emerge within consolidated democracies, challenging the assumption that capture is confined to transitional regimes. This suggests that systemic imbalances — driven by economic fragility and polarization — are creating fertile ground for capture across Europe. By the time the conference takes place, the results of the risk map will be compiled and presented through the launch of a dedicated website.

JOS15 Economy and Journalism

PP 0367 Nonprofit news and Pennsylvania's local journalism ecosystem under strain: Promises and limits

Aaron Hyzen[1], David Berman[2], Victor Pickard[1]

[1] University of Pennsylvania, Annenberg School for Communcation, Philadelphia, USA
[2] Seton Hall University, Department of Communication- Media and the Arts, South Orange- NJ, USA

This contribution examines how nonprofit news is being mobilized as a response to the structural crisis of U.S. local news through a focused case study of Pennsylvania. Over the past two decades, the collapse of commercial advertising revenues, the rise of digital platforms as gatekeepers, and the contraction of newsroom employment have produced "news deserts," weakened civic oversight, and intensified political and informational polarization across the globe. In this context,

nonprofit, mission-driven journalism has emerged as a prominent and hopeful alternative, promising to sustain watchdog, investigative, and community-centered coverage that commercial models struggle to support. At the same time, growing dependence on philanthropy and uneven policy interventions raise questions about the long-term sustainability and equity of the nonprofit turn, particularly in geographically and politically divided states such as Pennsylvania.

This mixed-methods study addresses two questions: how key stakeholders envision the role of nonprofit news in creating a sustainable, robust local news ecosystem in Pennsylvania, and how they assess its potential to provide statewide coverage and reach underserved communities. Pennsylvania offers a revealing site for examining these questions for three reasons: it is a paradigmatic "purple" U.S. battleground state marked by deep political cleavages; it is a leading hub of nonprofit news innovation; and, at the same time, it is grappling with expanding news deserts and policy proposals to end support for public media. Empirically, the article draws on eleven semi-structured interviews with nonprofit news executives, journalists, funders, and advisors operating at local and statewide levels across Pennsylvania. Using qualitative thematic analysis, we develop themes to interpret how actors within this ecosystem understand the promises and limits of nonprofit journalism as a remedy for market failures in local news. This qualitative design enables an in-depth exploration of how normative commitments, funding structures, and institutional legacies shape stakeholders' visions of a sustainable information system. To further triangulate the interview data, we map nonprofit news expenditures using public tax records and compare them with county-level local journalist employment records in Pennsylvania, identifying news deserts and supporting key findings from the interviews.

The findings show that stakeholders widely view nonprofit news as indispensable to rebuilding local news and civic information, while also underscoring that financial sustainability—though under significant strain—is only one dimension of the challenge. Both interview participants and the expenditure mapping highlight how nonprofit growth risks reproducing longstanding geographic inequities by concentrating resources in major metropolitan centers and leaving rural, low-income, and historically marginalized communities underserved. Interviewees across the sample also express growing recognition that philanthropy and audience revenue alone are unlikely to secure durable coverage. Stakeholders increasingly view public investment as a pragmatic response to the limits of nonprofit funding models. Taken together, the study argues that nonprofit journalism should be understood not merely as an organizational form, but as an arena within a broader, contested reimagining of how democratic societies will finance and govern robust local news in the post-crisis era.

JOS16 Emotions and Journalism

PP 0382 Emotionalization of (political) news: Journalists' perspective across four European countries

Agnieszka Stepinska[1], Nicolas Hubé[2], Thomas Scherer[3], Veronika Kövesdi[4], Artur Lipiński[1], Laure Beaulieu[2], Keyvan Ghorbanzadeh[2]

[1] Adam Mickiewicz University, Faculty of Political Science and Journalism, Poznan, Poland
[2] University of Lorraine, Research Center on Mediations CREM, Nancy, France
[3] European University Viadrina, Faculty of Social and Cultural Sciences, Frankfurt Oder, Germany
[4] ELTE Centre for Social Sciences, Institute for Political Science-, Budapest, Hungary

Emotionalisation of news is widely regarded as a pervasive phenomenon affecting general journalistic practices, even in contexts where objectivity remains the cardinal value of the profession. With the advent of social media and hybridization of media systems scholars emphasize the growing salience of moralized communication and inclination to define issues in terms of right and wrong, harm, or responsibility. In platformised media environments the use of moral language on the one hand enhances visibility, authority, and audience engagement but on the other reshapes journalistic boundary work and contributes to the growing polarisation of the public spheres (Marie & Petersen, 2025; Solovev & Pröllochs, 2022).

Transnational trends in contemporary journalism are primarily shaped by economic drivers, technological innovation, and changing audience behaviours (Newman & Cherubini, 2025). A digital media transformation has led to increasing reliance on social media and mobile platforms. Due to 'platformisation' of news (Hase et al., 2023), journalistic media face severe challenges of attracting and retaining audiences, eroding trust in journalistic media (Ejaz et al., 2024), the rise of alternative communicators spreading disinformation on digital platforms (Bail, 2022), and questioning journalistic authority in describing reality (Mosca & Quaranta, 2021).

To overcome emerging economic challenges, media are increasingly relying on personalised, emotionalized, and moralised content strategies to cater to digital audiences and exploring AI-driven tools to enhance efficiency and cost-effectiveness through automation in content production. Hence, emotionalization can be understood as a continuum of practices that meets a range of interests for media professionals (Beckett & Deuze, 2016; Peters, 2011).

While much of the research on the emotionalization of news has focused on content, less is known about the manner in which journalists internalize production constraints and public expectations (Schwinges, 2024). This paper aims to study explanations of news selection and framing of political events.

For this study, we conducted a series of in-depth interviews (from 2 to 5 per country) with journalists in France, Germany, Hungary, and Poland. The selection of countries allows us to compare Western and Eastern European media systems, with different journalistic cultures and relations between state and media (Brüggemann et al., 2014; Hallin & Mancini, 2004;

Herrero et al. 2017; Mellado, 2021). We recruited participants of the study based on three criteria: (a) type of medium; (b) type of media ownership (public versus private), and (c) professional profile (political journalists and editors).

In line with the previous observation on the emotional turn in news coverage, reporters and editors admitted that there is commercial pressure on them to seek emotionally charged news to attract audience attention. Although reporters try to stay detached, they are prone to framing politics as a conflict and defining political issues in terms of right and wrong because such a narration "sells" news better. However, it comes at a price: in some extreme cases (terrorist attacks, crime stories), the emotional involvement of the journalists can become a health danger, and trauma units have been established in some newsrooms.

JOS16 Emotions and Journalism

PP 0383 Effects of Constructive Journalism on emotions, attitudes, and behavior: A meta-analysis and systematic review

Hannah Greber[1], Svenja Schäfer[2], Annika Ahrens-Schwabe[3]

[1] University of Vienna, Communication Science, Vienna, Austria
[2] Wageningen University & Research, Strategic Communication, Wageningen, Netherlands
[3] University of Vienna, German Studies, Vienna, Austria

Journalism plays a central role in democratic societies by keeping citizens informed and encouraging political participation. However, research indicates that the negativity bias in journalism can harm audiences' well-being by fuelling feelings of pessimism, anxiety and powerlessness, which are also among the main reasons why audiences choose to avoid the news.

In response to these concerns, constructive journalism (CJ) has emerged as an alternative approach to covering news. CJ aims to provide a nuanced, optimistic, and solutions-focused portrayal of current events. To achieve this, CJ applies strategies from positive psychology to news production to help individuals and society flourish. The concept describes an umbrella term, encompassing solutions journalism and restorative narratives.

Since the introduction of CJ in 2011 (Gyldensted, 2011), many have tested its effects, including more positive emotions after reading the news, increased engagement, higher self-efficacy, and stronger intentions to act after reading constructive news (K. McIntyre & Lough, 2023). However, the effects of CJ do not seem to be clear-cut. While studies indicate consistent effects of CJ on positive emotions, inconsistent effects are observed for engagement and behavioral intentions (K. McIntyre & Lough, 2023). To clearly outline the effects of CJ, we conduct a systematic review and a meta-analysis of studies testing effects of CJ, solution journalism and restorative narratives to (a) identify which key outcomes are experimentally tested, (b) establish the average effect sizes of CJ on these key audience outcomes, (c) test whether effects vary depending on CJ conceptualizations, and (d) assess the presence of publication bias. This will offer relevant insights into the potential of CJ and offer practical guidance for news organizations.

We follow the state-of-the-art in meta-analysis. The study has been pre-registered (anonymous link). We use the PRISMA guidelines in our screening process to maximize transparency; the codebook, data, and data analysis will be accessible on OSF. We follow PICOS to determine the eligibility of papers included in the framework. The keywords we used are: constructive journalism OR solutions journalism OR solution journalism OR restorative narrative OR restorative journalism.

We include experimental studies that evaluate the impact of CJ compared to a full or traditional journalistic control on a general population sample. Selected papers must quantitatively assess outcomes and be available in peer-reviewed journals or grey literature, and be published between 2011 and October 13, 2025. We searched Web of Science, Scopus, ProQuest Dissertations & Theses, Google Scholar, and OSF preprints, to ensure a comprehensive evidence base. The search process resulted in a total N = 2781. After the deduplication process, the final sample consists of N = 2307 studies.

These studies will be screened and double-coded by two authors familiar with CJ. For data analysis, we will conduct a series of meta-regressions using the available effect sizes and split the sample by DV to analyze each DV separately. We will also assess publication bias.

JOS16 Emotions and Journalism

PP 0384 The emotions of collaborative journalism

Karianne Sørgård Olsen[1], Birgit Røe Mathisen[1], Ragnhild Kristine Olsen[2]

[1] North University, Faculty of Social Sciences, Bodø, Norway
[2] OsloMet, Faculty of social science, Oslo, Norway

Recent scholarship conceptualizes collaborative journalism as formal or informal arrangements in which news organizations and other actors share data, sources and editorial decision-making to produce coverage beyond the capacity of any single

newsroom (Stonbely 2017; Sambrook 2018; Jenkins & Graves 2019; 2022; Mesquita 2023; Mesquita et al. 2025). Research on rural and local journalism further shows how collaboration functions as a survival strategy for resource-strapped community newsrooms, with journalists expressing broadly positive attitudes toward both formal and informal partnerships (Lincoln et al. 2025). At the same time, studies of emotions and affect in journalism demonstrate how feeling rules, emotional labor and affective attachments shape newswork and professional identity (Pantti 2010; Wahl-Jorgensen 2020; Pantti & Wahl-Jorgensen 2021; Kotišová 2025).

Yet these strands of scholarship rarely intersect. While existing studies map the organizational, economic and field-level logics of collaboration, we know little about the emotional and affective dynamics through which collaborative practices are lived in small local newsrooms.

This study addresses this gap by examining inter-organizational collaboration in a Norwegian initiative—the collaborative desk—established by the Local Association of Local Newspapers (LLA), the public broadcaster NRK, and the Centre for Investigative Journalism (SUJO). Partly state-funded, the desk produces data packages for more than 110 local newspapers, providing statistics and editorial resources for locally produced news stories. Within the Norwegian media system—where strong local newspapers coexist with a powerful public service broadcaster—this initiative offers a compelling case for examining the emotional dynamics of inter-organizational journalism.

Drawing on Sara Ahmed's theory of emotions, the article examines how affective dynamics shape innovative forms of collaborative journalism. Rather than treating emotions as individual psychological states, Ahmed (2004) conceptualizes emotions as relational forces that circulate between bodies, objects and practices, forming "affective economies" that bind actors together and orient them toward particular futures. The study asks: How does collaboration between local newsrooms and the Norwegian Samarbeidsdesken shape emotional orientations that structure journalistic work and professional judgement in local newsrooms?

Building on research linking collaborative journalism to networked news production, resource pressures on local media and new models of public-interest reporting (Graves & Konieczna 2015; Jenkins & Graves 2019; 2022), the study contributes a local–digital perspective on collaboration between a national desk and small local newsrooms, and advances understanding of the emotional textures of collaborative journalism.

Drawing on qualitative interviews with local journalists, collaborating organizational actors and desk staff, the analysis shows how emotions such as enthusiasm, trust, guilt and vulnerability "stick" to tools, roles and expectations. Investigative methods become charged with excitement and professional pride; cross-newsroom workflows evoke trust, investment and guilt; and shared editorial goals create affective attachments that both sustain and strain collaborative processes. These emotions are not by-products of collaboration but constitutive forces that organize journalistic labor and hierarchies, legitimize editorial decisions, and shape understandings of professional ideals and accountability. Attending to emotional dynamics thus clarifies how collaborative projects succeed, falter, and reshape professional identities in an increasingly interconnected media landscape.

JOS16 Emotions and Journalism

PP 0385 Exploring emotions and metajournalistic discourses in European journalism festivals

Anna Luo[1]

[1] Vrije Universiteit Brussel, Communication Studies, Ixelles, Belgium

This paper examines the presence and role of emotions in European journalism festivals. Journalism festivals are live events that platform metajournalistic discourses in the form of presentations, panel discussions, and performances. Through an ethnographic study of two prominent European journalism festivals, the Voices Festival of Journalism and Media Freedom and the International Journalism Festival, this paper brings together three developing strands of journalism studies – emotions in journalism, metajournalistic discourses, and journalism spaces – to analyze how emotions facilitate metajournalistic discourses in live events.

Metajournalistic discourses – discourses about journalism's definition, role, and boundaries – have been particularly useful in understanding how journalism is adapting amidst contemporary challenges, though they have largely been analyzed in textual and audiovisual sites, such as trade journals and social media (Carlson, 2016). Metajournalistic discourses also provide insight into various aspects of emotions in journalism, such as the role of emotions in journalistic practice (Luo, 2025). While these insights have been empirically and methodologically valuable, they prioritize sites of metajournalistic discourse that primarily circulate online. Journalism festivals therefore offer a novel opportunity to examine offline metajournalistic discourses in spaces that bring together journalists, media professionals, and civilian audiences, whereby emotions circulate in-person.

The potential of live journalism events to revive and repair audience connection has already been identified in the confluence of journalism and performing arts (Postema, 2024; Adams, 2021). Within this body of work, live events are considered as a way to slow down the news cycle and bring audiences physically and metaphorically closer to journalists and their stories. Drawing on arguments from the "spatial turn" in social sciences and humanities, the spaces and places of journalism are considered with utmost importance in interrogating how audiences encounter and experience news, both online and

offline (Vodanovic, 2022; Peters, 2012). This paper builds on the spatial turn and brings emotions into the mix by centering the analysis on the role of emotions in the physical spaces of journalism festivals. In addition to the empirical contribution, this paper puts forth a methodological contribution through the use of participant ethnography as a tool for identifying and analyzing emotions in spaces where live metajournalistic discourses take place, which includes the aforementioned journalism festivals but can be applied in future studies of journalism awards ceremonies, film festivals, and even academic conferences.

JOS16 Emotions and Journalism

PP 0386 The objectivity norm as journalism's emotional regime. Revisiting the possibilities for humanitarian coverage

Anya Krystyna Zoledziowski[1], Ansgard Heinrich[1], Marcel Broersma[1]

[1] University of Groningen, Faculty of Arts, Groningen, Netherlands

This paper challenges the use and usefulness of the objectivity norm for contemporary journalistic practice. The objectivity norm — ostensibly the antithesis to emotionality — has long represented Western journalism's reigning "emotional regime." Emotional regimes, coined by historian William Reddy (2001), reveal how social (and professional) norms emerge and change, including who or what has the power to determine them. We argue that an evolution of journalism's reigning emotional regime – which currently de-values emotional expression and connection to the work – would enrich and improve coverage.

There's been a significant "emotional turn" in journalism studies, with emotions-based research revealing much about journalists' relationships with their sources and audiences, the influence of social media on newsmakers' well-being, and even what makes journalists happy (Beckett & Deuze, 2016; Kotisova, 2019; Wahl-Jorgensen, 2018, 2019). And yet, mainstream newsrooms are cautious to acknowledge the role of emotions in journalism, preferring instead to repeat the value of "objectivity" as their mantra. Thus, newsroom leaders valorize depersonalization, distance and focus on "just the facts," forcing journalists to navigate a paradox: they must follow rules that stigmatize emotions, while performing a job that is inherently emotional.

We argue that Western journalism's emotional regimes are shifting towards a stronger explicit embrace of emotional motivation in journalism work for several reasons – because of social media's emotional architecture, closer interaction with audiences, the industry's diversification, and political developments. However, change hasn't been wholesale and contemporary news coverage still suggests adherence to longstanding norms, driven by the objectivity regime.

Given the impact these have on communities and political debates, we use a critical discourse analysis to examine the coverage of U.S. President Donald Trump's mass deportations across two influential newspapers. To study if and how emotional regimes are shifting, we analyze articles (N = 150) published in June 2025 (the month with the most deportations so far) by the The New York Times—a national paper —and the Los Angeles Times—a regional paper. Through thematic analysis we zoom in on power (im)balances and how these play out in coverage of one of the U.S.'s largest immigrant populations, highly affected by the deportations.

Overall, our paper reveals a focus on political conflict and an overreliance on official sources – namely, Trump and his team. Previous research has found that the objectivity norm is a huge driver of this, and, notably, we found even local journalists continue this overreliance, despite ample work revealing Trump and his team aren't reliable.

This begs the question: what kind of coverage could we see if journalists didn't feel limited by emotion rules that make it difficult for them to adjust their practice, even and especially when they feel (emotionally) compelled to do so? This matters as journalists are increasingly covering politicians, like Trump, who are ushering in their own emotional regimes, marked by populism, anger, and fear. At a time when old political norms are replaced with new ones, we argue newsroom leaders should consider the role of emotions while conceptualizing new rules for covering increasingly charged and polarized realities.

PP 0469 "Did ChatGPT write this?": Emotional response of audiences to automated contents and AI Authorship in Journalism

Simón Peña-Fernández[1], Ainara Larrondo-Ureta[1], Koldobika Meso-Ayerdi[1], Urko Peña-Alonso[1]

[1] University of the Basque Country, Journalism, Leioa, Spain

The rise of news content produced wholly or partially through the use of generative artificial intelligence has reignited the debate surrounding its use in the media and its acceptance by audiences. Moving beyond technologically deterministic assumptions that equate the introduction of new tools with innovation, more nuanced perspectives highlight the central role of human agency, particularly in how media professionals and audiences engage with technological developments. In other words, for an innovation to be effectively realised in the field of media, it must go through a process of social appropriation (Peña-Fernández, Lazkano-Arrillaga & Larrondo-Ureta, 2019). From this perspective, audience trust and the progressive normalisation of AI-generated content will be just as crucial as the technology itself (Van Dalen, 2012).In this process of adoption, three factors have traditionally been considered indicative of audience acceptance of AI-generated content: quality, credibility, and interest.

In the case of quality, even prior to the emergence of the most advanced generative AI models, experiments suggested that AI-generated texts were already perceived by audiences as effectively replicating the informational style of journalistic writing (Clerwall, 2014; Haim & Graefe, 2017; Lui & Wei, 2019). Nor does credibility appear to be significantly affected in the case of AI-generated journalistic texts—at least when it comes to informational content—although findings in this area have been more mixed and context-specific (Gillespie, 2014; Jung et al., 2017; Tandoc, Yao & Wu, 2020; Waddell, 2018; 2019; Henestrosa, Greving & Kimmerle, 2023: Gutiérrez-Caneda, 2024; Aleessawi & Alzubi, 2024).

So far, the most pronounced difference in audience perception of AI-generated texts has concerned their readability—that is, how easily and enjoyably the content can be read. In this respect, journalistic texts produced by humans are generally perceived as richer and more engaging, particularly when they move beyond routine reporting and into areas requiring interpretation or opinion (Graefe et al., 2018; Melin et al., 2018; Zheng, Zhong & Yang, 2018; González-Arias, Chatzikoumi & López-García, 2024; Sui, 2025; Zhau, Zhou & Wang, 2025).

To this end, this study describes the results of an experiment that explored the emotional responses generated by AI-produced content, using neuroscience techniques. By monitoring implicit behavioral reactions to different stimuli, this method sheds light on aspects that traditional analyses often overlook—such as the degree of emotional involvement, arousal, and overall affective tone—in relation to the perceived authorship of AI and its role in producing journalistic content.

The experiment followed a quantitative research design, drawing on a representative sample of the target demographic—individuals aged between 18 and 70. A total of 100 participants were recruited (margin of error of ±7%, confidence level of 95%). Stratified sampling with proportional allocation was used, taking into account variables such as age, gender, and level of education. The sessions were conducted in a controlled environment.

The results suggest that text type and variables such as gender have a comparatively limited impact on the acceptance of AI-generated content and its perceived authorship, whereas factors such as the opinion-based nature of the text and the age of the audience appear to exert a greater influence.

PP 0470 A world of difference? Key predictors of attitudes towards AI in news across six culturally and geographically diverse countries

Nicolas Mattis[1], Sophie Morosoli[1], Laurens Naudts[2], Natali Helberger[2], Claes de Vreese[1]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands
[2] University of Amsterdam, Institute for Information Law IViR, Amsterdam, Netherlands

As many news organisations have started experimenting with (generative) AI in their journalistic workflows, a fast-growing body of literature has begun to map journalists' perceptions of these and other future initiatives (Mattis & de Vreese, 2025). This work usually identifies both hopes (e.g. increased workflow efficiencies) and concerns (e.g. decreasing editorial independence), highlighting that AI adoption must not necessarily be negative but could also provide added value to readers – for instance by making news more accessible, accurate, and diverse (Lin & Lewis, 2024).

However, it is unclear whether audiences share this view. While there are several relevant surveys and technical reports on public perceptions of AI in journalism (Mattis & de Vreese, 2025), most focus on isolated use cases or remain largely descriptive. Accordingly, we still know relatively little about the extent to which audience attitudes towards AI-supported journalism vary across countries and between different groups of individuals.

Hence, this study sets out to systematically compare attitudes towards AI-supported journalism across six culturally and geographically diverse countries (Brazil, Denmark, Japan, South Africa, The Netherlands, and the US). Drawing on survey

data from April 2025 (overall *N* = 6,961), our study zooms in on two concepts that we consider crucial in this context: (1) AI news engagement intentions and (2) attitudes towards hyper-personalised news.

To capture AI news engagement intentions, we asked respondents how willing they were to a) read, b) share, c) trust, d) talk about, and e) ignore news if they knew from the beginning that it was created with AI. As such, even though attitudes might not neatly translate into behaviour, AI news engagement intentions can still provide a helpful window into public demand for AI-supported journalism.

To an extent, the same is also true for attitudes towards hyper-personalisation, although they arguably pertain to a more specific application of AI. Here, we asked respondents to what extent they agreed that hyper-personalised news would a) help them engage with news content, b) give them more relevant news, c) improve their user experience, d) risk their data privacy, e) make them miss out on important news and f) help spread false and misleading information.

In addition to providing a comparative overview of these attitudes on a global scale, our key contribution is answering the following:

RQ1: To what extent can differences in a) AI news engagement intentions and b) attitudes towards hyper-personalised news be explained by geographical and individual-level characteristics?

That is, using hierarchical regression analyses, we hope to tease out whether different audience perceptions can primarily be attributed to their country of origin, individual-level factors such as demographics or institutional trust, or a combination of both. Understanding such variations will not only benefit academics, but also helps news organisations that hope to successfully navigate AI adoption in their everyday work.

PP 0471 Journalism education in the age of generative AI: adapting to new professional roles

Beatriz Gutiérrez Caneda[1], Tania Forja Pena[1]

[1] Universidade de Santiago de Compostela, Ciencias da Comunicación, Santiago de Compostela, Spain

The progressive integration of artificial intelligence, especially in its generative form, into newsrooms is causing significant disruptions in journalistic processes and informational outputs (Cools & Diakopoulos, 2024). Professional roles and newsroom teams are being profoundly reshaped by the changes introduced by disruptive technologies within the media ecosystem (Túñez-López et al., 2021). Consequently, these transformations are also reflected in the education and training of future journalists and other information professionals (Ufarte Ruiz et al., 2020), although not always with the necessary speed or precision.

The present study seeks to analyse these changes in depth, both in the professional and educational spheres, while also examining whether the transformations across different ecosystems are aligned, thereby enabling effective labour market integration for future information professionals. To this end, ten in-depth interviews were conducted with experts and professionals working in the fields of journalism and artificial intelligence. In parallel, the study analyses the curricula of the ten European universities considered the most prestigious according to the QS World University Rankings by Subject 2025 in the category Communication & Media Studies, which ranks institutions based on academic reputation, employer reputation, and research impact.

The initial findings indicate that the professional profiles most in demand as a result of the integration of generative AI into newsrooms include a technological component that was not as prominent in the past, along with a growing tendency towards multidisciplinary teams in which technological profiles (from fields such as engineering) are combined with more socially oriented ones (such as communication or journalism). As a result of this trend, a new role emerges: the "translational person," described by one of the interviewees as a professional who combines competencies from both domains and acts as an intermediary between colleagues from each field, facilitating more effective communication in the workplace.

Regarding the educational ecosystem, the results point to the incorporation of subjects related to artificial intelligence into new curricula, as well as to other disruptive technologies such as virtual or augmented reality. However, it is also important to note that a review of the existing literature reveals certain difficulties for universities in adapting to these changes, due both to the bureaucratic processes required to modify curricula and to the rapid pace at which technological innovations are being integrated into newsrooms.

PP 0472 How journalism stabilises AI imaginaries: Sociotechnical imaginaries of artificial intelligence in cultural heritage reporting in China (2022–2025)

Le Cao[1], Sheng Zhang[2], Kuang Jun Yuen[3]

[1] Friedrich-Alexander University Erlangen-Nuremberg, Institute of Theater and Media Studies, Erlangen, Germany
[2] Macau University of Science and Technology, Faculty of Humanities and Arts, Macao, Macao
[3] Hong Kong Baptist University, School of Communication, Hong Kong, Hong Kong

As generative artificial intelligence (AI) increasingly intersects with cultural governance, journalism plays a central role in explaining why AI is necessary, how it should be governed, and who should benefit from its deployment. In the domain of cultural heritage, news reporting does not merely convey technological developments but actively shapes the legitimacy, desirability, and future orientation of AI-driven cultural policies.

This study draws on the concept of sociotechnical imaginaries to examine how AI futures are constructed and stabilised through journalistic discourse. Sociotechnical imaginaries are understood as collectively held and institutionally performed visions of desirable futures that link technological innovation to social order (Jasanoff, 2015; Richter et al., 2023). Integrating this perspective with scholarship on journalism as an institutional actor, the study conceptualises mainstream news media as a stabilising device that organises technological meaning through agenda setting, evidentiary regimes, and speaker ecologies. Within the Chinese context, these processes are embedded in technonationalist narratives aligning technological modernisation with state capacity and cultural sovereignty (Ding, 2018; Goode, 2021; Zhao, 2008). China's hierarchical media system also enables analysis of how a shared national narrative generates differentiated imaginaries across media tiers (Hallin & Mancini, 2004; Stockmann, 2013). Existing journalism studies on AI focus on newsroom automation, professional ethics, or labour transformation, paying less attention to how journalism stratifies AI imaginaries within governance fields such as cultural heritage.

Based on this framework, the study addresses three research questions: (RQ1) How do Chinese mainstream media construct sociotechnical imaginaries of AI in cultural heritage reporting, in terms of visions, problem definitions, and value commitments? (RQ2) How do different media tiers produce stratified variants of a shared national imaginary, particularly regarding narrative emphasis and risk boundaries? (RQ3) Through which speaker configurations and evidentiary practices does journalism authorise AI imaginaries and normalise them as common sense in cultural governance?

Methodologically, the study adopts a mixed-method design analysing 5,670 news articles (2022–2025) from nine major Chinese news outlets. First, Python-based text processing and topic modelling using BERTopic are employed to identify dominant thematic clusters, keywords, and their temporal evolution, mapping the overall agenda and narrative trajectories of AI–heritage reporting. Second, stratified samples are subjected to qualitative coding in MAXQDA through two coding rounds (open and axial coding). Coding dimensions include imaginaries (visions, risks, governance solutions), speaker types (government, experts, firms, publics), and evidentiary sources (policy documents, scientific research, pilot projects, international comparisons), with intercoder reliability checks ensuring analytical consistency. Third, coded results are re-analysed in Python through cross-tabulations by media tier, topic, and time period, and interpreted through an institutional journalism lens that accounts for organisational positioning and policy linkages.

Findings show a dominant imaginary of "AI-enabled cultural governance," with value commitments centred on efficiency, governance capacity, and national competitiveness. Speaker ecologies privilege government and expert authority; firms are positioned as solution providers, and publics appear primarily as beneficiaries. Media tiers diverge: central outlets foreground state strategy and legitimacy, sectoral media stress technical pathways and standards, and commercial portals highlight application scenarios. Ethical and social risks are largely framed as manageable within governance arrangements.

JOS17 AI in Journalism II.

PP 0473 The co-production of ai imaginaries in the global south: A comparative analysis of media and policy narratives in South Africa, Nigeria, and Kenya (2016–2025)

Zamokuhle Mthethwa[1]

[1] Stockholm University, Journalism and Media Studies, Stockholm, Sweden

This paper proposes a comparative study of the co-production of Artificial Intelligence (AI) socio-technical imaginaries in three leading digital economies of Africa, South Africa, Kenya, and Nigeria, from 2016 to 2025. Grounded in the theoretical framework of socio-technical imaginaries, framing and agenda-setting theory the research investigates how collectively

held visions of desirable AI futures are articulated, contested, and institutionalized through the dynamic interplay between online news media and national policy discourses.

While significant scholarship has examined AI imaginaries in the Global North, a critical gap exists in understanding their formation and stabilization within African contexts, where distinct political histories, media landscapes, and development trajectories shape technological engagement. This study addresses this gap by arguing that AI is not merely a set of tools but a socially contested concept, whose public meaning and developmental pathway are shaped by a symbiotic exchange between media narratives and government policy action. Media frames public understanding and generates demand for political response, while policy codifies and validates certain visions, sidelining others.

Methodologically, the research employs a multi-phase qualitative design within a social constructivist paradigm. It integrates a framing analysis of 300 online news articles from mainstream newspapers in the three countries; a policy frame analysis of key national AI strategy documents; and in-depth interviews with journalists and policymakers. A subsequent frame alignment analysis will systematically compare media and policy frames to identify mechanisms of convergence, divergence, and co-production.

The study is guided by an overarching research question: How do online news media and government policy texts in South Africa, Kenya, and Nigeria interact to co-produce and consolidate specific AI socio-technical imaginaries? This is explored through sub-questions examining the dominant imaginaries in each domain, the discursive mechanisms of their co-production and consolidation, and the contrasting national characteristics shaped by local media systems and policy approaches.

The research predicts that media coverage will predominantly rely on elite and government sources, leading to frames that align with official policy discourses (H1). It further hypothesizes thematic correlation between media frames and policy language, reflecting a process of stabilization (H2), with cross-country variation in the strength of this alignment linked to the institutionalization of AI governance (H3).

By tracing the circulation and institutionalization of AI narratives, this research aims to contribute a geographically balanced, theoretically robust understanding of how technological futures are imagined in the Global South. It seeks to decenter dominant Northern narratives and illuminate the complex processes through which African societies negotiate and embed AI into their social, political, and economic fabrics, thereby advancing scholarship on socio-technical imaginaries, science and technology studies, and comparative media analysis.

PP 0474 Soft news, more views? The platformization of Swedish legacy news media on TikTok

Andreas Widholm[1], Rebecca Bengtsson Lundin[2]

[1] Stockholm University, Department of Media Studies, Stockholm, Sweden
[2] Södertörn University, Department of Social Sciences, Stockholm, Sweden

TikTok has rapidly become one of the most influential platforms among the so-called Generation Z and a consequential actor in a digital environment long dominated by US-based Big Tech companies (Liu & Yang, 2022). Originally launched as Musical.ly and primarily oriented towards entertainment, TikTok has gradually become a key platform for news and opinion formation (Vázquez-Herrero, 2022). Its short-video logic shapes how content circulates and has influenced how competitors such as Instagram and YouTube redesign their affordances towards similar formats (Bhandari & Bimo, 2022). TikTok's algorithmic recommendation systems tend to prioritise content that is entertaining and emotionally engaging (Hagar & Diakopoulos, 2023), raising concerns about how journalistic content is shaped when legacy news organisations adapt to platform affordances. Research suggests that news on TikTok often adopts affective and engaging forms rather than prioritising informational depth (Hendrickx, 2024), making TikTok a relevant site for re-assessing the relationship between soft and hard news in relation to platformization.

This paper investigates the platformization of journalism in Sweden through a quantitative content analysis of Swedish legacy news organisations' TikTok output. We examine how these organisations use TikTok affordances (e.g., short-video storytelling, rapid editing, music, text overlays, direct address, and TikTok-specific expressive conventions) and how these features shape the softness or hardness of news thematically and in presentation. Analytically, we also draw on Reinemann et al.'s (2012) multidimensional framework of soft and hard news to capture variation across topic, focus, style, and sourcing characteristics.

The study is based on a stratified random sample of posts drawn from the official TikTok accounts of Swedish legacy outlets during the entire year of 2025, covering public service, national tabloids, morning newspapers, and local newspapers (n = 1500). The analysis combines manual and automated coding procedures to map news topics, sources, platform-specific stylistic features, and engagement metrics (views and "digs"). We construct a soft/hard news index based on Reinemann et al.'s indicators and relate degrees of news softening to engagement.

Preliminary results show a clear softening of news on TikTok. The content tends to align with soft news both thematically and in presentation, with a dominance of episodic framing and short event-based news. Softening is closely tied to affordances such as fast-paced editing and prominent text overlays, which support emotional intensification and the compressed narrative structure typical for the platform. Presentation relies to a great extent on emotional reporting,

while the style remains largely impersonal rather than personal. Softening scores also tend to be positively associated with visibility and engagement (views and digs), although the strength of this relationship varies across outlets. Despite these platform-related similarities, the analysis identifies traces of historically rooted organisational differences across public service, tabloids, morning press, and local newspapers. Moreover, against the backdrop of decades of Swedish and Nordic media research (eg. Karlsson & Truedson, 2019), we find that TikTok journalism provides young people with increased visibility and agency as sources, suggesting a potential broadening of whose voices and views are represented in the news.

JOS18 Platforms and News

PP 0475 Beyond Metrics: The Platformized Epistemology of Datafied News Work

Elisabetta Petrucci[1]

[1] Roskilde University, Communication and Arts, Roskilde, Denmark

The emergence of 'datafied news work' (Kammer et al., 2025) has brought to the introduction of new actors in the production of news, with implications for journalistic epistemology, i.e. the institutionalized way of producing knowledge in the various forms of journalism (Ekström & Westlund, 2019). Previous research has mostly been concerned with platform companies, driven by commercial and market logics, providing the infrastructures news organizations rely on to produce and distribute the news (Nechushtai, 2018; Kristensen & Møller Hartley, 2023). However, platforms are also 'infrastructures for datafication', or technological systems that make possible the collection, organization, exchange and analysis of various types of data (Pybus et al., 2025). So, if we think of platforms as infrastructures in themselves, and pay attention to their technical workings, what other logics emerge as playing a role in the production of news? How do they interact with the long-standing epistemology of journalism? This paper provides an answer to these questions making use of data from ethnographic fieldwork conducted in three Danish news organizations. The data analyzed consists of field notes gathered while shadowing two journalists in each organization, as well as of interviews with the same journalists and other relevant actors within the organizations.

The paper relies on van Dijck and Poell's (2013) definition of logics as the principles and mechanisms through which platforms process information to explore how they interact with the epistemology of journalism. The paper finds that, even though previous studies have highlighted the prominent role of the logic of datafication in processes of news production through the study of audience metrics in newsrooms (Christin, 2020; Petre, 2021), moving beyond the specific focus on metrics and exploring how journalists encounter and deal with platform infrastructures allows to understand that there are more logics at play than solely datafication; namely, programmability, popularity and connectivity. The contributions of the paper are two-folded: first, by showing that a variety of platform logics are at play and getting enmeshed with the epistemology of journalism, the paper provides an empirical contribution to the study of datafied news production. Second, by arguing for the need to move beyond the specific focus on metrics and their impact on news production, the paper contributes conceptually to the academic discussions about the datafication and platformization of journalism. This, in turn, opens up the possibility for further research to explore the impact of platform infrastructures and their logics in other domains of news work, such as distribution, marketing and management.

JOS18 Platforms and News

PP 0476 How newsy is news? Measuring news conventionality across outlets, topics, and platforms

Steen Steensen[1], Bente Kalsnes[2], Gunhild Ring-Olsen[2], Lasha Kavtaradze[2]

[1] Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway
[2] Kristiania University College, Department of Communication, Oslo, Norway

What constitutes "news" has long been a foundational but contested question in journalism studies. While editorial journalism continues to endorse norms of factuality, neutrality, balance, and source attribution as defining features of news, empirical research has repeatedly shown that journalistic texts vary substantially in their degree of adherence to these conventions. Yet, despite extensive scholarship on news values, genres, and professional norms, there has been no systematic, large-scale attempt to operationalise and compare degrees of news conventionality across different forms of journalistic content.

This paper addresses this gap by developing and applying a News Conventionality Index (NCI), a composite measure capturing linguistic and discursive features associated with conventional, fact-oriented news reporting. The analysis draws on a large corpus of approximately 225,000 articles published in 2023 by 22 Norwegian news outlets across multiple platforms. Drawing on prior research on news genres, the index integrates five theoretically grounded dimensions: epistemic conventionality, subjectivity and evaluative stance, stylistic and emotional intensity, temporal anchoring, and discourse mode. Each dimension is operationalised through a set of linguistic features, defined as recurrent lexical, multi-word, and stylistic markers associated with that dimension. These features are organised into dimension-specific lexicons constructed inductively and deductively, based on prior research and close inspection of the corpus. Feature extraction and aggregation were conducted in RStudio using the *quanteda* package, which enabled efficient tokenisation, lexicon matching,

and document-level calculation across the corpus. All features were normalised by text length and standardised prior to aggregation into dimension-level scores and the composite index.

As an initial validity check, we compare NCI scores between news articles and opinion pieces. The results show a pronounced and statistically robust distinction between the two genres: news articles score significantly higher on overall conventionality than opinion articles (Cohen's d = 0.64), indicating a substantially more source-oriented, impersonal, and stylistically restrained mode of writing. Dimension-level analyses further demonstrate that this difference is primarily driven by lower subjectivity, reduced stylistic intensity, and weaker argumentative and narrative structuring, rather than by differences in temporal anchoring. Building on this validation, the full paper will apply the NCI to systematically compare degrees of news conventionality across newsroom types (local, regional, national, and niche outlets), journalistic topics, and platforms for publication, including differences between proprietary news websites and social media platforms (Facebook, Instagram, and TikTok). A preliminary analysis across newsroom types indicates that regional newspapers exhibit significantly higher levels of news conventionality than local, national, and niche outlets, which cluster more closely together in their degree of conventionality.

Rather than treating "news" as a uniform category, the analysis maps how adherence to conventional news norms varies within the contemporary news ecosystem, and how these variations align with organizational context, topical focus, and platform-specific publishing environments. In doing so, the study contributes a scalable empirical approach for examining how core professional norms of journalism are unevenly enacted in practice, and offers a basis for more fine-grained debates about genre boundaries, platformisation, and the conditions under which journalistic authority is maintained, adapted, or reconfigured.

JOS18 Platforms and News

PP 0477 'Reworking the news': News remediation for social media platforms

Marie Verstappen[1]

[1] VU Amsterdam, Political Communication & Journalism, Amsterdam, Netherlands

This study investigates how news is adapted for social media, using remediation as a theoretical lens. Over the past two decades, social media have gradually become dominant platforms for news consumption, and they now serve as the primary news source for a significant portion of the public (Newman et al., 2025). In response to these evolving audience habits, as well as a need for survival, journalistic outlets established a presence on these platforms (Batsell, 2015). News-making therefore often no longer ends with writing stories for the newspaper or the news website; articles travel further to social media platforms like Facebook, X, Instagram and TikTok.

The growing influence of social media, in turn, has disrupted traditional journalistic norms and practices and challenged long-established editorial routines (Hansen, 2020; Wu, 2018). Social media platforms operate under different rules than the publishers' own platforms, each with its own technical infrastructure, affordances, algorithmic curation, and audience demographics (Cetina Presuel & Martínez Sierra, 2019; Chua, 2023; Hase et al., 2023). Therefore, content cannot be simply copy-pasted or 'shovelled' but must be altered and tailored accordingly. This process occurs within a modern media ecosystem that is simultaneously *hybrid*, *high-choice*, and *liquid*, all of which significantly shapes how news moves across platforms (see e.g;, Barnard, 2024; Van Aelst et al., 2017; Bauman, 2000).

This study introduces remediation as a conceptual lens to explore how news is continually reconfigured across this modern media system. Drawing on Bolter and Grusin's (1999) foundational work, remediation describes how media forms refashion one another—absorbing, improving, or reinterpreting prior media formats to adapt to emerging technological and cultural conditions. The concept captures the mutual influence between old and new media. I argue this remediation framework provides a bridge between platform logic and editorial practice and can deepen our understanding of how contemporary news is actively created in response to the evolving logics of digital platforms. To illustrate these theoretical insights, the study draws on concrete examples of social media news production

Overall, this research contributes to the understanding of contemporary social media journalism by linking theoretical and practical perspectives. By foregrounding remediation as a lens for analysis, it provides insight into the ways news is continually reshaped for digital platforms, the influence of platform affordances on journalistic work, and the evolving role of social media editors in shaping public news consumption.

JOS18 Platforms and News

PP 0478 TikTok as a news ecosystem: An analysis of actors, content and information disorders during a power blackout

Jorge Vázquez-Herrero[1], María-Cruz Negreira-Rey[1]

[1] Universidade de Santiago de Compostela, Communication Sciences, Santiago de Compostela, Spain

TikTok has become one of the main social platforms for accessing and reporting news. When an event occurs, media outlets, journalists, and all kinds of users share what happened on this already consolidated platform. This underscores TikTok's role as a relevant channel for news access, although its distinctive features are more closely associated with short-form video, entertainment, and algorithmic recommendation. In this scenario, disinformation also tends to proliferate, with the risk of quickly reaching large audiences.

Following the nationwide blackout in Spain in April 2025, this study aims to analyze the information circulating on TikTok during the event and, consequently, what a user would find when accessing the platform. Using the TikTok Research API, we retrieved content posted within the first 36 hours (n = 62,643 posts). The analysis began with a reconstruction of the event's timeline on TikTok, focusing on the role of news media, the types of actors reporting on the blackout, and the disinformation narratives that emerged.

In response to an unexpected and highly relevant news event, the circulation and consumption of content on TikTok reveal certain trends and the coexistence of journalistic actors with other users. Media outlets played a significant role in the volume of news content published about the blackout–21 of the 25 users who post the most videos are media outlets–; however, their content was not the most widely circulated or viewed– 8 of the 25 users with the most views are media outlets. Algorithmic mediation therefore continues to play a key role in the dissemination of videos on TikTok. This explains why non-journalistic accounts emerged that published five or more videos in a very short period, appropriating content from other accounts to republish or remix in order to achieve high view counts.

During the first 36 hours after the blackout, the most viewed content focused on what people were experiencing at that moment and in their own contexts. News outlets began posting within the first half hour, reporting on the power outage in several cities and across the country. Soon after, different disinformation narratives started spreading, driven by anonymous users, content creators, and pseudo-media. These narratives included various conspiracy theories and went viral due to TikTok's content circulation logic.

In events such as the blackout, users seek quick and easily accessible information on social networks like TikTok, while news media struggle to compete in terms of speed, virality, and volume of content. Moreover, the limited presence of government authorities further fueled the spread of disinformation that appealed directly to emotion, circulated within specific communities, and thrived on algorithmic recommendation.

Any user accessing TikTok to learn about an event such as the blackout will encounter a mix of videos curated by the platform's algorithm. Within this algorithm-driven news ecosystem, media outlets, pseudo-media, content creators, news-fluencers, and other actors interact. Most of this content will not have been produced or verified by professional journalists, posing a significant risk for audiences who believe they are well-informed by relying on platforms like TikTok.

PP 0489 Meme digests as indicators of tabloidization in Ukrainian and Polish online news media

Oksana Zhuravska[1]

[1] Lviv University of Trade and Economics, Department of Marketing, Lviv, Ukraine

The article analyses the genre-related, functional, and narrative characteristics of meme digests in Ukrainian and Polish online news media during the crisis periods of COVID-19 and the full-scale war. The object of the study comprises 251 meme digests published between December 2019 and December 2024 by the Polish outlets Wiadomości, Fakt, Rzeczpospolita, and Wyborcza, and the Ukrainian outlets Suspilne, Ukrainska Pravda, Obozrevatel, and UNIAN. The selection of these media is determined by their leading audience reach in their respective countries, alongside differences in editorial policy and market positioning, which directly affect the quality of content and adherence to professional journalistic standards.

Memes are conceptualised as multimodal texts and carriers of cultural information (Dawkins, 2016; Shifman, 2014; Wójcycka, 2019; Skott, 2022), while meme digests are treated as journalistic compilations of such texts in various compositional formats, both with and without accompanying journalistic commentary. Data were collected using Google tools (Search Engine and Colab), and subsequently analysed through quantitative and qualitative content analysis and the logical method, which enabled the identification, examination, and systematisation of instances where memes function as elements of journalistic digests.

The intensification of memes within journalistic news discourse during crisis periods may be interpreted as a manifestation of tabloidization, expressed through shifting media priorities and boundaries of taste (Johansson, 2007, 32). In academic discourse, tabloidization is associated with moral panic (Sparkl, 2000; Conboy, 2021) and is defined as a commercially

successful yet ethically problematic form of journalism dominated by sensationalism, dramatization, and clichés (Miller, 2012). Excessive visualisation influences news selection and may distort the audience's informational worldview (Djupsund, 1998: 12), as online media, social networks, and video platforms have provided tabloidization with new tools of audience engagement, particularly visual ones (Hanusch, 2013; Magin, 2021; Collier, 2021: 270).

The quantitative findings show that in both countries meme digests are published primarily by tabloid outlets, whose core readership consists of men aged 55–64 and 65+ with secondary and higher education. Such media generally favour large volumes of content, within which journalistic standards of accuracy, balance, and separation of facts from commentary and evaluation are frequently violated.

In Ukrainian media, the number of meme digests is almost twice as high as in Polish media (69% and 31% respectively), primarily due to materials covering the full-scale war (40% and 20%), politics (8% and 5.6%), show business and culture (9.6% and 2.8%). Sport is the only topic where the Polish outlet Fakt dominates, with 16.5% compared to 0.4% in the Ukrainian outlets Obozrevatel and UNIAN.

The qualitative results indicate that outlets employing tabloid strategies in their editorial policy tend to favour structurally and semantically simplified meme digests. These typically take the form of lists of meme collages (images with captions) or galleries (using dedicated website structural elements), introduced by a brief note outlining the news trigger. While journalistic text may accompany the meme collages, it is usually trivial in nature, merely describing the images without providing the additional context necessary for deeper understanding.

PP 0490 Selection and construction in the science news cycle: A Belgian case study of university press release newsworthiness and churnalism during the COVID-19 pandemic

Miguel Vissers[1], Gert-Jan de Bruijn[1], Steve Paulussen[1]

[1] University of Antwerp, Communication Studies, Antwerp, Belgium

News reports remain an important actor for the communication of scientific research to the non-scientific public. Journalists are however frequently scrutinized for misrepresenting scientific research, where it is questioned whether the news media reflect a reduced but appropriate picture of the scientific reality, or if journalists' inclination to focus on the newsworthy aspects results in a distorted image. Simultaneously, further cost-cutting and the emergence of a 24/7 news cycle have led to a situation where less scientific experts, often needed to assess the value of scientific research, are employed in the news media, with those who remain seeing their workloads rise. Consequently, science journalism becomes more dependent on information subsidies by sources, where scientists and universities are specifically viewed with trustworthiness.

On the side of academia, multiple studies have already shown that communication departments of universities have significantly expanded their press offices who consider it crucial to attract news media attention. Here, press releases remain relevant for both university public relations and science communication. Due to this public relations expansion at universities and the further shrinking of science journalism, the power relation between journalists and press officers might shift further. This could enhance so-called churnalism, where journalists textually reproduce (public relations) information subsidies. A critical stance should therefore be taken with regards to both the press officers writing their press releases and journalists producing their news articles, where understanding how scientific findings, advances, controversies, and debates become newsworthy remains important.

In the context of our article, the study of newsworthiness deals with understanding why certain press releases end up as being covered by journalists in news media stories *and* how these stories are consequently constructed (Kroon & Schafraad, 2013). We studied this selection and construction through a quantitative content analysis of all research-focused press releases (271) sent out by a Belgian university and 763 related news articles during the COVID-19 pandemic. Our research shows that these university press releases are very successful in being selected for news production (79.7%), with both the amount of news factors and specific news factors (*continuity* and *trigger*) present in the press release positively influencing journalistic selection. Most notable is the ubiquity of churnalism, measured through a validated computer script (Vonk et al., 2024), with almost all news articles containing textual copy-pasting. This leads us to argue that the responsibility for accurate science communication increasingly lies with those who communicate to journalists. Every science communicator should therefore uphold a form of journalistic and scientific deontology. They should not fear their chances of 'making the news'. *How* they make the news should be their priority.

PP 0491 How to measure invisible diversity in television news: A quantitative content analysis approach

Emma Verhoeven[1], Steve Paulussen[1], Alexander Dhoest[1]

[1] University of Antwerp, Communication Studies, Antwerpen, Belgium

Quantitative content analyses of media have traditionally focused on visible diversity markers such as gender or ethnicity, inferred from appearance. This approach leaves dimensions like sexual orientation, transgender identity, and other non-visible characteristics inconsistently measured or confined to qualitative research. Scholars have addressed the need for more quantitative intersectional studies on representation that explore more than one identity marker (Scharrer et al., 2022). This paper addresses that gap by presenting a codebook designed to operationalize different diversity markers, including invisible aspects, in television news content. News content presents specific methodological challenges for quantitatively analyzing diversity compared to other media: news segments feature brief appearances by diverse actors whose characteristics may not always be explicitly stated, or only when it is relevant to the topic. Paradoxically, audiences often know about elite news actors' identities (e.g., celebrities or politicians), such as sexual, transgender, or ethnic identities. Nonetheless, traditional quantitative content analyses exclude these aspects, relying exclusively on manifest content visible within the media text itself. This approach leads to a blind spot, where identities that are publicly known but not mentioned within news coverage remain uncounted in quantitative analyses.

The codebook was developed within the Dutch-speaking Belgian context and builds on the Electronic News Archive (ENA), an archive that has coded all primetime news broadcasts since 2003. Its existing codebook is based on manifest characteristics and already includes aspects related to gender (operationalized as man/woman) skin color (white/non-white), name (Belgian-sounding/not Belgian-sounding), and disability (disabled/non-disabled). This presentation focuses on how we extend that codebook to provide coding instructions for actor characteristics including gender identity (also encompassing non-binary people), sexual orientation, intersex and transgender identities, ethnicity, religion, and nationality. We distinguish between four layers of representation: what is visibly represented, explicitly mentioned, contextually implied, and externally verifiable. For external verification, we employ Wikipedia as a standardized knowledge source, deliberately excluding coder assumptions from the process. This approach, while labor-intensive, allows researchers to capture diversity beyond visual cues or subjective interpretation.

The extended codebook is currently being applied by 13 trained coders to all primetime television news episodes broadcast by commercial network VTM and public broadcaster VRT in 2024 (N = 730). Intercoder reliability testing will be completed in February 2025, with full coding finished by May 2025. All coding is performed on the actor level (N = 21,608).

During this presentation, we lay out the codebook and the methodological challenges it poses. We also present the empirical findings that demonstrate which diversity markers were externally validated but would have remained invisible in traditional quantitative content analysis, illustrating the added value of our approach. By making invisible diversity visible through systematic measurement, we provide journalism scholars with tools to assess whether news media are quantitatively representing different demographic groups or perpetuating representational gaps.

PP 0492 Framing and deliberation: An analysis of frames in the coverage of public debates in Europe

Rubén Rivas-De-Roca[1], Berta García-Orosa[1]

[1] Universidade de Santiago de Compostela, Ciencias da Comunicación, Santiago de Compostela, Spain

The media have historically played an essential role in public opinion debates, as they provide a particular view of reality (Dzur, 2002). From the conceptual perspective of the deliberative public sphere (Strömbäck, 2005; Splendore et al., 2024), the development of inclusive discussions is essential for the functioning of democracy. There are issues of global scope regarding which journalists can adopt a deliberative role. It is also important to understand how these issues are framed in the media, since this contributes to the normalization of certain positions (Lecheler and de Vreese, 2019).

In this context, the objective of this research is to explore how the use of some news frames favors or limits the deliberative potential of journalism on issues of public interest. Three research questions are posed: What types of frames predominate journalistic coverage of public debates? Do these frames contribute to reasoned deliberation? Which frames are transnational, and which are culturally specific?

To this end, a content analysis of news published by media outlets in the five most populous countries in Europe (France, Germany, Italy, the United Kingdom, and Spain) is used, with three news organizations per country. Specifically, all publications from those 15 media outlets are examined regarding several global issues for 2025: the awarding of the Nobel

Peace Prize, the Gaza Peace Plan, COP30, and the 80th Session of the UN General Assembly. Qualitative analysis is based on framing theory as media outlets usually select a particular approach (frame) to report on an event (Entman, 1993). Through prior coding of frames, the study of these frames allows for the identification of the premises and representations of the debates generated around these issues.

Initial results point to the homogeneity of certain frames, while a genuinely deliberative perspective is often missed. However, differences between countries and media outlets are also evident, with some providing a more conducive frame for deliberation. This study contributes to current debates on the mission of journalism in a changing digital age, arguing that deliberative news coverage could improve the democratic accountability of political actors at the European level.

PP 0493 Social media logics beyond social media? A comparative analysis of BBC and CNN's short video carousels

Daniel Lloyd[1], Jonathan Hendrickx[2]

[1] Dublin City University, Institute of Future Media- Democracy and Society, Dublin, Ireland
[2] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Audiences increasingly consume vertical, short videos across social media platforms, ranging from TikTok to Instagram Reels and YouTube Shorts (Laaksonen et al., 2024). In 2014, as traditional news organisations struggled to retain audiences, they adapted to social media's shift toward video by creating and disseminating novel types of news content on these platforms, fostering a relationship marked by dependency (Meese & Hurcombe, 2021; Ekström & Westlund, 2019). In a more underexplored trend, the same news organisations are adopting short-form videos on their own proprietary platforms. Consequently, the homepages of news websites and mobile apps increasingly feature scrolling video carousels containing videos that display many similarities with those shared on social media platforms. Despite their prominence, there is a lack of scholarly knowledge on how news media utilise these carousels, what types of videos populate them, and how these choices relate to journalism and/or social media norms.

This comparative content analysis examines the video carousel publishing strategies employed by two of the world's leading Western digital news outlets, the BBC and CNN. Focusing on homepage video carousels within each outlet's news apps, the study analyses 572 videos and accompanying thumbnails collected over a constructed two-week period between August and November 2025. The research investigates how legacy broadcast news organisations are adapting short-form video to their institutional logics.

By coding video characteristics such as topic and platform-centric features (Hendrickx & Vázquez-Herrero, 2024), the study aims to answer the following research questions:

RQ1: How do short-form video carousel publishing strategies differ between BBC and CNN?
RQ2: What are the primary short-form video topics featured on BBC and CNN homepage carousels?
RQ3: What social media platform-centric features do short-form videos featured on BBC and CNN homepage carousels adopt?

Short-form video is an increasingly important communication format, particularly for younger audiences. Yet, many questions remain regarding its integration into existing legacy news organisational practices and its future prospects. Therefore, this research will offer insights into the media's approach to short-form video and how interface design shapes the future of news communication. The study is informed by existing literature on news organisations' approach to short-form video and journalism norms (e.g. Hase et al., 2023; Hendrickx & Vazquez-Herrero, 2024; Wirz & Zai, 2025). While conceptually, we draw on literature on platform isomorphism, the dislocation of news and journalism, and social media journalism. Initial analysis highlights varied approaches. The BBC has a consistent strategy that prioritises promotional and non-news-related videos, while CNN is more experimental and news-focused.

PP 0576 Certainty in uncertain times: How news media repertoires shape war-threat perceptions in the age of misinformation

Toni van der Meer[1], Alexandra Schwinges[1]

[1] University of Amsterdam, Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands

Rising geopolitical tensions across the globe requires Europe shifting to a "wartime mindset", as NATO Secretary General Mark Rutte announced last year (NATO, n.d.). Yet, in an age of misinformation, fragmented media landscapes, and declining institutional trust, the increasingly complex processes of *how* citizens use information to form war-threat perceptions and *how certain* they feel about their own risk perceptions, remains understudied. Understanding these processes is critical, as citizens' perceptions and confidence in assessing war-threats can directly shape their capacity to respond adaptively.

Literature has already shown that while war-threat perceptions affect important preventive behavior (Slezackova et al., 2024), they are subjective and shaped more by heuristics or biases than by systematic information processing (Eliezer Yudkowsky, 2008). Yet, today's information environment has undergone several critical changes regarding the increased challenges of misinformation (Ecker et al., 2024), which warrants a novel approach to studying what informs war-threat perceptions. Therefore, this study introduces the role of *uncertainty*, a central concept in misinformation literature (Lyons et al., 2021; Wood et al., 2023), to understand war-threat perceptions. We argue that uncertainty in perceptions is particularly relevant in the context of war threats, where information ambiguity and subjectivity are already high and uncertainty may only amplify fear, influence emotional response, and complicate decision making (e.g., preventive actions like evacuation) (Tandoc & Lee, 2022).

Accordingly, this project explores the information sources that citizens rely on for war-related news and whether distinct information-use repertoires emerge. Next, we assess how these repertoires shape the formation and certainty of war-threat perceptions and the association of risk (un)certainty with perceived efficacy in threat coping and with practical preparedness behaviors.

Theoretically, we integrate research on information source reliance (Adetayo et al., 2022; Humprecht et al., 2020) and attitude certainty (Aven, 2025; Błaszczyk & Pieńkowski, 2025) into the Social Amplification of Risk Framework (Kasperson et al., 2022), advancing a novel perspective on how risk perceptions acquire confidence. By expanding contemporary studies of misinformation (van der Meer & Hameleers, 2025), through mapping how media repertoires and perceived misinformation salience shape both risk perceptions and the confidence with which they are held, we offer critical insights into how citizens can navigate complex information landscapes and enhance resilience to anxiety, manipulation, and maladaptive responses.

We conduct a preregistered quota-balanced cross-national survey across eight European countries (Netherlands, Germany, Denmark, Finland, France, Italy, Poland, and Lithuania (total $N = 4{,}000$)) to assess how war proximity, cultural attitudes towards uncertainty, and resilience to misinformation shape these dynamics. Participants report on primary war-information sources, their frequency of use (Wilson & Maceviciute, 2025), and their perceived misinformation salience (van der Meer & Hameleers, 2025). War-threat perceptions are measured via multi-dimensional scales capturing perceived affect, susceptibility, and severity of war (Walpole & Wilson, 2021), as well as citizens' attitude certainty (Petrocelli et al., 2007). Finally, personal coping efficacy and emergency preparedness (based on the European Union's 2025 preparedness strategies) are measured. The survey is programmed, and translated and ready to be fielded late January 2026, a full paper is expected before summer 2026.

JOS20 Audiences and Journalism I.

PP 0577 Domesticating disinformation: How news audience practices shape the resonance of disinformation

Hanna Vincze[1], Sabina Mihelj[2], Stefan Janjić[2], Andreea Mogos[3]

[1] Babes–Bolyai University, Communication- Public Relations and Advertising, Cluj-Napoca, Romania
[2] Loughborough University, Communication and Media Department, Loughborough, United Kingdom
[3] Babes–Bolyai University, Journalism and Digital Media, Cluj-Napoca, Romania

Disinformation campaigns have recurrently been shown to strategically promote narratives that resonate with specific societies or communities, and instrumentalize local sensibilities or grievances (Innes et al., 2021; Nehring et al., 2023; Bastos & Tuters, 2023; Tolz & Hutchings, 2023; Laputska & Yeliseyeu, 2024). Much less is known about how these phenomena of resonance play out at audience levels. In this paper, we turn to the concept of domestication, as previously used in the study of foreign news to describe the localization processes that render far-away events comprehensible or relevant for local audiences (Clausen 2004), and operationalize it in the study of the way audiences engage with disinformation. We examine how audiences use their local knowledge, cultural and political repertoires and personal experiences to make sense of disinformation, in terms of both assessing its credibility and constructing its meaningfulness in local contexts, and how these modes of engagement in their turn create or undermine the credibility of disinformation narratives.

The research is part of a larger project on disinformation practices and their variations in cultural and geopolitical contexts. A total of 24 focus groups with 146 participants were conducted in Poland, Romania, Serbia and the Arabic speaking

communities in the UK, six for each case, divided into three age groups, and balanced by gender. In each country, participants discussed false or misleading news and social media posts drawn from the local media environment and related to the war in Ukraine, more specifically public appearances of president Zelenskyy, and the existence of biolabs in Ukraine. Transcripts were analyzed using thematic coding in CAQDAS software. Based on this empirical material, we ask: (**RQ 1) What are the main sources of knowledge or domains of experience in which audiences anchor their assessment of misleading content? (RQ 2) What is the function of these domestication strategies in engaging with disinformation?**

We find that audiences employed references to personal histories, professional knowledge, educational experience, popular geographies, local and international politics and national history to both assess the items discussed as credible or not, and to construct their local relevance. In each case, we find that audiences referred back to major themes of their local discoursive contexts, which anchored their discussions, from political corruption to the COVID-19 pandemic, from narratives of victimhood to those of historic greatness. We connect these domestication strategies to the traditional audience stances described by Toepfl as affirmative, negotiated and oppositional (Toepfl, 2013), following Hall's classic encoding/decoding model, and show how they can serve both critical reflection and rejection of disinformation, but also the acceptance of disinformation narratives. By conceptually bridging the study of foreign news and studies of news audiences with the emerging field of audience studies of disinformation, we aim to offer a model of the way audiences navigate the current information environment that goes beyond information deficit models of combating disinformation, and argue for the importance of local news cultures and participatory practices in which public knowledge takes shape and in which strategic disinformation narratives prove resonant or dissonant.

JOS20 Audiences and Journalism I.

PP 0578 Time well spent? Exploring emotional engagement with news through native experience sampling

Kenza Lamot[1], Tim Groot Kormelink[2], Tessel Bogaard[3]

[1] Ghent University, Communication Science, Gent, Belgium
[2] Vrije Universiteit Amsterdam, Language and Communication, Amsterdam, Netherlands
[3] Mediahuis, Nrc, Amsterdam, Netherlands

Both within journalism studies and practice, the discourse on audience engagement has predominantly centered around audience analytics: software that monitors and collects audience behavior, translating it into quantifiable metrics such as clicks or attention time. Newsroom practices are shaped by the analysis of these metrics (Tandoc, 2019), under the presumption that this enables journalists to tailor news content more effectively to audience interests and thereby increase engagement. However, interpreting audience behavior and inferring motivations is a notoriously fraught process because of the many limitations associated with audience metrics (Napoli, 2011). Therefore, Steensen et al. (2020) have urged scholars to acknowledge these limitations and complement metrics with alternative methods.

Answering that plea, the first aim of our study was to empirically capture dimensions of engagement beyond behavior. Proposed as an alternative to time spent (i.e., quantity of news consumption), we developed the notion of "time well spent", focused on the quality of the news experience. The second aim was to develop and trial an innovative 'native experience sampling' method that addressed limitations of previous methodologies by concurrently assessing the discrepancy between behavior (as operationalized through metrics) and value. Concretely, this involved presenting news users with a brief pop-up questionnaire querying their emotional state and experience of worthwhileness after reaching a certain scroll depth in a news article. Uniquely, this took place via the infrastructure of the actual news websites of Dutch newspapers NRC and Noordhollands Dagblad and Belgian newspaper De Standaard.

Our findings, triangulating multi-level regression analyses with random intercepts and qualitative thematic analysis, suggest that for news to qualify as *time well spent* several preconditions must be met. First, an emotional response is a vital positive force in enabling *time well spent*. Worthwhileness was positively associated with several emotional responses compared to cases in which no emotional response was elicited. Contrary to expectations, these emotions did not solely have to be positively valenced: strong negative emotions such as disturbance or sadness often provided the most worthwhile experiences. Qualitative analyses clarified what made users' time worthwhile, with justifications referencing satisfied needs, including knowledge-based needs (e.g., "give me perspective," "teach me something new") and feeling-based needs (e.g., "acknowledge me," "give me someone else's perspective").

We conclude by reflecting on the promise of our NESM methodology for journalistic practice. The user needs and form- and style-related criteria inferred from NESM can function as evaluative benchmarks, enabling news organizations to assess how journalistic formats, topics, and stylistic choices align with users' ideal news experiences. While these facets may not be easily aggregated into a single metric, recurring use of NESM may help news organizations systematically reflect on the multidimensional nature of news experiences, complementing behavioral metrics.

PP 0579 How people encounter and interpret political information in a real-life context

Tim Groot Kormelink[1]

[1] Vrije Universiteit Amsterdam, Language- Literature and Communication, Amsterdam, Netherlands

How people encounter and interpret political information in a real-life context

Understanding how media shape people's ideas about politics has become increasingly challenging in a highly digitalized and fragmented media environment. Citizens no longer rely on a small set of shared news outlets; instead, they navigate diverse and individualized information trajectories across professional news media, social media platforms, messaging apps, influencers, entertainment media, and interpersonal conversations. These varied encounters jointly inform political sense-making, yet most existing research captures only fragments of this process.

Much research focuses on limited information sources or narrowly defined populations. For example, studies on polarization frequently rely on Twitter/X data (Kubin & von Sikorski, 2021), while experimental research on mis- and disinformation necessarily isolates specific media stimuli (Greene & Murphy, 2021). Large-scale international surveys provide valuable comparative insights (Newman et al., 2024), but do not sufficiently capture differences related to socio-economic status or ethnicity. Qualitative studies, in contrast, offer rich insights into sense-making practices within specific communities (e.g. Xia, 2024), yet often lack generalizability. While these approaches have advanced understanding of media effects, mechanisms, and practices, they fall short of capturing how people's everyday media use *as a whole* informs their ideas about politics.

This study argues that a holistic, inclusive approach is needed to better understand mediated political sense-making. It therefore addresses the following research question: **How do people encounter and interpret political information in a real-life context?** "Real-life" refers to studying political information practices as they unfold in everyday settings, across online and offline sources, and among diverse social groups. By doing so, the study contributes empirically to key theoretical debates in media and communication studies, including filter bubbles, selective exposure, and cognitive dissonance.

To meet the methodological challenges posed by fragmented media use, the study employs an innovative mixed-methods design that leverages digitalization. First, it uses **digital trace data** derived from data donation, whereby participants request, download, and donate data collected about them by platforms such as Google, Meta, and TikTok (Boeschoten et al., 2023). Digital trace data enable detailed reconstruction of the political information participants encounter and engage with online, without relying on recall or self-report (Ohme et al., 2024). Second, the study integrates **a two-month, bi-weekly qualitative diary study** (Moe & Ytre-Arne, 2022), in which participants submit structured reflections about two political topics (Donald Trump; Dutch national elections) they (may) have encountered during the previous days, including their own interpretations of this information. Retrospectively, the same topics are identified within participants' donated digital trace data using state-of-the-art machine learning techniques, including large language models (Laurer et al., 2024), followed by manual and/or automated content analysis. Diary data are analyzed inductively using grounded theory (Corbin & Strauss, 1990).

Prioritizing inclusivity, recruitment combines a panel designed to approximate a representative sample of the Dutch population with targeted outreach to groups typically underrepresented in media research, such as individuals with lower educational levels or non-Western backgrounds. This approach enables systematic comparison across groups and advances understanding of shared and divergent patterns in how people encounter and interpret political information.

PP 0580 Ukraine's wartime news fatigue: Lessons for global journalism

Tetiana Gordiienko[1,2], Dariya Orlova[1]

[1] National University of Kyiv-Mohyla Academy, Mohyla School of Journalism, Kyiv, Ukraine
[2] NGO Media Development Foundation, MDF Research Lab, Kyiv, Ukraine

Across diverse media environments, news organizations increasingly struggle to sustain audience engagement with the news. The constant flow of updates, alerts, and emotionally charged reporting that is also amplified by digital platforms, has transformed news consumption into a demanding and often exhausting practice.

Ukraine provides a particularly revealing context in which to examine these dynamics. Since the onset of Russia's full-scale invasion, audiences have been exposed to an extended period of high-intensity, crisis-driven news, marked by constant updates, emotional strain, and existential stakes (Internews Ukraine, 2025). This prolonged wartime media environment offers a unique opportunity to observe how sustained exposure to critical news reshapes audience engagement, coping strategies, and patterns of selective avoidance over time. Rather than treating Ukraine as an exceptional or isolated case, this study approaches it as an analytical lens through which broader processes of news fatigue can be examined in conditions of prolonged uncertainty.

The proposed study examins the consequences of protracted exposure to crisis-driven news for audience engagement and news avoidance. It is situated within existing scholarship on news fatigue and avoidance (Skovsgaard & Andersen, 2019; Skovsgaard & Andersen, 2022), selective and topic-based news avoidance (Schäfer, Betakova & Lecheler, 2022), and global trends in news consumption and trust documented in the Reuters Institute Digital News Report (Newman et al., 2023), allowing our findings to be positioned within global shifts in attention, trust, and audience behavior.

The study employs an explanatory sequential mixed-methods design. It consists of five linked stages: a survey of 1,000 respondents aged 18–60 living in cities with populations over 50,000; a content analysis of 1,878 articles published by ten local news outlets; six months of automated media monitoring across approximately 110 outlets using LOOQME.IO; an analysis of Google Analytics data from ten independent local news sites in five different macro-regions of the country; and expert interviews to contextualize findings and inform recommendations.

The findings challenge a common assumption that news avoidance reflects apathy or disengagement from public life. Instead, audiences described filtering and rationing news as an act of self-preservation in response to emotional saturation. Participants prioritized practical, reliable, and actionable information, while repetitive, sensational, or emotionally overwhelming coverage accelerated disengagement. Long-term crisis reporting that lacked local relevance and emotional sensitivity was found to intensify news fatigue.

Importantly, the study highlights a strong demand for credible, context-rich local journalism that addresses people's everyday challenges—coverage that national and international media often cannot replicate. These findings point to an opportunity for local news organizations to rebuild trust and deepen engagement by providing information that is both socially meaningful and directly relevant to community life.

While grounded in the Ukrainian wartime media context, this presentation uses empirical findings to illuminate broader dynamics of news fatigue that are increasingly relevant across crisis-affected media environments. The findings contribute to discussions on how news organizations can sustain meaningful public connection under conditions of prolonged uncertainty.

PP 0581 Journalistic cultures across Belgium's linguistic communities: A quantitative content analysis of journalistic roles and themes in the news

Ellen Thorisaen[1], Sarah Van Leuven[1], Bouko Catherine[2]

[1] University of Ghent, Department of Communication Sciences, Gent, Belgium
[2] University of Ghent, Department of Translation- Interpreting and Communication, Gent, Belgium

Belgium's multilingual media landscape reflects linguistic and political segmentation with the country's two dominant communities, the French- and Dutch-speaking media, operating under separate regulators, press councils, and accountability instruments (Raeymaeckers & Heinderyckx, 2017). Their media markets differ in its ownership, economic trends and audience behaviour (De Bens & Raeymaeckers, 2010). Public and private broadcasters and newspapers publish in one language targeting one community (De Bens & Raeymaeckers, 2010; Sinardet et al. 2004). Against this backdrop, Hallin and Mancini (2004) classify Belgium within the *Democratic Corporatist Model*, marked by moderate pluralism, press freedom and strong media regulation, yet note that media systems are rarely monolithic. The Francophone media have been linked to traits of the *Polarized-Pluralist Model*, with close ties to political actors and more monitoring, interventionist, and collaborative roles (Bonin et al., 2017; Hallin & Mancini, 2004), while Flemish media exhibit stronger commercialization and tabloidization, resembling the *Liberal Model* (Vandenberghe & Raermaeckers, 2024). Yet clear empirical evidence of distinctive media systems and journalistic cultures between the communities is lacking. Prior research (Mertens et al., 2019), based on surveys, found only minor differences in perceived role conceptions.

Through a manual quantitative content analysis, this research systematically compares whether Belgium's two media landscapes translate into distinct journalism cultures. Specifically this study analyses the presence of distinct journalistic cultural traits of the Dutch-speaking and French-speaking community, based on two indicators:

Journalistic role performance: The sub-question is: do journalistic role performances differ between Dutch-speaking and French-speaking media? This study operationalises roles across six non-mutually exclusive role dimensions: interventionist, watchdog, loyal, service, infotainment, and civic. By assessing how roles manifest in content, this study moves beyond survey-based role conceptions while conceptualizing the collective outcome of newsroom decisions and reporting styles (Van Dalen et al., 2011; Mertens et al., 2019).

Themes selected: In parallel, we analyse thematic focus to assess whether Flemish and Francophone outlets prioritize different topics (e.g., politics, economy, crime, culture, international affairs, and so on).

The dataset comprises two television news programs, two radio news services, two newspapers, and two online news platforms from both language communities, sampled over six months in 2026. It includes public and private outlets as well as popular and elite segments, amounting to approximately 950 news items. This cross-platform, cross-community design allows direct comparisons of role performance and thematic focus across ownership models and audience orientations.

This presentation will show these results and aims to contribute to refining Hallin & Mancini's framework for linguistically segmented contexts and to deepen understanding of journalism's functions in divided societies.

PP 0582 Reconstructing journalistic authority through news literacy initiatives: Evidence from Swiss news media

Laura Amigo[1], Julien Perrot[2], Nathalie Pignard-Cheynel[2]

[1] Università della Svizzera italiana, Institute of Media and Journalism IMeG, Lugano, Switzerland
[2] University of Neuchâtel, Academy of Journalism and Media AJM, Neuchâtel, Switzerland

In French-speaking Switzerland, journalism's relational authority –the socially constructed right to be listened to (Carlson, 2017)– is increasingly challenged. This erosion is linked to broader transformations in news organisations, including digitisation, newsroom downsizing, and audience disaffection (Udris & Eisenegger, 2025). In this context, news literacy —understood as, enhancing knowledge of news production processes and audiences' ability to engage with them (Tully et al., 2021)— has emerged as a strategic response to rebuild audience relationships and journalistic legitimacy (Amigo et al., 2023). Yet, despite extensive scholarship on news literacy, the role of news organisations in shaping this field remains underexplored.

Addressing this gap, this study examines how news organisations in French-speaking Switzerland mobilise pedagogical approaches to journalism. It investigates:

RQ1. What initiatives adopting a pedagogical approach to news-making are undertaken by news organisations in French-speaking Switzerland?
RQ2. How do these initiatives conceptualise the journalist-public relationship?
RQ3. How do journalists perceive the initiatives' goals towards audiences?

To address these questions, we conducted a mapping of 143 initiatives underway between 2023 and 2025 by news organisations in French-speaking Switzerland. Using their latest publicly available description (websites, social media, etc.), initiatives were categorised based on their main characteristics (Pignard-Cheynel & Amigo, 2023) to identify the most common initiative types. A thematic analysis (Braun & Clarke, 2012) of initiative descriptions was used to identify underlying audience conceptualisations. Additionally, we conducted 15 interviews between November 2023 and April 2024 with journalists involved in the initiatives. Questions explored journalists' perceptions of the initiatives' goals and assumptions about audiences. Interview transcripts were analysed thematically.

We identified six types of initiatives, with "newsrooms' guided tours" (33%) and "journalistic training for audiences" (31%) being the most prevalent. These formats offer controlled access to the traditionally closed spaces and practices of news production. Across initiative descriptions, the journalist–public relationship is predominantly framed as asymmetrical: audiences are positioned as "curious outsiders" (37%), invited to discover journalism's inner workings and spaces, or as "novice learners" (44%), expected to acquire journalistic skills under professional supervision. Interview data show that, beyond promoting transparency and critical thinking, journalists view these initiatives as a way to reaffirm their distinctiveness. In doing so, they frame audiences as needing guidance to navigate the information ecosystem, emphasising the need to help them distinguish between content grounded in journalistic ethics and content produced by non-professionals.

Overall, findings suggest that news literacy initiatives are mobilised as a way to rebuild journalistic authority beyond news content itself, by cultivating relational forms of engagement and creating spaces that promise greater accessibility to journalism. News organisations approach news literacy not only as the transmission of professional skills and standards, but also as an experiential, relational, and at times affective practice. However, this relational turn remains marked by a paradox: while initiatives promote closeness and participation, journalists continue to maintain control over access, roles, and professional boundaries. This study contributes to discussions analysing news literacy as a site of boundary work (Jaakkola, 2020), showing how journalists seek to reconstruct authority while responding to contested legitimacy.

PP 0583 Resisting illiberal public spheres: Journalistic agency under democratic decline

Ricardo Ribeiro Ferreira[1]

[1] University of Liverpool, Department of Communication and Media, Liverpool, United Kingdom

The decline of liberal democracy has become a global trend. This de-democratisation process is tied to the rise of "illiberal public spheres", where disinformation, polarisation and the political instrumentalisation of the media erode democratic discourse and institutions (Štětka & Mihelj, 2024). Journalists, as key actors in this ecosystem, are not only subject to these pressures but also positioned to resist them, making their responses critical to fully understanding democratic decline. This paper develops a theoretical model of journalistic resistance through the analysis of three underexplored cases that share trajectories of democratic decline but differ significantly in their media systems: Peru, Bolivia, and Ecuador. In doing so, it contributes to ongoing efforts to de-westernise debates in journalism studies and respond to calls to diversify theory-building through research grounded in the Global South (Wasserman, 2018).

Journalistic resistance is broadly defined as the conscious acts of journalists to oppose adverse and threatening conditions with the intent to improve their safety and practices (Bustamante & Relly, 2021). Several studies argue that journalists and news organisations can facilitate de-democratisation when 'captured' or 'instrumentalised' by business and political elites (Schiffrin, 2021; Selvik & Høigilt, 2023). However, few studies have examined and theorised journalistic resistance to these dynamics (Wright et al., 2024). The extant literature is often scattered across political science, communication and regional studies, which limits the development of a cohesive framework. Recent studies illustrate the diversity of resistance practices. In Israel, journalists responded to accusations of left-wing bias by applying "strategic bias", intentionally leaning to the right (Panievsky, 2022). In Poland and Slovakia, resistance became routinised through protest and engagement with professional associations (Benazzo, 2025). In the United States, journalists delayed tasks and "buried" content perceived as undermining editorial independence (Wright et al., 2024). Other important contributions have focused on violence and safety (Hughes, 2024; Slavtcheva-Petkova et al., 2023), providing critical insights into the resilience of journalists operating in hostile environments. The connections between resistance and resilience, whether in relation to violence, political instrumentalisation, or broader processes of de-democratisation, offer a foundation for theorising resistance beyond physical violence.

This study draws on news ethnography (Schultz, 2007), shadowing 10 political journalists in each country during editorial meetings and field assignments, complemented by semi-structured interviews. Journalists were recruited from three influential news organisations in each country, using desk research of recognised media monitoring reports and news archives. Fieldnotes and interview transcripts are analysed through thematic analysis (Braun & Clarke, 2019), following an inductive–deductive logic informed by both existing scholarship and emerging patterns in the data (Saldaña, 2021). This paper presents preliminary results from the first phase of fieldwork, outlining emergent forms of resistance, their organisational conditions, and their implications for theorising journalistic agency under de-democratisation.

PP 0584 Shared values and new structures - Transformative approaches of organizing media work in a meta-organization

Alwin Baumhöver[1], Matthias Künzler[2]

[1] University of Innsbruck, Department of Organisation and Learning, Innsbruck, Austria
[2] Institute for Media and Communication Studies, Department of Political and Social Sciences, Berlin, Germany

Technological advancements, declining traditional business models, and societal changes increasingly challenge the roles and structures of journalism and media organizations (Deuze & Witschge, 2020). In response, (non-)professional media actors are increasingly turning towards collective endeavors to sustain public interest journalism through alternative forms of organizing (Buschow & Suhr, 2024). Some of these collectives now take the form of 'meta-organizations' (Lowrey et al., 2023), organizations whose members are other organizations. By assuming specific support roles and functions, meta-organizations may foster collaboration and innovation among their members (Buschow & Suhr, 2022; Hepp & Loose, 2021). However, while meta-organizations offer a promising model for addressing current challenges for (journalistic) media, the influence of their organizational design (e.g. membership structure, decision-making processes) on (journalistic) media work remains underexplored. Accordingly, we ask: *"How does the organizational design of meta-organizations influence cross-organizational collaboration between professional and non-professional media actors?"*

To answer this questions, we draw on 'meta-organization' theory from the literature of Organization Studies (Ahrne & Brunsson, 2005), and insights from the literature of Journalism Studies (e.g. Buschow & Suhr, 2022), to examine forms, practices, and dynamics of collaboration within the Berlin-based meta-organization Publix. Founded in early 2024, it convenes around 30 (media) organizations to promote an independent media landscape, facilitate journalistic innovation, and strengthen democratic discourse. Publix provides infrastructure like co-working spaces, organizes event venues, provides funding, and facilitates open strategy processes to promote collaboration.

Employing a single case study design with embedded units (Yin, 2018), we analyze Publix and its member organizations, treating Publix as the primary case while analysing individual member organizations in greater depth. Our case study data base incorporates multiple data sources including publicly available and internal documents, observational notes, and semi-structured interviews conducted with the management team of Publix and different member organizations.

Based on our findings, we discuss the potential and challenges meta-organizations pose for collaborative (journalistic) media work. In doing so, this study contributes to the literature by exploring the influence of new organizational designs on contemporary journalistic production. Furthermore, being both manifestations and catalysts of transformations within the journalistic field, by analyzing such pioneering organizations (Hepp & Loose, 2021), we provide additional insights into the evolving institution of journalism and its structures and practices.

PP 0585 Resilient aspirations? Crisis discourses and transnational career motivations of journalism's next generation

Vera Katzenberger[1], Rick Jana[2]

[1] University of Leipzig, Department for Communication and Media Studies, Leipzig, Germany
[2] Ludwig Maximilians University of Munich, Department of Media and Communication, Munich, Germany

Journalism is widely perceived as a profession in crisis, facing economic, technological, and normative challenges. Research shows that journalism students are particularly sensitive to these crisis narratives, which shape their professional expectations and long-term commitment to the field (Hanitzsch et al., 2016). Across different national contexts, students report growing uncertainty regarding job security, professional autonomy, and career prospects, even as intrinsic motivations remain remarkably stable (Mombelli & Beck, 2023; Hovden et al., 2009; Bjørnsen et al., 2007). These pressures are further intensified by debates on artificial intelligence in journalism, which often portray automation as a potential replacement for core journalistic tasks (Aitamurto & Boyles, 2025; Veenstra et al., 2025; Ng, 2024).

Yet, despite persistent discourses on precarity, shrinking newsrooms, technological disruption, and declining public trust in journalism, substantial numbers of young people continue to enter journalism programs worldwide. This paradox raises a central question: How do aspiring journalists justify their professional ambitions in a field dominated by crisis discourses, and how are these justifications shaped by culturally embedded understandings of journalism?

Addressing a key gap in journalism research that remains largely confined to nationally bounded perspectives, this study adopts a transnational approach. It draws on qualitative interviews with (so far) 21 journalism students from Ghana, China, Pakistan, Germany, Denmark, the US, and the UK, capturing diverse journalism cultures across different media systems. Building on research on journalism education and journalism cultures (Hanusch et al., 2015; Sanders et al., 2008), the study examines students' motivations for pursuing journalism and how these motivations are shaped by specific cultures, institutional contexts, and imaginaries of journalism.

Theoretically, the study integrates two complementary perspectives. First, it conceptualizes the "crisis of journalism" not merely as a set of economic or technological problems, but as a public and professional discourse that structures how journalism is imagined and evaluated, shaping students' expectations long before they enter the profession (Hanitzsch et al., 2016; Santos-Sainz, 2013). Second, it draws on Bourdieu's concept of illusio to explain why individuals continue to invest in journalism despite insecure working conditions. Illusio captures the belief that journalism remains "worth doing" even under conditions of precarity, low pay, political pressure, and technological uncertainty (Nölleke et al., 2022).

Our first findings reveal three central patterns. First, across all countries, students are strongly driven by intrinsic and idealistic motivations, particularly the desire to contribute to society, pursue meaningful work, and exercise creativity and autonomy. Second, crisis perceptions do not deter students, rather, they often reinforce journalism's perceived societal relevance, especially in contexts marked by political pressure or misinformation. Third, cultural contexts shape distinct motivational emphases, ranging from professional self-realization to a strong democratic mission. Together, these findings point to what we conceptualize as resilient aspirations, i.e., a form of professional motivations that persists and sometimes

intensifies despite structural pessimism and narratives of decline. At the same time, this resilience has clear limits. Many journalism students envisage a "plan B" in their career trajectories and signal an unwillingness to unconditionally accept precarious working conditions.

JOS22 Journalistic Content II.

PP 0601 Mapping esotericism in German news media using Structural Topic Modeling

Anna Davydova[1]

[1] University of Münster, Department of Communication, Münster, Germany

Established journalism plays a central role as an institutionalized epistemic authority in the production of knowledge. Especially in times of uncertainty, public reliance on journalistic media increases, reinforcing journalism's function in structuring and contextualizing knowledge claims. In digitalized media environments, however, peripheral actors such as esotericists introduce alternative forms of knowledge production that challenge established knowledge orders. The term esotericism encompasses non-hegemonic ideas and practices (Zander, 2021), ranging from seemingly harmless spiritual healing to worldviews that may function as gateways to anti-democratic narratives. In countries like Germany, where traditions such as homeopathy and Waldorf education have deep cultural roots, esoteric movements may pose challenges to science-based societies and democratic norms.

The growing relevance of esotericism is reflected in its frequent appearance in communication research, particularly in studies on conspiracy theories, right-wing populism, vaccine skepticism, extremist groups, or alternative media. Yet, in most of this research, esotericism remains a peripheral reference rather than a primary object of analysis. Little is known about how esotericism is perceived and contextualized in public discourse, and whether journalism recognizes it as a potential challenger to established knowledge orders. Addressing this gap, the present study examines which topics make esotericism visible in news coverage and how this has changed over time.

To explore this, Structural Topic Modeling was applied to a corpus of 4,394 news articles from German national news media (private and public broadcasters, qualitative and tabloid media) related to esotericism, collected via MediaCloud from 2013–2025. Articles were retrieved using the keyword stem "esoteri*". Based on model diagnostics, 15 topics were extracted and qualitatively interpreted using representative documents and FREX-weighted terms. The resulting topics range from "soft" topics like yoga or nature mysticism to "hard" topics like politically charged conspiracy-linked movements, as well as protest and mobilization.

The results reveal a clear shift in journalistic attention within esotericism-related topics. Lifestyle-oriented and culturally normalized practices, such as yoga and self-optimization, were highly visible prior to 2018 but declined substantially after 2020, particularly during the COVID-19 pandemic. In contrast, topics with explicit societal or political relevance—such as "Reich Citizen" and "völkisch" movements and alternative medicine—have increased in prevalence since 2020.

These patterns suggest that journalism has recognized the evolving positioning of esoteric actors over time. Coverage shifts from lifestyle-oriented practices toward topics in which esoteric groups increasingly seek social and political relevance. By amplifying reporting on these "hard" topics while reducing attention to "soft" lifestyle-oriented forms, journalism registers esoteric actors as potential challengers to the established knowledge order and orients public understanding toward their broader societal implications. In responding selectively to these developments, journalism engages in boundary work, distinguishing between culturally normalized practices and forms of esotericism that carry political, epistemic, or social relevance. This differentiation illustrates how journalism perceives and manages emerging challenges to its epistemic authority.

JOS22 Journalistic Content II.

PP 0602 Polarizing German media narratives on the Gaza war 2023–2025

Lena Von Zabern[1], Louisa Pröschel[1]

[1] Universität Hamburg, Fakultät für Wirtschafts- und Sozialwissenschaften Sozialwissenschaften Journalistik und Kommunikationswissenschaft, Hamburg, Germany

The crimes against humanity committed by Hamas-led groups on October 7, 2023, and the genocidal acts committed by Israeli authorities and security forces during the subsequent war on Gaza, are well documented and backed by international, non-governmental and research organizations (B'Tselem, 2025; OHCR, 2025; IAGS, 2025).

Yet, numerous studies indicate that western media are consistently falling short of maintaining the level of impartiality required in their coverage of Israel's military actions in Gaza (Centre for Media Monitoring, 2025; Mey, 2025; Richter, 2016). Among media professionals and scholars, there is a growing consensus that the level of bias in German media discourse on

Gaza is unprecedented, ultimately contributing to eroding trust in mainstream media coverage on the war (Fawzi et al.,2025; Goldmann, 2025; Sis, 2025; Brandenburg & Mahdhaoui, 2024). As low levels of media trust are frequently attributed to highly polarized issues (Blattner & Voelkel, 2023; Jackob et al., 2019), this raises a critical question: To what extent does German media reporting on the Gaza war employ frames that may deepen societal divisions and fuel public polarization?

To date, qualitative analyses on German media coverage of the Gaza war remain scarce. This study seeks to address this gap by examining the framing patterns (Entmann, 1993) employed by seven major German newspaper outlets from the conservative right (WELT, BILD, Focus, FAZ) to the liberal left (Spiegel, SZ, taz) over the first two years following October 7, 2023 until the ceasefire on October 10, 2025. Using a structuring qualitative content analysis, based on Kuckartz (2016) and Altheide (2000), on a stratified sample of 900 articles, this study investigates whether these frames vary by the political orientation of each newsroom, how they evolve over time, and whether the media's portrayal of the conflict contributes to public polarization or signals a broader ideological shift toward the political right.

Our preliminary findings confirm patterns found in international studies on Western media coverage of the Gaza war (Centre for Media Monitoring, 2025; Youmans, 2024; Zaboura, 2025): Across outlets, Israeli authorities and military sources dominate; Israeli victims are humanized, while Palestinian civilian casualties are often downplayed, conflated with Hamas and rarely linked to Israeli war crimes, obscuring responsibility. These patterns are more visible in German right-leaning media. Left-leaning media seem to adopt a more balanced stance towards 2025 but remain vague regarding historical context and genocide allegations. What stands out in German media coverage is the reframing of the Gaza war discourse in conservative-right newspapers into a highly polarized proxy debate about German migration. This framing strongly reflects patterns of affective polarization, characterized by an 'us-versus-them' narrative that contrasts 'terrorist migrants and their radical-left, antisemitic supporters' with 'reasonable Germans seeking to curb migration.' Rarely challenged in liberal-left newspapers, such a reframing of the Gaza war not only threatens to erode trust in mainstream media, but it relocates the Israel–Gaza war into a different highly-contested discursive arena, activating migration as a discursive trigger point (Mau et. al, 2024) that amplifies latent affective fault lines.

JOS22 Journalistic Content II.

PP 0603 American media coverage of sexual violence during warfare: The Case of Hamas Sex Crimes

Eytan Gilboa[1], Lilac Sigan[1]

[1] Bar Ilan University, Communication, Ramat Gan, Israel

This paper investigates American media coverage of sexual violence during modern warfare. It demonstrates serious controversies and deficiencies via the case study of the Hamas attack on southern Israel on October 7, 2023. This attack, along with the continuous holding of Israeli hostages, included vicious sexual violence against women and men, that were confirmed by a special UN investigation. Given that organized sex crimes have been silenced in past wars, it is crucial to study how weaponized sex crimes are exposed and how they are depicted in traditional and digital media. This paper studies how these specific war crimes were documented, investigated, and reported in mainstream media. Content analysis was used to trace reporting on Hamas' sex crimes from October 7, 2023, until the ceasefire of October 10, 2025. The media outlets that were studied were all situated in the US but of significant global influence: The New York Times, CNN, and the Associated Press. These outlets were chosen because of their liberal orientation and assumed to be more sensitive to sex crimes. The paper begins with a literature survey of the ways the American media covered or ignored sex crimes in recent wars including the Russia-Ukraine war and wars in the Middle East.

The analysis focused on:

- Coverage of early revelations of the sex crimes, reactions of local and international women's organizations, and the denial of these crimes.
- Publication of investigations of these specific crimes by professional bodies such as the UN, Dinah Project, Amnesty, and Israel Rape Crisis Center.
- Documentation of testimonies about these crimes in film (Screams Before Silence, 2024, Bearing Witness to the Massacre, 2025).
- Coverage of subsequent testimonies of released hostages that suffered sexual violence during their captivity.

PressReader was used to track coverage of these events. Keywords used were sex (or sexual) crimes, hostages, Gaza, Israel, and Hamas. The main finding was widespread omissions of events and published documents. The paper does presents rare investigations conducted by the media on the matter at the beginning of the war, especially the one published in the New York Times on December 28, 2023. It then presents the harsh critical responses to these publications and how they may have negatively affected the reporting patterns of additional new testimonies about these crimes. The results showed limited or no coverage of significant evidence, that derived from strong efforts to deny or efface testimonies of the victims, as part of information warfare. Despite the large body of available credible evidence, overall, news outlets created and disseminated a distorted and misleading reality of Hamas sex crimes. The distortion was motivated by both internal and external pressure in newsrooms, which derived from political agendas that called to deny these crimes, despite the evidence. The paper shows that these processes had affected even communication professionals and scholars. If coverage

of widely proven, premeditated sex crimes in warfare is directed by ideological predisposition, then truth is lost and so is the battle against such crimes in future wars.

JOS22 Journalistic Content II.

PP 0604 The DeepSeek chatbot as product, political instrument, and technological force: A comparative analysis of news discourses in the US, UK, and China

Johan Farkas[1], Dechun Zhang[1], Xiaomeng Lan[2]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark
[2] Beijing Normal-Hong Kong Baptist University, Department of Communication, Zhuhai, China

This paper presents a comparative, qualitative discourse analysis of news articles in major news outlets in the US, UK, and China about DeepSeek, a large language model chatbot developed in China that sparked massive media attention in early 2025. As generative AI systems increasingly function as both commercial technologies and objects of geopolitical contestation, journalistic coverage plays a key role in shaping how such systems are publicly understood, negotiated, and contested. This study addresses an empirical gap by critically analyzing media coverage of DeepSeek through a qualitative, comparative lens.

Empirically, the study analyses two months of news coverage—from 20 January 2025. where the Deepseek chatbot was launched, to 19 March 2025—published in *The New York Times* (US, n = 177), *The Guardian* (UK, n = 74), the BBC (UK, n = 36), and *The People's Daily* (China, n = 1,161). Full samples were included from the UK and US while a randomized sample of 10% was selected from *The People's Daily* to have comparable sample sizes. The resulting corpus of 403 articles (US: 177; UK: 110; China: 116) was analyzed through three rounds of qualitative coding: first, overarching themes were established inductively; second, quotes from across the material were grouped under the established themes, and third, conflicting discursive articulations were identified and analyzed through the theoretical vocabulary of Critical Discourse Analysis (CDA).

Guided by an overarching research question of how major news outlets in the US, UK, and China report on the launch of the DeepSeek chatbot and how it is discursively articulated, the study finds three overarching and conflicting discourses in news coverage across the US, UK, and China. First, DeepSeek is articulated as a *product* by a company, offering new opportunities to consumers, while bringing fierce new competition to financial markets, potentially threatening the market dominance of US firms such as Meta, Alphabet, and OpenAI. Second, DeepSeek is articulated as a *political Instrument* of a nation state, i.e. China, challenging established geo-political relations and stability. In the US and UK, DeepSeek is often articulated through direct Cold War parallels, for example as representing a so-called 'Sputnik moment' (i.e. comparable to the arms race between the US and the Soviet Union). Third, and finally, DeepSeek is articulated as a t*echnological force* with agency of its own, i.e. a transformative socio-technical agent that, through techno-determinist rhetoric, is portrayed as having the ability to drastically transform societies with little possibility of interference or oversight.

The article argues that these concurrent discursive constructions are not merely descriptive but perform important ideological work. By alternately commodifying, securitizing, and naturalizing DeepSeek, news media contribute to shaping the horizons of legitimate debate about AI governance, geopolitical competition, and democratic oversight. In doing so, they articulate generative AI not only as an emergent technology, but as a central object of contemporary geopolitical struggle.

JOS22 Journalistic Content II.

PP 0605 Journalism between West – and another West: Finnish news media's coverage of the exception law on the Eastern border

Mervi Pantti[1], Risto Kunelius[1], Nuppu Pelevina[1], Marko Ampuja[1]

[1] University of Helsinki, Media and Communication Studies, Helsinki, Finland

In autumn 2023, approximately 1,300 asylum seekers crossed Finland's eastern border. In the Finnish media it was quickly reported as a hybrid operation by Russia, testing Finland's security policy and to evoking uncertainty. Following a quick political debate, the Eastern border crossing points between Finland and Russia were temporarily closed. In spring 2024, after a longer political debate, the Finnish Parliament approved the Border Security Act as an exception law, which entered into force in July 2024.

Our paper examines the media debate surrounding the Border Security Act in Finnish daily news outlets and in the political press. Our analysis offers an example of how the current rapidly changing – and unpredictable – international security environment provokes public discussions where democratic societies are faced with a moment where they negotiate between their commitment to fundamental democratic values (human rights, international commitments) and the pressing, immediate concerns of national security. Our study offers an empirical analysis of the performance of journalism caught up in this dilemma.

Our data consists of 450 news articles, covering a wide range of political affiliations. Empirically we focus on how these position Finland simultaneously geopolitically (to the concrete, geographical West) and ideologically (to the democratic, universalised value community of the West). More concretely we ask: 1) How is Finland's position within the Western community constructed in news coverage of the Border Security Act? 2) What forms of epistemic governance do news media employ when shaping perceptions of Finland's Western identity?

Our findings reveal two discourses, both anchored to the institutional routines of news journalism: a security-political discourse and a rule-of-law discourse. Through appeals to different epistemic authorities, these discourses construct Finland as part of the West—either as a member of an increasingly consolidated Western security community or as part of a reference group of liberal-democratic Western democracies. These notions of "the West" differ both geographically and in terms of their core values.

In the first discourse, which emphasizes national security and defends the exceptional law, Finland is constructed as the outpost of the West. In the second discourse, which takes a critical stance toward the exception law, Finland's national identity and image are constructed as part of the Western democratic community—as a rule-of-law state that adheres to international agreements. The discourses and their designated epistemic authorities reflect not only divisions within the domestic political landscape but also the emergence of new alignments at the international level—within Europe and beyond. In the negotiation between national security and the rule of law, the news media continues to hold the power in framing the debate. However, by positioning the security discourse as hegemonic, the media highlight the role of the security elites as epistemic authority.

PP 0693 Conceptualizing and demarcating professional journalism: a systematic scoping review

Maaike Severijnen[1,2], Yael de Haan[1,3], Cok Bakker[2,4], Koen van Turnhout[5]

[1] HU University of Applied Sciences Utrecht, Quality Journalism in Digital Transition, Utrecht, Netherlands
[2] Utrecht University, Philosophy and Religious Studies, Utrecht, Netherlands
[3] University of Groningen, Media and Journalism Studies, Groningen, Netherlands
[4] HU University of Applied Sciences Utrecht, Value oriented Professionalisation and Practice, Utrecht, Netherlands
[5] HU University of Applied Sciences Utrecht, Human Experience and Media Design, Utrecht, Netherlands

Over the past decades, journalism has faced large transformations due to technological changes, the role of citizens in the media landscape, and the decline of established media organizations. These challenges have fueled the debate over the boundaries of journalism (Deuze & Witschge, 2020). At the same time, a substantial body of research has examined journalism as a profession, contributing to the delineation of its boundaries. Scholars have explored key concepts such as professional journalism, journalistic identity, ideology, roles, norms, and values (Deuze 2005; Hanitzsch & Vos, 2017).

Nevertheless, critical questions remain regarding the extent to which the profession is capable of maintaining its boundaries in the current changing media landscape (Carlson & Lewis, 2015). Especially in an era in which journalism encounters pressure from politicians, the public, and big tech, it is crucial to understand the core of journalism and its boundaries. Only then can journalism define its role in a changing society.

Addressing this issue requires a deeper understanding of the underlying threads influencing the profession, and how core concepts associated with journalistic professionalism, such as identity, ideology, roles, norms, values, are interconnected. Existing studies have often examined these in isolation.

To obtain these insights, we conducted a systematic literature review (scoping review) in journalism and media studies, focusing on academic literature that conceptualizes the profession of journalism in the past three decades. Our initial selection comprised 1455 papers, which we narrowed down to 234 using a strict protocol.

Our scoping review revealed that in journalism and media studies, the focus is often more on journalism as a collective entity: at the institutional or organizational level. Little attention is paid to the journalist as an individual. The synthesis of our scoping review shows that the boundaries of journalism are influenced by five different factors, at a collective and individual level, and within and outside the profession. The first factor relates to how external developments (economic, societal, and technological dynamics) alter the perceptions of journalism as a collective. The second factor pertains to the internal debate that influences the perspectives of journalism as a collective. Regarding the third factor, external developments also directly influence the individual. In the fourth factor, the internal debate within journalism influences the journalist as an individual. In the fifth factor, personal norms, values, and beliefs influence the views of the individual.

With this scoping review, we took a first step toward describing the influences and disentangling the core concepts of professional journalism. We conclude with a research agenda to further study this subject empirically.

PP 0694 Epistemic profiles: Tech journalists vs tech communicators

Irit Neumann[1], Zvi Reich[1]

[1] Ben Gurion University, Communications, Beer Sheva, Israel

Public understanding of technology becomes increasingly critical in modern knowledge societies, increasing audience dependence on proficient news-reporting. Reporting technology must cope with rapid innovations and complexities of translating technical issues for mass lay audiences. While previously this was mainly the domain of tech journalists, professional communicators with formal technological backgrounds take growing part in technology coverage. Still, both epistemic profiles remain notably under-explored.

This study explores expertise among both epistemic communities using the novel method News-Sorting. Currently, 21 interviews – 17 journalists and 4 communicators – were conducted. The target sample will include 20 journalists and 10 communicators, covering roughly 25% of journalists' and 50% of communicators' populations. Interviewees were asked to rank a sample of their recent publications (N = 25) according to their complexity levels while reflecting on their ranking. To ensure elicitation of the most advanced manifestations of expertise, study covers highly experienced and proficient reporters and communicators (according to field-experts), in spirit of expertise research.

Preliminary findings

While both tech reporters and communicators use generic journalistic practices, e.g., reliance on expert sources, they routinely use some unique practices and perceptions, that characterize the technology "microculture" (Ericson et al., 1989), elaborated in the following themes:

Dual epistemic stance

Tech reporters establish professional authority through subtle forms of self-aggrandizement by disdaining competitors' work. This tendency may reflect internalization of the competitive high-tech industry mindset, emphasizing self-efficacy and authoritativeness (Tassabehji et al., 2024). Conversely, reporters tend to downgrade their own knowledge compared to expert-sources, possibly to cultivate privileged relationships with insider tech-company sources. Communicators, however, highlight their advantages compared to expert-sources, yet express epistemic humility toward journalistic writing skills, ranking presentation of information as more challenging than understanding the information itself. Yet, communicators insist this epistemic gap tends to shrink throughout the years.

Experiential and sensory knowledge

Some reporters acquire experiential knowledge by actively tinkering with tangible objects (products, applications, etc.), thereby developing physical sensory experiences. They actively apply practices of domain specialists to validate the quality and functionality of technological objects reviewed. This knowledge is quite rare in journalism since journalists are considered "interactional-experts", while physical sensory knowledge characterizes "contributory-experts" (Collins & Evans, 2007). Still, communicators are enriched with technological tools unused by journalists. One unusual example involved a communicator who self-learned to develop a designated script for finding patterns within a database of thousands of documents received from a source.

Analytic capacity

(This specific theme was so far limited to reporters) Most reporters show surprisingly sophisticated proactive and analytical expertise, based on their pattern recognition capacities. For example, a reporter experienced in wartime financial investments anticipated a shift from immediate security-technology to a future fintech boom, by comparing historical wartime investments and considering the decline of financial reservoirs during the October 7th war.

Discussion

Findings not only contrast prevailing critique dismissing tech journalists as gullibly relying on press releases (Chyi & Lee, 2017) but also highlight sophisticated expertise-types rarely attributed to journalists, challenging the dichotomous division between interactional and contributive expertise, which may stay insufficient to halt the rising phenomenon of tech communicators.

JOS23 Journalists II.

PP 0695 Effective communication for peace - Collaboration between research and practice

Olivia Rademacher[1], Verena Waßink[1], Sonja Kretzschmar[1], Christoph Neuberger[2], Annika Sehl[3]

[1] Universität der Bundeswehr München, Institute of Journalism, Munich, Germany
[2] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany
[3] Catholic University of Eichstätt-Ingolstadt, Chair of Journalism Studies with a focus on media structures and society, Eichstätt, Germany

In view of challenges like digitalization or the reporting about wars and conflicts, media organisations are increasingly seeking advice and evidence-based knowledge from communication scholars (Meier 2020, 7). After all, research findings

only become effective when they are applied to real problems (Wunderlich et al. 2025, 1695), while practical experience provides feedback and new questions that make research more relevant, precise and innovative (Grubenmann 2016; Hanisch & Ollrog 2025, 55).

This paper evaluates the reciprocal relationship between academics and their research output and practice within the framework of an international research project in countries characterized by conflicts. Based on the approach of Meier and Schützeneder (2019), researchers and practice partners have collaborated over several years as 'participating cooperation partners' (Schützeneder et al. 2022, 125) to develop a theoretically based and innovative concept for journalism that is conflict-sensitive, de-escalating and meant to support peacebuilding.

Building on this framework, we address the following research questions: To what extent can such projects effectively benefit from academic expertise, and which factors facilitate – or impede – the transfer of theory into practice?

The collaboration between academia and practice was examined empirically in our project in a multi-stage and mixed-method process: (1) First, regular meeting protocols were analysed using qualitative secondary analysis to identify different phases and fundamental challenges of the cooperation. (2) Based on this, twelve practice partners and eight scholars were interviewed and analysed qualitatively using a semi-guided questionnaire (Bryman 2016).

The analysis showed that practitioners perceived cooperation with the academics as making an important contribution to the research project. The contributions consisted primarily of personal conversations and discussions, the preparation of thematically relevant scientific papers and presentations of the scholars' current work and key research findings. But that the cooperation also presented several challenges. In addition to organisational issues, differences in working methods and communication problems between the practice and the academic teams became particularly apparent. As a result, procedures had to be repeatedly adapted and optimised during the course of the project, for example by adapting the type and frequency of the cooperation. In order to support comparable future projects and mitigate potential problems at an early stage, we propose a theory-based and improved working strategy regarding the facilitate and impede factors we have identified, for example in various areas of organisational, content-related and communicational aspects. These are intended to improve cooperation between academic and journalistic teams in the field, thereby creating improved conditions for a successful transfer of theory into practice.

PP 0696 From bias claims to death threats: Understanding journalists' norm perceptions and responses to online attacks

Emma Van Der Goot[1], Kathleen Beckers[1], Dina Strikovic[1]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Online attacks, by the public or political elites, towards journalists are increasingly common. While some criticism is a legitimate and healthy element of public debate, the nature of media criticism has taken on a more worrisome tone. Journalists are increasingly faced with insults, sexism, and threats, particularly in the online environment. Social media offers citizens unprecedented opportunities to directly target journalists with little consequences. These attacks are found to have far-reaching implications for journalists, including feelings of fear, self-censorship, and ultimately (considerations of) leaving the profession. At the same time, considering the routine nature of attacks, it is argued that journalists learn to tolerate and accept them. Some scholars even argue that attacks have become a 'normal' aspect of the profession. Yet, this notion of normalization remains under-theorized: for whom, and which forms of online attacks are considered normal is not well understood. This paper addresses this gap by examining journalists' injunctive and descriptive norms towards online attacks, that is their evaluation of the appropriateness and perceived prevalence of different forms of online attacks. Understanding these norms is essential because they may shape how journalists respond to online aggression: perceptions of inappropriateness may lead journalists to counteract attacks whereas perceptions of prevalence may cause journalists to ignore them. We therefore also investigate how norm perceptions translate into behavior. We pose the following research questions:

RQ: *(1) How do journalists perceive the appropriateness and prevalence of online attacks, and (2) how do these perceptions explain how they respond to them?*

To investigate these questions, we conducted an experiment with Dutch journalists (N = 171). We presented journalists with a critical statement coming from a social media account targeting a journalist (both actors were anonymized). We manipulated the content of the message, either containing a mild form of criticism, harsh criticism, a personal insult, sexism, or threat. We explore whether journalists' norms differ depending on the type of online attacks, as well as their background characteristics, including gender, the themes they are working on, and political leaning. We expect to find that female and left-wing journalists perceive attacks as more common than their counterparts yet consider them to be less appropriate. We also anticipate that political journalists, and those working on polarized themes will perceive attacks as more normal (more frequent and appropriate). Furthermore, we investigate how journalists' norms influence how they respond to the attacks (i.e., do they engage, ignore, or report it?). We hypothesize that perceptions of prevalence cause journalists to ignore attacks, whereas perceptions of inappropriateness lead them to counteract them. Together, these

finding will provide crucial insights into the normalization of online attacks and how journalists respond to them. In the coming months, we will pre-register and analyze the data and we will be able to present the results during the conference in Brno.

PP 0697 From handshakes to protocols: The changing relationship between journalists and tech companies

Stefan Baack[1], Raul Ferrer Conill[2], David Cheruiyot[3]

[1] Independent, Independent, Berlin, Germany
[2] University of Stavanger, Department of Media and Social Sciences, Stavanger, Norway
[3] University of Groningen, Media and Journalism Studies, Groningen, Netherlands

The proliferation of generative AI products represents a fundamental shift in the relationship between journalism and tech companies. While previously, tech companies sought to control the means for distributing journalistic content via search engines or social media platforms, they now increasingly summarize this content and incentivise users to remain within their product interfaces. This threatens to further erode the relevance and autonomy of professional journalism (Simon, 2022).

The success of generative AI products was made possible in part because tech companies exploit technical standards designed around a "handshake agreement": website owners allow crawlers to collect their data in exchange for visibility in search engines (Schellekens 2013). However, the robots.txt protocol – the technical manifestation of this agreement – puts a significant burden on website owners and is inadequate for managing AI crawlers, resulting in what Longpre et al. (2024) call a crisis of consent regarding web data accessibility. News publishers have proactively been trying to push back against this (Fletcher 2024), but given the imbalances inherent in robots.txt journalistic autonomy might continue to suffer (Voinea 2025).

In response, several new technical standards have been proposed or are being developed to manifest new social contracts for governing AI crawlers. Possibly the most consequential initiative to come up with this standard is the "AI Preferences" working group of the Internet Engineering Task Force (IETF), one of the most important standards organizations for internet technology (https://datatracker.ietf.org/wg/aipref/about). The working group develops a "vocabulary" that should provide content creators more fine-grained and machine-readable ways to express how their content can be used for AI products.

This paper draws on interdisciplinary perspectives to argue that journalism studies must look beyond the direct usage of AI tools to study how the infrastructural conditions of newsmaking are being rewritten. We further conduct an in-depth thematic analysis of the IETF working group's draft proposals and related public mailing list discussions, which bring together representatives from AI companies, news publishers, policy makers, and NGOs. Our goal is to analyze how changes introduced in the draft proposals reveal major conflicts between the participating parties, and what these changes mean for journalism.

Our study finds that most conflicts revolve around the question of where to draw the line between "search" and "summary." News publishers and other content creators want to establish a clear distinction between traditional search engines and generative AI products, while tech companies seek to blur the difference. The results are attempts to define "search" not as a product category (as in "traditional search engine") but as a question of output formats. But this leaves the question, to what extent is the output directing users to the original source? We conclude that the outcome of these negotiations (between "search" and "summary") will impact the future economic model of journalism, but also more fundamentally, the extent to which journalism remains the primary gatekeeper of publicly relevant information.

PP 0698 Inside the algorithmic newsroom professional perspectives on artificial intelligence

Paola Palomino Flores[1], Dolors Palau-Sampio[2]

[1] Universidad Peruana de Ciencias Aplicadas - UPC, Communications, Lima, Peru
[2] Universitat de València, Department of Theory of Languages and Communication Sciences, Valencia, Spain

Artificial intelligence (AI) is increasingly reshaping journalism not only at the level of newsroom routines, but also in terms of professional authority, ethical responsibility, and epistemic control. While much of the debate has emphasized efficiency, automation, and innovation, less attention has been paid to how AI reconfigures journalists' sense of agency and their capacity to account for editorial decisions. This paper presents a synthesized contribution from a doctoral research project, that examines how AI influences journalism and journalists' professional perspectives in contemporary digital news environments.

The study adopts a mixed-methods research design aimed at capturing both the discursive construction of artificial intelligence in journalism and its lived professional implications. It combines a longitudinal content analysis of 8,003 news articles published between 2020 and 2024 in leading media outlets in Spain and Peru, used as an analytical contrast between distinct media-system configurations. The content analysis maps structural patterns in AI-related coverage, including thematic

trends, editorial positioning, and dominant frames over time. This quantitative mapping is complemented by a qualitative interpretive analysis of frames, metaphors, and narrative modes through which AI is represented in journalistic discourse.

In order to contextualize these findings, the study incorporates 42 semi-structured interviews with journalists, editors, and newsroom professionals. Rather than constituting a separate empirical block, the interviews function as an interpretive layer that bridges media discourse and professional practice, enabling a systematic examination of how AI is understood, negotiated, and contested in everyday newsroom decision-making. The qualitative findings reveal a persistent pattern of professional ambivalence: while participants recognize the instrumental value of AI for automating routine tasks and enhancing data-processing capacities, they also express concerns regarding algorithmic opacity, the erosion of editorial autonomy, deskilling processes, and the dilution of responsibility.

Overall, the study identifies a structural gap between media discourses that frame AI-driven innovation as inevitable or inherently progressive and journalists' professional realities, which are marked by uncertainty, negotiation, and ethical tension. By conceptualizing professional ambivalence as a structural feature of algorithmically mediated newsrooms, this paper contributes to ongoing debates on journalistic authority, ethical accountability, and professional agency in digital journalism. By foregrounding professional perspectives while embedding them in media discourse analysis, the paper conceptualizes artificial intelligence as a site of ongoing professional negotiation rather than as a neutral technological advancement. It argues that the impact of AI on journalism is shaped less by the technology itself than by organizational cultures and institutional arrangements, where questions of agency, accountability, and professional authority are actively contested and redefined.

JOS24 AI, Platforms and Journalism

PP 0699 How news finds you on TikTok: Tracing algorithmic exposure and engagement via user data donations

Lion Wedel[1]

[1] Weizenbaum Institute for the Networked Society, Digital News Dynamics, Berlin, Germany

The impact of the TikTok recommender system on democratic discourse remains a critical research gap. While its technical architecture is well known (Liu et al., 2022), the social consequences of how individuals encounter news and political information remain unclear. Additionally, young audiences increasingly acknowledge alternative information sources beyond professional journalism while still applying journalistic normative standards (e.g., Anter & Kümpel, 2023). The necessity of broadening the concept of news in empirical research has been demonstrated in empirical work has been demonstrated using browser trace data on news and political information (e.g., Loecherbach et al., 2024). However, for social media platforms, and TikTok specifically, we have yet to understand how much, and in what forms of interaction and consumption, TikTok users encounter journalistic and non-journalistic information. We pose two research questions:

RQ1: What are the typical exposure and engagement patterns of information from conventional and unconventional news sources that appear in user TikTok feeds?

RQ2: Are those patterns significantly different between conventional and unconventional news sources?

We employ a multi-method approach using a dataset of 49 TikTok Data Download Packages (DDPs) donated by German participants and linked to survey data. The DDPs contained 1,992,622 references to unique videos, of which the necessary meta- and content data for classification were available for 1,677,759 (84,2%) of the videos. Our analysis differentiates between *exposure patterns* (the trace of suggested videos) and *engagement patterns* (active engagement measures including watch time, likes, and shares).

Content classification is conducted via automated multimodal analysis using a Large Language Model (e.g., Qwen3-VL). Preliminary tests show high reliability (ICR > 0.75) against a human-coded dataset (n = 100). Professional journalistic accounts are identified via the *database for public speakers (DBÖS)* via username matching. Finally, we adapt process mining to the event logs (i.e. DDPs) to explore the "trace dynamics" of informative content—identifying how different user groups (segmented by age, gender, and political leaning) encounter and engage with journalistic vs. non-journalistic information.

This work-in-progress contributed to a better understanding of information dynamics on TikTok, specifically the exposure and engagement patterns of users with news and knowledge content from journalistic and non-journalistic sources.

Data collection has been completed, and the first pretests for the automated content analysis have been conducted. Results will be available by early summer, primarily constrained by the processing time for automated content classification of 1,677,759 videos.

PP 0700 The relevance of human factor and transparency: Perceptions of artificial intelligence and information credibility in news production. Results from an online survey in Spain

Rodrigo Marinas[1], Marcel Mauri-de los Rios[1], Júlia Vilasís-Pamos[2], Ruth Rodríguez-Martínez[1]

[1] Pompeu Fabra University UPF, Communication Department, Barcelona, Spain
[2] University of the Balearic Islands, Department of Applied Pedagogy and Psychology, Palma de Mallorca, Spain

One of the critical shifting grounds in journalism studies, regarding the theme of ECREA 2026, is the impact of artificial intelligence (AI) in news production and the audience perceptions of those changes. To promote transparency and accountability in the media, it is essential to study the beliefs of the public concerning how AI tools are implemented in content production processes, especially in countries like Spain, marked by a low level of trust in the media brands. In a context where a growing part of the population is integrating these technologies into their daily lives, the objective of this research is to analyse the perception of spanish audiences regarding AI in journalism in four main aspects: knowledge, scope, application preferences and degree of comfort and credibility. An online survey of 16 questions was conducted by Yougov to a representative sample of 2,004 residents in Spain in April 2025, considering variables such as the familiarity with AI, the level of agreement about its objectivity, the different uses in news production or the degree of credibility given to information verified by AI (versus a journalist). Among the main results, almost half of the Spanish population considers themselves to be unfamiliar or very unfamiliar with AI (46%), although 77% are aware that they interact with it on a daily basis. On the other hand, a significant proportion endorse the integration of AI in newsrooms, mainly as a support tool for journalists (in tasks as translations or text improvements). Furthermore, the human factor is a key component in news consumption: the credibility of a news item verified by a journalist (56%) is almost double that of one verified by AI (30%). Finally, 80% of respondents demand transparency from the media regarding the use of AI. Significant relations are observed between these perceptions of AI and educational level, gender, income and age. As previous research concludes, audience attitudes towards the role of AI in journalism emphasise the human component of the journalist in the creation, supervision and verification of news.

JOS24 AI, Platforms and Journalism

PP 0701 Artificial intelligence in European fact-checking: Shifting journalistic routines and hybrid practices

Florence Oliveira[1], Adriana Gonçalves[1]

[1] University of Beira Interior, LabCom, Covilhã, Portugal

Advances in Artificial Intelligence (AI) are reshaping the foundations of journalistic practices, particularly fact-checking, contributing to shifting professional routines, roles and boundaries. Over recent years, fact-checking has gained prominence as a distinct journalistic activity in response to information overload and the rapid spread of misinformation. Within this context, verification initiatives have been increasingly pressured to respond more efficiently, opening the way for the adoption of automated technologies.

This study examines how four European fact-checking projects — Polígrafo (Portugal), Maldita.es (Spain), Vrai ou Faux from FranceInfo (France), and Facta (Italy) — are incorporating, or choosing not to incorporate, AI into their work processes, and the implications this has for journalistic routines and professional practices. The research adopts a mixed method, with a qualitative approach based on 13 semi-structured interviews with professionals from these organisations and a quantitative approach with the analysis of 1711 fact-checks published during the a period of alternate weeks between may and october 2024.

The present research aims to identify the stages of the verification process in which AI technologies are employed, to understand their impact on the organisation of work, and to assess whether automated systems are perceived as potential substitutes for human professionals. The central question is whether fact-checkers can be replaced by AI. If not, how is AI transforming the work of these professionals?

The findings reveal distinct paths of technological adoption shaped not only by technical affordances but also by journalistic values, organisational models and professional cultures. Polígrafo uses AI during the fact-checking phase, utilising specific online tools. Maldita, on the other hand, integrates AI into various verification stages, including the initial content screening (collection phase), cross-referencing data with previous databases (fact-checking phase) and generating standard responses via a chatbot to interact with the audience (distribution phase). These solutions accelerate processes and structure a more efficient, data-driven routine. FranceInfo's Vrai ou Faux section takes a more artisanal approach, considering human judgement irreplaceable at all stages of verification. Here, AI is present sporadically in the form of ChatGPT, which supports small tasks. Finally, in contrast, Facta is the only agency to reveal that it does not use any AI tools.

Rather than pointing towards a uniform trajectory of technological replacement, the results highlight hybrid configurations in which human expertise and automated systems are interconnected and complementary, each performing distinct

functions within the verification process. By focusing on fact-checking as a key journalistic practice, this study contributes to broader debates on the future of journalism in the AI era, showing how shifting technological grounds are redefining professional skills, ethical boundaries and editorial accountability.

Artificial Intelligence; Fact-Checking; Journalistic routines

JOS24 AI, Platforms and Journalism

PP 0702 Tracing sociotechnical imaginaries of digital journalism, 1995–2025

Karlijn Achterberg[1], Frank Harbers[1], Rik Smit[1], Scott Eldridge II[1]

[1] University of Groningen, Media and Journalism Studies, Groningen, Netherlands

This paper explores the discursive construction of sociotechnical imaginaries about journalism and technology from the mid-1990s onwards. Defined by Jasanoff (2015: 4) as "collectively held, institutionally stabilized, and publicly performed visions of desirable futures," we scrutinize the pivotal role these discourses and the imaginaries they convey have played in shaping and restricting which futures of journalism journalistic actors envision, adopt, and resist. This paper intervenes with a much-needed critical-historical perspective on the socio-political dynamics of discourses about new technologies and journalistic innovation that challenges the idea that digital innovation is inherently good, naturally technology-driven, and that its direction is inevitable and unavoidable (Godin, 2015). We argue instead that technological innovation for journalism has been socially constructed as a panacea within future-oriented discourses (Harbers, 2024).

To do so, we unpack the concept of the sociotechnical imaginary in terms of both its explanatory power and its heuristic use. Exploring the performative nature of sociotechnical imaginaries and the way competing imaginaries are strategically exploited by actors with diverging interests (ranging from 'techbros' and politicians to publishers and journalists). We focus on the discursive interaction between the future-oriented nature of such imaginaries and the way they offer a strategic reinterpretation of past developments within journalism to convince and naturalize their "diagnosis that points to the need for a fundamental change in the shape of pressure to innovate" (Hepp and Loosen, 2022: 118).

This is then followed by a comparative analysis of defining critical discourse moments since the 1990s (e.g., the emergence of the early web; web 2.0 and social media; smartphones and digital platforms; and (Gen)AI) in the Netherlands and Norway. Our corpus consists of a wide selection of public debates on journalistic innovation and journalism's future within national newspapers and magazines as well as specific trade journals and industry websites, such as Villamedia, the Dutch Journalism Fund, Fritt Ord and journalisten.no. This Northern-European focus addresses the emergence of these imaginaries within democratic-corporatist media systems, where the tension between commercial drivers and public service conceptions of journalism further entangle the relationships between news media and technology.

From our analysis, we illustrate how imaginative discursive work (i.e., the formulation of sociotechnical imaginaries in news texts) has had material and practical implications for the historical development of newspapers in the digital age. Our study further informs specific debates about technological innovations, analyzing the legitimization of their adoption in light of journalism's imagined future. From a critical historical perspective, by challenging the self-evidence with which the need and benefit of journalistic innovation is presented, we can show the role innovation discourses play in actively shaping journalism's future. Highlighting this, we aim to better inform the emergence of a more inclusive, democratic and pluriform debate about the nature of journalistic innovation, digital technologies, and the future of journalism.

JOS25 Alternative Media

PP 0712 Socio-demographic and professional backgrounds of alternative media authors in Germany

Tilman Klawier[1]

[1] University of Hohenheim, Institute of Communication Science, Stuttgart, Germany

Research on alternative media has seen a strong revival, driven by the emergence of various new outlets in many countries that position themselves against the dominant mainstream media. While a lot of studies have examined the content and audiences of these outlets, little is known about the producers of contemporary alternative media outlets. Traditionally, alternative media have valued diversity and participation, fostering open structures that should enable amateurs with various backgrounds to engage in the process of news production. However, it is questionable how much these ideals remain today. Some prominent alternative media authors have worked or still work for mainstream media. This may be indicative of a general trend resulting from two significant developments in the alternative media landscape. First, the label 'alternative media' has been appropriated by right-wing outlets. Though these outlets also claim to provide a corrective to the mainstream media, their perspectives and editorial principles can be expected to differ from those of original alternative outlets commonly associated with leftist social movements. Second, the alternative media landscape is marked by a convergence with the mainstream that is also observable in more traditional alternative outlets (Kenix 2011). Consequently, they may rely more on professional journalists rather than involving marginalized groups that are excluded from the news media. This

study therefore asks what backgrounds the authors of alternative media have today, and how these differ from mainstream news, focussing on the particular context of Germany.

The study is based on a systematic analysis of the backgrounds of the authors from the two most popular alternative outlets of the political right (Nius, Tichys Einblick) and left (NachDenkSeiten, Jacobin). Background information is collected for all authors who wrote at least three articles in 2025 (n = 232) using public data sources (e.g., LinkedIn), and analyzed with a coding scheme. We examine the size, gender ratio, and mean age of the author pools. Additionally, we investigate in which professional sectors and for which specific employers the authors have worked before or still work. To date, the data collection is 90% finished.

Preliminary results show that men are overrepresented across all outlets to a greater extent than in mainstream media. With respect to age, there are differences within both ideological camps, suggesting that the outlets target different audiences. Analyses of the authors' professional backgrounds show that many have written for mainstream media. This is particularly true for authors from right-wing outlets, many of whom have worked for conservative mainstream media, though only a minority continues to do so. Furthermore, the data reveal that many authors also write for other alternative media, a practice that is more prevalent among left-wing outlets. Apart from that, left-wing outlets have more politicians and scholars among their authors, while right-wing outlets have a higher share of authors from the business sector. Overall, the findings suggest that popular German alternative media on both sides of the ideological spectrum have highly professional content producers. However, alternative media appear to differ from mainstream media in the more prominent role of partisan pundits.

JOS25 Alternative Media

PP 0713 Political alternative media in Germany: Prevalence, segmentation, and democratic distance (2021–2025)

Heidi Schulze[1], Simon Greipl[1], Julian Hohner[1], Diana Rieger[1]

[1] LMU Munich, Department of Media and Communication, Munich, Germany

In June 2024, Germany's Federal Ministry of the Interior banned the media company behind *Compact* magazine, citing the dissemination of racist, conspiracy-driven, and anti-democratic content. Although the Federal Administrative Court later overturned the ban on procedural grounds, the case highlights the continuing relevance of political alternative media in democratic public spheres. Despite comparatively small audiences, such outlets can shape public discourse, mobilize supporters, and undermine trust in democratic institutions, particularly through scandalization, emotionalization, and narratives of censorship.

Political alternative media have long been linked to radical mobilization. In digital environments, antagonistic outlets - especially on the far right - have proliferated and professionalized, often mimicking journalistic formats while being guided primarily by political rather than journalistic norms. They position themselves as correctives to a perceived "mainstream" and promote ideologically framed interpretations of current events. Yet there is a lack of longitudinal population-based research examining how political alternative media use develops over time and how it relates to multidimensional political attitudes linked to radicalism and extremism.

Based on previous research, this paper asks broadly: *How prevalent is political alternative media use in Germany between 2021 and 2025, how has it changed over time, and to what extent is it associated with ideological segmentation, right-wing extremism affinity, and anti-democratic attitudes?*

The analysis draws on five waves (2021–2025) of the *MiD* survey, a repeated cross-sectional study representative of the German population. Political alternative media use was measured via self-reported frequency (1 = *never* to 5 = *very often*) of using five outlets categorized as far-right (Compact, Junge Freiheit, Tichys Einblick) or far-left (Junge Welt, Jungle World) (e.g., Kristensen et al., 2023). Based on their consumption patterns, respondents were classified as exclusive far-right users, exclusive far-left users, or cross-cutting users. We analyze prevalence, intensity, exclusivity, and ideological overlap over time, and link usage patterns to multidimensional measures of right-wing extremism affinity and anti-democraticy attitudes (full scales and measures explained in the methods report as developed by Farren et al., 2025).

Results show that political alternative media use remains a minority phenomenon. From 2021 to 2025, an average of 6.2% of respondents reported at least occasional use, while fewer than 2% reported frequent use; overall levels were largely stable. Far-right alternative media dominated the landscape throughout, both in absolute terms and within the group of alternative media users.

At the same time, usage became increasingly ideologically segmented. Across both ideological camps, the share of exclusive users-consuming outlets from only one ideological spectrum-increased over time. Far-right alternative media were most frequently used in isolation, indicating increasingly closed and homogeneous usage patterns, while cross-ideological use occurred only among small and volatile groups.

Finally, alternative media use is strongly associated with radical and anti-democratic attitudes, particularly among exclusive users. Among far-right users, right-wing stances and anti-democratic attitudes increased substantially over time. Overall, the findings suggest that political alternative media in Germany are not expanding broadly but consolidating within closed

ideological segments, reinforcing anti-democratic attitudes and making them structurally relevant actors in radicalization-prone information ecosystems despite their limited reach.

JOS25 Alternative Media

PP 0714 Stability on shifting grounds: Funding rhetorics and resilience in Portuguese alternative media

Cátia Ferreira[1], Carla Ganito[1]

[1] Catholic University of Lisbon, Human Sciences Faculty, Lisbon, Portugal

Journalism faces a global structural crisis as market-driven models collapse under digital disruption and democratic backsliding (Pickard, 2019; UNESCO, 2022). In Southern Europe, this crisis is amplified by systemic fragilities: low subscription rates, late digital adoption, and weak institutional support (Hallin & Mancini, 2004; Papathanassopoulos & Miconi, 2023). Portugal exemplifies these vulnerabilities, where independent outlets operate in a "structural void" without robust state or philanthropic safety nets. Against this backdrop, alternative media become critical laboratories for experimenting with funding models that reconcile autonomy with survival.

This exploratory study investigates how Portuguese alternative outlets articulate resilience through funding rhetorics, using the Actor-Structure dialectic (Sandoval & Fuchs, 2010) as a theoretical lens. Alternative media are not "pure" entities; they exist in constant negotiation between structural constraints (legal status, financial precarity) and actor-driven ideals of independence and dissent (Atton, 2002; Downing, 2001; Fuchs, 2010). Funding models emerge as the primary site where these tensions materialize, shaping organizational strategies and audience relationships.

The study adopts a qualitative methodology, employing thematic analysis (Braun & Clarke, 2006; 2021) to examine media self-discourse on financial sustainability. Case selection draws on Ganito & Ferreira's (2024) mapping of the Portuguese alternative media landscape, which identified Fumaça, Divergente, and Gerador as emblematic of distinct sustainability logics: militant independence, professional rigor, and cultural hybridity. Data were analyzed across four dimensions to capture how funding rhetorics mediate the Actor-Structure tension: Foundations (ownership, revenue mix, transparency), Narratives (mission, antagonism), Relations (audience naming, calls-to-action), and Aesthetics (interface design, tone).

Preliminary findings indicate three rhetorical logics: Fumaça frames grants as a temporary "necessary evil" en route to full community funding, mobilizing audiences as co-strugglers; Divergente emphasizes methodological transparency and professional rigor, positioning supporters as enlightened patrons sustaining investigative depth against market failure (Teixeira & Jorge, 2021); Gerador adopts a hybrid model, blending journalism with cultural and educational products, constructing audiences as cultural citizens who gain lifestyle benefits (Cagé, 2016). These strategies reveal funding as an ethical and performative practice, redefining sustainability under structural voids.

By situating Portugal within the Polarized Pluralist Media System (Hallin & Mancini, 2004), this study contributes to comparative debates on media resilience in Southern Europe and informs policy frameworks that treat journalism as a public good. Ultimately, it argues that funding rhetorics function as adaptive strategies on shifting grounds, offering insights into how alternative media innovate at the intersection of ethics, economics, and audience engagement to envision inclusive futures.

JOS25 Alternative Media

PP 0715 Who qualifies as a journalistic media outlet? Insights from the EMFA and the media sector

Sara Pérez-Seijo[1], Rubén Rivas-de-Roca[1]

[1] Universidade de Santiago de Compostela, Communication Sciences, Santiago de Compostela, Spain

The media ecosystem has undergone profound transformations over recent decades. The reconfiguration of the communicative environment has coincided with the steady rise of media intermediaries, such as search engines and social networks, which have fundamentally reshaped the media landscape and generated new tensions among actors, particularly between news organisations and digital platforms.

Within this evolving context, research points to a more diverse media environment, albeit one characterised by lower levels of public trust than traditional news offerings. Distrust is especially pronounced in media systems with high levels of social media news consumption, alongside a growing tendency toward intentional news avoidance. These dynamics underscore the challenges faced by professional journalism in sustaining audience engagement and institutional legitimacy amid an abundance of competing information sources.

Simultaneously, the emergence of pseudo-media outlets or interloper media has further complicated journalism's role. These actors appropriate the visual and discursive conventions of established news media while contesting core journalistic norms, often fostering polarisation, provocation, and politically driven narratives presented as public-interest news.

In this scenario, the boundaries of journalism become increasingly blurred, prompting extensive academic debate over what constitutes a journalistic media outlet in the contemporary media ecosystem. This boundary-setting is also intertwined with regulatory initiatives, such as the entry into force of the European Media Freedom Act (EMFA) in 2025, which defines a media service as an entity that provides "programmes or press publications, under the editorial responsibility of a media service provider, to the general public, by any means, in order to inform, entertain or educate".

Against this backdrop, the present study examines how journalistic media are defined and how boundaries are drawn between them and emerging actors that, positioning themselves as new media, introduce external norms and practices that challenge the profession. Grounded in the EMFA, the analysis incorporates the perspectives of academics, journalists, and representatives of professional media associations as key stakeholders in the sector. Three research questions guide the study: Which variables shape the definition of a journalistic media outlet? What distinguishes a journalistic media outlet from an interloper or pseudo-media actor? Should the definition of a journalistic media outlet be open or closed? Methodologically, the study adopts a qualitative approach based on a thematic analysis of the EMFA and a focus group with media experts.

Preliminary findings suggest that the EMFA adopts a predominantly economic approach, framing the issue in terms of market failures and outlining actions for regulatory bodies. While focus group participants question this economic framing, they nonetheless converge on the relevance of key normative principles, including journalistic independence, editorial accountability, and transparency. They further argue that professional mediation, including verification, contextualisation, and ethical standards, constitutes the key boundary separating journalistic media from interloper media and other emerging actors, often associated with political or economic intentionality and limited accountability. Finally, participants advocate for an open, adaptable definition of journalistic media that remains responsive to ongoing technological and organisational change while acknowledging its inherently contextual and purpose-driven nature.

PP 0716 Metamorphosis of journalistic practice on YouTube: The Turkish experience

Can Ertuna[1], Ozan Aşık[2]

[1] Bahcesehir University, New Media, Istanbul, Turkey
[2] Charles University, Institute of Sociological Studies, Prague, Czech Republic

This study examines the changes in journalistic practice on YouTube within Turkey's authoritarian media environment, where traditional journalism has been structurally captured through political, economic, and regulatory pressures. As mainstream media outlets have lost autonomy and credibility, a growing number of professional journalists have migrated to YouTube, using the platform as a primary space for news commentary, political analysis, and public debate. Rather than treating YouTube merely as an alternative distribution channel, this study conceptualizes it as a digital medium that actively reshapes journalistic norms, labor, and professional identity.

The research asks three interrelated questions: How does journalistic practice change when YouTube becomes the primary site of news production and dissemination? How do platform governance, algorithms, and monetization strategies reshape journalistic autonomy and editorial decision-making? To what extent does YouTube journalism offer genuine independence from political control in an authoritarian context or reproduce new forms of constraint?

The study is based on semi-structured, in-depth interviews conducted between March and July 2024 with 14 prominent Turkish journalists who transitioned from legacy media to YouTube. These journalists had extensive professional backgrounds in television, print, or radio journalism and collectively reach audiences comparable to, or exceeding, those of mainstream news organizations. The interviews were thematically analyzed to capture changes in journalistic roles and perception of the occupation, content production routines, audience relations, and strategies of self-branding, as well as structural constraints, censorship, and self-censorship.

The findings show that YouTube enables journalists to bypass institutional newsroom hierarchies and editorial censorship, granting greater control over content and direct engagement with audiences. However, this autonomy is conditional. Journalistic labor on YouTube becomes individualized and entrepreneurial, collapsing the division of labor typical of news organizations. Journalists are compelled to adopt self-branding strategies, monitor audience metrics, and tailor content to opaque algorithmic preferences. Algorithmic visibility and monetization pressures influence topic selection, tone, and headline framing, often privileging emotionally charged or controversial content over conventional news values.

We argue that journalist YouTubers in Turkey constitute a "new mainstream" that simultaneously resists state-driven media capture while becoming structurally dependent on platform capitalism. This dual dependency reshapes journalistic practice, shifting it away from institutional watchdog journalism toward hybrid forms of commentary, aggregation, and opinion leadership. These transformations are driven by a reconfiguration of communicative space, journalistic roles, and discursive authority under platform logics. The Turkish case demonstrates that while digital platforms partially loosen journalism's dependence on traditional forms of power, this limited autonomy is offset by new forms of control exercised through algorithmic governance and economic dependency on platforms.

Keywords

Journalist YouTubers, algorithmic governance, self-branding, entrepreneurial journalism, division of labour

PP 0800 What audiences do when journalists don't meet their expectations: A study of audience responses and their determinants

Garusi Diego[1], Clara Juarez Miro[2], Sandra Banjac[3], Folker Hanusch[1]

[1] University of Vienna, Department of Communication, Vienna, Austria
[2] University of Barcelona, Department of Political Science, Barcelona, Spain
[3] University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

Although research on audience expectations of journalism has expanded substantially over the past decade, less is known about what happens when these expectations are not met. Understanding these consequences, however, is crucial for grasping how people make sense of and engage with journalism. Drawing on Expectancy Violation Theory (EVT; Burgoon & Jones, 1976), early studies have demonstrated that violations of journalistic expectancies lead to negative outcomes, such as decreased news consumption and lower levels of trust (e.g., Fawzi & Mothes, 2020).

However, EVT postulates that violations of expectancies do not necessarily result in negative consequences. Rather, the process is more complex, possibly resulting in expectancy adaptation (Burgoon & Hubbard, 2005). Moreover, audiences may justify such violations depending on contextual factors, such as perceived relational closeness with journalists (Raemy & Vos, 2020) or the availability of attractive alternatives (Cohen, 2010). It is therefore necessary to investigate in greater detail the diverse consequences of expectancy violations in journalism, as well as the factors shaping them.

Against this background, the present study examines: (RQ1) the extent to which audiences intend to modify their expectancies when an important journalistic expectancy is violated; (RQ2) the extent to which audiences justify the violation of an important journalistic expectancy, affecting the likelihood of using, trusting, and liking the journalist who violated it – three core elements of the audience-journalist relationship (Wilhelm et al., 2021); and (RQ3) how audiences' evaluations and news consumption practices influence responses to such violations.

To address these questions, we conducted a representative survey of the Austrian population (N = 1,026) in August 2025, asking respondents to identify one out of 28 possible audience expectancies that they considered most important. The results show that 59% of respondents did not intend to adjust their expectancy following its violation. A similar distribution emerged across the variables measuring intentions to use, trust, and like the journalist who violated it: around 50% reported that they would be less likely to do so, approximately 40% indicated no change, and roughly 10% stated that they would actually be more likely to use, trust, and like the journalist and their work.

Logistic regression analyses reveal that journalists' perceived authenticity (closeness to audiences, transparency, and warmth) positively influences audiences' intentions to maintain or even increase their use of, trust in, and liking of a journalist who violates an expectancy, as well as audiences' willingness to adjust expectancies accordingly. Conversely, perceiving journalists as being free to independently decide how to perform their work has the opposite effect. These findings suggest that perceived benevolent intentions of journalists make audiences more willing to justify expectancy violations. In addition, frequency of news use negatively affects intentions to continue using and trusting a journalist after an expectancy violation, supporting Cohen's (2010) argument that audiences are less willing to justify violations when attractive alternatives are readily available.

Overall, this study adds nuance to research on audience expectancies and the consequences of their violation. It shows that expectancy violations do not produce uniform outcomes, which depend on a range of contexts.

PP 0801 What young people want from news vs what journalists provide: introducing the "youth values" concept to bridge industry and audience perspectives

Heidi Rosok-Dahl[1], Marianne Borchgrevink-Brækhus[2], Joëlle Swart[3]

[1] Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway
[2] University of Bergen, Department of Information Science and Media Studies, Bergen, Norway
[3] University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

Public service media are legally required to inform, educate, and connect with a broad audience, including adolescents and young adults. At a time when young people's news habits have shifted toward mostly incidental and indirect use (Reuters Institute, 2025), however, public broadcasters struggle to reach audiences of all ages. This paper proposes the concept of 'youth values', arguing that, rather than nudging young people to appreciate PSM's existing conceptualizations of news, newsrooms should strive to better understand what makes news valuable for informing young audiences and when news becomes relevant in facilitating public connection.

Current scholarship on news values has predominantly approached the question of newsworthiness from an industry perspective but has paid far less attention to what constitutes valuable news to audiences (see Temmerman & Mast, 2021, for an exception). Moreover, existing conceptual and methodological frameworks for studying news values mainly emphasize *content*-related values (i.e., what valuable news is *about*). This neglects other dimensions that shape societal

understandings of 'newsworthy information', including perceptions of *when*, *where*, and how news becomes valuable and *for whom*.

To capture "youth values" beyond industry-defined and content-centered dimensions, we draw on two empirical studies from Norway, a relevant case given the strong position of PSM and their significant investments in news initiatives geared toward young audiences (e.g., NRK Ung; Røsok-Dahl, 2025; Adami, 2024). Combining three months of ethnographic newsroom fieldwork at the national public service broadcaster NRK with multi-method audience studies (recurring interviews, media diaries, and video-ethnography) of how 25 young Norwegians experience news in everyday life, this study reveals tensions and similarities between how news is tailored to young audiences and how news becomes valuable in their lifeworlds.

On this basis, we introduce a multidimensional model for analyzing «youth values» across the levels of *content, technology, form, social context,* and *experience,* contributing to the theorization of news values by integrating views on what is newsworthy from both industry and audience perspectives. We find that newsrooms tend to approach information that is newsworthy to young people mainly from a technology- and goal-focused perspective, prioritizing content that is constructive, platform-adaptive, visually attractive, and 'viral'. In contrast, younger audiences find news valuable when it enables sociability and a sense of belonging (cf. Bengtsson, 2023); when it provides multiple perspectives; when it enables smooth navigation and 'sober' presentations; and when news is experienced as emotionally resonant.

Our analysis of «youth values» thus challenges assumptions that young people constitute a fundamentally different audience from previous generations. While their pathways to news have changed—prompting newsrooms to adapt strategies and distribution—young people's expectations of journalism show notable continuity with those of older generations. A more important discussion lies in how journalism can offer news that resonates with young people's lifeworlds, addresses what they see as issues of common concern, and enables sociability within their everyday communities. The study thus bridges a gap in journalism studies by offering a rare perspective on how «youth values» are negotiated across industry and audience perspectives.

JOS26 Audiences and Journalism II.

PP 0802 Public trust in AI use in fact-checking: Qualitative insights from focus groups with Spanish citizens

Roger Cuartielles[1], Maria Castellví-Lloveras[1], Elisenda Aguilera-Cora[1]

[1] Pompeu Fabra University, Communication Department, Barcelona, Spain

Recent research suggests that the use of AI in fact-checking can have positive effects on citizens' trust and credibility, as AI is often associated with increased objectivity (e.g. Lan et al., 2025; Lee and Liu, 2025). However, this emerging research remains limited and relies largely on quantitative and experimental designs, leaving qualitative perspectives—capable of providing more nuanced and context-sensitive insights—underexplored. To address this gap, the present study adopts a qualitative approach based on four focus groups with Spanish citizens (N = 24). Spain constitutes a particularly relevant case, as it is one of the European countries with the lowest levels of trust in the information ecosystem (Newman et al., 2025) and displays marked distrust in fact-checking organisations (Calvo et al., 2022). This context makes it especially suitable for examining how AI shapes public trust in fact-checking as a journalistic practice. Participants ranged in age from 18 to 68 years, included men and women, and had diverse educational backgrounds, both with and without university education, to capture a broad range of perspectives. The findings reveal limited public knowledge and generally low trust in the journalistic role of fact-checking organisations. At the same time, participants expressed ambivalent views regarding the use of AI in fact-checking. On the one hand, AI was associated with expectations of greater impartiality; on the other, it raised concerns about the amplification of disinformation and the potential loss of jobs. Regarding specific tasks, activities such as monitoring disinformation and identifying claims were widely perceived as appropriate for delegation to AI. These tasks were often viewed as potentially more rigorous and less cognitively demanding for humans when supported by AI, which was seen as particularly effective for processing large volumes of data. Similarly, the use of AI for translation, transcription, and the dissemination of content was generally trusted, provided that human oversight remained in place. In contrast to attitudes towards journalism more broadly, some participants expressed confidence in fact-checkers writing verifications with the assistance of AI. This position was justified by the expectation that fact-checkers, unlike journalists, are not required to develop a distinctive writing style but should instead present verified information in a clear, neutral, and standardised manner. A smaller number of participants also considered it acceptable for AI to be used to create deliberately false audiovisual content for educational purposes, with the aim of raising awareness about the risks of AI-generated disinformation. Finally, greater trust in AI use for assisted and automated verification was observed among younger participants with university education (aged 18–35). Among other participants, perceptions were more ambivalent, and greater trust was often placed in human fact-checkers, particularly due to their professional training and physical presence. Overall, the findings show that citizens' perceptions of AI use in fact-checking are far from homogeneous and suggest that higher levels of education may be associated with greater trust in AI, rather than with increased scepticism towards its adoption. The findings may also inform future research and guide journalistic and fact-checking organisations in their consideration of AI adoption.

JOS26 Audiences and Journalism II.

PP 0803 Beyond personal preference: The structural drivers of news avoidance in Türkiye – A comparative analysis of traditional and new media audiences

Burak Erdoğan[1]

[1] Ankara University Faculty of Communication, Journalism Department, Ankara, Turkey

In a media ecosystem where news consumption habits and practices are rapidly evolving, the "news avoidance" phenomenon has become a critical issue for democratic societies, which rely on the role of media to maintain checks and balances. At a stage where individuals can consume news regardless of time and space, it has also become possible to avoid it. This study aims to examine the Turkish context of news avoidance by comparing traditional and new media users via utilizing a mixed-methods approach comprising 1628 survey responses and 23 semi-structured interviews conducted in Türkiye between late May 2025 and early June 2025. The findings reveal that 10,9% of the participants avoided the news consistently—defined as not consuming any news in the prior week. When including those who avoid the news "sometimes, often, or always" the figure climbs up to 74,7%. Notably, new media users avoid the news more (11,6%) compared to traditional media users (6,6%). While traditional media users perceive following the news as a "civic duty" and show greater interest in the political agenda, new media users tend to trust news organizations less and exhibit a more distant attitude. Furthermore, new media users are more susceptible to the impact of negative content, which is often substituted for alternative digital activities such as gaming and social media usage. The evidence indicates that news avoidance is not only a matter of individual preference but also a consequence of the structural evolution of the media. Since the early 1990s, increasing commercialization, monopolization, and de-unionization have triggered a crisis of representation in journalism. Adding on, the digital era's pressure for speed and reliance on clickbait metrics have caused a sensationalist "event journalism" that eclipses quality "situation journalism." The lack of ethical standards and the homogenization of news content are weakening the bond between news outlets and citizens. In conclusion, this study demonstrates that news avoidance in Türkiye is a result of both the crisis of journalism and the new media, where the news is not the priority. The findings suggest that negative and overlapping news content are weakening the news consumption rate. Although it is hard to debate around a mass disengagement, the rising trend of avoiding the news shows that a fundamental re-evaluating of journalistic standards is necessary.

JOS26 Audiences and Journalism II.

PP 0804 Let's hear the other side: the interplay of populism and anti-populism in Flemish talk shows

Lonnie Renne[1], Kenza Lamot[1], Sarah Van Leuven[1]

[1] Universiteit Gent, Communication Sciences, Gent, Belgium

Mainstream news media have become more central in understanding the rise of (right-wing) populism in Europe, as they may provide a fertile climate for populism to thrive (De Jonge 2019; 2021a; 2021b; Manucci, 2017, Mazzoleni, 2008; Krämer, 2018). At the same time, mainstream media are increasinly accused of bias within right-wing anti-media populistic communication (Engesser et al., 2017; Strömbäck & Åkerlund, 2025). Other authors point to the apparent dominance of an anti-populist discourse in mediated public debate (Goyvaerts & De Cleen, 2020; Shchinova et al., 2024).

Empirical studies typically tend to focus on populism, anti-media populism or anti-populism separately, whether in political communication or news discourse (e.g. De Mulder & Paulussen, 2021; Jagers & Walgrave, 2007; Hameleers & Vliegenthart, 2020). Holistic research into the frequency and patterns of the interplay of populism, anti-media populism and anti-populism in news related content remains limited. Despite its importance for fully understanding the populism-media nexus, as these phenomena don't exist in vacuum but are in constant interaction (cf. Voutyras, 2024). In Europe, populism-media research has predominantly focused on political party broadcasts, social media or established newspaper reporting (e.g. Engesser et al, 2017; Hameleers & Vliegenthart, 2020; Jagers & Walgrave, 2007). Talk shows remain understudied, especially in Flanders. Yet talk shows are particularly relevant due to their live format, the journalist-politician interaction and limited editorial control, which might make them especially suitable for populist communication (Blassnig et al., 2025; Bos & Brants, 2014; Ernst et al., 2019). This leads to the research question: **How do populism and anti-populism manifest in Flemish talk shows?**

Flanders, the Dutch-speaking northern region of Belgium, has known early breakthrough of radical-right wing populist parties. Over time, increasing media attention and accommodation, likely facilitated their growth (De Jonge, 2021a; 2021b; Schafraad et al., 2012). Flanders does not enforce a strict *cordon médiatique*, allowing journalists for varied strategies in dealing with populist actors and themes (De Jonge, 2021b; De Jonge & Gaufman, 2022). This makes it a compelling case for analysis. Some strategies, like confrontation, may inadvertently reinforce populist claims of media bias (Esser et al., 2017; Krämer, 2018).

Through a quantitative and qualitative content analysis of three Flemish current affairs talk shows, this study therefore aims to shed light on (1) the prevalence of populist, anti-media populist, and anti-populist communication, and (2) the roles of diverse actors herein, and (3) how the populism-anti-media populism interplay manifests. The sample consists

of 60 episodes—20 each from direct competitors De Tafel van Gert (commercial broadcaster), Bar Goens (commercial broadcaster) and De Afspraak (public broadcaster)—aired between 28 April and 29 May 2025. To guide deductive coding, a literature-based framework was developed, distinguishing four modes of populism–media interaction: (1) Populism through media, (2) populism by media, (3) anti-media populism (4) anti-populism. Data coding and analysis are planned between January 2025 and April 2026. Findings will advance a more comprehensive and ecologically valid understanding of how populism and anti-populism manifest within the media–populism nexus.

JOS27 Uncertainty and Journalism

PP 0805 The place of inequality in journalism scholarship: A systematic literature review

Andreas Riedl[1]

[1] University of Augsburg, Department of Media- Knowledge & Communication, Augsburg, Germany

Social inequality has become a central concern across social sciences, with many of today's "wicked problems" tied to growing inequalities, as reflected in the United Nations Sustainable Development Goals. For many forms of inequality, understanding public discourse is crucial, as inequalities are not only materially structured but also discursively constructed and contested—placing journalism research at the core of scholarly engagement with inequality. Despite frequent engagement with issues of power, representation, and access to public communication, it remains unclear to what extent journalism studies has developed a coherent and cumulative body of knowledge on social inequality. While a recent literature review focused on communication about economic inequality (Vaughan et al., 2025), it remains unclear how journalism research engages with other forms of inequality. Therefore, we conducted a systematic literature review following the STAMP method (Rogge et al., 2024) to clarify the field's broader contribution. It covers English-language, peer-reviewed journal articles and book chapters addressing any form of social inequality in relation to journalism. To be included, titles, abstracts, or keywords had to contain *inequality* or *equality* and *journalis**; broader terms such as *equal** were avoided due to their frequent use in generic phrases. The search was conducted in 2024 across Web of Science, EBSCO Communication & Mass Media Complete, and ProQuest, without restrictions on publication year. The initial search yielded 1,143 records; after removing duplicates, 765 publications remained, of which 234 were retained following manual screening for formal criteria and relevance. The final sample was coded using a quantitative–qualitative scheme, with intercoder reliability ranging from .53 to 1.0 (Brennan and Prediger's kappa; mean = .81).

Findings indicate a highly uneven landscape of inequality research in journalism studies. Research concentrates on a narrow set of inequality dimensions, with gender inequality addressed in well over half of the studies and racial or ethnic inequality in roughly a quarter, while class-related, economic, and many other forms of inequality—such as health, educational, environmental, digital, or criminal justice inequalities—receive little or no attention. Intersectional perspectives remain limited, with under 20% of studies adopting an explicitly intersectional approach. Across major domains of journalism scholarship, inequality research focuses primarily on journalism on an institutional level and on journalists as actors; inequality in journalistic content receives less attention, and inequality related to media use is largely absent. Within these domains, printed news media dominate, whereas journalistic practices, technologies, social media, and audience-related dimensions constitute blind spots. We find limited theoretical grounding, with few studies articulating clear definitions of specific inequality forms and almost none engaging with holistic theoretical frameworks (similar for diversity: Loecherbach et al., 2020). Finally, research sites and first authors are heavily concentrated in the Global North, particularly the United States and Western Europe, alongside a pronounced gendered authorship pattern in which women lead most research on (gender) inequality. Together, these findings highlight the need for a broader, more theoretically grounded, and more globally inclusive research agenda on social inequality in journalism studies, commensurate with the field's (potentially) central role in understanding inequality.

JOS27 Uncertainty and Journalism

PP 0806 Autonomy lost: Revisiting Bourdieu's nomos and the "small universe" of the journalistic field

Scott Eldridge[1]

[1] The University of Groningen, Center for Media and Journalism Studies, Groningen, Netherlands

Within field theory, the concept of *nomos* refers to the autonomy a field possesses to determine its own laws in contrast to other societal fields (Bourdieu, 2005: 32–33). However, the autonomy a field has in setting out its vision and its sense of distinction from other fields in society is not without complexity, and it is certainly not absolute. Afterall, a field is a "microcosom within the larger social macrocosm", both independent from and influenced by other forces at play in society; put differently, it is "a small universe caught up in the laws of functioning of the larger universe" (Bourdieu 2005: 32).

Nomos also describes the 'rules of the game' set out by a field. When followed, these rules legitimate individual actors' positions within the field by offering a set of parameters and guiding logics. This paper picks up Bourdieu's concept of *nomos* to ask whether the sense of vision and division captured in his concept of autonomy persists. It accounts for external forces, including political and commercial ones (working in tandem), that are affecting journalism's ability to maintain its own distinct logics; its own rules.

To be blunt, that distinction is faltering in media systems where the competition for attention – in an economy increasingly predicated on attention – has incentivized ignoring, negating, and even rewriting these rules. This is evident in the already-uneasy relationship between journalism and politics as two fields of power, amplified by politics' handmaids in these incursions, including platforms companies and large corporate media owners that have prioritized commercial over normative ambitions (Eldridge, *forthcoming*).

It focuses narrowly on the incursions into the journalistic field made by political and corporate media actors through a systematic discursive and sentiment analysis of right-wing, digital political media in the US and UK. In these systems, recent developments have offered warning signs of autonomy loss, with politicized political media engaging in affective and aggrieved narratives of a fractured society (Eldridge, 2025), and the lines between journalism and politics being erased by sitting politicians taking on 'news media' functions (e.g., *GB News*), exerting control over content (e.g., *CBS News*), and with press rooms taken over by politicized peripheral media actors who once served as campaign staffers, government employees, and elected representatives (Eldridge, *forthcoming*).

From its analysis, this paper argues journalism is suffering the consequences of these incursions. With 'news media' following rules that originate in other small universes, journalism's control over its own autonomy risks being lost. While journalism will always be shaped by larger social and political factors, the levels of political polarization and ideological fragmentation that we are seeing represented is often more intense and more widespread than we would find were we to poll either UK or US society (Eldridge 2025: 29–30; 194–196). This paper concludes with a model for understanding the complex socialization processes that need to be accounted for when trying to understand how fields are impinging upon one another, and how they affect the field's own sense of vision and division.

PP 0807 AI in journalism: Analysis of practices in Ibero-America

Michele Catanzaro[1], Laura Cervi[1], Santiago Tejedor Calvo[1]

[1] Autonomous University of Barcelona, Journalism and Communication Sciences, Cerdanyola del Vallès Barcelona, Spain

In this work, we analyse thirty case studies of the implementation of Artificial Intelligence (AI) in journalism in Ibero-America (the cultural region comprising Spain, Portugal, and Latin American countries). Our study addresses a gap in current research by examining how AI is reshaping the media in a less-studied part of the world. This effort uncovers innovative practices and emerging challenges that are relevant to both researchers and media professionals worldwide.

AI is having a profound impact across global media ecosystems, generating unprecedented opportunities as well as significant challenges. Media studies are striving to interpret this phenomenon, yet the existing literature still displays notable gaps. For example, a literature review we conducted revealed a marked underrepresentation of the Global South compared with Western Europe and North America.

Expanding the geographical scope of research is essential for addressing global inequalities and for exploring disparities in technological infrastructure, media freedom, and regulatory oversight. At the same time, it offers a valuable opportunity to diversify approaches to the topic by incorporating the wide range of strategies and perspectives that emerge across different contexts.

Focusing on Ibero-America makes it possible to include an important region of the Global South in this discussion, while enabling comparisons with Global North countries that share linguistic and cultural ties with it.

Our work begins with the construction of an exhaustive and up-to-date catalogue of AI implementation experiences in Ibero-American journalism. Using a case study methodology, we extract a sample of thirty examples from this catalogue and analyse them in depth.

We examine questions such as where AI is used in the news value chain (from back-end applications to algorithmic personalisation); what the main objectives are (improving fact-checking, enhancing investigative work, increasing revenues, etc.); how AI is transforming newsroom practices and journalistic labour; and how ethical issues are addressed (including accountability, independence, and environmental impact). We also assess how scalable and transferable these experiences are, with the aim of making our research useful to practitioners.

Additionally, we compare our findings with those in the existing literature and with insights from a set of expert interviews, in order to evaluate the validity of current theories and identify trends specific to the Ibero-American context. Finally, we discuss the extent to which journalism in the region is incorporating AI in support of journalistic values, or instead yielding to corporate constraints.

This research is part of IA-COM project ("Artificial Intelligence for the Promotion of Quality Journalism and Media Literacy: Applied Technological Advances and Challenges in the Era of Disinformation"), a project funded by the Spanish Ministry of Science, Innovation and Universities.

JOS27 Uncertainty and Journalism

PP 0808 Churning the information cascade – PR, news agencies, and news outlets linked to copy-pasting practices

Nina Abrahams[1], Charlotte Knorr[1], Lars Guenther[1], Janise Brück[1]

[1] Ludwig Maximilian University of Munich, Department of Media and Communication, Munich, Germany

As journalism faces ongoing challenges such as revenue loss and resource constraints, specialized beats such as science journalism have come under pressure, bearing manifold implications for journalistic text production. Our study explores the practices of online science journalism and its sources under the lens of churnalism: a process generally understood as the "recycling" of pre-packaged material from third parties such as press or agency releases by journalists without further editing. Due to factors like time pressures in daily routines, news outlets appear to rely on the republishing of content provided by news agencies, often verbatim. However, the emergence of this phenomenon remains underexplored: considering that news agencies themselves extensively use and copy press releases, there is a lack of empirical examinations tracing this "information cascade" – from the uptake of PR materials by news agencies to their subsequent (re-)publication in journalistic outlets. To examine this specific information cascade in science journalism – which seems to be especially subjected to churnalism – we draw on data related to press releases from two German research institutions. Instead of analyzing the news agency releases in isolation, we link original press releases to corresponding news agency copies and subsequent online media coverage through a qualitative content analysis (n = 35), focusing on both formal and compositional aspects. Our findings reveal a cascade-like information transfer characterized by the verbatim copying of parts of the material, both from press releases to news agency copies, and from agency copies to media coverage. This distinct type of journalistic recycling primarily manifests in the material through the copy-pasting of parts of the text body, occasionally supplemented by additional information not present in the original material. Within the context of churnalism in science journalism, the results highlight the influential role of both PR and news agencies as well as their interconnections on journalistic reporting, with implications for copy-pasting practices and agenda-setting processes in this nexus.

JOS27 Uncertainty and Journalism

PP 0809 Independent journalism in Europe: Resilience and innovation amid the media crisis

Maria Gonçalves[1]

[1] Lusófona University, Centre for Research in Applied Communication- Culture- and New Technologies, Lisbon, Portugal

In the present media landscape, journalism faces a crisis of legitimacy, reflected in the number of news avoiders, low trust in news, and growing concerns about disinformation (Digital News Report, 2025). Moreover, the consumption of news through social media and the decline in paid-subscription models threaten the sustainability of commercial media. This scenario reflects, among other concerns, a saturated market model, in which decisions about the value of news are geared towards capturing clicks and generating mass content, relegating the relevance and credibility to a secondary role. Hence, the present research is situated within the debate on the crisis of legitimacy and sustainability of journalism, and on emerging journalistic configurations—such as independent journalism (Beers, 2006)—embedded within the diverse landscape of alternative media (Harlow & Salaverría, 2016), which seek to address this crisis. These organisations, self-proclaimed as independent, adopt new formats of production, funding and organisation, positioning themselves as critics of the status-quo, and the economic interests dominating mainstream media. Through a content analysis of 25 European independent journalism organisations and 14 semi-structured interviews with journalists, this research sought to analyse what does independence mean for these organisations, and how that reflects in the funding models adopted, their editorial values, organisational structure and production practices. The results show a significant growth of independent organisations across Europe, most being digital, with 65% of them appearing since 2014, reflecting a still growing sector. Considering the funding model, individual donations, foundation grants and fellowships occupy the three main sources of funding, with foundations having the largest share. Nevertheless, interviewees didn't report any conflicts of interest or fears of influence from foundations, recognizing a mutual relationship of trust, as they play an essential role for maintaining sustainability. Financial independence is also ensured through a strong emphasis on revenue diversification, with organisations relying on workshops, sales of publications, subscription models or ethical advertising. Regarding editorial values, among the core values shared by the organisations are independence, observed in 20 (n = 25), investigative journalism, observed in 17 (n = 25), non-profit status, observed in 16 (n = 25) and transparency, observed in 14 (n = 25) organisations. Reflecting on the future, journalists were optimistic about the growth of independent journalism, claiming that readers are looking for alternative information and are willing to pay for it. Although sustainability is an on-going challenge, most projects have seen a growth in donations and readers, as well as in revenue. Reflecting on the future of the sector, journalists were optimistic about the growth of these independent organisations, claiming that readers are looking for more alternative information, and are willing to pay for quality reporting. Although sustainability is an on-going challenge, most projects have seen a growth in donations, readers and revenue. Amid a crisis in the media landscape, alternative and independent organizations have emerged as a force of resistance, aiming to restore the social value of journalism and to reconsider the traditional models that have long underpinned the profession.

JOS28 Futures of Journalism

PP 0820 Mapping two decades of Artificial Intelligence in news media: From niche to mainstream to politicized

Alba Diez-Gracia[1]

[1] University of Salamanca, Sociology and Communication, Salamanca, Spain

Interest in Artificial Intelligence has grown exponentially and transversally amongst Journalism Studies for the past decade (Ioscote et al., 2024). Research has thoughtfully studied journalistic perceptions and outlooks on AI (de-Lima-Santos & Ceron, 2021), its applications (Sonni et al., 2024), ethical concerns (Misri et al., 2025; Reynolds & Nolan, 2023), and media regulations (Sánchez-García et al., 2025). However, less attention has been paid to the narratives on AI technologies that news media project onto the public agenda, with most literature focusing on case studies prior to the 2022 ChatGPT, chatbots and GenAI boom (Cools et al., 2022; Echauri, 2024; Nguyen & Hekman, 2022).

Drawing on agenda-setting and framing theories, this research addresses this knowledge gap by examining news media portrayals of AI through 64 technical and contextual terms (e.g. chatbot, deepfake, ChatGPT, OpenAI) during the period 2001–2024. Thus, this study is driven by three research questions: (1) Which AI-related issues—including AI itself—are highlighted in news media; (2) how these are framed and with what attributes; (3) how this narrative has evolved over time.

To this end, N = 7,538 news were automatically retrieved via The New York Times and The Guardian APIs using 64 terms related to AI technologies, companies and trends. After selecting the news that matched the object of study, a final sample of N = 3,177 was subjected to a content analysis structured around 3 categories: issues and attributes; framing; and roles and archetypes in the representation of AI.

Findings mark the start of the coverage in 2001 in both digital news media, with two main publication peaks: a 241% increase in 2014 and a 695% increase in 2023, following Google's acquisition of DeepMind and the release of ChatGPT, respectively. Although the coverage has kept mostly neutral regarding software, tech and scientific progress, its impact on socio-economic issues—employment, health, culture, politics—has gained traction in recent years, turning AI into a mainstream, yet polarized and politicized issue. While the economic growth of Big Tech or the progress of AI as an assistant in health and medical research are portrayed as positive, negative frames increasingly permeate the media agenda concerning AI's social and ethical risks, emphasizing biases, informative disorders, and threats to employment, democracy, diversity, and child protection. A portrayal that tends to depict—and confuse—AI with anthropomorphic robots or human-like qualities, but also through the companies and human faces that "represent" them (owners, founders, CEOs).

While these findings show that interest in AI is not new, they encourage reflection on the role that the media currently play as agenda-setters, observers, commenters, and gatekeepers, as these narratives form part not only of the collective worldview but also everyday practices. This shift to the mainstream has turned AI from a scientific-technological advancement into a buzzword (Gbadegeshin et al., 2021); "a news topic in transition" (Nguyen & Hekman, 2022, p. 449) that becomes part of the editorial, political and ethical positioning of the media, requiring as much accuracy as accountability in an uncertain battleground for the attention, trust and credibility of a (dis)connected audience in a hi-tech context.

JOS28 Futures of Journalism

PP 0821 This player is going to be the next star of Bayern Munich … Who? Are new business models in digital journalism changing established news structures?

Thomas Birkner[1]

[1] University of Salzburg, Department of Communication, Salzburg, Austria

Introduction

For more than a hundred years, one of the most established ways of journalistic news storytelling followed the so-called inverted pyramid model of answering the most important questions right at the beginning of a news story: who, what, when, where, why, and how (5W1H). Based on findings from a larger research project funded by the German Research Foundation (DFG) we wanted to answer the following research questions:

RQ1: How have news articles evolved over the last hundred years in German news?
RQ2: What explanations for this evolution can be found?

Framework

For Michael Schudson, news writing following the inverted pyramid model "was a literary invention that asserted the journalist's authority to define for readers the most important element of a news event" (Schudson, 1991, p. 438). This "form of news" (Barnhurst & Nerone, 2001) was invented in Anglo-American journalism by the end of 19th century (Pöttker, 2003) and was also established in German journalism at the beginning of the 20th century (Author, 2016). It is still trained in journalism school and described in journalistic textbooks. What is missing, is an analysis of how this form developed over time.

Methods

Applying computational methods (Fan et al., 2025; Van Atteveldt & Peng, 2021) like natural language processing (NLP), including named-entity recognition (NER), and part-of-speech-tagging (POS), we analyzed n = 8,568 articles from German newspapers and their web pages from 1924 until 2024, every ten years, to find out, if who? what? when? where? were answered within the first 300 characters of the text. Additionally, we interviewed n = 15 German journalists from different generations on how they learned to write news stories and on their journalistic working routines.

Findings

The findings of our automated content analysis show that the inverted pyramid model remained relatively stable during the Weimar Republic, National Socialism and WW2, and survived even communism in East Germany as well as the rise of television. In our data, the model of answering the w-questions at the beginning then is declining from 2004 onwards to 2024. Most of the interviewed journalists claim that they learned the inverted pyramid model. Some younger journalists said that it contradicts new business models.

Discussion

Journalism is always changing and has always changed. New forms of multimedia storytelling arose in the digital media ecosystem. At the ECREA conference in Brno we want to discuss, how new business models are challenging the inverted pyramid model. Headlines like “Heidi Klum reveals dirty secret” try to provoke the next click and get readers behind a pay-wall, by not answering the most important w-question.

JOS28 Futures of Journalism

PP 0822 Towards an open media ethics? A cartography of outward-facing discourses of four French-speaking media councils (2019–2025)

Lavinia Rotili[1]

[1] UCLouvain / ORM, Communication and Journalism, Louvain-la-Neuve, Belgium

This ongoing study investigates how media councils develop outward-facing discourses in response to increased political instability, declining public trust in the media, technological evolutions, and information disorders.

It offers a cartography of public discourses developed by four media councils in French-speaking Belgium, Switzerland, France, and Quebec. Informed by Ward’s (2016) model of open media ethics, this mapping aims to identify (1) professional and non-professional recipients of these discourses; (2) the degree of audience participation in shaping and reacting to these discourses; (3) how media councils redefine their missions. It also unveils (4) the intentions and nature of these discourses.

To achieve these objectives, the theoretical framework combines media accountability (Fengler et al., 2022), Ward’s global open media ethics (2016; 2019), and metajournalistic discourse (Carlson, 2016).

Media councils have been studied as media accountability and professional self-regulation tools (Bertrand, 2000; Fengler et al., 2022; Eberwein et al., 2018). Recent literature focuses on councils’ traditional missions of standards-setting and complaint-handling (Harder, 2021; Lauk, 2021; Verhoeven & Van Leuven, 2025). However, few works examine how they are redefining their scope (MCDA, 2025) and mostly provide descriptive overviews of their public discourses (MCDA, n.d.). Literature lacks a comprehensive understanding of the intentions behind these discourses and what those reveal about the evolution of media ethics. This research fills this gap by providing a cartography informed by Ward’s framework (2016; 2019) on global media ethics. This model advocates for participatory, dialogue-based media ethics and helps assess whether a group is oriented towards more open forms of ethics (Ward, 2016). To complement this analysis, we frame media councils’ discourses as metajournalistic discourses (Carlson, 2016). While this approach is rarely applied to media councils (Eldridge, 2025), it helps understand the intentions behind media councils’ discourses through processes of boundary-setting, definition-making, and legitimization.

The study is based on (1) a thematic analysis of 35 semi-structured interviews with different categories of media council members, and (2) a thematic analysis of media councils’ outward-facing discourses. The corpus comprises 100 texts (newsletters, information bulletins, annual reports, press releases), 5 videos, and 6 podcasts across the four councils.

The four councils (French-speaking Belgium, Switzerland, France, and Quebec) were chosen because of their common language, similar organizational structures, and practices. Three of them operate in small media systems sharing similar characteristics (Puppis et al., 2009; Hallin & Mancini, 2004) and journalistic cultures (Ramaprasad et al., 2019).

Preliminary results show that (1) all councils are including more public-oriented activities and discourses, but only Quebec's one explicitly assumes this new mission. (2) The main audiences of media councils remain journalists and citizens, but media councils' investment in outreach and research activities may reflect a desire to communicate with political authorities. (3) The most frequently cited motivation of outward-facing discourses is to combat disinformation and rebuild public trust. However, some media councils seem to legitimize themselves in the context of attacks on the press and low trust in the media.

JOS28 Futures of Journalism

PP 0823 Source diversity initiatives in Danish news media: Catalyst for change or business as usual?

Kresten Roland Johansen[1]

[1] Aarhus University, Department of Media and Journalism Studies, Aarhus N, Denmark

At a time of growing distrust in news and mainstream media worldwide, and amid global events such as the Covid-19 pandemic and the war in Ukraine, source diversity in journalism is widely recognized as a key factor in fostering public trust and enhancing the legitimacy of news media (Moy, 2020). In this respect, paying attention to source diversity in journalistic reporting is regarded as an emerging yet contested issue in journalistic practice. This study explores how editors and journalists in Danish national news media perceive and implement initiatives designed to enhance source diversity. While similar research has been conducted in the United States (Grannan et al., 2025), this is the first study of its kind within a Nordic media context. In recent years, Nordic news organizations have increasingly emphasized source diversity. However, recent research has relied almost exclusively on content analyses, surveys, and interviews with journalists (Jørndrup, 2022; Kjeldsen et al., 2024; Mathisen, 2021; Sjøvaag & Pedersen, 2018; Niemi & Pitkänen, 2017), leaving editorial perspectives, strategies and decision-making largely unexplored.

Theoretically, this study draws on role theory (Hanitzsch & Vos, 2017), specifically the framework of professional roles in journalism based on the hierarchies of influences model (Reese & Shoemaker, 2016). Current research has primarily applied role theory to journalists' perspectives and practices (Hanitzsch, 2017; Mellado et al., 2023). This project focuses on both the editorial and journalistic perspectives, identifying ideals, practices, and potential gaps between the organisational and operational context where journalism is produced daily (Ferrucci & Kuhn, 2022).

Based on semi-structured interviews with eight editors and twelve journalists from six leading Danish media outlets that actively promote source diversity, this study presents a range of emic definitions of source diversity. The core findings show how different initiatives promoted by editors and organizations seek to strengthen source diversity in news coverage, how these initiatives are perceived by journalists, and whether they serve as catalysts for change or ultimately fall short of yielding significant changes in journalistic reporting. Interviews with editors reveal that their efforts primarily focus on monitoring sources- mostly in terms of gender- setting goals and raising awareness about insufficient diversity. Few dedicate time or develop tools to drive substantial changes. The outcomes remain modest: sustained managerial attention leads to minor improvements, but these effects tend to fade once the focus shifts elsewhere. Upcoming interviews with journalists will explore why these initiatives appear to have such limited impact. Specifically, they will examine whether journalists perceive source diversity as important and aligned with their professional role, as well as how issues of time and competing editorial priorities in the day-to-day newsroom work influence their engagement.

The study contributes to the conference theme of 'diversity of voices' by examining how source diversity is promoted by news organizations and the rationale behind these efforts, while also highlighting the structural and professional impediments to increasing source diversity in journalistic practice.

JOS28 Futures of Journalism

PP 0824 Networks of Influence: Journalism Innovation and the Politics of Public Support

Giordano Zambelli[1], Pauljan Truyens[1], Ike Picone[1], Sarah Vis[1]

[1] Vrije Universiteit Brussel, Department of communication sciences, Brussels, Belgium

Over the past three decades, innovation has gained a prominent position as a potentially decisive response to journalism's challenges, gradually replacing quality as a dominant metajournalistic concept (Costera Meijer, 2020). Yet, research has shown that innovation often functioned as an inadequate guiding principle for journalism's structural transformation. News organizations tended to interpret it as a placeholder for short-term financial gains, pivoting from one tech project to another, often without clear long-term benefits (Creech & Nadler, 2018; Posetti, 2018; Hermida & Young, 2021).

Recently innovation has also emerged as a key funding rationale in media policy circles. Governments, particularly in Europe, have embedded innovation into policy frameworks, launching schemes to support journalism's digital transformation (Noster et al., 2025). However, these schemes have struggled to account for the complexity of the media ecosystems

they addressed, where public broadcasters, legacy groups, and news startups coexist. Empirical evidence shows that most recent funding initiatives have disproportionately benefited incumbents (Buschow, 2022; Kaltenbrunner et al., 2025; Zambelli, 2025; Eder & Sjøvaag, 2025). Why this outcome has become so common remains underexplored, especially in terms of how such schemes are conceptualized and what innovation rationales prevail in policy design.

To address this gap, this study investigates the formulation and design of a specific funding instrument: the Digital Transformation Programme of the Flemish Relanceplan, a €35 million initiative implemented between 2023 and 2024. Based on 23 semi-structured interviews, it explores(RQ1) the stakeholder network that co-shapes the funding instrument, and (RQ2) the consequences this has for how innovation is defined and mobilized by key actors.

Grounded in Policy Network Theory (Rhodes, 2007) and applying Stakeholder Analysis (Van den Bulck, 2019), this regionally-targeted study identifies several structural conditions that may help explain the generally conservative character behind most innovation schemes. Legacy media actors appear closely tied to intermediaries and policymakers, while smaller organizations remain peripheral. This asymmetry enables informal access routes that favor early influence over programme design. As a result, a Matthew effect shapes resource distribution: actors with existing capital, legitimacy, and networks are best positioned to benefit. Meanwhile, a loosely defined framing of innovation allows a dominant techno-centric logic, largely aligned to platform actors' discursive framing, to override more diverse or public-interest interpretations. This ultimately narrows the spectrum of supportable journalistic models and beneficiaries within journalism innovation policy.

PP 0907 Communicating scientific uncertainty in the news: Generalist journalists' conceptual understandings, challenges, and strategies

Finja Isabel Augsburg[1], Fabian Prochazka[1], Eva Thomm[2], Johannes Bauer[2]

[1] University of Erfurt, Department of Media and Communication Studies, Erfurt, Germany
[2] University of Erfurt, Faculty of Education, Erfurt, Germany

Many of today's crises and concerns are rooted in socio-scientific issues where scientific and social problems are deeply intertwined and no single, clear-cut solutions exist (Zeidler et al., 2003) – examples include climate change and genetic engineering. Reporting on such issues confronts journalists with the challenge of understanding and conveying the inherent uncertainty of scientific knowledge (de Jong et al., 2024; Dunwoody, 2020; Gustafson & Rice, 2020). Scientific uncertainty refers to a "state of incomplete knowledge that can result from a lack of information or from disagreement about what is known or even knowable" (IPCC, 2015, p. 128). Gustafson and Rice (2019) distinguish four forms of uncertainty: deficient uncertainty (lack of evidence), technical uncertainty (methodological or statistical limitations), consensus uncertainty (ambiguous or conflicting findings), and fundamental uncertainty (findings may prove wrong). Incorporating such uncertainties into reporting requires journalists to possess both conceptual understanding and a complex set of professional skills (Fiscutean & Rosu, 2025; Guenther & Ruhrmann, 2016). COVID-19 and the climate crisis have shown as striking examples that generalist journalists are increasingly required to cover highly specialized scientific topics and communicate scientific uncertainty, often without extensive training or experience in identifying, handling, and conveying it (Capurro et al., 2021; Painter, 2013). However, existing research on uncertainty communication has focused predominantly on science journalists, leaving the perspectives of generalist journalists underexplored.

Our study addresses this gap by using semi-structured online interviews with 14 generalist journalists from local, regional, and national newsrooms in Germany. We examined how these journalists conceptualize scientific uncertainty, asked about the challenges they perceive in communicating it to their audiences, and the strategies they describe for conveying it.

The results suggest that the interviewed journalists perceive scientific uncertainty as an inherent aspect of science that arises mainly when science cannot (yet) answer questions relevant to their audiences. For conveying scientific uncertainty, our study reveals a meta-challenge journalists emphasized: enabling the public to make informed decisions despite, and in consideration of, uncertainty. Journalists view scientific uncertainty as prompting an expansion of their traditional neutral and critical role toward more extensive interpretive and contextualizing practices. For example, they describe using knowledge about their audiences to anticipate and prevent potential misinterpretations or rejection of information on socio-scientific issues due to the presence of scientific uncertainty. We term this role-extending practice "stewarding" public engagement with scientific uncertainty. It reflects journalists' awareness that communicating scientific uncertainty can yield negative outcomes (e.g., delegitimization) and encompasses their willingness to go beyond traditional role boundaries to foster its

understanding and thus enable its inclusion in public decision making. Following from this meta-challenge, our interviews revealed three sub-challenges journalists perceive: making uncertainty understandable and accessible, avoiding confusion and frustration, and generating interest. To address these challenges, journalists mentioned eight strategies, including sensitive wording and tone, complexity reduction, constructiveness, and storytelling.

Overall, our results suggest that generalist journalists perceive the communication of scientific uncertainty as a challenging and carefully attended aspect of their practice, demonstrating conceptual awareness and a repertoire of distinctive strategies.

JOS29 Journalistic Work I.

PP 0908 A mixed-methods study on the effectiveness of discursive journalism for reducing affective polarization

Rebecca Tatjana Strohmeier[1], Luisa Wilczek[2], Sehl Annika[1], Sonja Kretzschmar[2]

[1] Catholic University of Eichstätt-Ingolstadt, Department of Journalism, Eichstätt, Germany
[2] University of the Bundeswehr Munich, Institute of Journalism, Munich, Germany

Affective polarization poses considerable challenges to democratic processes and social cohesion (e.g., Torcal et al., 2025). Although the relationship between the media and affective polarization is complex, it remains essential to address how journalists can mitigate this phenomenon or, at least, prevent its further reinforcement (Kubin & von Sikorski, 2023). We argue that Brosda's (2008) normative concept of *discursive journalism* offers a promising approach in this regard. Discursive journalism is anchored in Habermas's (1984, 1987) ideal of deliberation and Baum's (1994) conception of journalistic action as a means of cultivating a "*rationality of mutual understanding*" in society (German: *"Verständigungsrationalität"*) (Brosda, 2008). According to discursive journalism, journalists are expected to play an active role as *advocates of discourse* who are responsible for establishing a discursive environment that stimulates *multi-perspectivity* and *rationality* or, in other words, an inclusive and orderly exchange of ideas driven by the strength of arguments (Brosda, 2008).

Against this backdrop, we aim to examine whether journalistic content that follows the implications of discursive journalism reduces affective polarization in recipients over time (*RQ*). We employ a mixed-methods approach with two consecutive studies to address our research question. First, we conducted a longitudinal survey experiment across three survey periods with a quota sample of N_{t0} = 3,800 respondents from Germany via an online access panel. Respondents were randomly assigned to an experimental (EG) and control group (CG). Each survey period involved a video clip of a fictional TV debate show featuring a journalist and two discussants with opposing views on a polarizing topic as a stimulus. In the EG video (*discursive condition)*, the journalist serves as an *advocate of discourse*, fostering *rationality* and *multi-perspectivity* in the debate, whereas, in the CG video (*non-discursive condition)*, the journalist acts more passively.

Second, we conduct an in-depth focus group study with a small sample of respondents from our survey experiment to further contextualize and enrich our quantitative findings.

This study contributes to journalism studies in both theory and practice: First, it introduces the normative concept of discursive journalism as a potential avenue for addressing affective polarization. Second, it tests the empirical soundness of this concept's posited potential using a rigorous mixed-methods approach.

JOS29 Journalistic Work I.

PP 0909 Understanding journalistic culture by comparing embeddedness in sport and business journalism

Tim Vos[1], Folker Hanusch[2]

[1] Michigan State University, School of Journalism, East Lansing, USA
[2] University of Vienna, Communication, Vienna, Austria

Recent scholarship has pointed to the value of examining embeddedness as a key dimension of journalistic culture (Juarez Miro, et al., 2025; Vos & Hanusch, 2024), with the focus largely on journalists' position in local communities (McAdam & Hess, 2024; Rivas-de-Roca, et al., 2025). The scholarship has identified embeddedness – understood as the extent to which one shares the values, experiences, histories, places, and languages of a group – as a plausible influence on the roles,

epistemologies, and ethical orientations of journalists (Vos & Hanusch, 2024) and as a possible driver of audience trust and engagement (Schiffrin, 2019).

This paper builds on this line of research by empirically examining and comparing the value of embeddedness in two journalistic beats: sport and business reporting. These beats are analytically interesting because both involve groups who use specialized language and share values, and news coverage often involves journalists spending time in close proximity to those groups, but there are also substantial differences in the groups or subcultures they cover (Bradshaw & Minogue, 2019; Grünberg & Pallas, 2013). Embeddedness in these beats is seen as both a blessing and a curse – close connection leads to deep understanding of the beats, but the lack of power-distance leads to suspicion from fellow journalists, resulting, for example, in sport reporting being seen as journalism's 'toy department' (Rowe, 2007; Boyle, 2017).

To further enhance our understanding of embeddedness, this paper asks three broader research questions. First, we ask how sport and business journalists understand embeddedness within a) the subcultures they cover, b) within broader societal culture, c) within their beats, and d) within the institution of journalism. Second, we ask how sport and business journalists' embeddedness relates to their orientations regarding their a) roles, b) epistemologies, and c) ethics. Finally, we ask how sports and business journalists differ along their understandings of embeddedness as well as their roles, epistemologies and ethical orientations.

To address these questions, we draw on more than 30 in-depth interviews with sport and business journalists based in Austria, a country that bears many similarities with other Western media systems. Austrian journalistic culture has a strong orientation toward the detached observer role, with autonomy being highly valued (Hanitzsch et al. 2025) – both key aspects which have been seen as clashing with the practice of both sport and business journalism. Further, both beats are covered in both established traditional media as well as in dedicated, specialist outlets, allowing for a variety of organizational environments and their influences to be studied.

While data collection is ongoing at the time of submission, preliminary insights show some considerable similarities in relation to these journalists' understandings of embeddedness as well as their journalistic culture, but they also point to some nuanced differences that allow for deeper insights into the ways in which journalistic embeddedness can be a useful explanatory concept for studying journalism comparatively.

PP 0910 Moving to the "why" of news. The rise and development of interpretive journalism in the 21st century

Daan Stokvis[1], Marcel Broersma[1], Yael de Haan[1]

[1] University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

Since the 1960s, journalists have increasingly focused on explaining and interpreting events and the reasons these happened, rather than just reporting on them (Salgado & Strömbäck, 2012). In both scholarship and journalism practice, it is argued that journalism has shifted from reporting on the "what, who, when, where and how" of news, to explaining and answering the "why" question (Patterson, 1993; Patterson, 1996; Barnhurst & Mutz, 1997). While interpretive journalism has attracted greater attention in academic debate, empirical studies remain scarce. Most claims rely on a few content analyses from the 1980s and 1990s, predating the rise of the internet, and focusing only on the United States and predominantly on election news (Salgado & Strömbäck, 2012).

Due to this lack of empirical evidence, scholarly criticism on the presumed rise of interpretive journalism has increased. Scholars not only highlight the limited scope of existing studies, but note that these lack a clear definition of interpretive journalism, often distinguishing only between descriptive and non-descriptive news. Because interpretive journalism was operationalized in various ways, comparisons across findings were difficult. Scholars have therefore suggested to operationalize interpretive journalism more clearly, focusing on journalistic explanations of current events, personal evaluation, and predictions of the future (Salgado & Strömbäck, 2012; Soontjens, 2019).

However, memory scholars argue that research on interpretive journalism lacks an emphasis on history. They argue that historical context needs to be incorporated into the definition and studies of interpretive journalism, as journalists often use history to explain recent events; past events serve as a benchmark and explanatory ground for understanding the ever-changing present and are used as analogies to predict future events (Neiger & Tenenboim-Weinblatt, 2016; Edy, 1999; Zelizer & Tenenboim-Weinblatt, 2014).

This study responds to such calls for more empirical research on interpretive journalism as well as a clear operationalization and a specific focus on history. We analyze interpretive journalism in the Netherlands through a quantitative content analysis of articles (N = 3000) in two national and one regional newspaper, covering the period 2004–2024. We specifically focus on how journalists evaluate the news, use current information to predict future developments, and use information about the past to interpret and contextualize ongoing events and actions. The Netherlands has been chosen as a case study because the results will be comparable with previous longitudinal studies in Europe, which have mostly focused on countries with a longer democratic tradition. Secondly, most studies about the Netherlands focus on election coverage during the 1990s, and lack a long-term perspective. This case study offers an opportunity to build on previous research and gain insights into the long-term development of Dutch journalism in the 21st century, fostering an understanding of

interpretative journalism over time and since the rise of the internet. Moreover, we further refine its conceptualization, highlighting the importance of history in interpretive journalism as well as differences and similarities between regional and national journalism. Preliminary results show that journalists often incorporate historical context into articles to explain current events, making it a central feature of interpretative journalism.

PP 0911 The fragility of news accuracy: Negotiating the ideal and practice of accuracy in contemporary journalism

Cato Depauw[1]

[1] University of Antwerp, Political Communication, Antwerp, Belgium

Accuracy is regarded as a foundational norm of journalism that is not only of paramount importance to the way journalists perform their professional role, but also as a key condition underlying public trust in news and evaluations of media credibility (Sterling, 2009; Urban & Schweiger, 2014). Audiences expect news media to provide reliable, verified information as a basis for accountability and professional integrity (Joseph, 2011; Porlezza & Russ-Mohl, 2013). At the same time, what counts as "accurate" is not universally defined: expectations of accuracy vary, and journalists may therefore translate this norm into practice in different ways, depending on their perceptions of audience expectations.

Theoretically, accuracy has been conceptualized as reporting that deviates as little as possible from reality (Lawrence & Grey, 1969; Porlezza, 2019). However, both journalists and researchers acknowledge that fully representing reality is epistemologically and practically unattainable (Gauthier, 2005). This tension is particularly evident in discussions of subjective accuracy, which refers to accuracy of meaning and narrative interpretation rather than the correct reporting of discrete facts. Although subjective accuracy is explicitly reflected in many ethical codes, it proves more difficult to translate into journalistic practice, as it intersects with other normative values such as fairness, completeness, etc. (Boudana, 2016).

These conceptual challenges are further intensified in a contemporary information environment characterized by speed, uncertainty, and competing information flows from a wide range of actors (Bjerknes, 2024; Shapiro et al., 2013). News production is marked by continuous updates, retrospective corrections, and revisions of earlier reporting, often under intense competitive pressure to deliver breaking news (Timmerman, Van Leuven, & Bronselaer, 2025). These pressures are exacerbated by economic constraints that have reduced newsroom resources and increased reliance on generalist journalists, limiting time for verification and in-depth contextualization (Blach-Ørsten, Hartley, & Wittchen, 2021; Connolly, 2024).

Technological developments further complicate journalistic accuracy. Journalists express uncertainty about the implications of generative AI and social media for reliable reporting (Trattner et al., 2022; Vergeer, 2018). Although these platforms increase access to sources, they also introduce verification difficulties, particularly when dealing with anonymous accounts (Xu & Gutsche Jr, 2021). Despite these challenges, audienceexpectations for timely and error-free reporting remain high (Anderson, 2025; Manninen, 2020).

Although accuracy remains a widely endorsed normative ideal, limited empirical research has examined how journalists themselves experience and enact this norm in daily practice, as existing studies have largely focused on verification, error correction, or inaccuracies from the perspective of news subjects (Palmer, 2013; Porlezza, 2019). Few recent studies examine how journalists define accuracy, how they prioritize it, and which aspects they perceive as most difficult to uphold (Shapiro et al., 2013). Building on previous insights, this study examines how journalists conceptualize and negotiate accuracy in professional practice. Drawing on survey data from Belgian journalists, it explores how accuracy is defined, enacted, and prioritized, as well as the challenges journalists perceive with respect to both its objective and subjective dimensions. By foregrounding journalists' own perspectives, the study contributes to a more integrative understanding of news accuracy under contemporary production conditions.

JOS30 TikTok and News

PP 0912 Journalists and influencers navigating news on TikTok during a natural disaster: Same game, different rules

Jorge Vázquez-Herrero[1], María-Cruz Negreira-Rey[1]

[1] Universidade de Santiago de Compostela, Communication Sciences, Santiago de Compostela, Spain

The values of journalism and journalistic practice itself are under dispute—a lively debate occurring across all communication spaces, including those originally focused on entertainment that have now become entry points for information. TikTok is a clear example of this within a platformized context in which journalism seeks to maintain its relevance while experiencing tensions stemming from algorithmic logics and peripheral actors.

In this scenario, we propose the need to comparatively analyze the content published by journalistic actors, content creators, and the most viral posts in the coverage of a given event, comparing the thematic agenda they address, their informational treatment, and their adaptation to the platform. The torrential rains in Valencia (Spain) in 2024, known as the DANA, serve as the case study in this research to understand how a phenomenon of great informational relevance is represented in real time by news outlets, content creators, and viral content.

The study begins with the collection of 55,042 posts published between October 29 and November 5 that mentioned one of the 19 most affected municipalities, using a novel data collection approach through the TikTok Research API and Python—a method applicable to other research in digital journalism. After several stages of dataset evaluation, multiple criteria were applied to obtain a final sample of 45,368 videos. From this dataset, random subsamples were generated for each of the relevant defined categories (news outlets, content creators, and viral posts), resulting in a total of 300 videos analyzed, which were subjected to a mixed-method content analysis.

The results indicate differences in thematic coverage and in the construction of news about the DANA. What happened on October 29 is the main focus in most viral and news outlets videos, whereas influencers place greater emphasis on volunteers. Regarding the use of sources, it is noteworthy that 46% of influencer videos omit them.

With respect to information treatment, a high presence of opinionated content is observed among influencers (43%) and viral posts (31%), while news outlets remain largely distant from this practice (6%). Both sensationalist and spectacle-driven content are predominant among the most viral videos, which are also the ones that most frequently lack spatiotemporal context. Conversely, among influencers we find that 19% of videos exhibit a service-oriented purpose, particularly regarding the availability of aid and volunteer logistics.

In terms of format adaptation, news outlets make the greatest effort, while such adaptation is low or absent in most viral and influencer content. Finally, we can advance that news outlets show strong guarantees, with 94% of their videos avoiding significant information disorders, whereas we find videos that certainly or likely misinform among influencers (15%) and viral posts (10%).

This case illustrates how journalism seeks to maintain its legitimacy in an environment where journalistic standards are increasingly blurred. Various actors attempt to fulfil a journalistic role but perform it differently, seeking either to imitate news outlets or to replace them. The study therefore identifies the risks faced by audiences who now rely on platforms such as TikTok for information.

PP 0913 'From the field to porridge': Social media influencers as gatekeepers in finnish TikTok journalism

Margareta Salonen[1], Jonathan Hendrickx[2]

[1] University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland
[2] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Journalism has become increasingly platformized and the use of social media is a standard for legacy news outlets around the globe (Newman et al., 2024). Similarly, social media influencers as content producers for legacy news outlets have gained traction in newsrooms (Author). Previous research has looked at social media influencers in general (Leaver et al., 2020), in marketing (Reinikainen, 2022), as political influencers (Pöyry, 2023) and from the perspective of (freelance) journalists who act as influencers (Mellado & Hermida, 2022). However, a deeper theoretical and empirical understanding of the use of social media influencers as journalistic content producers for legacy media is lacking (cf. Hurcombe, 2024).

This study provides a better understanding of this relationship by presenting a case of the Finnish public service media Yle's use of a social media influencer as a journalistic content producer. Between July-September 2024, Yle's youth brand Yle Kioski published a TikTok series 'From the field to porridge' with a farmer-influencer called Amski. The dataset covering the production includes 15 TikTok videos, interviews with Yle's producer and the farmer-influencer (2 hours), and 26 pages of field notes from two meetings between them observed by the lead author.

By utilising qualitative iterative analysis (Tracy, 2018) and gatekeeping theory (Author), the study looks at the TikTok series' content (RQ1), and the journalistic norms and values Yle's producer and Amski negotiated for their production (RQ2). The research provides practical understanding of how gatekeeping power, i.e. decision-making power, is divided between the two actors, and how a social media influencer holds power over the shared content and the producer over journalistic norms. Theoretically, we see the influencer as the *gatekeeper of content* and the news producer as the *gatekeeper of journalistic norms*. In addition, the study extends gatekeeping theory to understand the role of social media influencers in the digital news environment.

PP 0914 Citizens being "unalived"? Exploring the relationship between TikTok journalism and algospeak

Jonathan Hendrickx[1], Jorge Vázquez Herrero[2], María Cruz Negreira Rey[2]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark
[2] University of Santiago de Compostela, Facultad de Ciencias de Comunicación, Santiago de Compostela, Spain

In his 2025 book, US linguist Adam Aleksic discusses how social media platform's far-reaching algorithms are transforming everyday language usage (Aleksic, 2025). One notable example is *unalive*, replacing "dead" or "to kill" (Schock et al., 2025). These types of new words are increasingly referred to as *algospeak*, a portmanteau of algorithm and Orwellian newspeak (Weingarten, 2025). They are launched into contemporary TikTok and wider social media language by necessity, as creators must be creative to bypass algorithmic censors, which ban posts containing specific words and phrases. Algorithmically-curated censorship can pose far-reaching problems for news media and individual journalists that seek to build a community of followers on the platform. With TikTok journalism rapidly expanding in size and scope (Degen et al., 2024; see also the 2025 Digital News Report for an international overview of the platform's rising popularity), little is known about how journalistic production and dissemination practices on the platform are constrained in practice. This study seeks to fill this gap in scholarship, proposing a multi-method methodological study design consisting of quantitative content analysis and in-depth semi-structured expert interviews and the following two research questions:

RQ1: To what extent is algospeak salient in journalistic content on TikTok?
RQ2: To what extent do journalists consider algospeak when they produce content for TikTok?

We focus on the TikTok channels curated by legacy news outlets (private and public service media-owned) in four European countries: Belgium, Denmark, Spain and the United Kingdom. This approach allows us to investigate algospeak across a diversity of different languages, offering a novel linguistic approach. We will randomly select samples of TikToks shared between January and March 2026 by eight news outlets, one publicly and one privately owned from each nation. A codebook will be developed based on prior TikTok journalism-related studies (Hase et al., 2023; Hendrickx & Vázquez-Herrero, 2024) and implement noting the presence or absence of algospeak words and phrases. Next to this, we seek to reach out to the eight selected news outlets and carry out interviews with one editor or journalist from each. These interviews will be operationalised to validate and contextualise our content analysis and provide more novel insights into how algospeak is affecting journalistic production and dissemination processes on TikTok. These interviews will be scheduled for the first quarter of 2026.

We seek to present preliminary findings at ECREA26, projecting that algospeak will be relatively common in influencing news production processes on TikTok as specific words and themes will actively be avoided, for instance related to the ongoing conflict in Palestine. At the time of writing and to the best of our knowledge, this would be the first study that investigates algospeak from a journalistic perspective. This would be our main contribution to the state-of-the-art in terms of TikTok journalism, social media algorithms affecting user behaviour, and freedom of expression being stifled as a result of algorithmic bans, which arguably is particularly threatening for the free, unfiltered dissemination of news and journalistic content intended to inform audiences without bias or censorship.

JOS30 TikTok and News

PP 0915 Between rigor and virality: A comparative analysis of Brazilian and Portuguese news media on TikTok

Ilo Alexandre[1]

[1] Lusófona University, Department of Communication Sciences/ECATI, Lisbon, Portugal

In recent years, traditional media outlets have faced a significant decline in audience share, particularly among younger generations who increasingly turn to social media for news consumption. Since the onset of the COVID-19 pandemic, news organizations worldwide have intensified their presence on TikTok, a platform particularly favored by Generation Z (born from 1997 to 2012). Despite the growing body of research on media outlets' engagement with TikTok across various countries (Chobanyan & Nikolskaya, 2021; Estrada-García & Gamir-Ríos, 2023; Maroto-González et al., 2024; Vázquez-Herrero et al., 2022), there remains a significant gap in understanding how the Portuguese-language news media are adapting to this ecosystem. This study investigates the Lusophone context by comparing Brazil and Portugal, aiming to understand how news media from two different continents sharing the same linguistic background navigate the platform's unique requirements and audience expectations.

Guided by a platformization framework, the research examines how 12 news outlets (legacy and digital-born) from both countries are reshaping journalistic practices to fit TikTok's affordances. We analyzed the top 30 "popular" videos from each outlet (N = 360), covering Portuguese media (Expresso, Jornal de Notícias, Público, ECO, Mensagem de Lisboa, Observador) and Brazilian outlets (Estadão, Folha de S. Paulo, O Globo, Agência Pública, Aos Fatos, Congresso em Foco). Using a mixed-methods approach, we examine engagement metrics (likes, comments, shares), platform-specific features

(hashtags, stickers, GIFs, emojis, filters, sounds), news categories, content origination (repurposed vs. TikTok-native), and audience response patterns.

While the Brazilian data is currently under analysis, preliminary findings for the Portuguese media indicate that while Portuguese media outlets are actively using TikTok, their strategies vary widely. Although the ratio Plays/Followers is high among the digital natives, legacy media receive, on average, more comments. Notably, despite the extensive use of hashtags, many outlets underutilize platform-specific features that could foster stronger audience interaction.

The study addresses a dual objective: it explores how journalism can utilize digital platforms to extend its reach while critically assessing whether this adaptation represents a valuable evolution or if the pursuit of virality compromises journalistic rigor. By linking platform logics to editorial choices and audience practices, this research contributes to understanding the evolving relationship between journalism and digital platforms in Portuguese-language contexts.

JOS30 TikTok and News

PP 0916 News on TikTok: Narrative strategies at scale and their reception among young audiences

Chiao-I Tseng[1], Kristoffer Holt[2], Beate Schirrmacher[3], Katja Schupp[4]

[1] University of Gothenburg, Department of Applied IT- div CLIC, Gothenburg, Sweden
[2] Linnaeus university, Department of Media and Journalism, Kalmar, Sweden
[3] Linnaeus university, Dept. of Film and Literature, Växjö, Sweden
[4] Johannes Gutenberg-University Mainz- Germany, School of Journalism, Mainz, Germany

The rapid rise of TikTok as a news platform marks a profound shift in how journalism is produced, distributed, and experienced, particularly among younger audiences. More than half of leading news organisations now publish news content on TikTok, where short-form video, personalisation, and algorithmic visibility shape journalistic practices and audience expectations. Despite growing scholarly attention, there remains limited understanding of how platform-specific affordances transform news narrative strategies and how these transformations shape young audiences' perceptions of news values, credibility, and quality.

Addressing this gap, the paper examines how TikTok news videos reconfigure the relationship between engaging storytelling and factual truth claims, and how these reconfigurations are received by young audiences. Drawing on multimodal discourse analysis and intermedial approaches (Bateman & Tseng, 2023; Holt & Schirrmacher, 2022), the study conceptualises TikTok not merely as a distribution channel but as a structuring media environment in which professional norms, news storytelling approach and audience relations are renegotiated. Particular attention is paid to how truthfulness and credibility are constructed through multimodal performances, authenticity cues, and narrative authority, rather than through traditional institutional markers (Enli, 2015; Schirrmacher, 2024).

Methodologically, the paper combines large-scale, computationally grounded multimodal analysis of TikTok news videos (Tseng et al, 2026/forthcoming) from mainstream, alternative, and influencer-driven channels with audience-oriented reception studies focusing on young adults' experiences of news on the platform. The analysis identifies recurring audiovisual narrative strategies—such as personalisation, emotionalisation, fragmentation, and self-referential address—and examines how these strategies interact with markers of facticity, authenticity, and credibility, as well as how they are evaluated by young audiences.

The paper argues that TikTok journalism exemplifies a broader transformation in which journalistic authority is increasingly negotiated through affective engagement and intermedial storytelling rather than institutional distance or professional detachment. At the same time, the convergence of mainstream, alternative, and influencer-driven styles blurs established boundaries between journalism and other forms of mediated communication (Schirrmacher & Holt, 2026/forthcoming). TikTok journalism thus foregrounds a central tension in contemporary democratic communication: balancing engagement and visibility with enduring claims to truth, credibility, and public value.

This paper is based on the cross-faculty research project TACTik: Transformation and Consequences of News on TikTok, funded by the Swedish Research Council.

JOS31 Journalists' Well-Being

PP 0925 Assaults on journalists and mental well-being: Evidence from Germany

Thomas Hanitzsch[1], Antonia Markiewitz[1]

[1] LMU Munich, Depatment of Media and Communication, Munich, Germany

Journalism scholarship has paid increased attention to the work-related stress and mental well-being of journalists (e.g., Bélair-Gagnon et al., 2025; Hoak, 2021; Osmann et al., 2021; Šimunjak & Menke, 2022). At the same time, a growing body of studies is concerned with accelerated threats to journalists' safety and rising numbers of assaults on journalists in a variety of countries (e.g., Reporters Without Borders, 2025; Slavtcheva-Petkova et al., 2023, 2025). Initial evidence suggests that frequent exposure to these assaults may incur significant harm to journalists' psychological well-being (Lee & Park, 2024; Papendick et al., 2020). Despite these indications, journalism researchers have yet to explore the impact of attacks on and harassment of journalists on their work-related stress and mental well-being.

The current study aims to close this gap. Drawing on results of a survey of German professional journalists (N = 1301), this paper examines the effect of journalists' exposure to work-related assaults on their levels of psychological distress, psychological well-being, and the intention to leave the profession. Conceptually, we build on approaches common in occupational health psychology, notably the transactional stress model (Lazarus & Folkman, 1984) and the job demands-resources model (Demerouti et al., 2001). Mental-health-related outcomes were assessed using clinically validated inventories, including the K10 (for psychological distress; Kessler et al., 2002) and the WHO-5 (for psychological well-being; Staehr Johansen, 1998).

We tested the following hypotheses: H1: Journalists exposed to attacks and assaults in the workplace experience (a) higher psychological distress and (b) lower psychological well-being. H2: Journalists subjected to work-related assaults have a higher inclination to leave the profession.

The results show that among the surveyed journalists, 58% have experienced online harassment, and 44% have been exposed to attacks in personal interactions. About one third of them reported experiences of threats/intimidation, discrimination, and mobbing. Both of our hypotheses were confirmed. Journalists who were exposed to assaults in the work context reported higher psychological distress and scored lower on psychological well-being. They also considered leaving the profession more frequently. Overall, these results are concerning and call for a robust response from media organizations and policymakers.

JOS31 Journalists' Well-Being

PP 0926 The pursuit of meaning in journalism: Exploring Portuguese journalists subjective well-being

Rita Araújo[1]

[1] University of Minho, Centro de Estudos de Comunicação e Sociedade, Braga, Portugal

There is a wide array of literature exploring the ways in which journalists are exercising the profession, in often precarious conditions and frequently under attack. Besides, they are often subject to long and irregular hours and many complain about the loss of status and recognition. All these add to their already extensive emotional labor, which can impact their wellbeing and negatively affect their mental health (Bélair-Gagnon et al., 2023a; Deuze, 2023; Šimunjak & Menke, 2023), pushing journalists out of the profession. Some authors suggest we are looking at a "mental health crisis" within the media industry (Deuze, 2023; Storm, 2024), with "too few" opportunities for happiness in journalism (Lewis, 2023, 193).

Research around journalists' emotional labor, mental health, joy, resilience, happiness and well-being has been growing steadily. There are two approaches to well-being: hedonic (also referred to as subjective well-being) and eudaimonic (also referred to as psychological well-being). In journalism practice, eudaimonic well-being would be related to its normative

role of a public service mission and democratic ideals (Ragsdale & Newman, 2023, p. 35), resulting on a sense of fulfillment that derives from acting in accordance with strongly held/valued moral ideas (Stupart, 2024, p. 19).

In this presentation, we will explore Portuguese journalists' hedonic well-being, which is usually measured through two dimensions: enjoying what you do, or finding it useful (Bélair-Gagnon et al., 2023b, p. 21). We conducted semi-structured interviews with Portuguese journalists working for several types of news media (N = 50), gathering a purposive and snowballed sample, in order to understand what contributes to journalists' subjective well-being and happiness. Results from qualitative content analysis show that, similarly to what is described in the literature, journalists' subjective well-being is usually expressed through enjoying what you do and finding it useful. Indeed, interviewees talk about their profession as a "passion", mostly due to the "privilege" of "telling the world". This is mostly achieved through feature-writing, meeting interesting people and dealing with diverse topics. Furthermore, journalists refer to the usefulness of journalism, related to the notion of a public service mission – that was highlighted during COVID-19. In spite of feeling passionate for journalism, many interviewees admit they have thought about leaving the profession. This happens not because of journalism *per se*, rather to the conditions in which it is practiced, which contribute to the feeling that well-being is not actively promoted within newsrooms. Journalists claim that, whenever they have a sense of well-being, it is usually achieved through workplace environment and interpersonal relationships. To the best of our knowledge, this is the first study to analyze subjective well-being in Portuguese journalism, adding to the growing body of literature and shedding light into an often-underrepresented geographical context.

PP 0927 Beyond the Breaking News: Mental Health, Ethical Strain, and Resilience in Emergency Journalism

Anna-Carina Zappe[1]

[1] TU Dortmund University, Institute of Journalism, Dortmund, Germany

Journalism is currently experiencing a period of profound transformation in which accelerated news cycles and economic pressure with increasing psychological strain. Within this context, emergency reporting represents a central yet underexamined field of journalistic practice. Journalists do not need to work in war zones or large-scale disaster contexts to become emergency reporters: local accidents, violent crimes, fires, or sudden deaths routinely confront them with acute situations of suffering, uncertainty, and time pressure. The probability of journalists being confronted with a potentially traumatic event is between 80 and 100 percent.

This paper presents findings from an empirical study that examines the consequences of emergency reporting for individual journalists, with a particular focus on resilience and mental health. It addresses two research questions: How do the consequences of reporting on specific emergency events manifest for journalists' health? And can journalists cope with emergency reporting, adapt, and even emerge strengthened – in other words, respond resiliently?

The study is grounded in an integrative, profession-oriented framework linking sociological and social psychological role theory with concepts from emergency psychology. Prior research indicates that journalists are uniquely exposed to ethical and emotional strain because they repeatedly witness potentially traumatic events while being expected to remain professionally detached, a constellation that can foster guilt and moral conflict (Browne et al., 2012; Backholm & Idås, 2015). Such ethical dilemmas have been shown to correlate with posttraumatic stress symptoms and broader impairments to mental health (Idås et al., 2019).

Methodologically, the study employs a multimethod triangulation design combining a survey with qualitative follow-up interviews (Flick, 2017). The empirical material is structured around four case studies of emergency events in Germany with 30 journalists. These cases represent different types of emergencies while sharing core characteristics such as fatalities, intense media pressure, and ethical ambiguity, allowing for a comparative analysis of consequences across contexts.

The findings reveal a differentiated pattern of outcomes. On the one hand, journalists reported immediate physical exhaustion, emotional involvement, and heightened stress during emergency assignments. In the weeks and months following the events, some experienced intrusion, hypervigilance, mistrust, and avoidance behaviors, consistent with trauma-related reactions described in previous research (Simpson & Boggs, 1999; Weidmann, 2008). Ethical dilemmas – particularly concerns about harming victims, violating personal values, or benefiting professionally from tragedy – emerged as central stressors and might lead to longer-term strain.

On the other hand, the study also identifies resilience processes and positive consequences. Many journalists described adaptive coping strategies, learning effects, and a strengthened professional self-concept. In several cases, emergency reporting led to increased confidence, ethical clarity, closer collegial relationships, and professional recognition, aligning with concepts of posttraumatic growth documented in earlier studies (Idås et al., 2019; McMahon, 2020).

Overall, the paper conceptualizes resilience in emergency journalism not as an individual trait but as a dynamic process shaped by ethical reflection, experience, and organizational support. It concludes that addressing the mental health consequences of emergency reporting is essential for sustainable working conditions and for maintaining journalistic quality in times of ongoing upheaval.

PP 0928 Coping with Care and Career: Gendered Strategies in Public Service Journalism

Renata Sedláková[1], Michaela Vetešková[2]

[1] Palacký University CMTF, Communication studies, Olomouc, Czech Republic
[2] Palacký University, Communication Studies, Olomouc, Czech Republic

This paper presents findings from an ongoing qualitative study employing grounded theory to examine how Czech female journalists working primarily in public service media negotiate emotional and mental well-being when making decisions about career development and family life. Drawing on in-depth interviews with eight female journalists, the study explores how gendered expectations embedded in journalistic work — such as norms of constant availability, professional dedication, and uninterrupted career trajectories — intersect with limited institutional support for caregiving in Czech society.

Public service media are normatively associated with values of social responsibility, equality, and inclusivity. However, participants' accounts reveal a persistent tension between these declared principles and everyday organizational practices. Respondents describe structural constraints that complicate the reconciliation of professional and family roles, including informal expectations of flexibility, workload intensity, and career continuity that disproportionately affect women with caregiving responsibilities.

Methodologically, the study applies grounded theory to foreground journalists' lived experiences and to inductively develop analytical categories from the data. Emerging concepts include coping strategies, emotional regulation, anticipatory decision-making, professional self-limitation, and ongoing identity negotiation within newsrooms. Coping strategies are not conceptualized as individualized psychological responses, they are understood as gendered and structurally conditioned practices shaped by organizational cultures, institutional norms, and broader societal arrangements governing care, work, and family roles.

Participants frequently describe career–family decisions as matters of individual responsibility, despite simultaneously recognizing the structural nature of the constraints they face. This individualization of responsibility contributes to emotional strain, reinforces gendered inequalities within journalistic organizations, and often results in constrained career trajectories for women journalists (even in the public service media). The paper argues that these coping strategies should be analyzed as situated responses to the institutional logics of public service journalism rather than as private choices, thereby highlighting the need to critically reassess how public service media address gender equality within their own organizational practices.

JOS31 Journalists' Well-Being

PP 0929 Freelancers or "forcedlancers"? Precarity among Portuguese journalists

Joaquim Fidalgo[1], Juliana Alcantara[2], Bibiana Garcez[3]

[1] Universidade do Minho, Communication and Society Research Centre, Braga, Portugal
[2] Erasmus University Rotterdam, Erasmus School of History- Culture and Communication, Rotterdam, Netherlands
[3] Universidade de Coimbra, Faculdade de Letras da Universidade de Coimbra / ICNOVA, Coimbra, Portugal

One of the many signs of the crisis affecting media and journalism is the growing job precarity among journalists. In Portugal, a significant portion of professionals live in a very precarious situation: no permanent contracts, job insecurity, very low pay, and no supplementary benefits (payment during holidays, days off, allowances). The reasons for this situation are related to the difficult economic situation of media companies, with a sharp drop in revenue from both advertising and sales or subscriptions. Forced to reduce costs, companies are cutting the item that weighs most heavily on their balance sheet: personnel expenses. Thus, newsrooms have been shrinking substantially, with the lack of permanent staff being compensated for by resorting to temporary workers, who are cheaper and more dispensable in crisis situations. Some of these journalists with no permanent labor contract have the voluntary status of freelancers, and therefore should not be classified as precarious: they choose this situation of independent workers to have greater freedom and frequently provide services to multiple companies. But many others, in fact, are not freelancers, but rather "forcedlancers" or "fakelancers," since they would prefer to have a stable and permanent link to a media outlet, but the company refuses to hire them in such conditions. And so, they provide services to a single company, being obliged to fulfill all the duties of any professional with a contract, but without having the same rights.

The purpose to better understand precarity among Portuguese journalists from their own perceptions led us to develop this research project. On the one hand, we sought to understand to what extent the personal and professional lives of these journalists are affected by their precarious situation. On the other hand, we tried to evaluate to what extent journalism practiced under these conditions is affected (and in what ways) by the fragile professional situation of many of its practitioners. In addition to a theoretical reflection on the concept of precariousness and its historical context, we developed empirical research consisting of a biographical approach. Semi-structured interviews were conducted with 29 professional journalists considered to be precarious workers. The issues addressed in the interviews were framed within four axes: (1) views and self-representations of precariousness, (2) ethical challenges in the context of precarity, (3) work

routines of precarious workers, and (4) perceptions of employment and work in precarious conditions. The findings suggest that precarious journalists define their condition based on the objective conditions in which they work, but they also internalize a subjective feeling of unfair treatment, uncertainty regarding the future, and doubts about their continuity in this profession. But, paradoxically, almost all of them feel fulfilled by working in journalism, apparently compensating the precariousness of their working and living conditions with a great passion for the profession. Therefore, many admit to quit the job and eventually find another one where they feel better treated, but, on the other hand, it is difficult for them to take that step because they feel so deeply attached to journalism.

JOS32 Young Producers and Consumers

PP 1012 Inform or influence: Generational differences in journalistic role conceptions

Jan Hofer[1]

[1] Westfälische Hochschule, Journalism and Communication JPR, Gelsenkirchen, Germany

Journalistic practices of topic selection and framing play a decisive role in shaping public perceptions of social reality. Accordingly, journalistic role conceptions have long constituted a central focus of journalism research (Hanitzsch et al., 2019; Weaver et al., 2007; Weischenberg et al., 2012). A substantial body of literature has examined the criteria guiding journalists' topic selection (Galtung & Ruge, 1965; Schultz, 2007; Harcup & O'Neill, 2017), as well as transformations in professional role understandings—particularly in response to increasing audience participation in journalistic processes facilitated by digital and social media environments (Singer et al., 2011; Costera Meijer & Groot Kormelink, 2017; Newman et al., 2017).

An additional analytical perspective on journalistic role conceptions arises from the tension between objectivity and subjectivity. Normative models of journalism, rooted in news value theory, emphasize the aspiration to report as objectively and neutrally as possible. From the standpoint of democratic theory, this normative orientation is associated with the expectation that public opinion formation should be grounded in comprehensive and reliable information (Bennett & Pfetsch, 2018; Dahlgren, 2005; Strömbäck, 2005). In contrast, the concept of *boundary work* foregrounds an alternative understanding of journalistic practice, in which transparent ethical and political positioning functions as a guiding principle (Gieryn, 1983; Carlson, 2015). This approach permits a degree of thematic partiality and explicitly acknowledges subjective, and in some cases activist, elements within journalism.

Despite extensive scholarship on journalistic role conceptions, the extent to which age and generational affiliation shape these understandings remains insufficiently examined. The present study addresses this research gap for Germany by investigating the following research questions:

RQ1: How important are established professional quality standards to German journalists from Generation X and Generation Y?

RQ2: Do journalists themselves perceive differences in journalistic role conceptions between Generation X and Generation Y?

The empirical analysis is based on semi-structured interviews conducted between October and December 2025 with twenty journalists from Generation X and Generation Y. The sample comprises recipients of the German journalism award *"30 under 30,"* which has been presented for two decades to outstanding journalists under the age of 30. The interview guide was developed on the basis of the established item battery on journalistic role conceptions from the *Worlds of Journalism Study* (Hanitzsch et al., 2011; 2019).

The findings indicate that while the professional self-understanding of journalists from both generations continues to be dominated by a neutral, mediating role conception, younger journalists between the ages of 25 and 35 feel significantly less bound by this norm. Members of Generation Y display a greater openness to incorporating their own values and personal experiences into their journalistic work and regard explicit positioning on certain issues as more legitimate. This tendency is especially pronounced in relation to socially polarizing topics such as climate change, migration, and feminism.

PP 1013 Whose perspectives shape journalism? Social background and role perceptions of early-career journalists

Tanja Köhler[1], Johanna Mack[1]

[1] Hochschule Bonn-Rhein-Sieg, Institute for Media Research and Development, Sankt Augustin, Germany

The number of journalists holding academic degrees has been steadily increasing in Germany and Austria for several years (von Garmissen et al., 2025; Kaltenbrunner et al., 2020). This process of academisation is often interpreted as an indicator of growing professionalisation. At the same time, however, it has been associated with a decline in social diversity and the loss of non-academic perspectives within journalism (Kaltenbrunner et al., 2020). Moreover, the de facto academisation of the profession has raised entry barriers for individuals from lower social backgrounds (Kracke et al., 2024).

Against this backdrop, social background has gained increased relevance. Journalists' social origins shape internalised interpretative patterns that may influence topic selection, framing, and the representation of journalistic content (Lueg, 2012; Saxer & Schanne, 1981). A structural narrowing of access to the profession therefore entails risks for thematic diversity, journalistic credibility, and public trust in journalism, as well as for democratic discourse more broadly. The question of who produces media content thus carries a clear socio-political dimension, as a functioning democracy depends on trust in journalism.

Despite its significance, social background has so far received little systematic attention in journalism research. Although classism has recently been discussed more intensively in the media sector (Gamper & Kupfer, 2024; Theißl, 2023), empirical studies examining the effects of social diversity initiatives by German media organisations on the recruitment of early-career journalists remain scarce.

This paper addresses this research gap by presenting findings from the largest study to date on the social background of early-career journalists in Germany. The analysis is based on a standardized online survey of 250 journalism trainees, including newsroom trainees and students at journalism schools. The survey captures key indicators of social background as well as journalistic role perceptions among early-career journalists, thereby enabling an examination of the relationship between social origin and professional self-understanding.

The results show that the majority of respondents come from academic family backgrounds. The analysis of role perceptions reveals a high degree of consensus across social backgrounds with regard to central professional roles. Critical watchdog functions and informational, intermediary, and analytical tasks are prioritised across groups and constitute a shared core understanding of journalistic work. At the same time, the findings indicate that social background has a relevant influence particularly with regard to interventionist role perceptions. Respondents from lower and middle social backgrounds assign greater importance to advocatory and interventionist tasks, understanding journalism more strongly as a means of social participation or support for marginalised groups. In contrast, respondents from higher social backgrounds place greater emphasis on journalism's traditional control function vis-à-vis political and economic elites.

JOS32 Young Producers and Consumers

PP 1014 "Otherwise you'd go crazy": Eco anxiety, psychological stress and mental health needs in climate journalism

Maggie Holzreiter[1], Vera Katzenberger[1], Maria Hendrischke[1]

[1] University Leipzig, Department for Communication and Media Studies, Leipzig, Germany

Climate journalists play a crucial role in mediating knowledge about the climate crisis and its societal consequences. While their work is essential for public awareness and democratic decision-making, the psychological stress associated with engagement with an existential global crisis has received little systematic scholarly attention. This study addresses this research gap by examining work-related stress factors, climate-related emotions, coping strategies, and desired forms of support among climate journalists.

Drawing on the stress–strain concept from occupational psychology (Poppelreuter & Mierke, 2012), the study conceptualises journalistic stress as the result of interpersonal and personal stressors interacting with available resources and coping mechanisms. In addition, theoretical approaches from environmental psychology are integrated, particularly research on climate emotions (Pihkala, 2022b) and eco-anxiety (Clayton et al., 2017), as well as transactional coping theory (Lazarus & Folkman, 1984). Pihkala's process model of eco-anxiety and eco-grief (Pihkala, 2022a) serves as a sensitising framework for analysing adaptive and maladaptive coping patterns in the context of long-term climate reporting.

Empirically, the study is based on 20 qualitative, semi-structured interviews with German-speaking climate journalists from different media genres (print, online, radio, television, and social media) and employment types (staff and freelance). The interviews were analysed using qualitative content analysis, with a category system derived deductively from existing literature and inductively from the material.

The findings show that climate journalists experience multiple, overlapping stress factors. In addition to the emotional burden of reporting on climate change impacts and human suffering—comparable to indirect exposure to climate-related stressors described in previous research (Doherty & Clayton, 2011; Fritze et al., 2008)—participants report stress arising from conflicts within editorial offices, accusations of activism, time pressure, limited resources, and hostile audience reactions such as online harassment. These stressors reflect both general occupational risks of journalism (Loosen et al., 2023; Beiler & Stascheit, 2017) and climate-specific challenges, including perceived inadequacy of political action and lobbying against climate protection.

Regarding emotional responses, interviewees describe a broad spectrum of climate emotions (Pihkala, 2022b), including fear and worry, anger and frustration, but also hope. While symptoms resembling climate anxiety are present, they are mostly articulated as functional emotional responses rather than clinical impairments, aligning with research that conceptualises climate anxiety as potentially adaptive (Clayton, 2020; Whitmarsh et al., 2022).

Nine coping strategies were identified. Six are classified as adaptive, including self-efficacy through journalistic work, a focus on constructive or solutions-oriented reporting, social support, self-care through time-outs, knowledge acquisition, and

humour. Three strategies are considered maladaptive: emotional distancing through rationalisation, avoidance, and repression through continuous work. These patterns resonate with prior findings on coping in climate-related professions (Head & Harada, 2017; Ágoston et al., 2022).

Finally, the study reveals a lack of institutional support for climate journalists' mental health. Participants express a desire for recognition of psychological strain by editorial offices and for preventive structures such as counselling or peer support. Overall, the findings highlight the resilience and the vulnerability of climate journalists and underline the need to integrate mental health considerations into newsroom practices and journalism research.

PP 1015 Strong traditions and new trends: Nordic journalism students in changing times

Jari Väliverronen[1], Jan Fredrik Hovden[2], Liv Iren Hognestad[3], Valgerður Anna Jóhannsdóttir[4], Kristina Riegert[5], Asbjørn Jørgensen[6]

[1] Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland
[2] University of Bergen, Department of Information Science and Media Studies, Bergen, Norway
[3] NLA University College, Journalism- Media and Communication, Kristiansand, Norway
[4] University of Iceland, Faculty of Political Science, Reykjavik, Iceland
[5] Södertörn University, School of Social Sciences, Stockholm, Sweden
[6] Danish School of Media and Journalism, Institute for Journalism, Aarhus, Denmark

The Nordic countries are historically considered "most similar systems" (Miles 1996) because of their strong political, cultural and societal ties. Similarities are also evident in their media systems (Hallin & Mancini 2004; Brüggemann et al. 2015; Syvertsen et al. 2014; Humprecht et al. 2022), journalists' views (Ahva et al. 2017), and journalism education (Hovden et al. 2016).

Upon a closer Nordic inspection, many (emerging) differences have been found at a systemic level (e.g., Ohlsson 2015; Ala-Fossi, 2020) and among individual journalists (Hovden & Väliverronen 2021) during a period of notable changes in journalism. One group where the potential impact of changes has received less attention is journalism students. Their views were extensively gauged in the Nordics in three waves of studies in 2005–2012, and findings indicated a shared and increasingly similar professional orientation (Hovden et al. 2016). Since then, observations have only been made nationally (e.g., Mäenpää & Ahva 2017 for Finland).

To observe recent developments, we conducted the fourth wave of the Nordic Journalism Students survey in autumn 2025. Our data consist of 1,741 responses from journalism students based in 27 J-schools in all five Nordic nation-states, and Greenland. We investigated journalism students' views on journalism, the education they had received, their future aspirations in journalism, their backgrounds and their media use. In this presentation, we will focus on their role perceptions and future aspirations.

Early results indicate that Nordic students' role perceptions have remained quite stable. Following earlier research (Hovden et al. 2016), investigative, monitoring, and reporting roles garner notable support. The least important roles, related to financial considerations and political agenda-setting, highlight students' ongoing support for the Nordic traditions of autonomy and neutral reporting (Ahva et al. 2017). In a more recent trend, students are also highly willing to stimulate new ideas and promote public debate. Alongside the largely shared orientation, there are notable regional differences as well, with Greenland particularly standing out.

Another key finding shows a notable decline in the proportion of Nordic students who are (fairly) certain that they want to work as journalists (from 73% in 2012 to 65% in 2025). At the same time and much like before (Hovden et al. 2016), students prioritise studying practical and profession-oriented skills, such as interviewing and source criticism, while subjects like media history, public administration and communication theory are less popular. This raises concern about the profession's long-term resilience. Uncertainty about a journalistic career is by far strongest among Icelandic students, and considerable in Finland, countries where media organisations have been particularly affected by financial pressures.

PP 1016 Real-time emotions in response to digital news: Effects of format, exposure sequence, and media literacy on youth civic engagement

Berta García-Orosa[1], José Luis Capón-García[2], Nelly Condori-Fernández[3], Eva Cid-Rivas[1]

[1] University of Santiago de Compostela, Communication Sciences, Santiago de Compostela, Spain
[2] University of Santiago de Compostela, Education, Santiago de Compostela, Spain
[3] University of Santiago de Compostela, Department of Electronic and Computing, Santiago de Compostela, Spain

This paper presents the final results of an interdisciplinary study (conducted by researchers in Communication, Political Science, Education, and Artificial Intelligence) that examines how young Europeans emotionally experience political information in digital environments, with particular attention to the role of format, exposure sequence, and prior ideological orientations. The research addresses three core challenges for communication in Europe: (1) the affective disengagement and low levels of political involvement among young people; (2) the growing influence of digital platforms and their algorithmic architectures in shaping public emotions; and (3) the need to rethink media literacy from a perspective that integrates both cognition and affect.

Young Europeans interact with political information predominantly through digital platforms, where their exposure to news is often incidental, emotionally saturated, and strongly conditioned by algorithmic design. However, there is still limited academic evidence regarding **how young people emotionally experience such exposures,** how these emotions influence their civic motivation, and what role format and digital consumption routines play in this process.

To address this gap, the research team conducted a controlled experiment in which 289 students were exposed to political news content presented in multiple formats and sequences. Emotional responses were assessed through self-report measures (I-PANAS-SF, SAM) and automated facial-expression analysis using the Kopernica tool. The study was complemented by a preliminary survey that gathered information habits, media trust, and ideological positioning, which enabled a more contextualised interpretation of the experimental findings.

The results reveal a clear predominance of negative emotions in response to political news—particularly frustration, shame, and confusion—while positive emotions (such as pride, calm, or joy) appeared only marginally. The TikTok-style audiovisual format increased interest and emotional activation but also elevated frustration compared with traditional text-based news. Exposure sequence also played a significant role: viewing the video first and then reading the text reduced frustration and enhanced participants' affective connection with the content. No robust ideological patterns emerged, owing to the low representation of conservative participants, although the data did suggest that ideological affinity may modulate emotional valence.

These results open an important debate for the research community: how can the emotional connection between young people and the public sphere be rebuilt in a platform-mediated ecosystem that amplifies affective signals? The study provides empirical evidence to inform media-literacy interventions directed not only at strengthening critical thinking but also at enhancing emotional regulation in digital environments. This, in turn, requires rethinking what "civic engagement" means in environments shaped by algorithmic systems, and considering how educational strategies might help emotionally reconnect young people with political life.

Overall, the study advances scientific understanding by offering an empirical approach grounded in real-time emotional measurement; by analysing formats, platforms, algorithms, and affective responses in an integrated manner; by proposing intervention models that address the links between emotions, information consumption, and democratic engagement; and by opening new avenues for investigating how platform design shapes political attitudes.

JOS33 Journalistic Work II.

PP 1017 The spatial reconfiguration of journalistic labour and alienation

Salih Kinsun[1]

[1] The University of Essex, Sociology, Colchester, United Kingdom

This article examines how remote work settings, particularly working from home, reshape the labour conditions of UK local journalists and transform the experience of alienation within contemporary capitalism. While flexible work models expanded rapidly during the COVID-19 pandemic, this study offers original qualitative evidence showing how these arrangements reconfigure journalistic labour by spatially relocating production into the domestic sphere. Drawing on Marx's (2011) theory of alienation and 26 in-depth interviews, the article demonstrates that journalists' homes are not merely alternative workplaces but active sites of capitalist production where domestic objects (e.g., dining tables, sofas, or beds) and private spaces (such as kitchens, living rooms, or bedrooms) acquire new functional and economic roles. This spatial restructuring produces a distinctive form of alienation: journalists become estranged not only from their labour and living spaces but also from their identities as both workers and family members.

The findings show that these forms of domestic alienation have direct and corrosive effects on journalistic practice. The spatial relocation of news production into the home, combined with the dissolution of temporal boundaries between work

and non-work, generates conditions of constant availability in which journalists experience themselves as perpetually "on alert". This mode of labour intensification accelerates news production and fragments journalistic workflows, encouraging reactive and episodic reporting over sustained inquiry. As domestic spaces are continuously repurposed for production, opportunities for editorial reflection, collaborative deliberation, and investigative depth are structurally diminished. Moreover, the erosion of boundaries between professional and personal identities weakens journalists' capacity to uphold occupational norms orientated toward public service, instead fostering compliance driven by insecurity with platform metrics and managerial expectations. The result is an increasingly homogenised and low-quality local news output, marked by superficiality and diminished democratic value. By tracing how alienation rooted in the domestication of labour reshapes journalistic time, space, and subjectivity, this article demonstrates that remote work does not merely relocate journalism but actively reconstitutes its epistemic practices, professional values, and institutional capacity to serve local publics.

Journalism, Remote Work, Flexible Labour, Precarity, Alienation

JOS33 Journalistic Work II.

PP 1018 The (re)configurations of Portuguese local journalism in the context of platformization

Mateus Noronha[1]

[1] LabCom Communication and Arts, Faculty of Arts and Letters, Covilhã, Portugal

As the structures and logics of digital platforms reshape economic sectors and social life, journalism is challenged to adapt to the production and circulation of news in the context of platformization (Dijck et al., 2018), described by the authors as the process through which the structures, business models, and forms of governance of digital platforms penetrate economic sectors and spheres of life, challenging the role of the media in the public sphere and in the audience attention market. The authors identify three dimensions through which the phenomenon affects media activity. For the present study, two of them are relevant: adaptations of journalistic practices and values; and the implications of the governance (affordances) of digital social platforms on the circulation of information. From an administrative perspective, it is necessary for media organizations to understand and adapt to platform logics in order to achieve greater relevance in this environment (Ferrer-Conill & Tandoc, 2018; Ferrucci et al., 2020; Jenkins et al., 2015). However, a critical reading indicates that platforms control interactions, data collection, views, advertisers, and billing, generating dependence and subordination (Poell et al., 2020). In this scenario, local journalism is at a serious disadvantage (Schulz, 2021), due to factors such as the lack of staff and resources to manage platforms and low numbers of followers and interactions, since media outlets with low relevance are sidelined in favor of large media organizations (Toff & Mathews, 2021; T. Vos & Heinderyckx, 2016). In addition to these difficulties, in Portugal, local journalism is undergoing a slow transition from print to online (Jerónimo, 2015; Noronha, 2020b). This communication proposal aims to present the results of research on how platformization has (re)configured local journalism in Portugal in the two dimensions mentioned above. Based on this question, the study had the following specific objectives: a) to identify how local journalism in the Central Region of Portugal has been (re)configured in its professional practices and values through the use of Facebook profiles to circulate its news; b) to investigate the challenges and strategies of local media in adapting to the logics and limitations of the governance norms (affordances) of the Facebook and Google platforms. To address the first objective, a content analysis is conducted based on news published on the Facebook profiles of 20 media outlets in the Central Region of Portugal, between 01/11/25 and 30/04/26, in order to analyze the influence of metrics on content production by identifying, for example, the use of clickbait, the republication of news, and churnalism (Van Leuven, 2019). For the second objective, semi-structured interviews are conducted with 20 editors responsible for managing digital platforms, to identify their perceptions regarding content performance on social networks, as well as the effects on financial results and the business model. A predominance of the reproduction of content from media websites on Facebook profiles is expected and, in part, the use of resources to influence metrics, as well as evidence of the difficulties faced by local media in producing metrics capable of generating revenue. but with successful exemples.

PP 1019 Journalists' political role conceptions in the face of democratic backsliding: A Pan-European approach

Imke Henkel[1], Thomas Hanitzsch[2], Sandra Lábová[3], Jón Gunnar Ólafsson[4], Dariya Orlova[5], Zrinjka Peruško[6], Sergio Splendore[7], Neil Thurman[2], Jari Väliverronen[8], Dina Vozab[6]

[1] University of Leeds, School of Media and Communication, Leeds, United Kingdom
[2] Ludwig Maximilian University Munich, Department of Media and Communications, Munich, Germany
[3] Charles University, Communication Studies and Journalism, Prague, Czech Republic
[4] University of Iceland, School of Social Sciences, Reykjavík, Iceland
[5] National University of Kyiv-Mohyla Academy, The Mohyla School of Journalism, Kyiv, Ukraine
[6] University of Zagreb, Faculty of Political Science, Zagreb, Croatia
[7] University of Milan, Department of Social and Political Sciences, Milan, Italy
[8] Tampere University, Communication Sciences, Tampere, Finland

With the worldwide rise of authoritarianism (Boese et. al., 2022; Repucci & Slipowitz, 2023), the question to what extent journalism is effected by threats to democracy, can counter, or, to the contrary, may support them, has become an urgent concern (Johnson & Veenstra, 2024). Scholars argued that journalists can strengthen citizen's resilience against democratic backsliding by helping to inform citizens about political processes (Kaftan & Gessler, 2025). However, other studies showed that journalists can also foster the erosion of democracy if they focus on representing and amplifying grievances and disaffection with democratic processes (McDevitt, 2022). In this context, Europe is of particular interest as recent years have witnessed increasing democratic backsliding across the continent, threatening its democratic tradition (Norris, 2017). Although mostly identified in Eastern and Central Europe (e.g. Castaldo & Memoli 2024; Cianetti et al., 2018; Lorenz & Anders, 2021), a rise in anti-democratic trends has also been observed in Western European countries such as the United Kingdom (Blick, 2024) and Italy (Coletti, 2025). Democratic backsliding has become a pan-European concern (Oleart & Theuns, 2023).

Our paper analyses how journalists across Europe perceive their political role in the context of rising democratic backsliding and illiberal democracies. We draw on a large data set of surveys with journalists in 26 countries across Eastern, Central, and Western Europe (N = 13,098). The surveys were fielded between 2021 and 2024 as part of an international research project in which the authors of this study participate.

Our paper asks how journalists' political role conceptions differ across Europe (RQ1); whether the degree of perceived press freedom and of state repression against journalists effect journalists' political role conceptions across Europe (RQ2); and whether the degree of media freedom and of democracy as measured by independent organisations effect how journalists across Europe perceive their political roles (RQ3).

We draw on 24 survey items pertaining to journalists' professional role conceptions that cluster into four politically relevant milieus (cf. Hanitzsch, 2011): informers and analysts; critical advocates; interventionists; and loyalists. To assess the political context and specifically the state of democracy within which journalists work, we use a number of measures. First, we draw on an item from our survey to measure journalists' perceived media freedom. Second, we assess whether authorities in the respective country engaged in surveillance and/or blocking of critical and investigative journalists, drawing on a questionnaire answered by the researchers conducting the surveys in each country. Third, we use data from Reporters Without Borders' Press Freedom Index and from the Economist Intelligence Unit's Democracy Index to measure the degree of media freedom and democracy journalists encounter in each country. To evaluate the effect of different degrees of media freedom and of democracy on journalists' political role conceptions across our 26 we apply multilevel linear regression analysis with random intercepts.

Our pan-European approach, including countries from East to West, runs counter most existing research in journalism studies that focusses either on Eastern or on Western Europe, and thus aims to overcome the still prevailing cold-war divide (Peruško et al., 2021).

PP 1020 Identity work in regional journalism: A print–digital comparison

Maruša Mavsar[1]

[1] Alma Mater Europaea, Strategic Communication Management, Maribor, Slovenia

Research on traditional regional and local media frequently discusses these outlets as representational actors that mirror pre-existing territorial identities. In parallel, their digital transformation is often assumed to strengthen participatory capacities and processes of identity construction. This paper complements both assumptions by shifting analytical attention from representation to the everyday organizational, discursive, and visual practices through which regional belonging is produced, by approaching regional media as identity infrastructures.

The paper is based on a comparative analysis of selected regional newspapers and regional online platforms in Slovenia and Croatia, analysed over comparable publication periods. It asks how regional identity is constructed across print and digital formats and where infrastructural identity work becomes uneven. The analysis combines quantitative content analysis and

multimodal analysis, supplemented by contextual information on ownership structures and editorial routines obtained through interviews. Identity construction is examined through patterns of thematic organization, voice, and visual structuring of regional belonging across print and digital formats.

The findings reveal print-digital asymmetries in the ways regional journalism and its media formats perform identity work. Regional newspapers continue to sustain relatively coherent forms of identity construction through stable sectioning, repetitive symbolic geographies, and visually anchored narratives. Online regional media in both countries, by contrast, exhibit a more fragmented mode of identity construction. While print editions reproduce regional belonging as a cumulative, continuous process, identity-related content on online platforms is dispersed across news flows and shaped by immediacy-driven publishing logic. Additionally, platform-specific affordances for participatory and multimodal identity work are only partially realized in everyday regional news production. These differences are interpreted as being associated with temporal and organizational constraints of digital news production rather than with editorial intention. The observed patterns appear consistent in both countries, suggesting structural rather than culturally specific dynamics.

By identifying key practices of identity work in Slovenian and Croatian regional media and isolating print-digital asymmetries, this paper contributes to the debates in journalism studies on platformization and journalism's societal roles. It argues that, alongside economic and organizational pressures, regional journalism also faces challenges related to its meaning-making role, shaping how regions are held together and reproduced in today's media systems.

JOS33 Journalistic Work II.

PP 1021 (Changing journalistic frameworks) Competing institutional logics in data journalism

Sanna Volny[1]

[1] Södertörn University, Journalism / School of Social Sciences, Huddinge, Sweden

The growing availability of open data and digital tools has introduced new forms of work into newsrooms, challenging established journalistic values, norms, and routines. It also raises fundamental questions about the nature of journalism. As a hybrid practice situated at the intersection of journalism, programming, data analysis, and visualization, data journalism constitutes a particularly fertile site for examining how competing institutional logics are negotiated in everyday editorial work.

Building on institutional logics theory (Thornton, Ocasio, & Lounsbury, 2012), this study conceptualizes data journalism as an arena in which multiple institutional logics coexist and are actively negotiated. It asks: (1) Which institutional logics structure data journalism practices in contemporary newsrooms? (2) How are tensions between these logics negotiated and stabilized through everyday editorial practices?

The analysis identifies four central institutional logics—professional journalistic, quantitative, hacker, and visual design logics—and examines how these are translated and combined in practice. These logics are carried and translated by individuals through practices, underlying norms, and legitimizing arguments.

The study draws on in-depth interviews with 20 data journalists, editors, designers, and data analysts in Poland, Estonia, and Latvia, supplemented by reconstructive interviews based on concrete data journalism projects. All data have been collected and are analyzed using thematic analysis (Braun & Clarke, 2006, 2019).

The findings show that data journalism does not replace established journalistic logics but reconfigures them through selective integration of external logics. While journalistic objectivity and verification remain core ideals, they are reformulated through quantitative ideals of methodological rigor, hacker norms of openness and collaboration, and visual logics emphasizing accessibility and audience engagement.

This study contributes to journalism research by offering a theoretical model of how various professional logics interact within data journalism. Additionally, the study provides new empirical insights into data journalism practices in Central and Eastern Europe.

Keywords

data journalism; institutional logics; hybrid journalism

JOS34 Beat Journalism

PP 1034 Economic knowledge, journalistic knowhow and the expertise(s) of financial journalists

Hagar Lahav[1], Zvi Reich[2]

[1] Sapir College, Department of Communication, Sderot, Israel
[2] Ben Gurion University, The Department of Communication Studies, Beer-Sheva, Israel

The study examines the expertise of economic reporters and commentators and how they assess and address the epistemic challenges of daily newswork. It applies a novel theoretical framework – the *Journalistic Content Knowledge* (JCK) framework (Reich & Lahav, 2021) – and a new research method, *News Sorting*.

The JCK conceptualizes journalists as experts not in economics itself, but in reporting on economics, integrating domain-specific knowledge with journalistic expertise. To capture this integration in practice, the study asked 20 leading economic journalists to rank samples of their recent publications (N = 500 items), first according to economic challenges and then according to journalistic challenges. The ranking was followed by in-depth interviews during which participants reflected on their decisions, reconstructed the challenges they faced, and described the practices they used to address them. This mixed-methods design enables a detailed analysis of how economic journalists experience, evaluate, and manage epistemic challenges in concrete production situations drawn from their own work.

The study reveals how the interplay between economic knowledge and journalistic judgment unfolds in specific items, identifies key challenges in economic reporting, and shows that economic reporters can be characterized by three distinct professional and epistemic orientations.

Findings show that journalists consider economic challenges more demanding than journalistic ones, highlighting the significant epistemic weight of the beat. Economic and journalistic challenges were moderately correlated (Pearson $r = 0.473$, $p < .001$), indicating ongoing interaction between them. This interaction is especially evident under two contrasting conditions: highly challenging stories that require planning, initiative, and creative adaptation to formats and genres, and highly routinized stories, such as press releases and official announcements, where economic and journalistic knowledge merge into a form of "news subsidy." In most cases (N = 381 items), journalists applied economic and journalistic knowledge intuitively and automatically, while finding it difficult to articulate or separate these forms of knowledge, underscoring the role of tacit knowledge (Collins, 2010) grounded in experience.

The study also identifies three recurring epistemic orientations through which expertise is enacted: discovery and gathering, analysis and interpretation, and presentation and accessibility. These orientations shape journalists' practices and allocation of resources, and are more closely related to media type, genre, and format than to formal role definitions or organizational hierarchies.

Findings suggest that although economic journalists are not economists and their subject-matter expertise varies, some demonstrate high levels of professional expertise by effectively integrating economic and journalistic knowledge.

While this study deliberately shifts attention from external evaluations of economic literacy to how expertise is enacted in practice, this analytical focus does not directly assess journalists' formal economic knowledge. Therefore, the findings should be understood as offering a complementary perspective on journalistic expertise rather than refuting claims about gaps in economic knowledge among journalists.

JOS34 Beat Journalism

PP 1035 How news beats shape Nordic journalists' ideals and perceived influences

Vilde Ellingsberg[1]

[1] University of Bergen, The department of Information Science and Media research, Bergen, Norway

News beats have long structured journalistic work by organising newsroom divisions of labour and shaping professional roles, expertise, and autonomy (Margin & Maurer, 2019; Reich & Lahav, 2020; Reich, Jackman & Blum, 2021; Reich & Lahav, 2021). Yet, in a time where journalism is facing economic, technological, and social challenges, the role of news beats and beat journalists is reconfigured. News beats increasingly operate under conditions in which their relevance, resources, and legitimacy must be actively negotiated. Against competing arguments that beats have become less important versus claims that they have merely been transformed, beat journalists' own perceptions of their role become a crucial lens for understanding how beat journalism is being reshaped. Comparative research from the Worlds of Journalism Study demonstrates that journalistic role orientations and perceived autonomy vary systematically across contexts, indicating that specialisation continues to structure journalistic practice (Hanitzsch et al., 2019; Hanitzsch & Basyouni Hamada et al., 2025).

Situated within ongoing debates on professional role orientations, journalists' perceived influence, and the future of beat reporting, this chapter draws on survey data from the third wave of the Worlds of Journalism Study (WJS3) from the Nordic countries (N = 2585) to address two research questions. RQ1: To what extent does news beat specialisation shape journalists' professional role orientations and perceived influence in the Nordic media context? RQ2: How do specialised beats—politics, culture, and sports—differ from generalist journalists in terms of professional role orientations and perceived influence?

Using cross-table analysis with tests of significance, the findings reveal persistent and systematic beat-related differences. Political journalists remain strongly oriented toward watchdog and public-affairs ideals; cultural journalists emphasise interpretive and educational roles; and sports journalists combine professional detachment with pronounced audience-oriented and entertainment logics. By demonstrating that news beats continue to function as distinct professional

micro-cultures—even as they must actively justify their relevance within increasingly metric-driven and flexible newsroom environments—this chapter contributes to debates on journalistic specialisation in three ways. First, it challenge assumptions that beats are either stable or in decline by showing that their persistence is contingent on ongoing professional negotiation. Second, it extends Worlds of Journalism research by foregrounding beat affiliation as a key axis of differentiation in journalists' ideals and perceived autonomy. Third, it provides regionally grounded evidence that professional differentiation remains resilient, but increasingly contested, in contemporary journalism.

Key words

beat journalism, role orientations, specialisation, Nordic

JOS34 Beat Journalism

PP 1036 Cracks in the mirror of truth: The contradictory epistemological beliefs and claims to journalistic truth in and between news beats

Viljami Vaarala[1]

[1] University of Helsinki, Swedish School of Social Science, Helsinki, Finland

The epistemic authority of contemporary journalism has been founded upon the normative role of a truth-teller. However, this epistemic role has been challenged in many Western democracies not only by emerging actors online but also by professional journalists who increasingly distance themselves from the objectivity ideal—the proxy concept of journalistic truth (Figenschou & Ihlebæk, 2019; Muñoz-Torres, 2012). The epistemic contestations over journalism's legitimacy and observations on the plurality of epistemological beliefs within professional journalism have led to calls to re-examine the scholarship on professional journalists' epistemological beliefs beyond traditional subjectivity/objectivity dichotomies and to assess the more fundamental philosophical traditions behind journalism's epistemological concepts (e.g. Godler & Reich, 2013; Hearns-Branaman, 2016). Despite these calls having attracted some qualitative research on journalists' epistemological beliefs beyond conceptions of objectivity and facts, the study of journalists' epistemological beliefs and conceptions of truth, encompassing both epistemological (i.e. how journalism knows) and ontological dimensions (i.e. of what is journalism writing about; what journalism can know about the world), remains scarce and limited to Anglo-American contexts (e.g. Hearns-Branaman, 2016).

This paper contributes to this line of qualitative scholarship by interviewing 33 Finnish professional journalists representing five news beats (business/economy, culture, editorial, politics, and sports) on their epistemological beliefs and analysing their claims to truth through post-foundational discourse analysis. The interviewees' claims to journalistic truth are scrutinised in light of four philosophies that each adopt a specific stance in relation to epistemological realism/relativism and ontological realism/relativism: (absolute) realism, anti-realism, critical realism, and pragmatism (Ekström & Westlund, 2019; Hearns-Branaman, 2016).

The results show that truth is still considered a viable concept for journalism, yet there are perceptible differences in claims to truth between the news beats as well as male and female journalists. The findings reveal that especially male journalists covering business/economy, politics and sports are more likely to argue for the ontological realist core of journalism and demarcate their beats from others by deploying epistemological realist arguments with indications of absolute realist philosophies and correspondence theory of truth (e.g. renouncing the need to interpret events before reporting about them).

I argue that such claims driven by epistemological realism impose untenable normative expectations that degrade the institution's epistemic authority when journalism fails to "mirror" external reality as such. Overcoming such discrepancies would require educating professional journalists on questions of epistemology and ontology and providing them with argumentative tools to partake in online metadiscourses about the veracity of journalism where journalists' interpretations and value judgments over bits of knowledge and facts are framed as forms of antirealism (Figenschou & Ihlebæk, 2019).

JOS34 Beat Journalism

PP 1037 How much is "enough"? Mapping the desired knowledge of economic journalists

Oded Jackman[1], Zvi Reich[1]

[1] Ben Gurion University of the Negev, Communication, Beer Shiva, Israel

Economic journalism plays a central role in conveying essential information that shapes citizens' understanding of economic processes and their outcomes (van Dalen, de Vreese, & Albæk, 2015; Strauß, 2018). However, while scholars agree quite unanimously that economic journalists lack sufficient knowledge of economics (Damstra, Boukes & Vliegenthart, 2018; Knowles, Phillips & Lidberg, 2017; Doyle, 2006; Manning, 2013; Mullen, 2018; Schifferes & Coulter, 2012; Tambini, 2010; Thompson, 2013), there was never systematic effort to define what may count as "sufficient".

The current study maps for the first time the expected knowledge of economic journalists, using in-depth interviews with 30 people, half of whom are economic experts (academics and senior officials) and half senior economic reporters and commentators from leading Israeli national news outlets. To elicit a detailed and nuanced map of desired knowledge, participants were asked one central question: suppose that there was a special school for economic reporters and commentators, how would its curriculum look? This approach has already shown its fecundity in mapping the desired knowledge in another news beat (author 1 & author 2, 2025).

Interestingly, both journalists and experts agreed on the core of economic knowledge that economic journalists are expected to master, yielding a curriculum of more than one hundred knowledge items. However they differed substantially on the status, depth, priorities, functions and epistemic purpose of this knowledge. According to the economists the primary challenge of economic reporting isn't knowledge, rather understanding who are the 'real' experts to rely on.

The epistemic gaps between journalists and economic experts manifest in three dimensions:

I. **Knowledge purpose and function:** While economic experts conceptualize economic knowledge as an intrinsic intellectual pursuit aimed at understanding, economic journalists see this knowledge as a practical tool for minimizing error, ensuring narrative accuracy, and effectively popularizing complex information for lay audiences, prioritizing practical know-how essential for turning economic information into newsworthy stories.
2. **Knowledge scope:** While economists prioritized depth and multi-layered, interconnected comprehension of economic phenomena, economic journalists emphasized knowledge breadth and capacity to process information promptly.
3. **Epistemic authority:** While the authority of economic experts stems from personal mastery of disciplinary knowledge and credentials, journalists see themselves as part of a distributed epistemic framework (Eyal, 2019), skilfully combining the contributions of external experts (economists, analysts, officials) with their own procedural expertise in locating, processing and disseminating economic information.

Bridging these gaps is achievable thanks to both parties' shared commitment to accurate economic reporting. To succeed, they must acknowledge being part of the same "epistemic community." On one hand, economists should adopt a less dismissive approach toward journalists' competences, recognizing their unique capacity for knowledge mediation, and actively help popularize abstract economic phenomena without sacrificing accuracy. On the other hand, journalists must acknowledge their own epistemic limitations and cultivate a deeper curiosity toward economic theory and its contribution to in-depth news reporting.

JOS34 Beat Journalism

PP 1038 Hybridising Swedish sports journalism: Between professional and alternative ideals in supporter-produced journalism

Simon Tengberg[1]

[1] Stockholm University, Department of Media Studies, Stockholm, Sweden

Supporter-produced sports journalism has become an increasingly visible component of contemporary sports media, yet its position in relation to professional journalism remains theoretically and empirically underexplored. This paper addresses that gap by examining supporter journalism through the lens of hybridity, asking how professional and alternative journalistic attributes are articulated in supporter-produced texts in comparison with legacy media. Focusing on the Swedish context, the study investigates SvenskaFans, one of Sweden's largest supporter-driven sports media platforms, and compares its football coverage with that of two leading national newspapers, Dagens Nyheter and Aftonbladet.

Drawing on theories of hybridity, alternative media, and genre, the study conceptualises supporter journalism as situated within a hybrid media environment where professional and participatory logics intersect. The operationalisation of hybridity is inspired by a three-level framework (textual, system, and discursive), while alternative media are understood relationally in tension with mainstream journalism rather than as a fully oppositional category. Genre theory is employed to examine how journalistic forms, styles, and narrative conventions are negotiated.

Methodologically, the paper employs a quantitative content analysis of 474 text-based articles published in 2021. The sample consists of football-related coverage from SvenskaFans, Dagens Nyheter, and Aftonbladet, limited to the top division for

men (Allsvenskan). The analysis compares the outlets across five dimensions: genre, main topic, actors, textual style, and counter-hegemonic attributes. These dimensions allow for a systematic assessment of both convergence and distinction between supporter-produced and professional sports journalism.

The findings show that SvenskaFans largely adopts recognisable journalistic genres and professional conventions indicating a substantial degree of professionalization. Matchday coverage dominates across all outlets, and supporter journalism frequently relies on original reporting rather than reproducing legacy media content. At the same time, SvenskaFans displays distinctive characteristics: a greater mix of subjective genres (such as columns and analyses), a stronger presence of editorial contributors as narrative actors, and a more personal, interpretive, and positively framed writing style. While counter-hegemonic attributes associated with fanzine culture, such as subcultural references and humour, are present, but they do not dominate the overall content. Taken together, the results suggest that supporter journalism occupies an ambiguous position between alternative and professional media. Rather than representing a symmetrical hybridisation, the relationship appears asymmetrical: supporter journalism increasingly resembles professional journalism, while legacy media show limited influence from supporter-based practices.

By demonstrating both convergence and enduring distinctions, the study contributes to ongoing debates about hybridity, professional boundaries, and normativity in journalism studies. Rather than treating hybridity as a descriptive endpoint, the findings suggest the need to conceptualise supporter-produced journalism as occupying an unstable and asymmetrical position within the hybrid media system. This has broader implications for how journalism research understands emerging actors who simultaneously challenge, reproduce, and are absorbed by professional journalistic norms.

JOS35 Journalistic Content III.

PP 1119 Measuring framing using large language models: Evidence from refugee reporting

Lukas Benedikt Hoffmann[1], Katharina Genz[1], Martin Emmer[1]

[1] Freie Universität Berlin, Media and Communication Studies, Berlin, Germany

Framing is a central concept in journalism research, used to understand how news conveys meaning, organizes interpretation, and guides public judgment (Entman, 1993; Scheufele, 1999). However, research has largely treated framing as relatively static, and measured it cross-sectionally or over only short time periods (Matthes, 2012). While scholars increasingly emphasize the dynamic nature of framing (Deprez & Raeymaeckers, 2010; Gottlieb, 2015; Greussing & Boomgaarden, 2017; Shih et al., 2008), the measurement of framing dynamics at scale remains methodologically underdeveloped.

Existing approaches can be grouped into three categories: Manual coding is the most valid approach, but infeasible for long time spans and large corpora. Traditional automated tools with dictionary approaches, in contrast, allow the analysis of framing over longer time periods yet with a weak construct validity. More sophisticated methods, centrally topic modeling, have been used as a pragmatic compromise, allowing longitudinal analyses at scale, although often requiring additional interpretive steps to align topics with theoretically defined frames (Heidenreich et al., 2019; Hoffmann & Hameleers, 2024).

Recent advances in large language models offer new possibilities for theory-guided automated content analysis, yet their application to framing research remains underdeveloped and insufficiently validated so far. This paper introduces a transparent, theory-driven LLM-based workflow for automated framing analysis. We contribute methodologically by translating Entman's frame elements into explicit, machine-readable coding rules and by proposing a multi-stage validation procedure that ensures interpretability and sustained human control, including manual pretesting, the construction of a human-coded gold standard dataset, prompt calibration and scaling. This framework provides clear analytical potential by enabling the systematic measurement of frame variance, dominance, and stabilization over time. Importantly, this workflow treats LLMs as constrained analytical tools within a human-supervised validation process rather than autonomous classifiers.

Longitudinal framing research requires consistent frame decisions across changing vocabularies, actors, and events, which poses challenges for both manual coding and traditional automated methods. We argue that LLMs, when constrained by theory-driven prompts and deterministic settings, are particularly well suited to capture such temporal variation while maintaining conceptual consistency. Against this background, we illustrate the analytical potential of the approach using refugee framing as an empirical example: with a dataset of N = 73,000 newspaper articles, we compare the framing of two contexts (Syrian/Ukrainian refugees) in four countries (Germany, UK, Switzerland, Spain) in three languages (German, English, Spanish), with eight theoretically grounded frames.

Methodologically, we finetune prompt design with few-shot examples and deterministic settings for LLMs, specifically the GPT-4.1 API, to output structured JSON data with information on frame decision, detected frame elements, textual evidence and confidence scores without model retraining. This approach is tailored to provide interpretability, replicability and portability to other issues.

This paper contributes to journalism research by offering a replicable framework for longitudinal framing analysis. It demonstrates how large language models can be integrated into established framing theory with conceptual rigor, while enabling analyses at a temporal and comparative scale that remains difficult to achieve with established manual and dictionary- or topic-based approaches.

PP 1120 Framing corruption: A cross-country analysis of media coverage on political corruption in varying media systems

Yara Mijnhout[1], Anne Kroon[1], Chris Starke[1], Sofia Wickberg[2]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands
[2] University of Amsterdam, Amsterdam Institute for Social Science Research, Amsterdam, Netherlands

This paper adopts a cross-national comparative two-study design to investigate how news media in Bulgaria, Italy, the Netherlands, and the United Kingdom frame political corruption. These countries vary both in their media systems (Hallin & Mancini, 2004) and in their perceived levels of corruption. By analyzing news coverage from 2018 to 2024, we account for variation over time. The study proceeds in two stages: (1) a qualitative content analysis (N = 124) to inductively conceptualize frames of political corruption, resulting in a comprehensive taxonomy, and (2) a quantitative content analysis (N = 1000) applying this taxonomy to measure frame prevalence across countries, and to explain variation through contextual factors, such as press freedom and institutional trust, via multilevel modeling.

Study 1 identified seven distinct issue-specific frames of political corruption. These frames range from those highlighting the root causes of corruption (individual and systemic) to those emphasizing responses and reforms. These seven issue-specific frames were conceptually grouped into three higher-order meta-frames, which capture how news media construct different interpretations of corruption and make the issue visible and meaningful to the public.

Study 2 assessed the prevalence of corruption frames across the selected countries and time periods, demonstrating substantial cross-national variation. The *Elite and Foreign Power Abuse* meta-frame is most dominant across all countries, whilst the *Push for Reform* meta-frame is least common. The *Systematic Institutional Failure* meta-frame is widespread but less so in Italy, and it remains the most stable over time. Moreover, lower institutional trust is associated with a higher prevalence of the *Elite and Foreign Power Abuse* meta-frame, whereas more press freedom is associated with a higher prevalence of the *Push for Reform* meta-frame.

Overall, news media frame political corruption predominantly as either systemic failure or individual wrongdoing, consistent with previous research (Berti, 2019). We extend this literature by demonstrating that corruption is also framed through calls for collective action and reform. While these patterns reflect the structural characteristics of media systems, our findings indicate that contextual factors, specifically press freedom and institutional trust, also shape how corruption is framed across countries. These findings highlight the importance of context in the news media's representation of political corruption.

This study is the first to develop a comprehensive, inductively derived taxonomy of political corruption frames relevant to various European media systems. Unlike previous research that focused on individual framing elements, this study reconstructs full frame packages, providing a more integrated picture of how political corruption is portrayed in the news media. It contributes substantially to understanding cross-national differences in media framing through a quantitative lens.

PP 1121 Tracing the copy-paste: News diversity in a small journalism system between homogenization and pluralization

Boris Mance[1], Marko Robnik Šikonja[2], Žagar Aleš[2], Igor Vobič[3]

[1] University of Ljubljana, Department of Communications, Ljubljana, Slovenia
[2] University of Ljubljana, Laboratory for Machine Learning and Language Technologies, Ljubljana, Slovenia
[3] University of Ljubljana, Department of Journalism, Ljubljana, Slovenia

Contemporary journalism is being re-grounded by a converging set of structural pressures: democratic backsliding that (re)politicizes information flows, intensified media ownership concentration that constrains editorial autonomy, and digitally accelerated news production cycles that reward speed, routinization, and standardization over verification and contextualization (e.g. McChesney, 2016; Pickard, 2020; Golding and Murdock, 2022). Building on the political economy of communication and media sociology, this study explores how structural conditions generate news homogenization despite institutional pluralism, treating news diversity as a struggle over visibility, representation, and infrastructural power.

While pluralization is normatively associated with the articulation of heterogeneous interests, actors, and voices, homogenization emerges through shared infrastructures, dependence on news agencies and information subsidies, metricized routines, and source hierarchies that systematically privilege institutionally central actors—sometimes to an extent described as "excessive similarity" (van Cuilenburg, 1999). These processes are not mutually exclusive but paradoxically co-constitutive: an abundance of outlets can still coincide with narrowed agendas and voices, creating an illusion of

diversity rooted in market multiplicity rather than substantive difference (e.g., Karppinen, 2018; Nechustain, Zamith, and Lewis, 2023). Slovenia, a small, interdependent post-socialist media environment marked by "political commercialism" (Splichal, 1995) and platform-driven reconfiguration of news production alongside a decline of journalistic authority (Vobič, 2025), is approached not as an exceptional case but as a theoretically informative one. Small markets render structural dependencies easier to observe, even though the same mechanisms operate elsewhere with varying intensity.

The study draws on 13,207 news items from 141 news media outlets, collected with banded temporal sampling design to capture routine production. Methodologically, it combines detection of verbatim text reuse based on ≥10-word n-gram overlap with semi-automated extraction of cited sources using large language models. To avoid black box inference, we pair automation with manual checks and conservative thresholds, and report uncertainty- so that computational outputs support, rather than substitute for, interpretive judgment.

The findings reveal a paradox in which a multiplicity of outlets masks high levels of content homogenization. Approximately one quarter of all news items are directly or indirectly dependent on the national news agency, with additional homogenization arising through ownership concentration, regional proximity, and ideological alignment. International news is especially affected: fewer than one third of foreign-affairs articles explicitly cite foreign media or agency sources, and where attribution exists it is highly concentrated around a narrow core of Western agencies (AFP, dpa, Reuters). Across media groups, institutional political actors dominate source visibility, while civil society and peripheral actors remain marginal.

The paper contributes by reframing news diversity as a question of infrastructural power rather than ideological balance, demonstrating how computational methods can complement—rather than supplant—critical analysis, and arguing that journalism's democratic function depends not only on the number of outlets, but on transparent, plural, and accountable information flows.

JOS35 Journalistic Content III.

PP 1122 Journalism without history; news without context – A critical political economic analysis of UK media coverage of Israel's ban of 37 INGOs from Gaza

Des Freedman[1], Sydney Forde[2]

[1] Goldsmiths University of London, Media- Communications and Cultural Studies, London, United Kingdom
[2] The University of Pennsylvania, Annenberg School for Communication, Philadelphia, USA

Journalism, according to the former publisher of the *Washington Post*, Phil Graham, is 'the first rough draft of history'. This paper starts from a different place: the assertion that history is often evacuated from journalism and that, as a result, news is impoverished, and audiences are under-served. This is partly to do with profit-driven journalism privileging breaking-news reporting over the expensive business of articulating context and memory. It is also, however, to do with journalism's commodity status under capitalism, in that it is not simply an economic commodity but also a *reified* area of human activity in which public affairs are transformed into private transactions. Throughout this paper we highlight the spectral qualities of journalism: its flattening of history, its preoccupation with 'miscellaneity' as described by Raymond Williams, and its subsequent mystification of the social world. We illustrate these processes through an analysis of mainstream reporting of Israel's ban of over three dozen humanitarian aid groups from entering Gaza in early 2026, highlighting journalism's systemic historical gaps via studying the framing of events surrounding Israel's illegal occupation in Palestine.

In 2025 Israel introduced a new mandatory registration system for international non-governmental organisations (INGOs) providing humanitarian operations in Gaza, which included new requirements that organizations share detailed information about their staff, funding and operations- a process that has been described as "vague, politicised and impossible to meet without breaching humanitarian principles" (United Nations, 2025). In January 2026, Israel banned 37 aid groups from entering Gaza due to "fail(ing) to meet security and transparency requirements" (Siddiqui, 2025), including Doctors without Borders. One senior UN official warned that such a ban would "cripple" relief operations and cause a "catastrophic collapse of humanitarian services" (Burke, 2026). Throughout this paper we critically examine how top legacy news organizations in the UK have contextualized and historicized this aggressive Israeli escalation, specifically by considering both the absences – the lack of references to imperial manoeuvering in the creation of Israel and the marginalization of issues of occupation and violence – as well as the patterns of meaning when this history is (occasionally) acknowledged.

Throughout our political economic analysis, we turn to the work of Hungarian Marxist Georg Lukács who argues that the functionality of journalism under fetishized capitalist logics reproduces only a fragmented and partial view of the world, while hiding the more systemic connections of capitalist life. Lukács explained that journalism, under said conditions, is thus unable to portray a true picture of the dynamics of capitalist society (even if it wanted to do so), let alone to sustain its preferred narrative of heroic reporters holding power to account. Journalists, like other 'bureaucratic' professionals, are therefore deeply compromised by reified social relations. We conclude that a range of structural factors- including patterns of corporate ownership, a prevailing consensus on foreign policy objectives and a deep-rooted connection between journalistic and political elites- are rooted in contemporary geographies of power that have contributed to this de-historicization of the world represented by legacy news.

JOS35 Journalistic Content III.

PP 1123 Pictogramisation of news photography

Ilija Tomanic Trivundza[1]

[1] University of Ljubljana, Media and Communication Studies, Ljubljana, Slovenia

Over the past two decades, media outlets have increasingly been resorting to the use of highly generic and even non-journalistic images, such as stock photographs, in their news coverage. Moreover, we have seen an increased willingness to use photojournalistic images as if they are ahistorical, interchangeable visualizations. Although photography's "special connection" to "the real" has never been as unproblematic as normative presuppositions of mainstream journalism or the theoretical notion of indexicality implied, the growing use of such photographs greatly contributed to the erosion of visual evidentiality as news routinely became accompanied by, or narrated with, photographs with no direct connection to reported events. The severing of the connection to "the real" and generic depictions of content transformed such images from specific visual accounts of events into a general visual shorthand akin of pictograms.

The critique of the pictogramisation of news photography is grounded in (my) typology of functions of photographs in the process of narrating news. There are three basic functions (and by extension epistemic positions) which news photographs can perform in narration of news: informational, illustrative or decorative. Pictogramisation of news photography can occur via three practices: 1) routinized use of stock photographs to cover certain topics, news segments of or even breaking news, 2) use of journalistic images as if they would be stock photograph, and 3) recurring use of photographs with similar generic motives and results in increased share of decorative images. The presentation will highlight the epistemic consequences of the pictogramisation of news photography as such images move from the confinement of soft news, such as curiosities or crime into the domain of spot news coverage and war photography. It is structured around case studies from online editions of Slovene (RTVSLO), British (The Guardian) and US (New York Times) mainstream media.

In the presentation, I will argue that the move from news photographs to "photojournalistic pictograms" implies not only the renouncement of the potential of photography to act as a bearer of certifiable information but that it also fundamentally changes the nature of audience/citizen witnessing via news, which becomes increasingly reliant on invisibility rather than visibility, on trust and opinion rather than on proof or verifiable facts. With this, it unwittingly contributes to the post-truth zeitgeist and thus undermines the status of journalism as a privileged, if imperfect, epistemic actor in democratic societies.

JOS36 Audiences and Journalism III.

PP 1124 From avoidance to agency: Re-designing news recommender systems to re-engage news avoiders

Michelle Kulig[1], Manuel Puppis[1], Willem Buyens[2], Steve Paulussen[2], Hilde Van den Bulck[3]

[1] University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland
[2] University of Antwerp, Department of Communication Studies, Antwerp, Belgium
[3] Drexel University, Department of Communication, Philadelphia, USA

In today's high-choice media environment (Van Aelst et al., 2017), news organizations face pressures to adapt to technological change and shifting audience expectations. Digital platforms, widely used for news (Newman et al., 2025), rely on algorithmic recommender systems which, optimized for commercial objectives, prioritize entertainment-oriented content (Hagar & Diakopoulos, 2025; Wirz & Zai, 2025). This can foster unintentional news avoidance, frequently obscured by the "news finds me" belief (Gil de Zúñiga & Cheng, 2021). While news organizations increasingly adopt such systems (Blassnig et al., 2024; Bodó, 2019), their role in shaping news avoidance remains poorly understood. This is particularly concerning given the rise of intentional news avoidance, driven by news overload, repetitive coverage, and well-being harms, among others (Newman et al., 2025; Gorski, 2023). Importantly, these motivations result not only from the nature of the journalistic content itself, but also from how recommender systems select and distribute it, often overwhelming users or failing to provide meaningful choices, potentially undermining individuals' agency to stay informed, contributing to a broader "epistemic crisis" (Dahlgren, 2018).

Drawing on the epistemic welfare framework (Authors, 2025), this study investigates how news recommender system design may mitigate news avoidance by empowering citizens to exercise epistemic agency. It addresses two key gaps in journalism research: limited attention to how algorithmic systems influence news avoidance, despite emerging work on the topic (Mattis et al., 2024), and insufficient examination of news users' evaluations and design-related preferences, which have been addressed only selectively (e.g., Mitova et al., 2023; Strikovic et al., 2024). To address these gaps, a cross-national online survey in Belgium and Switzerland (N = 3,076) was conducted to assess intentional and unintentional news avoiders' behavioral motivations, system evaluations, and recommender design preferences related to epistemic agency. Preferences were examined across media systems and types of media organizations.

Findings indicate that news avoiders are less likely to endorse recommender systems. Particularly trust-driven avoiders express privacy concerns and, along with unintentional avoiders, lower agreement with topic discovery benefits. They most strongly are associated to a desire for user agency, particularly modifying settings and deactivating recommendations. Avoidance related to overload and topic salience show similar but weaker associations. Preferences for following

specific topics are markedly linked to well-being and powerlessness motivations, suggesting topical control as an emotional coping strategy. Repetitiveness-driven avoidance is linked to preferences for identifying, understanding, and disabling recommendations, indicating a tendency to disengage from perceived deficient algorithms. Among unintentional avoiders, only topic selection preferences showed a meaningful effect, suggesting a potential pathway for re-engagement. Across contexts, accuracy and trustworthiness ranks first as design criterion for news recommender systems; relevance, often tied to personalization, ranks lower than accessibility and broad reach of news, and immediacy ranks lowest.

These insights offer practical guidance for news organizations and respond to calls to extend journalistic responsibility to algorithmic news distribution (Bastian et al., 2021). They indicate that recommender systems prioritizing user agency and information accuracy can help address structural drivers of news avoidance, thereby strengthening journalism and empowering citizens in their informational choices.

JOS36 Audiences and Journalism III.

PP 1125 Attention control in the contemporary media environment: A mixed-methods approach to understanding content abundance and news experience

Constanza Gajardo[1], Courtney Tabor[1], Antonis Kalogeropoulos[1], Camila Mont'Alverne[2], Patricia Rossini[3], Tom Nicholls[4]

[1] Vrije Universiteit Brussel, Smit, Brussels, Belgium
[2] University of Strathclyde, Journalism- Media and Communication., Glasgow, United Kingdom
[3] University of Glasgow, School of Social and Political Science, Glasgow, United Kingdom
[4] University of Liverpool, Faculty of Humanities and Social Sciences, Liverpool, United Kingdom

Digital media environments are characterized by content abundance, algorithmic delivery, and constant updates that compete for users' attention (Boczkowski, 2021). News is increasingly encountered alongside entertainment and social content (Disseldorp & Bouko, 2025) in feeds designed to reward speed, frequency, and low-effort engagement (Lindström et al, 2021). While these structural conditions shape the information environment for everyone, individuals differ in their ability to maintain attention, exercise control, and engage intentionally with news (Cole et al., 2025). This study examines how content abundance in digital media environments interacts with individual attention control, shaping how news is encountered, processed, and valued.

We adopt a mixed-methods approach combining a three-wave panel survey with simultaneous online tracking conducted in Brazil (n = 1,998) and the United Kingdom (n = 1,248) and in-depth interviews with 72 survey respondents. The quantitative analysis examines whether self-reported attention challenges are associated with patterns of news use, current affairs knowledge, and misinformation beliefs. The qualitative interviews explore how individuals experience content abundance in everyday news encounters, focusing on perceived distraction, overload, coping strategies, and the subjective sense of control.

Quantitative results show that respondents who report more challenges with attention spans spend similar amounts of time with news sources than those who report fewer. However, perception of attention challenges is consistently associated with lower news self-efficacy and a stronger perception that news is not made for people like themselves. Concerning news use outcomes, attention problems are correlated with lower knowledge scores and with greater belief in misinformation, highlighting the possible negative effects of a lack of attention control. Finally, attention moderates the relationship between news use and knowledge, widening knowledge gaps between attention control groups, and it moderates the relationship between feeling alienated from news and belief in misinformation, suggesting an accessibility disconnect for people with attention deficits.

Qualitative findings illuminate how these patterns are experienced. Participants describe digital news environments as fragmented and distracting, with short-form content, algorithmic interruptions, and constant notifications undermining sustained attention. News is frequently skimmed rather than read in depth, with headlines, summaries, and ambient exposure substituting for sustained engagement. Many respondents report psychological overload, desensitization, and avoidance in response to repetitive and negative coverage, alongside concerns about trust and information quality. At the same time, individuals describe strategic adaptations, including selective attention, deliberate limitation, platform-specific curation, and reliance on incidental awareness to remain informed without becoming overwhelmed.

Together, the findings suggest that content abundance shapes the informational experience of exposure in uneven ways. For individuals with weaker attention control, abundant and algorithmically structured news environments are associated with lower self-efficacy, reduced knowledge gains, and greater susceptibility to misinformation, even when exposure levels remain high. These results highlight how attention-related inequalities intersect with contemporary news environments, producing differences not only in whether people encounter news, but in how effectively that exposure translates into understanding and democratic competence.

JOS36 Audiences and Journalism III.

PP 1126 Experiencing News Marginalization: How low-literate adults navigate and understand news and journalism

Alexander Smit[1], Joelle Swart[1], Marcel Broersma[1]

[1] Rijksuniversiteit Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

This study examines how low-literate Dutch citizens understand and experience news in relation to the linguistic barriers and socio-digital inequalities they face in their everyday lives. The value of news as a shared frame of reference for connecting to the public realm is not evenly distributed in society. For many low-literate adults, news does not function as a public resource but presents a cognitively demanding, emotionally taxing, and socially distant information environment. This not only shapes low-literate adults' access to news, but also their perceptions of journalism's relevance, experiences of recognition by newsrooms, and the inherent value of news in their everyday lives.

Building on observations and interviews with Dutch low-literate adults (N = 32), we show that news inequalities and inequities not only emerge around accessibility but, foremost, in relation to recognition and representation. Participants' accounts reveal that traditional news practices, for example, on television and radio, are often experienced as irrelevant, overwhelming, or "not for people like me," reflecting a lack of linguistic accessibility, relatable representation, and recognition, as well as institutional acknowledgment. Additionally, participants point to an experiential misalignment: topics such as politics and the economy are framed in ways that do not align with their lived experiences. This risks eroding relevance and trust, which may result in limited informed citizenship and a sense of disbelonging.

Our findings challenge skills-based news literacy frameworks by demonstrating that news engagement or alienation is not solely dependent on access, skills and (digital) literacy, but also on whether disadvantaged publics are addressed and recognized as legitimate news audiences. Drawing from this understanding, we introduce the concept of news marginalization, defined as the patterned exclusion of disadvantaged publics from news as a meaningful civic resource through routine journalistic norms of language, framing, and audience address. Rather than framing disadvantaged citizens as deficient news users, we show how established journalistic practices and current news literacy frameworks fall short in accounting for low-literates' recognition, representation, and lived experience, hindering the democratic function of journalism. Consequently, we argue for a socially situated understanding of news inequities is required in order to be able to produce news that is equitable, inclusive, and socially meaningful to all publics.

PP 1127 Making sense of news interest and disinterest: A scoping review

Hanne Peeters[1], Pauljan Truyens[2], Kristin Van Damme[3]

[1] Ghent University- imec, imec-mict-UGent- Department of Communication Sciences, Ghent, Belgium
[2] Vrije Universiteit Brussel, imec-SMIT- Department of Communication Sciences, Brussels, Belgium
[3] Ghent University, Department of Communication Sciences, Ghent, Belgium

Journalism plays a crucial role in democratic societies. News informs audiences about current affairs (Nielsen, 2017), raises awareness of societal issues (King et al., 2017), and contributes to shared understanding and social cohesion (Du, 2023). However, journalism can only fulfil these democratic functions if audiences are willing to engage with news. Over recent decades, this essential condition has come under pressure. International research shows a persistent decline in audiences' interest in news, with particularly low levels among young people and women (Newman et al., 2024). This trend raises pressing concerns about journalism's relevance, its capacity to connect with audiences, (Swart et al., 2022), and increasing inequalities in news use (Tabor et al., 2025). Scholars such as Nelson (2025) observe how audiences increasingly "do not care" about news, which is troubling given that news interest strongly predicts diverse and robust news repertoires (Peeters et al., 2025).

Despite the importance of this development, and the fact that news interest has been studied for decades (e.g., Jeffres & Atkin, 1996; Hargrove & Stempel, 2002; Drok et al., 2018), an exploration of existing literature reveals a striking conceptual gap. Unlike related constructs such as news avoidance or trust in the news, which benefit from thorough theoretical development (e.g., Andersen et al., 2024; Strömback et al., 2020), there is no comprehensive framework for understanding news interest and disinterest. It remains rather unclear how these concepts are experienced, whether audiences interpret them in comparable ways, whether different forms can be identified, and how they relate to neighboring constructs.

To address this gap and initiate theoretical consolidation, we conducted a scoping review. To our knowledge, this is the first systematic synthesis of how news interest and disinterest have been defined, conceptualized, and operationalized in research. Following the JBI Manual for Evidence Synthesis (Peters et al., 2024) and PRISMA guidelines (Tricco et al., 2018), we employed a layered search strategy across Web of Science, Scopus, and Communication Source. A rigorous title–abstract and full-text screening resulted in approximately 200 eligible peer-reviewed English-language journal articles in which news (dis)interest constitutes a central research focus (the final screening phase is still ongoing).

Preliminary findings indicate conceptual fragmentation. Although news interest appears frequently in research, it is rarely explicitly defined. Many studies treat "news" and "interest" as common-sense terms, assuming they are commonly understood (Røsok-Dahl & Ihlebæk, 2024). Yet, operationalizations vary widely, ranging from attention to news (Mesch et al., 2013), to cognitive engagement (Masullo Chen et al., 2020), behavioral patterns (Yuan, 2011), or self-reported interest (Trew et al.,2009). On the other hand, news disinterest is often theoretically neglected or treated merely as the inverse of interest (e.g., Schäfer et al., 2024), rather than being examined in its own right.

Taken together, the findings reveal substantial conceptual ambiguity regarding the concepts of news interest and disinterest. Clarifying how these concepts are experienced, particularly news disinterest, is crucial for a better understanding of audience-news relationships. This review provides a nuanced theoretical foundation for future empirical research into both concepts.

JOS37 Journalistic Practices

PP 1138 Mapping journalistic OSINT networks and practices across layers of supply, interpretation and popularisation

Will Fee[1], Christoph Raetzsch[1], Daniela Rebello[1]

[1] Aarhus University, Media and Journalism Studies, Aarhus N, Denmark

Over the past decade, data journalism investigations have adopted open-source intelligence (OSINT) techniques and practices (Dodds et al. 2025; Karan 2024; Kotisova & van der Velden 2023; Zamith 2023; Reese & Chen 2022). These operational tools and methodologies include the use of geospatial data, crowd-sourcing data collection, and multi-dimensional event reconstruction. Their growing presence within data journalism practice has enhanced collaborative and cross-national approaches for larger investigations, including underlying business models and funding schemes (de-Lima-Santos 2023). The term 'open-source investigations' (OSINV) is now increasingly used to distinguish journalistic uses of such methods from their origins in state surveillance and criminological research (van der Woude et al. 2024). OSINT/V practitioner communities are becoming part of a "trust-building infrastructure" (Zamith 2023) that journalists access to embed transparency into their data-based storytelling.

Charlton et al. (2024) have analysed such collaborations in relation to fact verification, mapping the dynamics of collaboration and developing an initial theoretical framework that distinguishes between the input, throughput and output stages of OSINT/V in news practice. Based on this framework, this research paper analyzes how OSINT/V practices are transferred into newsroom products across networks of practitioners affiliated to three layers: 1) a supply layer of activist civil society organizations raising issues or providing data; 2) an interpretation layer of dedicated research teams acting as investigative specialists; and 3) a popularisation layer of global news brands adopting and innovating OSINT/V approaches to create visibility and credibility for their practices. The research contributes to the development of a broader framework for 'mainstreaming niche innovations' in journalism studies (Geels 2004; Authors 2023) to underline the networked transfer of skills, practices and tools between different actors in journalistic investigative networks.

Empirically, the study is based on mapping actor relations between participants of Europe's largest data journalism conference, Data Harvest in Mechelen, Belgium, from 2016–2026. Using the conference's online directory of all speakers for link retrieval, the main method consists of a social network analysis (SNA) of ties between actors (Nooraie et al. 2020), calculating the top 10% of central actors in each layer based on frequency of attendance and collaborations in projects. The study then analyses in which functions these actors have contributed to prominent data journalism projects presented at Data Harvest, and how these collaborations have contributed to mainstreaming OSINT/V techniques and practices in newsrooms. Centrality measures from the network analysis allow the creation of a shortlist of central authorities in each layer, who will be interviewed during the 2026 conference to add a qualitative understanding of practice development in the field. The research links OSINT/V practices, their development and popularisation across news production layers with a grounded understanding of the networked nature of project-based, international investigative collaborations. As a timely contribution to a field of growing research and practical relevance in digital journalism, it explores how the incorporation of trust-building methodologies from alternative fields can help restore journalism's "epistemic authority" in society (Carlson 2020).

JOS37 Journalistic Practices

PP 1139 Do we need to ask about field access systematically? Challenges (and solutions) for recruiting journalists as research participants

Phoebe Maares[1], Korbinian Klinghardt[2], Steffen Grütjen[3], Anna Zimmermann[3], Daniel Nölleke[4]

[1] University of Tübingen, Institute for Research on Far Right Extremism, Tübingen, Germany
[2] Hochschule Darmstadt, FB Media, Darmstadt, Germany
[3] Katholische Universität Eichstätt-Ingolstadt, Journalistik, Eichstätt, Germany
[4] Deutsche Sporthochschule Köln, Institut für Kommunikations- und Medienforschung, Köln, Germany

In this presentation, we problematize the increasing challenge in empirical journalism research to gain access to (representative) samples and want to prompt a discussion in the research community of how to address this threat to scientific validity. While it is important that scholars access journalists' perspectives to understand how journalistic culture, practice

and the field are changing, researchers repeatedly find that potential participants either do not respond to interview and survey invitations or actively decline to participate (Blanchett et al., 2023). Although declining participation is legitimate, response rates, challenges in sampling, or the implications of self-selection often remain methodological footnotes. With this presentation, we strive to contribute to a more reflective and transparent handling of this issue in journalism research.

Based on four world café discussions with (journalism) researchers and journalists, we identified several *threats to research validity and approaches to mitigate them as well as reasons for non-participation and solutions to address them*. The world café discussions with about 40 participants were held in September 2025 at a national journalism research conference in Germany and moderated by us. Results were documented and systematically analyzed by the submitting authors.

With regard to **research validity**, discussants mentioned uncertainty about the general population of their studies since many journalists are atypically employed and thus not listed as newsroom staff. Discussants also highlighted the implications of self-selection biases, either due to journalists' personal interests and priorities or because employers encourage participation in research to different extents. Such experiences and concerns potentially affect researchers' selection of research topics shifting to questions that can be addressed without accessing journalists. The discussants suggested **strategies to address these challenges**, one of them being a call to increasing transparency in the methods and limitations sections of research articles, referring to obstacles in the recruitment process. Furthermore, participants suggested triangulating non-responses through other data points. Documenting, archiving and describing data more clearly to make it available for further use were also mentioned as well as meta-studies identifying potential patterns of non-responses. Lastly, participants discussed to what extent soft responses like written cancellations could be used as data sources, touching on ethical issues.

With regard to the **reasons why journalists do not participate** in research, discussants mentioned oversaturation from too many requests by researchers and students, to journalists' feeling of lacking time and competence, to research's limited value for practice, to journalists' insufficient access to data afterwards, and to a potential divulgement of trade secrets. In order to **build lasting trust in journalism research**, discussants advocated for closer cooperation with editorial offices, for example through newsroom visits. Here, personal contacts could sharpen mutual trust and build bridges. Further, they emphasized the importance of accessibility and practice-orientation when presenting the projects' goals and approaches to potential participants.

The discussion indicates that scholars share an awareness and a wish to systematically address these issues. Hence, this contribution aims at stimulating further conversation with an international research community at the ECREA conference.

JOS37 Journalistic Practices

PP 1140 How nature connectedness shapes journalists' values and professional practices

Isabella Gonçalves[1], Finn Geiger[1], Oliver Quiring[1]

[1] Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

To what extent does a connection to nature impact the roles and practices of journalists? In recent years, there has been a growing academic interest in fostering Connection to Nature (CTN). Although no single definition of CTN prevails in the literature (Tam, 2013; Tiscareno-Osorno et al., 2023), the concept is generally understood as the extent to which individuals feel, think, and experience themselves as part of the natural world (Nisbet & Zelenski, 2013). Prior research shows that CTN is linked to environmental concern, goals, and sustainable practices (Richardson et al., 2020; Stenfors et al., 2025; Whitburn et al., 2019), as well as more ecologically conscious attitudes and behaviors (Hatty et al., 2020; Lengieza & Swim, 2021). In communication research, CTN has mostly been examined as a dependent variable, for instance in experiments testing whether mediated nature experiences increase connectedness (Arendt & Matthes, 2014; Janpol & Dilts, 2016). However, little attention has been given to CTN as an independent variable that might shape journalists' values, role conceptions, and professional practices. This study integrates theoretical perspectives on CTN (Gosling et al., 2010; Lengieza & Swim, 2021) with research on journalistic roles and professional values (Hanitzsch & Vos, 2017; Mellado, 2019) to examine how journalists' perceived CTN relates to their role orientations and reporting practices. To this end, we invited more than 30 German journalists- who have been awarded for their contributions to environmental reporting- to participate in in-depth interviews. Our sample currently includes eight journalists with experience in both publicly funded and commercial media, and additional interviews are forthcoming. Participants reported broad professional backgrounds but showed a shared focus on investigative and data-driven methods. Their mean age was 44; 83% identified as male and 17% as female. Our interview guide included questions about participants' motivations for covering environmental issues, their perceived connectedness to nature, their journalistic role conceptions, and their professional practices. Preliminary findings show that participants identified with multiple journalistic roles, but two stood out: the democratic watchdog and the agent of social change. CTN emerged as a central factor shaping these practices. Most participants regarded fostering CTN among audiences as an explicit goal of their work, and many described CTN as influencing how they frame environmental stories. Different dimensions of CTN were associated with different reporting approaches, suggesting that journalists' own relationship with nature meaningfully informs their professional decisions. This study opens a new line of inquiry by positioning CTN as a psychological factor relevant to journalists' role conceptions and practices. Limitations include the focus on journalists already engaged in environmental reporting and the exclusive reliance on interviews. Future work could combine validated scales of CTN with measures of journalistic role orientations to explore these associations more

systematically. Despite these limitations, this study contributes to both environmental communication and journalism studies. For journalism research, we identify an additional factor shaping journalists' role conceptions and professional practices. For environmental communication, we show that the perceived degree of CTN influences communicators and the messages they produce.

JOS37 Journalistic Practices

PP 1141 'A sense of shared reality': Community, place, and practice at mill media

Christopher Silver[1]

[1] Robert Gordon University, Gray's School of Art, Aberdeen, United Kingdom

This paper will present initial findings from a week of qualitative fieldwork undertaken in July 2025 at the headquarters of Mill Media, the Manchester based start-up credited with 'reinventing community journalism' (Cooke, 2024). As Usher (2021) argues, 'Journalists are communicators of culture and traditionally have been empowered as cultural authorities to communicate place' (p. 7). With its emphasis on long-form narrative journalism and city-regional cultures, Mill Media offers a fruitful site for discovering how such traditions of place-based journalistic authority can be revived and recombined with contemporary digital journalism practices. This paper will draw on fieldnotes and eight interviews with Mill Media journalists, with particular attentiveness to the production of the *Manchester Mill;* the company's inaugural title launched in 2020 and now part of a stable of city-based news brands.

In the context of convergent global media culture, a return to journalistic practice centred on place has a particular significance in the UK due to over a century of press centralisation in London squeezing local titles in favour of readerships based around class (Curran and Seaton, 2019, p. 45). Furthermore, while significant studies in the U.S have considered challenges to place-based journalism through newsroom ethnographies at metropolitan dailies (Ryfe, 2012; Anderson, 2013; Usher 2014) this approach has not been followed to the same extent in the UK, despite a venerable tradition of enquiry into the practices and routines of specialist and 'beat' journalisms (Tunstall, 1971).

As the first scholarly inquiry concerned with journalistic practices at Mill Media, this paper will outline the routines, cultures, and the nature of efforts to 'typify' news events at the start up (Tuchman, 1978, pp 211–12) . In doing so, the following questions will be considered:

To what extent does the underlying model of a community and subscriber driven online publications shape journalistic practices at Mill Media?

How does the emergence of Mill Media map on to wider social and cultural trends in the UK: such as the gentrification of post-industrial urban spaces, the re-emergence of civic and regional polities, and the mobility of immaterial labour?

Does the re-valorisation of place within journalistic practice, alongside the renewal of long-form and narrative journalism (cf. Braghieri, 2021) represent a response to the wider epistemological crisis of mediated actors and institutions? (Davies 2018).

Schlesinger's (1987) landmark *Putting 'Reality' Together: BBC News*, notes that a 'stop watch' culture (p.84) of rapid deadlines within ubiquitous news organisations was often a key element shaping journalistic practice. In contrast, the 'shared reality' that Mill Media journalists refer to relies on a slower news cycle, higher audience engagement and the leveraging of particular place-based loyalties. This paper will sketch a new conceptual outline of this potential co-created reality, as part of a necessary project to restate journalism's role in the creation of publications of record, a concept that has itself always been bound to notions of community and place (Cotter, 2010, p.253).

JOS37 Journalistic Practices

PP 1142 Adapting the news: A study of the selection and editing practices for social media news, and the impact on journalistic authority

Gunhild Ring Olsen[1], Håvard Kiberg[1], Steen Steensen[1], Bente Kalsnes[1], Arne Krumsvik[1], Lasha Kavtaradze[1]

[1] Kristiania University College, Department of Communication, Oslo, Norway

Most newsrooms have become increasingly dependent on spreading their content through social media platforms. Existing research has explored the vulnerabilities and counterstrategies of journalistic platform dependency, but the actual content production processes, and the rationales behind them, are often overlooked. This paper addresses this gap by examining 15 Norwegian newsrooms' daily news production for Facebook, Snapchat, Instagram, and TikTok.

Theoretically, the study leans on the concept of journalistic authority, defined as a contingent relationship in which certain actors come to possess a right to create legitimate discursive knowledge about events in the world for others. Journalistic authority is, in other words, based upon the relations that make authority possible, and is never automatically granted. Instead, it is dependent upon actual work results and the narratives journalists construct about the value of their work. New practices for selecting and presenting news stories on social media, and the narratives constructed around these stories, therefore can have great impact on journalistic authority. From this, we ask two research questions: 1) What practices do

Norwegian newsrooms apply to select and edit news for different social media platforms? 2) How can these selection and editing practices help build or weaken journalistic authority?

The empirical material of the study consists of observations and interviews with social media journalists and editors from 15 Norwegian newsrooms, where the newsrooms were strategically selected to secure diversity in size, ownership model, and geographic location. To gain further insight into routines and practices, one week of observation was conducted at one national and one regional newsroom. Known for professionalism and relatively stable financial conditions, the Norwegian news industry makes a good case for examining the development of new practices under favorable structural conditions.

Preliminary findings reveal that platform characteristics significantly affect selection and editing. Both Facebook and Snapchat are considered "traffic machines", but where most existing stories are reposted on Facebook with minimal changes, stories for Snapchat are fewer, heavily adapted, and highly commercial. In contrast, TikTok and Instagram are deemed important for branding and reach, making journalistic selection criteria more central. On all platforms, editing practices are tailored to platform algorithms and user demographics, often simplifying stories and avoiding certain images or words (like sex and Hezbollah) to bypass algorithmic moderation. Of stories produced solely for social media, most can be categorized as "explainer stories". In these stories, journalists and editors either explain ongoing news or the work practices and role of journalism to a younger audience.

Particularly the use of explainer stories and the strategic avoidance of certain words and images are telling examples of how newly developed practices have the potential to build or weaken long-term accumulated authority. While avoiding words and images may cede authority to algorithms, the explainer stories can potentially strengthen journalistic authority through demystifying journalistic practices and building a relationship with younger audiences.

MCS01 The Datafied City

PP 0670 Data practices as place narratives: Sense-making, accountability, and cultural organisations as media

Sara Trentham-Black[1]

[1] Sheffield Hallam University, Sheffield Creative Industries Institute, Sheffield, United Kingdom

This paper builds on the intersection of three contemporary dynamics: first, datafication, as a process that permeates everyday life with data (Hepp et al, 2018; Kitchin, 2014). Second, the shaping of culture by a complex tension between institutionalised culture (cultural organisations) and cultural dynamics that increasingly unfold across multiple platforms (Burgess et al, 2022), and third, the complexities and tensions in the datafication of institutional cultural activity, between culture as a space for support, investment, and accountability, and culture as a space for artistic expression and creativity (Belfiore, 2022; Durrer et al, 2019).

Cultural organisations must navigate these tensions in a context of increasing expectations of data-driven decision making (Tamm et al, 2022), awareness of the fallibilities of data (Kitchin, 2025), inconsistencies in reporting mechanisms of cultural value (Walmsley et al, 2022), and the challenges in balancing local and national accountability. This paper explores how cultural organisations 'sense-make' (Weick, 1995) through their data policies and practices. Drawing on an organisational ethnography of a performing arts organisation, it uses thematic, content, and discourse analysis to identify: 1) how cultural organisations define and activate data, from inception through processing; 2) how this shapes organisational self-knowledge, and 3) how this frames the accountability relationships with multiple audiences and stakeholders.

The case study is based in a location that balances a mosaic of identities including recent city status, a rich industrial heritage, and some of the most marginalised communities in England (UK Gov, 2025). The paper foregrounds how cultural organisations function as mediatized institutions and sites of connection in complex times, mediating accountability to self, place, and government, through data. Data practices do not just represent organisational activity, but actively produce spatial narratives on value, belonging, and impact within the city. In this sense, cultural data practices emerge as part of the shifting grounds through which urban futures, forms of inclusion, and modes of cultural value are negotiated, and data-driven decision making becomes a key interface through which cultural organisations negotiate their role within governance and local ecosystems. In doing so, the paper exemplifies the wider implications of data-driven accountability and sense-making in a datafied society and, innovatively, strategically defines culture in the media context, emphasising its role as a space of connection and communication.

MCS01 The Datafied City

PP 0671 Addresses, addressing, and addressability, and the data-fied state

Rebecca Ross[1]

[1] Central Saint Martins- University of the Arts London, Graphic Communication Design, London, United Kingdom

In "The City is a Medium," media theorist Friedrich Kittler wrote, "ADDRESSES are data which allow other data to appear" (1996, p. 724). Addresses facilitate relationships between media—in all its varied forms, content, and effects—and space. This paper considers the role of addresses, addressing, and addressability, within the contemporary data-fied state. Addresses provide a kind of substrate out of which relationships between governments and their constituent locations, individuals, and communities are composed. Existing literature tends to approach addressing in terms of globalized—or geodesic—approaches. By engaging with localized and emergent addressing systems, this research considers how addressing is embroiled with specific projects of governance. Focusing on the example of the UK, addressing is considered from three perspectives:

Historic

The development of the full national British postcode in the 1960s which coincided with the development of fully mechanized mail sorting as well as the development of computer systems to automate many other functions of government.

Contemporary

Recent developments to the UK's National Address Gazetteer, now a co-managed database which services a range of contemporary and emerging government and industrial functions. The National Address Gazetteer is indexed to the postcode but also designed as a more technically robust replacement with the potential to extend the reach, capabilities and purposes of government.

Future

The changing and increasing stakes of addressing in the context of the embedding of addressing operations more deeply within British government systems including synthetic intelligences. As addressing becomes more thoroughly operationalized as an aspect of governance, questions arise regarding its role in future subjectivities such as who and what does and doesn't get addressed, how, and why.

This paper draws from long-term work in progress on a monograph—*Postcode: addressing humans and machines*(under contract with UCL Press)—which take a historical and cultural approach to the history of addressing in the UK and the Republic of Ireland. At *The Synthetic city* conference in 2023 (Dublin), in response to the call, I proposed the idea of addressing as the coordination of relationships between synthetic and "usual" realities using a series of fragments drawn from the wider book. At ECREA 2026, as I am completing the manuscript, I propose to present from a specific more recently developed chapter which elaborates on my discussion of coordination by considering the role of addressing in consolidating contemporary state power.

MCS01 The Datafied City

PP 0672 Localizing platform governance: Learning from place-named Facebook group moderators in Greater London

Scott Rodgers[1], Liam McLoughlin[2], Susan Moore[3], Andrea Ballatore[4]

[1] Birkbeck- University of London, School of Creative Arts- Culture and Communication, London, United Kingdom
[2] Edge Hill University, Department of History- Geography and Social Sciences, Liverpool, United Kingdom
[3] University College London, The Bartlett School of Planning, London, United Kingdom
[4] King's College London, Department of Digital Humanities, London, United Kingdom

In early 2025, Facebook's global content moderation policies were subjected to sweeping changes that reignited public and scholarly debate about the platform's power, responsibility, and governance. While these shifts were visible and troubling, there has been comparatively little discussion of how such global policy changes intersect with how Facebook often operates as a localised communication infrastructure. This paper argues that understanding this disjuncture requires approaching social media governance less as a centralised, rule-based system, but as a set of **locally situated and orientational practices** through which platform governance is enacted in everyday, place-based and socio-technical contexts.

Empirically, the paper draws on in-depth qualitative interviews conducted in 2021 with administrators and moderators of twelve place-named Facebook groups across Greater London. These groups, organised around neighbourhoods, suburbs, and other locally meaningful spatial referents, occupy an important but under-examined position within Facebook's governance ecology. While formally subordinate to Facebook's global community standards and enforcement systems, they are governed in practice through the situated judgments, labour, and risk management undertaken by volunteer moderators who are themselves embedded in the localities their groups reference.

The analysis develops four themes. First, moderators' practices are shaped by their varied orientations to the *local situation*, in which online moderation is entangled with offline routines, reputations, and risks of place-based harm. Second, moderators actively make *representative claims to the local,* particularly around who and what the group stands for, while managing tensions between demographic representativeness, affective authenticity, and their group's relationship with formal political institutions. Third, moderators engage in *curating the local* by balancing the group's role as a noticeboard, a space of care, and a site of conflict, particularly around crime, commerce, and political issues. Fourth, moderators continually *negotiate the platform* itself, developing practical, often partial understandings of Facebook as an algorithmic, corporate, and mutable infrastructure that both enables and constrains local governance.

Conceptually, the paper situates these findings within debates that characterise Facebook as a state-like or quasi-sovereign actor. Such perspectives point to the unique power of translocal platforms like Facebook, yet risk overlooking how governance is localised through intermediary actors. We suggest engaging with the political concepts of subsidiarity and localism, to develop an alternative way of thinking about platform governance both empirically and normatively: one that recognizes moderation as a form of localised governing labour, while highlighting the limits of purely centralised or global regulatory solutions. In doing so, the paper contributes to scholarship on platform governance by emphasising a spatial analysis, demonstrating how global platforms are continuously re-made through situated practices of local moderation.

MCS01 The Datafied City

PP 0673 Doing public sphere in Rural East Germany – Local communication within and beyond journalistic structures

Hannah Hartmuth[1]

[1] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

East Germany and the former GDR as a social space has been widely discussed in literary, media, political, and academic discourses for years. However, "the East" is often treated as subordinate rather than a true participant. The study to be presented is built on two key assumptions: Firstly, the takeover of the East German press by West German publishers at reunification, which led to ongoing media concentration in East Germany (Tröger, 2024). Secondly, these economic factors have shaped institutional and discursive dynamics in current discussions about East Germany. This is why East German citizens often encounter barriers to full participation in national discourse, leaving their perspectives underrepresented

(Mau, 2024). In contrast, local public spheres tend to be more accessible, allowing greater citizen involvement with lower barriers. Simultaneously, the decline of professional local journalism worldwide raises concerns for democracy. Therefore, examining changes in local public spheres amid media consolidation is relevant beyond isolated cases.

Considering these factors, an interdisciplinary case study was conducted in a village with 1500 inhabitants in the north of the eastern German state of Saxony. It examines how local public spheres in East Germany are formed and how they are influenced by the decrease of journalistic structures, societal context, history, and discourse. The study is built on a theoretical framework combining public sphere theory, discourse theory, and field-informed approaches from ethnology and sociology. A multi-method-design was used to meet the complex requirements of the research subject. Semi-structured interviews were conducted with village residents and chairpersons of local associations. In addition, participant observation was carried out in the village, and the results were supplemented by a document analysis of various place-related sources and a content analysis of local news coverage.

First results of the case study can be summarised as follows: In infrastructurally well-positioned municipalities in East Germany, residents are dealing with the decline of local journalism creatively. For example, the local administration shares information about events via the WhatsApp status function instead of advertising in local newspapers. Furthermore, the findings show that inhabitants are generally satisfied with life in their village, largely due to its vibrant local association culture. Nevertheless, residents often feel constrained in their ability to participate in broader societal discourses, which is also a problem of press centralisation. On the one hand this confirms the democratic relevance of local public spheres. A well-developed local public sphere can, after all, satisfy certain needs that are normally directed towards a broader public sphere. On the other hand, the study also corroborates the well-researched inequality in discourse with and about East Germany. Regional disparities and the accompanying discursive imbalances can be observed on a global scale. The study therefore reflects two democracy-theoretical considerations central to current social science research.

PP 0674 Situating local journalism: Proximity between places and roles in news-production process

Francesca Tampone[1]

[1] University of Milan - Bicocca, Department of Sociology and Social Research, Milan, Italy

Capturing local journalism presents several challenges due to its inherently fluid and context-dependent nature. However, its inherent proximity and its marginal position within the broader journalistic field could offer a crucial lens through which to investigate processes of social and cultural change, which also affect the perception and experience of place.

Recognising local journalism's role as a powerful agent of socialisation and its unique proximity to the communities it serves, this study has investigated the role of local journalism towards their communities, considering digital and hybridised context. Journalism is thus understood from an institutionalist perspective, as it is shaped by routinised practices, explicit and implicit rules and beliefs that influence journalistic work. Institutionalist theory is valuable not only for analysing journalistic practices and dynamics, but also for understanding their adaptability in the context of digitalisation.

This study thus proposes the framework of "situating local journalism". This framework has been designed to acknowledge the intersecting relationships between: (1) the geographic places in which local newspress are rooted; (2) the digital environments where news circulates; and (3) the places of news production, whether physical and virtual. Local journalism is thus understood not merely as a professional activity that reports on a given territory, but as a social institution that actively co-constructs places through its routines, narratives and relationships. Proximity is here conceptualised in a two-fold way. On the one hand, it is intended as spatial proximity grounded in territories, everyday co-presence and dense relational networks. On the other, it is positional proximity, drawing on Haraway's reflections on situated knowledges: journalists' embeddedness shape their epistemic stance and forms of authority. Situating local journalism in this sense allows us to move beyond abstract, placeless notions and to theorise journalism as an institution whose legitimacy and futures are negotiated within concrete configurations of place, infrastructure and power. Elaborated from ethnographic observations of local newsrooms in North-western Italy between 2023 and 2024, this framework offers a theoretically grounded lens to understand how local media maintain social relevance and foster belonging in an increasingly unstable media world.

PP 0769 Co-creative communication and resistance in liminal contexts: vulnerability, participation, and solidarity purchasing groups in marginalised Italian communities

Marco Binotto[1], Michele Sorice[1], Andrea Volterrani[2]

[1] Sapienza University of Rome, Communication and Social Research, Rome, Italy
[2] University of Rome "Tor Vergata", Enterprise Engineering, Rome, Italy

Our presentation is based on research into the emergence of participatory practices in marginalised and liminal urban contexts in Italy. It focuses on the complex relationship between vulnerability, communicative ecosystems, and processes of community formation. We analyse two distinct yet interconnected phenomena: marginalised communities in the peripheries of southern Italy, and solidarity purchasing groups (GAS). We interpret these GAS as a form of resistance to neoliberal logics, through innovative communicative and organisational practices.

Our theoretical framework integrates an analysis of universal vulnerability with processes of deep mediatisation that transform localities into translocal assemblages, in which face-to-face interactions coexist with digital networks. Rather than designating 'vulnerable populations', vulnerability constitutes a permanent structural condition that is distributed in profoundly unequal ways. In the liminal contexts studied, this condition is exacerbated by socio-spatial segregation, institutional fragility, and persistent digital divides.

Communication plays a pivotal role as a transformative practice and instrument of resistance. A co-creative approach involving sharing problem definition, collectively designing interventions and distributing epistemic authority redistributes narrative power. This enables communities to autonomously construct meanings, practices and solutions. In the case of GAS, visual communication and collective identity, as expressed through websites, social media profiles and networks of hyperlinks, constitute fundamental infrastructures for building shared identities and organisational networks. This balances the need for simple narratives of community experiences with the complexity of storytelling, which can sustain contemporary, networked activism.

Digital media occupy an ambivalent position: on the one hand, they reproduce structural inequalities through the extractive logics of commercial platforms; on the other hand, when reappropriated strategically through co-creative processes, they facilitate novel forms of visibility, autonomous narrative production and hybrid participation. This research, based on a mixed-methods approach combined with creative methods, demonstrates how communities and GAS can constitute themselves as producers rather than consumers of content, discourse, and collective action. This enables them to develop everyday forms of resistance (and/or social direct action) against marginalisation, exclusion, and neoliberal individualism.

The theoretical integration of universal vulnerability, liminality and co-creative communication provides a robust framework through which to understand the emergence of agency, power and transformation in mediated contexts. Hybrid participation, mediated forms of relationality, and the communicative co-construction of narratives and collective actions can promote substantive resistance to neoliberal governmentality, social atomisation, and institutional fragmentation. From this perspective, co-created communication is a political practice that can broaden collective ambitions, empower shared action, and encourage forms of everyday resistance in cities and liminal/transitional spaces. It works towards fairer and more democratic social structures.

MCS02 Sustainability and Community-building

PP 0770 Remote working together in urban coworking spaces

Magnus Andersson[1]

[1] Malmö University, School of arts and communication, Malmö, Sweden

Digital technologies have untethered work from traditional workplaces, a development which was further accelerated by the global COVID pandemic (2020–2022). This development has led to increased spatial flexibility for knowledge workers whose 'laptop work' enable them to work from almost anywhere. Yet, the flexibility comes at a cost: despite the digital affordances of mediated co-presence, experiences of social isolation are common among remote workers. Furthermore, working from anywhere means never being fully freed from work; it is always present. This phenomenon is particularly salient when remote work is conducted from home, the primary sphere of private life. Many remote workers have therefore sought alternative environments that offer social as well as digital infrastructure, such as coworking spaces, coffee shops and other public milieus. As Polson (2026) argues, the growth of such establishments is reshaping many city centres in the Western world, where work and leisure are integrated in new ways. This paper asks: what does it mean to work in such "third places" beyond home and workplace (Oldenburg 1999), and what kinds of urban sociality does it give rise to?

As part of a larger ethnographic project on coworking spaces (CWS) in Scandinavia (*Hot desks in cool places: Coworking spaces as post-digital industry and movement)*, this paper focuses on the experiences of remote workers who, for various reasons, have stopped working from home and instead begun working in a local CWS. The CWS in question, located in central Malmö (Sweden), markets itself as a "homely coworking space" offering an informal atmosphere constituted by,

among other things, second-hand furniture, a large collective kitchen – and a ban on wearing shoes indoors. This relaxed, "non-corporate", atmosphere was highlighted by many participants as a reason for choosing this particular CWS.

Reflecting on this move, i.e. going to work beyond the home, the remote working participants emphasized the sociality with other coworking/ remote working tenants. In resonance with Oldenburg's concept of the third place, these others were considered neither colleagues nor friends, but something in-between. They worked side by side yet often knew more about one another's private lives than each other's work. Moreover, leaving the home and go to a "workplace" also meant that their homes reappeared as a "home" – a place for family life and intimate relations, unsullied by wage work.

MCS02 Sustainability and Community-building

PP 0771 The city's temporal gears: Negotiating temporalities in urban environmental communication

Lavinia Colantoni[1]

[1] Catholic University of the Sacred Heart, Communication and Performing Sciences, Milan, Italy

At the urban level, institutional communication can play a role in harmonising diverse perceptions of sustainability with the temporalities of the actors (Lammers & Barbour, 2006b; 2011) and of environmental crises. Information is co-constructed between local institutions and citizens through ongoing processes of social negotiation, enabling the articulation of compromise among different representations of sustainability (Moscovici, 1981) and the negotiation of possible futures.

While institutional discourse prioritizes citizen engagement, the ethnographic perspective reveals that communication flows are shaped by conflicting temporalities and heterogeneous paths- political, bureaucratic, media-driven and societal (Lundgren et al., 2015; Jurin, 2010; Howlett, 2020). The literature illustrates that environmental emergencies require rapid responses (Lundgren et al., 2015; Gunderson & Holling, 2002), yet institutional timelines often lag behind the urgency of ecological degradation (Jurin, 2010). As a result, environmental issues unfold on timescales that clash with both institutional reactivity and consensus-seeking processes (Howlett, 2020), generating structural frictions that undermine communication effectiveness.

My research investigates the factors interacting with these temporalities, impacting the effectiveness of local institutional environmental communication. Drawing on the case of the remediation of the Caffaro National Interest Site in Brescia- a long-standing highly controversial brownfield remediation project- the study specifically examines the dynamics through which the Caffaro Observatory, a participatory forum established in 2021, has established and pursued its communication protocol. The analysis focuses on stakeholder involvement (Dryzek, 2005; Putnam, 2000), the use of digital media (Bartoletti et al., 2016), institutional transparency (Istrate, 2022), and consensus-building (Turnhout et al., 2010).

Adopting a diachronic, multi-level methodology- based on participant observation, analysis of communication artifacts (bulletins, reports, guidelines), and interviews with key actors (policymakers, officials, community representatives)- the study highlights how communication effectiveness is shaped by the friction between heterogeneous temporalities, which can be conceptualized as a system of interlocking temporal gears. Each gear- representing political cycles, bureaucratic caution, media immediacy and civic expectations- rotates at a different speed and rhythm, often producing friction, misalignment or even blockages in the communication process. The resulting communication objects operate as "temporal boundary objects" (Yakura, 2002), serving as negotiated artifacts that mediate between these different temporal rhythms and stakeholder perspectives. These objects are both technical outputs and products of compromise, negotiation and structural attrition, reflecting the "shifting grounds" of social negotiation.

The results show how the asynchrony among diverse temporalities shapes the configuration of communication objects as a negotiated compromise. The communication protocol developed for the Caffaro remediation exemplifies an attempt to manage this asynchrony by setting up a path that, despite persistent frictions, keeps communication intelligible and acceptable to citizens. In this perspective, the very content and structure of communication emerge from clashes among heterogeneous temporalities and from the need to find workable compromises between incompatible rhythms while opening new pathways for negotiating possible futures.

MCS02 Sustainability and Community-building

PP 0772 Reclaiming participation through vulnerability and co-creation in mediatised liminal urban spaces

Andrea Volterrani[1]

[1] University of Rome Tor Vergata, Department of Enterprise Engineering, Rome, Italy

Urban peripheries increasingly reflect the "shifting grounds" produced by socio-spatial fragmentation, deep mediatization and structural inequalities. These contexts operate as liminal environments where everyday life unfolds across unstable

material and communicative infrastructures. Building on empirical research in Southern Italy and on theoretical contributions from deep mediatization (Couldry & Hepp, 2017), social figurations (Elias, 1978), and spatial singularisation (Reckwitz 2020), this paper proposes a reframing of participation grounded in universal vulnerability and co-creation.

Vulnerability—expanded here following Fineman's notion—offers a lens to interpret how individuals and communities navigate unstable socio-spatial contexts. Rather than identifying a category of "fragile groups," vulnerability exposes the structural interdependence shaping individual trajectories and neighbourhood life. In marginalised urban areas characterised by overlapping social figurations, fragmented expectations and competing symbolic regimes, neoliberal imaginaries continue to permeate participatory rhetoric, reinforcing managerial forms of governance that depoliticise public engagement.

Deep mediatization amplifies these dynamics by reconnecting local spaces to translocal flows of information, visibility and norms. This creates hybrid environments in which digital and face-to-face practices co-constitute identities, forms of public familiarity and everyday negotiations of space. As highlighted in previous studies on mediatised communities (Volterrani 2025), media infrastructures do not merely support communication but reorganise the terms of participation and agency.

Against this backdrop, the paper introduces co-creation as a transversal methodological logic capable of redistributing epistemic authority and enabling communities to articulate situated knowledges. Rooted in collaborative problem definition and shared authorship, co-creation extends the legacy of critical pedagogy and edu-communication traditions, supporting transitions from spectatorship to usage and, ultimately, to protagonism. In liminal contexts where social capital is often privatised or segregated, co-creation provides opportunities to transform relational density into collective capacity for action.

Empirical evidence from Southern Italy shows that co-creative infrastructures allow residents to challenge dominant narratives, reconfigure spatial imaginaries and produce alternative accounts of everyday life. This dynamic aligns with contemporary research on counter-narratives, participatory storytelling and community-based media practices. Rather than reinforcing resilience as a return to equilibrium, these processes cultivate resistance, understood as the capacity to confront structural inequalities, reclaim visibility and shape alternative urban futures.

Digital media play a dual role: while commercial platforms reproduce extractive logics, they can also be reappropriated through co-creative processes that enable community-driven visibility and hybrid participation. These practices suggest that liminal urban spaces can become laboratories for democratic experimentation, where shifting grounds evolve into grounds for encounter, inclusion and social transformation.

Integrating universal vulnerability, liminality and co-creation provides a framework for understanding how agency emerges within mediatised but structurally unequal urban environments. The paper concludes by emphasising the need for institutional models that sustain relational, material and communicative infrastructures capable of enabling co-produced participation and everyday resistance.

MCS03 Urban Infrastructure, Representation and Media

PP 0879 A touch of magical realism in architectural renderings. The role of visualisations in crafting urban futures

Jenni Kuoppa[1], Asko Lehmuskallio[2], Markus Laine[1], Helena Leino[1]

[1] Tampere University, Faculty of Management and Business, Tampere, Finland
[2] Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Digital visualisations of urban development and architecture, commonly referred to as renderings, are increasingly influential in crafting urban futures (Smitheram et al., 2018; Degen et al. 2022; Mélix & Christmann, 2022). Related research about these renderings has mainly concentrated on their manipulative effects and dangers of creating disinformation, or of them providing empty promises (e.g. Groulx & Lewis 2017; Kayalar & Uluğ, 2024; Sheppard, 2001). A specific criticism in related work is that a photorealistic style of presentation would create an illusion of an actually existing urban environment in the future, seducing and persuading viewers to interpret the plans in a favourable manner (Lee & Pae 2017; Degen et al., 2022). The critique hitherto provided relies on a specific visual style (photorealism) and its suggested effects on an actual (future) reality. The premise behind the critique is that the visual style (photorealism) would be interpreted in the light of a specific technology (photography) and its claims on an indexical relation to a depicted reality, hence leading to misinterpretations by experts and lay audiences alike.

Based on long-term field work in the development of Turku Science Park, including participant observation, semi-structured interviews with key stakeholders, and assessment of planning documents, we enter into dialogue with related work in the area that focuses on actual urban planning practices within which these images are embedded (see Degen & Rose, 2022; Degen et al., 2022; Mélix & Christmann, 2022; Smitheram et al., 2018). We suggest that architectural renderings are created for situational purposes and might never be intended to make claims of a one-to-one model of a future development,

as tends to be discussed in some of the related work. Also, when conducting a closer visual analysis of current renderings used in urban planning, we find that the visualisations include dimensions that break with assumptions of photorealism. In our case studies, most of the renderings analyzed are not very convincing as *photorealistic* renderings. Instead of emulating a pure photorealism, they play with a touch of *magical realism* (cf. Faris 2004), specifically displaying a future that may never be. Magical realism "combines the realistic and the fantastic so that the marvelous seems to grow organically within the ordinary, blurring the distinction between them" (Faris 2004, 1). This combination of realistic and magical elements provides an unsettling feeling of contradictory elements including a vagueness of depicted time and space (cf. ibid.). With the help of this magical realism, visual experts, urban planners and architects may discuss several, and at times conflicting potential futures, which they know might never get realized as initially suggested.

Using this framework, we aim to enhance the understanding of renderings as performative tools in urban planning and development, where aesthetics and presentation techniques extend beyond the goals of photorealistic, one-to-one models of future developments. This analysis allows for a more sustained discussion of the visual means of imagining livable futures.

MCS03 Urban Infrastructure, Representation and Media

PP 0880 At the crossing: Infrastructural power in everyday urban mobility

Maris Männiste[1]

[1] University of Tartu, Institute of Social Studies, Tartu, Estonia

Smart pedestrian crossings are increasingly deployed in Estonia as part of smart city initiatives, promising improved pedestrian safety, real-time responsiveness, and more efficient traffic management through sensor-based and data-driven technologies. As long as crossings function as expected, their operation remains largely invisible and fades into the background of urban life. It is only in moments of breakdown, such as when sensors fail to detect pedestrians, signal timings appear inconsistent, or movement is disrupted, that smart crossings become noticeable and contested.

The deployment of smart pedestrian crossings in Estonia has been shaped by longstanding public debates on traffic safety and surveillance. Their introduction, alongside other data-driven and surveillance technologies, has been motivated by concerns over road safety and efforts to reduce pedestrian accidents and fatalities. Traffic remains one context in which surveillance and predictive tools are often viewed favourably, despite broader public unease about datafication.

Drawing on a case study, this paper examines how infrastructural power is enacted through the operation, breakdown, and maintenance of data-driven pedestrian infrastructure. Within this context, smart crossings are framed as infrastructures of care that promise safety and responsiveness while embedding sensing, data extraction, and automated decision-making into everyday mobility. Based on interviews with municipality representatives who had implemented smart pedestrian crossings (n = 6), system developers (n = 3), and accessibility specialists (n = 2), the study reveals that the reliability of smart pedestrian crossings depends on routine maintenance and repair work, highlighting their ongoing vulnerability. At the same time, governance arrangements concentrate infrastructural power by tying municipalities to vendors who control software, data, and system upkeep, shaping how these systems regulate urban mobility and redistribute responsibility, authority, and trust in the smart city. Taken together, these findings suggest that smart pedestrian crossings operate less as seamless infrastructures of safety and efficiency and more as contested sites where access, responsibility, and ownership are continually negotiated.

MCS03 Urban Infrastructure, Representation and Media

PP 0881 Analysing the current and future urban impact of drone delivery services in Ireland and communication strategies from stakeholders

Marcos Dias[1]

[1] Dublin City University, School of Communications, Dublin, Ireland

In 2020, Irish Broadcaster RTÉ published a video report on Manna, a new drone delivery service, as they delivered two cappuccinos to a private house in Oranmore, a small town of 5,000 inhabitants in the West of Ireland. Since then, Manna has expanded its business to other urban areas in Ireland, targeting several suburbs of Dublin and has secured 30 million dollars in a recent funding round. However, Manna has faced significant backlash from residents across Dublin concerned with noise, privacy and safety issues and the lack of specific drone delivery regulations. Residents have resorted to different communication strategies to express their objection to these services. Some local community organisations such as GADRA (Griffith Avenue & District Residents Association) in Dublin's Drumcondra suburb have liaised directly with Manna, while other communities have mobilised politicians and local residents through townhall meetings and online platforms to protest against drone delivery services, such as the Drone Action D15 campaign in the Dublin 15 postal district, which includes Manna's main delivery hub in the Blanchardstown area.

The use of drones is regulated by the Irish Aviation Authority (IAA), but there are no current regulations that address the rights of local residents or delivery drone's environmental impact, as they fly over or near houses and green urban areas. In Dublin City Council's *Drone and Urban Air Mobility Strategy for Dublin City Council 2024 – 2029*, Manna and drone deliveries are briefly mentioned, along with the argument that for drone services to expand, "public trust and buy-in

will be the key" (Dublin City Council, 2024: 6). Other companies such as Wing, a business belonging to Google's parent holding company Alphabet, have also conducted drone delivery trials in Ireland. However, Manna remains the leading drone delivery company, and they have run their own communication strategies to support their business, including the commissioning of a noise report (Kennedy, 2025) from Trinity College Dublin and a letter of support signed by residents that they presented to Dublin City councillors.

This paper critically analyses the multiple factors involved in the current and future scaling up of drone delivery operation in Dublin, including regulations, resident concerns, feasibility, environmental impact and business models. It also analyses the communication strategies from both Manna and residents to defend or reject the implementation of drone delivery services in Ireland, and how local authorities are addressing the lack of regulation. It argues that the operation of drone delivery services in urban areas in Ireland as a disruptive technology and its future expansion must be sustainable from a social, environmental and business perspective, and that citizens' concerns must inform this process.

MCS03 Urban Infrastructure, Representation and Media

PP 0882 Operationalising Mediatopos for spatial analysis. Places of journalism in Former Yugoslavia

Danica Petrović[1], Sandra Banjac[1], Maja Babić[2], Marcel Broersma[1]

[1] University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands
[2] University of Groningen, History and Theory of Architecture and Urbanism, Groningen, Netherlands

Studying journalism as a spatial practice raises a crucial question: how can we study built space without relating it solely to architecture, its institutional settings, or user experience?

Empirical analysis of journalism´s spatiality remains limited, especially in non-Western and post-socialist contexts, shaped by former federal states. Media systems here developed within shifting political circumstances and strongly planned urban landscapes. Furthermore, existing studies mostly focus on normative-institutional analysis and newsroom culture, while analysis of material and territorial infrastructures of journalism is fragmented.

This paper addresses this question and shortcomings by introducing the conceptual framework of *Mediatopos*. This study's interdisciplinary research design encompasses news production as both a material and relational place, characterised by three interconnected dimensions:

1. media regulatory scripts
2. news production sites
3. spatialised journalistic practices

Applied to the case of Yugoslavia, a former socialist federal republic with a characteristic non-aligned position between the Western and Eastern blocs, the *mediatopos* shows how these three dimensions created a unique media system. Yugoslavia´s media system was decentralised and organised across multiple republics that were interconnected through shared broadcast, production, and distribution infrastructures. This relationship resulted in a dense network of newspapers, television, radio stations, and transmission towers that worked both at the republican and federal levels.

This form of spatially distributed media organisation provides a clear case for applying the three-part *mediatopos* framework, which is operationalised through a combination of qualitative methods. Media regulatory scripts are examined through archival analysis of media laws and policy documents. News production sites are analysed through architectural drawings, planning documentation, site visits, and spatial analysis of media buildings. Spatialised journalistic practices are explored through oral-history interviews with journalists and architects, focusing on how spatial layouts and temporal routines shaped professional work.

Taken together, the selected methods support multi-scalar empirical research. At the federal scale, the paper presents an initial spatial mapping of Yugoslav media infrastructures, visualising the distribution of media centres and hierarchies of news circulation. It then moves to selected exemplary sites, including a newspaper building, a television complex, and a broadcast tower, to demonstrate how architectural design and urban positioning shaped the journalistic system and everyday working practices within them. This scale-shifting strategy is supported analytically by visual tools, such as mapped research routes and spatial inventories of media sites, to guide the transition from federative patterns to site-specific readings.

Although developed through the Yugoslav case, this approach is not exclusive to it. This paper presents an interdisciplinary conceptual framework and methodological tool-set at the intersection of journalism studies and architectural research that contributes to ongoing discussions on space, journalistic practice, and power relations.

MCS04 Aesthetics, Play and Mediated Urban Space

PP 0984 The collaborative and hybrid outdoor: A mixed-method study of a large-scale Norwegian outdoor recreation project Stolpejakten

Yukun You[1], Trine Syvertsen[2]

[1] Southern Denmark University, Department of Design- Media- and Educational Sciences, Odense, Denmark
[2] University of Oslo, Department of Media and Communication, Oslo, Norway

In recent years, outdoor activities are increasingly mobilised to address societal challenges regarding public health, urban development, tourism and sustainable leisure, often through public-private partnerships. At the same time, outdoor space is mediatised and gamified through apps, platforms, and social media, blending analogue and digital experiences and reshaping how movement, play, and place are organised and experienced. These developments reconfigure outdoor environments as hybrid media infrastructures, facilitating holistic experiences beyond traditional outdoor recreation.

This article examines *Stolpejakten* [The Pole Hunt], a large-scale Norwegian initiative epitomising these shifts. Participants use apps and websites to locate "poles" in urban and rural spaces, collecting points and badges. Since 2013, *Stolpejakten* has expanded to 250 of Norway's 357 municipalities and attracted more than 200,000 participants, registering over 2.6 million poles (2025). The activity is free, as the infrastructure is maintained by volunteers and supported by the state, municipalities, businesses, and sport and tourism bodies. *Stolpejakten* aims to include all: "to facilitate the activation of both young and old; inactive people, schoolchildren, cyclists, disabled people and wheelchair users – or those who simply want to get to know the city and district better" (website).

Theoretically, the paper addresses *Stolpejakten* as a holistic experience, blending digital and physical, societal and personal, competitive and community elements. The paper draws on interdisciplinary perspectives from three research fields: Outdoor studies shed light on the turn towards "micro-adventure" and "nærfriluftsliv" [Norwegian term for nearby outdoor recreation], while sociology offers perspectives on public-private collaboration, self-optimisation, and community-building, and communication studies provide perspectives on gamification, locative games, and digital nudging.

Empirically, this article combines document analysis of media and websites, app walkthroughs of *Stolpejakten*, observations of physical sites across urban and rural locations, and participant narratives drawn from media interviews and social media. The paper explores 1) how *Stolpejakten* is organised as a collaborative effort between different stakeholders, 2) how *Stolpejakten* is designed as a hybrid experience between the physical and digital, and 3) participants' experiences.

The paper contributes in three ways. First, there is little interdisciplinary research on large-scale platformised projects such as *Stolpejakten* and comparable initiatives. Second, the analysis is situated in highly digitalised Scandinavian welfare-states, with public–private collaboration and policy-driven commitments to public health and outdoor accessibility. Third, the paper goes beyond single-method approach and use multiple sources to highlight collaborative, hybrid, and holistic dimensions. The paper also offers practical implications by highlighting design elements and cross-sector partnerships as essential, while also illuminating tensions.

A main finding is that *Stolpejakten* is not experienced merely as an app or a physical activity, but as a collaborative and hybrid spatial arrangement involving multiple stakeholders and integrating diverse meanings. Participants navigate through overlapping logics of connection, competition, and consumption, pursuing exercise, exploration, and education, while municipalities, volunteers, and private sponsors negotiate infrastructural, civic, and commercial dimensions. Rather than being driven by a single dominant motive, *Stolpejakten's* appeal lies in its capacity to hold together competing rationales (e.g., health promotion, community-building, gamified participation, local tourism), within a mediatised outdoor environment.

MCS04 Aesthetics, Play and Mediated Urban Space

PP 0985 Going back to the streets in the (post-)digital city: Why visual-material research matters

Giorgia Aiello[1]

[1] University of Milan, Department of Social and Political Sciences, Milan, Italy

Over the past decade, the role of digital technologies in shaping cities has become prominent in urban research. Big data, social media platforms, and algorithmic logics are now all central to how urban space is both represented and materialized. Meanwhile, the 'smart city' has taken center stage in both public and academic debates on urban planning. More recently, geographers and urban studies scholars have begun to focus on the aesthetic dimensions of cities' digital infrastructures. Some of this work has engaged with the visual-material approach I developed in the 2010s to conceptualize the urban built environment as a medium of communication in its own right.

However, in digital urban research, aesthetics is still too often treated as an outcome rather than as an active force in processes of spatial transformation and inequality. I argue instead that visual-material research is increasingly indispensable for understanding (post-)digital cities; aesthetic considerations routinely drive, rather than simply reflect, political and economic choices that result in urban injustice. As I show, an 'aesthetic trope' frequently underpins debates and decisions regarding urban redevelopment, functioning as a mode of governance that frames visual disorder as a social problem and

thereby legitimates capital-driven transformation. At the same time, digitally and visually mediated imaginaries consolidate aesthetic power by narrowing urban sensibilities around photogenic vistas and marketable lifestyles.

To move beyond platform-centric understandings of digitally mediated spatial production, I advocate methodological approaches that foreground sensory, embodied, and experiential engagements with urban environments. I outline the method of *being through there*, which brings scholars' embodied presence and movement into analytical focus, attuning research to the textures, materials, and encounters through which urban mediation unfolds. By "getting off Instagram" and returning to the streets, we can more fully account for the entanglement of digital infrastructures with the physical and symbolic conditions of urban life.

Ultimately, this paper positions visual-material research as vital to understanding how aesthetics shapes and is mobilized within the uneven spatialities of the post-digital city, thereby expanding the conceptual and methodological horizons of media geography.

MCS04 Aesthetics, Play and Mediated Urban Space

PP 0986 Becoming Wuzhen: Media aesthetics, temporality, spatiality, and the shifting authenticity of place

Yufei Guo[1]

[1] University of Groningen, Journalism and Media Studies, Groningen, Netherlands

Authenticity has long been a central concept in media studies (Dubrofsky 2022; Hill 2005), urban studies (Banks 2023; Zukin 2010), and tourism studies (Rickly 2022; Wang 1999), where it has been theorized as historical truthfulness, social construction, existential experience, or performative effect. As social life and space become increasingly mediatized, integrative approaches to authenticity are needed to bridge these fields and account for the mediated production of place-experience (Mercier and Abidin 2025). Thus, this paper examines how the authenticity of place shifts over time in relation to changing media aesthetics, temporal imaginaries, and mediated spatial organizations. Rather than a fixed attribute of place, this paper argues that authenticity operates as an analytical lens through which the "notion of place" is continually produced, transformed, and reconfigured. Specifically, this paper asks how media culture reshapes what authenticity "looks like" and comes to mean in a tourist destination over time.

The study focuses on Wuzhen, a historic scenic town in Zhejiang, China, as a case study and adopts a visual-material approach to place analysis (Aiello 2021). Wuzhen's affinity with media production makes it a revealing case, as the town has become one of mainland China's most renowned and profitable tourist destinations through its heritage value and successive roles as a television drama set, an international theatre festival venue, and a reality TV environment. The study combines two weeks of on-site ethnographic observation conducted during the Wuzhen Theatre Festival in October 2025 with a visual–textual analysis of selected television dramas, reality TV programs, festival materials, and social media content since the 2000s. Ethnographic fieldnotes document spatial organization, aesthetic design, tourist practices, and everyday interactions, while media analysis attends to formal elements, narrative structure, aesthetic style, and temporal framing. Together, these methods examine how mediated representations and lived spatial practices co-produce place and authenticity over time.

The findings identify three overlapping phases in Wuzhen's mediated transformation. In the early 2000s, a "cinematic past" emerged through the television drama *Sishui Nianhua*, which cast Wuzhen Dongzha (East Zone) as a nostalgic water-town landscape. In the 2010s, a "cosmopolitan future" was articulated through the Wuzhen Theatre Festival and the World Internet Conference in Xizha (West Zone), positioning the town as an outward-looking international cultural hub. Since 2021, a "performative present" has taken shape through reality TV and the circulation of social media content, producing an atemporal, postmodern pastiche that foregrounds lifestyle performance and consumption. These phases do not replace one another linearly but overlap and interact, generating a recursive temporal layering that continually reshapes how Wuzhen is imagined and experienced.

The study contributes to scholarship on media-space relations by demonstrating how authenticity is reconfigured through shifting media practices. Societally, it offers insight into how media production, tourism, urban (re)development, and cultural policy intersect in contemporary China, highlighting the social consequences of aesthetic reinvention for spatial experience. As such, it provides a non-Western perspective on how mediated authenticity shapes urban and tourist spaces under conditions of rapid development and intensified mediatization.

Authenticity; media tourism; temporal imagination; mediated place-making; Wuzhen

MCS04 Aesthetics, Play and Mediated Urban Space

PP 0987 Sky media and the vertical city: Spatial paths, infrastructural connections, and urban imaginaries in chongqing's drone light shows

Le Cao[1]

[1] Friedrich-Alexander University Erlangen-Nuremberg, Institute of Theater and Media Studies, Erlangen, Germany

Drone light shows have rapidly become a prominent feature of global urban nightscapes and cultural governance. While often framed as technological innovation or promotional spectacle, existing research rarely examines drone performances as mediating infrastructures that reorganize urban space, visibility, and governance. At the same time, scholarship on verticality has predominantly focused on military vision and surveillance, whereas emerging Chinese debates on "low-altitude media" and "sky media" have not yet been systematically connected to media infrastructural studies or everyday spatial practices. This theoretical and empirical gap is particularly salient in mountain-based megacities such as Chongqing in Southwest China, where the urban terrain is inherently volumetric.

To address this gap, the study conceptualizes drone formations as a sky medium with mediatic a priori rather than as neutral technical tools. It integrates three theoretical strands: (1) studies of verticality and volumetric urbanism, which illuminate how aerial sensing, vertical gazes, and layered spatial regimes reconfigure what becomes visible and governable; (2) media urbanism and infrastructural studies, treating the urban sky as a programmable communicative layer composed of devices, regulations, and institutional coordination, and bringing this into dialogue with Chinese notions of low-altitude media and urban interface; (3) political aesthetics and affective governance, which understand drone patterns and light scripts as "sky codes" that mobilize emotion, belonging, and future imaginaries. Based on this framework, the study investigates: RQ1 How do drone performances reorganize ground–river–mountain–high-rise–sky relations into a calculable vertical space, reshaping Chongqing's spatial paths and volumetric imaginaries? RQ2 How do government departments, cultural and tourism agencies, technology firms, platforms, and media form an infrastructural network that governs airspace, scripting, and risk regulation? RQ3 How do citizens, tourists, and drone enthusiasts experience, reinterpret, or contest these aerial images through on-site viewing and online practices, and what forms of urban affect and future-oriented imaginaries emerge?

Methodologically, the study adopts a multimodal qualitative design combining visual–spatial, textual–discursive and experiential–affective analysis. The dataset comprises official drone videos and scripts, policy/media documents, and screened Douyin comments (1271 texts and 1502 comments) from June 2023 to November 2025. In the visual–spatial layer, Python (OpenCV) is used to extract key frames; formations are manually annotated relative to riversides, bridges, mountain slopes and high-rise clusters to produce simplified trajectory diagrams showing how Chongqing's terrain is encoded into a low-altitude media corridor. In the textual–discursive layer, Python-based segmentation, frequency, co-occurrence and TF-IDF analyses identify discourse clusters such as "sky media", "low-altitude economy" and "governance model"; critical discourse analysis examines how these narratives translate infrastructural coordination, safety regulation and branding into seemingly neutral progress. In the experiential–affective layer, eight interviews and comments are thematically coded in MAXQDA, while selected viewer videos—focusing on framing and hashtags—situate aerial images within viewing contexts and mobility.

Findings show that pre-scripted heights, paths and patterns privilege riverside skylines and landmark towers while rendering other districts marginal; institutional actors stabilize an innovation-oriented "sky media" governance network; and viewers both embrace "cyber fireworks" branding and voice ambivalence over noise, safety and increasingly dense performance schedules.

MCS04 Aesthetics, Play and Mediated Urban Space

PP 0988 Do Manhole covers dream of media?

Tadafumi Sato[1]

[1] Kyushu Sangyo University, Department of Regional Development, Fukuoka, Japan

Introduction

The cityscapes featured in the film Blade Runner were inspired by Japanese cities. However, as the saying goes, truth is stranger than fiction. Nowadays, Japanese cities are witnessing the emergence of media that surpasses even the wildest imaginations of science fiction. That medium is the 'manhole cover'.

These covers represent the discovery of a new medium within Japan's urban spaces. Japan has installed manhole covers featuring diverse designs. Depicting anime and manga characters or reflecting local culture, there are over 10,000 variations.

This phenomenon stems from the social issue of ageing sewer infrastructure. To raise public awareness of this issue, governments and local authorities have increased their publicity efforts. Manhole covers have become a symbol of this initiative.

The issuance of trading cards featuring manhole covers began in the 2010s. These cards, issued by local authorities, can only be obtained by visiting the respective city. Their popularity has grown, with the number exceeding 1,200 varieties.

Today, manhole covers feature in TV and newspaper reports, attracting attention on social media. They are also used by companies for advertising purposes.

Research objective

The purpose of this study is to clarify the factors that have deepened the mediatization of manhole covers in Japan.

Manhole covers are a fascinating subject in the context of the city as a medium. They resonate with Kittler's (1996) focus on urban infrastructure. Their heterogeneity also evokes Foucault's (1986) concept of heterotopia.

However, manhole covers have not attracted the attention of media and communication researchers. I must confess that I paid them no attention whatsoever myself.

It was the university students I was supervising who first sparked my interest in them. Initially, I was sceptical of their ideas. To pursue their interest and answer my own questions, we began our research activities.

Research method

This study adopts Couldry's (2012) perspective, focusing on practices surrounding manhole covers. Furthermore this study does not interpret manhole cover designs as media texts. Such design interpretations hold meaning only for a limited group of dedicated fans.

When focusing on practice, we questioned two stereotypes surrounding manhole covers. One is the "appreciation" of manhole covers, and the other is the act of "collecting" cards. This is because assuming the existence of both reduces manhole covers to the domain of a select group of fans.

From 2021 to 2024, we observed people in public spaces and gathered data through questionnaires, interviews, event participation and interactions. Referencing Soja (1996), we examined these practices from the perspectives of space, the body, and the materiality of media.

Conclusion

We thought that the mediatization of manhole covers intensified through a material turn from cast iron to paper cards. This may have bridged physical and mental spaces, giving rise to a 'Thirdspace' (Soja, 1996).

However, cardification also occurred at dams and parks in Japan. By contrast, manhole covers appear to occupy a space that is highly compatible with the deep mediatization of the city (Hepp, 2017). This space is the 'ground'. This is because the modern flâneur walks with their eyes on the ground, perpetually capturing it with their smartphone cameras.

MCS05 Communities and Contested Space

PP 1085 Navigating youth mobility: Route planning and social media apps in the context of communicative mobility

Caroline Strecker[1], Gerit Götzenbrucker[1], Katharina Schrems[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

For young people, route planning services and apps are central to their everyday mobility and communication. Smartphone technologies are a prerequisite for mastering life in simultaneous and heterogeneous locations and enable young people to communicate in multi local spaces (Tully & Alfaraz 2017). Teenagers stay in contact with friends or family constantly; thus, locative mobility services might be of advantage for very young and vulnerable groups (*insecurity decreasing tools,* Monteiro & Gebo 2024). These might encourage exploration of surroundings and increase feelings of safety, but also open up opportunities for surveillance. Regretably, data and algorithms are under control of only a few global platforms.

The constraints of pre-installed software (Nachtwey & Straab 2020) on Android or Apple devices have a significant influence on communication and mobility practices. This affordance gives rise to "*dark scenarios*" (Meister & Schulz-Schaeffer 2020) of technological dependence, as users rarely develop their own solutions. In particular, the reading of (meta)data, action-prescribing algorithms, protocols, and default settings influence usage (van Dijk 2013). On top of this, technology use is reinforced by peer groups, and the default settings of apps are usually accepted without questioning functions and data processes. Nevertheless, drawbacks of location sharing data in particular has hardly been studied by researchers to date, as young people often use it unthinkingly.

Therefore the funded research project "JuMp! – Youth in (sub)urban mobility processes" is investigating the various media routines and mobility needs of young people (including those from working-class and immigrant backgrounds) between the ages of 15 and 24 in terms of user-friendliness, handling, and tech-design justice (Chook 2020). Following research questions are to be answered:

RQ1: How do geo- and social media systems affect the mobility of young people in Vienna, depending on their digital and media literacy?

RQ2: How mobility justice for young people is ensured in Vienna's public transport system?

As mobility repertoires are influenced by sociodemographic aspects results from 48 flash-interviews show that marginalized teenagers often disadvantaged: they benefit little from geomedia due to limited technical skills, battery management,

usability issues, and routine routes. The potential of communicative mobility (Couldry & Hepp 2023) is therefore not being fully exploited.

A mix of social science methods, including auto-ethnographies, interviews, mobility walks (Kusenbach 2003), and visual documentation, combined with participatory technology design methods, sheds light on these weaknesses and aims to contribute to the transparency and understanding of technology designs and their fairness.

MCS05 Communities and Contested Space

PP 1086 The city park as a platform for ideology, entertainment, and communication: A case study of Riga

Vita Zelče[1], Marita Zitmane[1]

[1] University of Latvia, Communication and Information Department, Riga, Latvia

The study analyzes Riga city parks as communication platforms. The first parks in Riga were established in the 18th century and became popular recreational spaces in the following century. In the 20th century, authorities used parks, through names, monuments, celebrations, and rituals, to convey ideological messages and values. Parks are also an important part of the modern urban environment in Riga. Our research focuses on two parks located on opposite banks of the Daugava River. The first is Vērmanes Garden opened in 1817 and named after Ann Wöhrmann, who financed its construction. The park's infrastructure includes greenery, paths, cafés, an outdoor stage, playgrounds, fountains, sculptures, and monuments. During the Soviet period, the park was renamed after Sergei Kirov and a monument to him was erected there. Various events have taken place in Vērmanes Garden, including the first car exhibition, campaigns dedicated to the fight against tuberculosis, a mourning rally dedicated to Stalin's funeral, and beer festivals. Today, this park is a popular venue for city celebrations and a marketplace during festivals in Riga.

The second park studied is Victory Park. It was established in the early 20th century and named in honor of the Russian Emperor Peter the Great in 1910. In 1923, it was renamed Victory Park in honor of the victory in the War of Independence, which secured Latvia's sovereignty. During the authoritarian regime, it was transformed into the main venue for political and military celebrations, concerts, and sporting events. During the Soviet period, a 79-meter-high monument commemorating the Soviet victory in WWII was built in the park. This is also where the May 9 celebrations were held after Latvia regained its independence. These celebrations communicated narratives aligned with Russian historical memory and Kremlin policy. The Russian Federation's full-scale invasion of Ukraine initiated radical changes in Victory Park. The celebration of the Soviet Union's (Russia's) victory in WWII on May 9 was banned, and the monument dedicated to this victory was also dismantled in August 2022. From 2022 to 2026, Victory Park is undergoing renovation, with the aim of transforming the park from a transmitter of Soviet messages into a modern platform for communicating the values of Europe and democratic Latvia.

Our study analyzes transformation processes, changing messages, and the effectiveness of Riga's parks as communication platforms. The study is based on a representative sociological survey of Latvian residents (to be conducted in March 2026) on attitudes toward parks, visual materials (e. g., photographs, postcards, posters and billboards, newsreels, live internet recordings) ethnographic observations, and interviews with park visitors.

The study reveals important aspects of the conference's main themes by analyzing city parks as shifting grounds of communication. It also discusses how geopolitical conflicts affect the urban environment, determining the ethical framework of parks within it and changing their communicative meaning. The study also addresses ambiguous public reactions to changing meanings attributed to parks.

MCS05 Communities and Contested Space

PP 1087 Platform-mediated urban tourism: Digital representations, urban imaginaries and sociocultural change in Rome

Ellenrose Firth[1], Stefania Parisi[1], Francesca Belotti[2], Laura Tedeschi[1]

[1] Sapienza University of Rome, Communication and social research, Rome, Italy
[2] Università degli Studi dell'Aquila, Dipartimento di Scienze Umane, L'Aquila, Italy

Our research addresses sociocultural transformations related to current forms of new urban tourism (Füller & Michel, 2014) in three Roman districts (Lynch, 1960) namely, San Lorenzo, Esquilino and Pigneto, focusing on the interplay between

online and on-site dynamics. The goal is to look at the influence of the platformisation of the tourism sector in non-central neighbourhoods of the city that are characterized by intangible cultural heritage linked to everyday life; here, "temporary population" (Brollo & Celata 2022) has been increasing, thus intensifying existing phenomena (gentrification, studentification, Smith 2005) and generating new ones (airbnbisation, foodification, Navarro-Jurado et al. 2023).

Studies that have problematised the transformations occurring in these districts (Parisi, 2014; Carbone & Di Sandro, 2019; Meli & Ricotta, 2022) have rarely framed them within a reflection on the interferences of digital platforms. This research aims to fill this gap by collecting the perspectives of activists, cultural associations, shopkeepers, and permanent and temporary residents, in order to identify the attractive and problematic aspects of the three districts and the role of digital platforms in the ongoing transformations.

The sociotechnical dynamics and "vernacular affordances" (Gibbs et al. 2015) of sectoral platforms such as Tripadvisor, AirBnB and Booking change the way of inhabiting urban spaces. By (mis)representing the places, such platforms end up "selling off" cities, neighborhoods, and related local cultures (Stors & Baltes 2018; Romano et al. 2023).

During the first phase of our analysis we looked at Tripadvisor reviews for our chosen districts, trying to understand how they were imagined and represented by platform users. The results of this preliminary phase informed the interviews we carried out during the second phase, as well as a nation-wide survey.

After identifying over 150 potential participants, we carried out 49 in depth interviews (19 for Esquilino, 15 for San Lorenzo and Pigneto), which allowed us to collect data from long term residents, activists, associations, as well as business owners. We thematically analysed (Braun & Clarke, 2012) the interviews, focusing on the key dimensions of the perception of the district by those who actually live it, the perceived transformations within the space, its representations in the media- both social and mainstream -, narratives surrounding the district - online and offline -, the role of sectoral platforms, and the cultural practices of the district.

Although lacking iconic monuments (excluding the Basilica of Santa Maria Maggiore), these areas are endowed with cultural meanings that cater to a demand for places represented and perceived as more authentic and livelier than Rome's historic center. There is a shared imaginary surrounding these neighbourhoods - specially in the case of San Lorenzo and Pigneto - which combines historical memory, artistic creativity, political progressivism, and the simple pleasures of food and beverage. Our interviewees, however, look at these elements critically, and consider them another way of consuming places: the distinctive elements of their districts are what digital platforms use to attract new consumers - in this case tourists, digital nomads, city users-, making it so that the area's so called *authenticity* becomes its *brand*.

MCS05 Communities and Contested Space

PP 1088 Crossing urban spaces as women: Female subjectivities between gentrification and media narratives in the roman neighbourhood of San Lorenzo

Laura Tedeschi[1], Stefania Parisi[1]

[1] Sapienza Università di Roma, Comunicazione e ricerca sociale, Roma, Italy

This project investigates how women negotiate, reinterpret, and reshape the shifting urban landscape of San Lorenzo, a gentrifying Roman neighborhood whose cultural, political, and symbolic identity has long been rooted in working-class history, anti-fascist memory, artistic production, and student life. Drawing on research that conceptualizes urban space and subjectivities as mutually constitutive (Sakizlioglu, 2018; Curran, 2018), the study examines how women who pass through the neighborhood daily grapple with issues of safety, belonging, accessibility, and cultural change.

The project builds on interdisciplinary scholarship linking gender, space, and gentrification (Bondi, 1991) and on work showing how media and communication shape perceptions of urban environments (Brown-Saracino, Rumpf, 2011). Gentrification is understood not only as an economic and spatial process but also as a site where gender identities are produced, contested, and mobilized. This approach rejects additive models that "add women and stir" (Williams, 2003) and instead treats gender as a relational attribute shaped by context.

The research aims to understand how female subjectivities negotiate and reinterpret a neighborhood undergoing cultural and material transformation. Specifically, how do women negotiate gender in everyday life, in a context of gentrification, media narratives, and shifting spatial conditions?

Methodologically, the project adopts a mixed qualitative approach: 30 semi-structured interviews with women who regularly frequent the neighborhood are conducted using snowball sampling to capture diverse subjectivities from an intersectional perspective. The sampling is supported by "go-along" ethnographic work (Kusenbach, 2003), conducted by the researcher, who is a female subject. This allows for the selection of informants, the drawing of territorial maps, including the use of spatial statistical tools, and the keeping of a photographic diary over six months. Environmental perception, spatial practices, social architecture, and social realms are explored from the lens of female subjectivities.

Preliminary findings highlight three thematic levels containing internal polarized dichotomies. The first concerns women's image of San Lorenzo. Most maintain a perception of a "small village," due to clear spatial boundaries and the presence,

albeit increasingly limited, of long-time residents who act as symbolic custodians of memory. At the same time, residents are seen as active participants in market-driven transformations, such as inflated rents or touristification.

Second, the neighborhood is widely perceived as inclusive, with multiple non-institutional, progressive, and left-leaning cultural spaces where women feel welcome and supported. The safety of private and internal spaces contrasts with the perceived lack of protection in liminal external spaces which are experienced as unsafe and inaccessible.

The third level concerns media impact: traditional news outlets portray San Lorenzo primarily through crime, drug use, or the "malamovida," generating a perception of danger among both residents and outsiders. Female subjects are often more sensitive to certain news stories, especially when they concern domestic violence and gender-based homicides.

By foregrounding women's situated perspectives, this paper disrupts the apparent unitariness of "the neighborhood" and challenges flattened, media-driven representations of San Lorenzo as primarily a space of hedonism, and (dangeorus) entertainment, offering instead critical viewpoint that reveals how gender reshapes the lived experience of urban change.

MCS05 Communities and Contested Space

PP 1089 Negotiating potential futures for declining rural towns – visions beyond exclusion and social fragmentation

Linda Ryan Bengtsson[1], Jenny Karlsson[2]

[1] Karlstad University, Department of Geography- Media and Communication, Karlstad, Sweden
[2] Karlstad University, Service Research Center- Karlstad Business School, Karlstad, Sweden

How do we envision the future for rural towns in decline? Representations of the future tend to depict an urban (digital) future where spaces beyond the city are merely provide necessities for the urban citizen, but not a liveable place in its own right. However, critical future studies argue that a transition to a more sustainable society requires multiple visions of the future that challenge our traditional ways of thinking (Jakobsone, 2017). Societies need to collectively create visions of multiple futures beyond the single rational (neoliberal) future path (Goode & Godhe, 2018). Swedish rural towns have been in transition for decades, from prosperous industrial communities – often dependent on a few dominant industries - to depopulated peripheral areas where industries have moved out and public institutions withdrawn. Still, despite identifying a negative trend over time, rural towns tended to adopt economic-centred development strategies modelled on the smart digital city, thus failing to create visions that respond to local contexts and needs, and pressing challenges such as social inequality and climate change. In a project initiated by the Swedish municipality of Hagfors, we explored a community-based approach to identifying and illustrating multiple visions of the futures of this mils-town, stretching until 2044. This paper is based on the narratives, images, sculptures and poems of the future formulated by participants in workshops and interviews. The participants were young adults, cultural workers, industrial workers, local entrepreneurs, politicians, pensioners, and commuters.

The future of Hagfors - if the current trend of continues - will be a place of loneliness and despair, with no jobs, an ageing population, limited public services and a lack of social interaction. Key aspects raised were the continuous withdrawal of recourses and the experience of living in a place in decline, as well as how legislation hinders a green transition in rural areas. Alternative futures included local food production, local energy production, physical meeting places across ages, higher education and housing adapted for all ages. Important values that emerged were collaboration, social inclusion and a more climate-neutral way of life. The study also highlighted the citizens of Hagfors' experience of rural towns being peripheral, both in a regional and a national perspective, and how it affects people's self-image (Stenbacka & Heldt Cassel, 2020). The workshops demonstrated a clear desire for change and a high awareness of how small communities are resourceful contributors to climate change and social change. Most prominent trough all visions of the future were the need for physical meeting places that support local engagement, collaboration, creativity and intergenerational interaction, beyond digital forums (Albris et al, 2024). Rural futures do not lie in digital solutions or smart technology, but in human relationships and physical interaction.

MIP01 Gender, Labour and Resistance across Screen and Platform Industries

PP 0103 Sexism in the screen industries: Understanding leadership and hierarchy through sex based discriminatory practices

Willemien Sanders[1]

[1] Utrecht University, Institute for Cultural Inquiry, Utrecht, Netherlands

Sexism is an umbrella term for many different discriminatory practices based on gender and sex. However, sexism does not occur in a vacuum but is related to deeply entrenched cultural ideas, values, and practices. It occurs both in high profile settings, such as Hollywood, and in locations well outside it (Liinamaa and Rogers 2022), such as the Dutch screen industries. Also, it is hardly ever addressed in research explicitly.

In my paper I will address several forms of sexist practices in the Dutch screen industries, based on several empirical research projects, both qualitative and quantitative, which I conducted in close collaboration with different colleagues and the foundation Vrouwen in Beeld (Women in the Picture). These practices both reproduce and sustain ideas about leadership and the hierarchies that are prevalent in the screen industries and that limit professional opportunities for female (and other non-male) screen professionals.

For instance, our exploratory research into income in the Dutch screen industries suggests a gender pay gap, as significant differences between female and male professionals' renumerations occurred on several independent variables (Sanders and Buijing 2025). Sexist practices are evident when it comes to the value assigned to specific jobs and tasks, and wages, according to Tang et al. (2022). They argue that in the Netherlands, wages are often lower in professions dominated by a female workforce.

Sexist and harassment practices are facilitated by the highly individualized network character of the industry (Hennekam and Bennett 2017). For instance, Hennekam and Bennett (2017) found that sexism is considered part and parcel of the creative industries, according to their respondents, to the extent that sexualized behaviours are not considered harassment. Our research with actresses, who see themselves as being on the lowest step of the hierarchical ladder, and who are confronted with blatant sexist attitudes and behaviours, shows that one strategy adopted was to accept it as part of the job. Actresses need to pick their battles when it comes to sexism (Sanders and Post, 2024).

The extremely intensive filming periods, the long hours and precarity of work, combined with the social economical reality that still addresses mothers as primary cares, considerably disadvantages women, including camera women, who already face sexist practices with respect to obtaining work, specifically as DoPs (Sanders and Van der Holt 2025). Eikhof and Warhurst (2013) argue it is the production model that is at the base of many practices that produce inequalities in the creative industries.

The continuing sexism in the screen industries (Coate et al. 2023) disadvantages women in their careers, much in line with experiences elsewhere (Dooley and Erhart 2023). By discussing the findings of research with different professionals through the lens of sexism, we can better understand how specific kinds of leadership and hierarchies are shaped and sustained by a variety of sexist ideas and practices across the screen industry.

MIP01 Gender, Labour and Resistance across Screen and Platform Industries

PP 0104 Producing gender (in)justice: Intimacy coordination as a labour practice in the film and television industry

Susanne Eichner[1], Sophie Glawe[2]

[1] Film University Babelsberg, Analyse und Ästhetik audiovisueller Medien, Potsdam, Germany
[2] Film University Babelsberg, Media Studies, Potsdam, Germany

Gender (in)justice can be understood as a discursive arena (Clarke 2005) in which different social fields (Bourdieu 1993) struggle over dominant ideologies, norms, and values. In the film and television industries, these struggles materialize both on-screen—through narrative, aesthetic, and representational choices—and off-screen, within production cultures, labour regimes, organizational structures, and media policies. Gender-unequal and harmful working conditions are closely intertwined with symbolic systems of representation, particularly with regard to sexualized violence, intimacy, and gendered stereotypes. While gender inequality and precarious labour conditions in the German media industries have been widely examined (e.g. Prommer & Loist 2019, 2023; Dadlani et al. 2024), less attention has been paid to how institutionalized practices of dissent emerge within production cultures and how they are negotiated over time.

This paper examines how discursive demands for gender justice are translated into industry-relevant practices that are currently undergoing processes of institutionalization. We focus on the emerging professional fields of Intimacy Coordination (IC) in Germany, conceptualizing them as media industry practices of contradicting that intervene in established production cultures (Thomas et al. 2024; Lünenborg et al. 2025). IC address power asymmetries, consent, and care in on-set labour relations, with implications for how discriminatory narratives and gendered myths are staged audiovisually. Both practices challenge long-standing industrial norms surrounding creative freedom, auteurism, and the normalization of harm in audiovisual production.

Situating our analysis within media industry studies and production culture research, we understand film and television as "media cultures in transition" (Banks 2018), shaped by the co-evolution of economic structures, organizational strategies, and cultural discourses. Methodologically, we combine situational analysis and situational mapping (Clarke 2005) with field- and assemblage-oriented perspectives to map discourses, actors, institutional frameworks, and power relations shaping intimacy coordination as an emerging media profession. The analysis draws on expert interviews with intimacy coordinators working in Germany, complemented by industry-related secondary material. The findings reveal a range of structural and individual resistances, from dismissive gestures and verbal rejection on set to organizational exclusion and silencing effects. While some forms of resistance are experienced as recurring and manageable, others actively obstruct intimacy coordination work. These dynamics are situated within a broader socio-cultural context marked by resurgent misogynistic discourses, producing what has been described as a contemporary "feminist paradox" (Kaiser 2023).

By foregrounding the meso-level of organized production, the paper contributes to critical debates in media industries and cultural production research. It highlights how dissenting labour practices move from marginalized positions toward partial institutionalization while remaining contested, and demonstrates the central role of production cultures, organizational structures, and industry norms in shaping both the possibilities and limits of gender justice in contemporary film and television production.

MIP01 Gender, Labour and Resistance across Screen and Platform Industries

PP 0105 Managing pleasure: How cultural platforms reshape leisure as performance

Juliette Parmentier[1]

[1] Université Libre de Bruxelles, Information and communication sciences, Brussels, Belgium

This research examines how digital cultural platforms foster a conception of leisure as an object of self-management. More specifically, focusing on the case of literary platforms, we demonstrate how readers who initially signed up on websites to keep track of their readings or discover new books end up setting personal reading goals (such as "read 100 books in a year"), establishing reading schedules, mobilizing managerial vocabulary, referring to other users as "colleagues" and to reading as "work", etc. We argue that it is the interfaces of these platforms—saturated with statistics, performance metrics, completion percentages, and "personal goals"—that encourage users to frame their cultural practices as measurable performances.

To analyze the impact of such platforms on literary practices, we conducted 47 semi-structured interviews of readers, all of whom are active users of one of four book recommendation platforms—Goodreads (the English-speaking leading book recommendation platform), Babelio (which is, with 2 million users, the most popular platform for French-speaking readers), Booknode and Livraddict (two smaller French platforms, supported by long-standing user bases). **34 of the interviewed readers participate in reading challenges, and 27 organize at least one of them.** Presented as mere games, these challenges nonetheless display a managerial dimension: participants must "validate" readings based on one or more constraints, often to earn "points" or reach achievement "levels" or self-imposed personal goals, usually within a limited timeframe, under the scrutiny of other participants, against whom they are sometimes ranked.

Although managerialization of the self has been thoroughly documented, the impact of quantification and performance logics on cultural practices remains strikingly understudied. We however claim that studying the managerialization of literary practices requires to take into account the particular relationship individuals develop with culture—which has not been specifically addressed in studies on datafication. The discourse of our interviewees was thus marked by contradictory injunctions specific to the world of books: on the one hand, a desire to intensify their literary practices—reading being consistently framed as inherently good—, and on the other, a need to constantly reaffirm that "it should remain a pleasure", resisting commercial and productivist logics deemed incompatible with the world of art. Readers wavered between the desire to "challenge themselves" by reading *more* - often adopting a "neoliberal agency" (Gershon, 2011) and thus edging toward a conception of the "self as [an] enterprise" (McNay, 2009)—, while simultaneously criticizing those who read *too much*, accusing them of reading badly and displaying an inappropriate sense of competition.

- Gershon, I. (2011). "Neoliberal Agency". *Current Anthropology*, 52 (4), 537–555.
- McNay, L. (2009). "Self as Enterprise: Dilemmas of Control and Resistance in Foucault's The Birth of Biopolitics". *Theory, Culture & Society*, 26 (6), 55–77.

MIP01 Gender, Labour and Resistance across Screen and Platform Industries

PP 0106 Imaginaries of platform work and (im-)possibilities of creator resistance in Turkish Creator Industry

Alkim Yalin[1]

[1] Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

As platforms frequently impose changes to enhance profit in the name of "commercial viability," creators are forced to constantly adapt their self-branding and content production strategies (Arriagada & Ibáñez, 2020; Cunningham & Craig, 2019). Recent research demonstrated that against changing platform features and algorithms, creators may try to "game the system" or "play the visibility" game to protect their visibility and engagement with their audience (Cotter, 2019; Petre,

Duffy, & Hund, 2019). These formations present a novel way of forging solidarity and organizing against platforms, such as in the case of "engagement pods," creator groups that were founded as grassroots communities that mutually engage with each other to game the Instagram algorithm (O'Meara, 2019). In some cases, the networks of solidarity built among creators through social media platforms may also lead to more traditional forms of workers' organization, such as the YouTubers' union that was built in Germany (Niebler, 2020). However, it remains understudied how creators' experiences of platform work and the local context contribute to shaping these resistance strategies.

This research investigates the individual and collective modes of resistance adopted by Turkish content creators and how these modes of resistance are tied to their imaginaries of platform work in the local context. According to Van Es and Poell (2020), platform imaginaries are the "ways in which social actors understand and organize their activities in relation to platform algorithms, interfaces, data infrastructures, moderation procedures, business models, user practices, and audiences" (p. 3). Related to this description, the imaginaries of platform work indicate how platform workers, including content creators, perceive and navigate platform work.

This study is focused on Trendyol's affiliate work program, which is established by the country's leading e-commerce platform- Trendyol- and constitutes the largest influencer network in the MENA region with more than 30 thousand creators. By drawing on 17 semi-structured interviews conducted with Turkish influencers and influencer agents between 2022 and 2024, the findings first demonstrate creators' vulnerability to constantly changing monetization rules and platform policies, while highlighting that creators' imaginaries of platform work are crucial not only for shaping how they navigate platform work but also for affecting their willingness to participate in collective action and labor organizing. While Turkish content creators are engaged in individual resistance tactics, and exchange tips and build solidarity with fellow creators in online and offline settings; they are holding back from engaging in more formal collective action both due to their perceived sense of competition and disposability in a large influencer network, and as a result of living in a political climate where freedom of expression and dissident political action is marginalized and silenced. The findings of this research suggest that possibilities of collective action are informed by creators' imaginaries of platform work, as well as local experiences and histories of resistance. As such, this research contributes to multiplying our frames of reference about a simultaneously global and local creator economy by providing situated knowledge about the Turkish creator industry and possibilities of resistance within it.

MIP01 Gender, Labour and Resistance across Screen and Platform Industries

PP 0107 Shifting grounds in cultural and media work: Countering inequality and sexualised violence between #MeToo and resurgent Anti-wokeism

Aljoscha Paulus[1], Christine E. Meltzer[1]

[1] University of Music- Drama and Media Hanover, Department of Journalism and Communication studies, Hanover, Germany

This paper investigates the persistence of sexualised discrimination and violence in the cultural and media industries, despite the visibility and momentum of the #MeToo movement. To empirically explore this phenomenon, we conducted 58 semi-structured expert interviews between April and October 2024, covering five regulatory levels—cultural and media workers, production companies, funding institutions, professional associations, and political/public administration actors—and two core branches of the cultural and media industries (performing arts and music). Participants were selected to reflect sectoral diversity, organizational and institutional roles, and a range of sociodemographic characteristics. Interviews focused on five research dimensions: perceptions of the problem of sexualized discrimination and violence, responsibilities for its causes and solutions, existing preventive and remedial measures addressing it, assessment and monitoring of these measures, and desired reforms to reduce or prevent sexualized discrimination and violence.

Findings show that while #MeToo has accelerated the development of safeguarding policies, their implementation remains uneven, largely voluntary, and weakly institutionalised. Structural vulnerabilities—precarious project-based employment, informal gatekeeping, and limited access to independent reporting pathways—continue to inhibit accountability, discourage reporting, and expose particularly freelance workers to recurring boundary violations. Legal frameworks, organisational policies, professional associations, and funding-linked instruments exist, but they are often insufficiently coordinated, inadequately enforced, or limited in reach. Interviewees consistently highlighted the need for binding standards, independent complaint mechanisms, anti-retaliation safeguards, mandatory and role-specific training (including professionalisation of safeguarding roles), collective representation, and funding conditionality as essential to meaningful change.

Positioning these empirical findings in a broader societal and political context highlights additional challenges. Across many Western societies, not only in Germany, anti-feminist and anti-"woke" discourses have grown increasingly prominent, framing equality, diversity, and anti-discrimination initiatives as ideological or divisive. While this broader dynamic was not a direct empirical focus, it provides a crucial lens for interpreting the uptake, legitimacy, and durability of safeguarding measures and reform priorities. Progressive movements such as #MeToo, and institutional initiatives to prevent sexualised discrimination, operate in a contested social environment where political and discursive pressures shape the possibilities for institutionalisation and enforcement.

The rise of right-conservative and anti-woke currents challenges the recognition of structural inequalities, the legitimacy of preventive measures, and the willingness of organisations and policymakers to institutionalise change. In this context, safeguarding in cultural labor is not only a technical or organisational task, but also a negotiation over normative authority, democratic governance, and cultural legitimacy. Reform efforts that fail to account for these pressures risk remaining symbolic, fragmented, or marginalised.

By linking empirical insights on sexualised discrimination, preventive practices, and institutional reform to current debates about cultural authority and normative legitimacy, the study speaks directly to the conference theme. It shows how media and cultural institutions in two core branches of the cultural and media industries (performing arts and music) negotiate contested norms, implement inclusive practices, and mediate between organisational, political, and societal pressures, illustrating the contribution of communication and media research to democratic cultural governance.

MIP02 Data, Platforms and Power in European News Media

PP 0207 Anatomy of the Polish Web: A Multi-Layer Analysis of Scripts, Trackers, and Data Infrastructure in the Top 10 News Portals

Adam Balcerzak[1]

[1] University of Warsaw, Laboratory of Media Studies, Warsaw, Poland

Online news portals increasingly operate as complex socio-technical systems in which editorial content represents only one layer of what users encounter. Beneath the visible surface lies an extensive network of JavaScript-based advertising technologies, analytics platforms, content delivery infrastructures, and third-party data flows. Although such systems have been examined globally, the Polish media ecosystem remains underexplored from a technical and infrastructural perspective. This study addresses that gap by conducting an in-depth analysis of the ten most-visited Polish online news portals, focusing on three domains: (1) embedded JavaScript scripts, (2) geographical distribution of third-party resources, and (3) hosting and data-center architectures underpinning the portals themselves. The design of this study was inspired by a talk by Aske Kammer (Roskilde University) at WMEMC 2025. The first component investigates the prevalence, type, and complexity of JavaScript resources loaded during page initialization. Prior research demonstrates that websites often load dozens or hundreds of external scripts many associated with advertising auctions, behavioural tracking, and analytics forming a deeply layered and opaque ecosystem (Englehardt & Narayanan, 2016). Building on these insights, our analysis identifies the number and structure of external scripts across portals, the prominence of major advertising and analytics providers, and the presence of nested script chains that expand the network of potential data recipients. Substantial differences between portals emerge: some load under 40 scripts, while others exceed 150. The study also detects common libraries, A/B-testing frameworks, and outdated components that may introduce supply-chain vulnerabilities, echoing concerns raised in large-scale measurements of outdated JavaScript ecosystems (Schelter & Kunegis, 2016).The second component examines the geographical distribution of third-party servers. Using DNS resolution and IP-to-location services, we map where advertising, analytics, and utility scripts are hosted. A significant proportion of data flows leave the European Union, travelling primarily to the United States and, in some cases, Asia. These patterns raise questions about data governance, cross-border data flows, and the geopolitics of infrastructural dependency issues highlighted in contemporary discussions on digital sovereignty (Musoni et al., 2023).The third component maps the hosting and data-center architectures of the portals themselves. By analysing ASN ownership, CDN routing, and server location, we identify primary hosting providers and the extent to which portals rely on domestic versus global cloud infrastructures. While several maintain core hosting within Poland, many distribute content through international CDN nodes, effectively situating parts of the national information ecosystem outside domestic jurisdiction. Collectively, the findings reveal an ecosystem marked by high variability, extensive reliance on third-party services, and infrastructural centralization beyond Poland and the EU. The opacity of script-based tracking chains and globally distributed hosting architectures underscores challenges for transparency, accountability, and editorial independence in digital media. By mapping these hidden layers, the study contributes a technical perspective to media-studies, platform-governance, and digital-sovereignty debates.

MIP02 Data, Platforms and Power in European News Media

PP 0208 Improvise, Adapt, Overcome: Structural conditions for adaptation in digital-only news media

Aske Kammer[1], Mark Blach-Ørsten[1]

[1] Roskilde University, Dept. of Communication and Arts, Roskilde, Denmark

This paper explores how structural conditions shape the adaptive capacity of successful digital-only news media. It focuses on two Danish cases (Føljeton and Zetland), both of which have developed from small news startups to sustainable or even profitable news media. While most research on innovation in journalism has focused on individual competencies and organizational practices, this study pursues a structural perspective and inquires which role media-systemic and political characteristics play in enabling continuous adaptation. Drawing upon institutional theory, including the concept of adaptive capacity, the analysis explores how Føljeton and Zetland have responded to (technological, economic, and societal) changes

to their environment through strategic shifts in editorial focus, product development, business models, and combinations of the three.

Empirically, the study conducts document analysis of more than a decade's annual reports and subsidy applications from the two companies under scrutiny. This approach provides insight into how they frame challenges and environmental shifts, and how they plan to meet and adapt to those challenges. Acknowledging how adaptation can be both reactive and proactive, the findings identify key instances of adaptation; that is, moments where the companies do something noteworthy to best suit their (changed) environments. Zetland transformed from a niche publisher of long-form journalism to a daily news outlet with a membership-based business model, and it has later pursued initiative to engage young audiences through personalization as well as audio and video formats. Føljeton has developed from mobile-first news to a newsletter-centric strategy, later wanting to integrate AI tools. These adaptations were consistently supported by the national innovation-subsidy scheme for news media; these subsidies, the paper argues, provided some measure of stability in an otherwise volatile environment.

The analysis demonstrates that adaptation is not merely an organizational characteristic, but, rather, a process conditioned by structural factors. The democratic-corporatist media-systemic model of Denmark as well as the welfare-state ideology and policy create a context that supports innovation and resilience. One central reason, the paper argues, is that the predictable frameworks of public subsidies provide institutional stability that makes long-term strategizing possible for companies that operate in a sector that faces technological disruptions. This way, emphasizing the importance of structural characteristics, the paper contributes to the scholarship on the innovation, sustainability, and adaptation of the news media.

MIP02 Data, Platforms and Power in European News Media

PP 0209 The configuration of journalistic work: Studying news workers as users

Torbjörn Rolandsson[1]

[1] Roskilde University, Arts and Communication, Roskilde, Denmark

This paper draws on ethnographic observations of Content Management Systems conducted at the Swedish public broadcaster Sveriges Television (SVT) to show how software design shapes digital news work. To conceptualize news workers as users, the paper deploys a material-semiotic perspective (Law, 2008), which draws attention to the relations between users, software, and designers (Woolgar, 1991), and to how technologies, through their composition, are inscribed with "scripts" (Akrich, 1992) that guide—but do not determine—human action and can come to reshape relations between organizational actors.

Data was collected at SVT in 2024 and 2025. Observations followed the work of a team of developers and designers building the company's news CMS, *Astrid*, for a total of six weeks, as well as work in a regional newsroom for one week. Observational data was complemented by 20 semi-structured interviews with 19 managers, developers, designers, and news workers.

The paper shows how software designers act as organizational intermediaries, mediating the ambitions and concerns of different actors in news organizations and attempting to materialize them in design. In performing this work, designers engage in understudied but consequential practices. Design work is characterized by forms of knowledge production, where designers study the labor of news workers and leverage this knowledge to legitimize the reshaping of journalistic conduct—either by enhancing certain features of journalistic work or by attempting to disrupt it and redraw the distribution of responsibilities in newsrooms. For example, the implementation of a co-writing function in the company CMS generated friction over the autonomy of journalists vis-à-vis their editors.

By foregrounding these dynamics, the paper advances research on the importance of new professions in the news industry. Previous research has primarily focused on developers (Deuze, 2004; Napoli, 2014; Möller, 2024). By focusing on designers, the paper highlights an overlooked group of actors who can exert significant influence over news work, as they study, recommend, and materialize particular ways of performing journalism, thereby shaping journalistic practice.

MIP02 Data, Platforms and Power in European News Media

PP 0210 More for less: Labour and process in factual television production

Anna Zoellner[1], Angus Dixon[2]

[1] University of Leeds, School of Media and Communication, Leeds, United Kingdom
[2] Glasgow Caldonian University, Department of Media and Journalism, Glasgow, United Kingdom

While a growing body of research investigates media production and the conditions of cultural work, there have been few attempts to apply Labour Process Theory (LPT) and its observations about capitalism and labour to this field (Sonn et al. 2019). In fact, labour process theory has been perceived as too deterministic, neglecting worker subjectivity and agency and, therefore, making it unsuitable for the investigation of cultural labour (Ursell 2000). Nevertheless, continuing efforts to rationalise media production processes raises the question of how such processual change affects media workers.

In this paper, we return to Harry Braverman's (1974) claims about labour under capitalism, which inspired LPT, and examine to what extent his observations apply in a contemporary cultural industries context. In particular, we focus on the production

of unscripted factual television programming in the UK and investigate the consequences of recent reorganization of the production process and its related changes in the division of labour and occupational roles for the experience of work. Our argument is based on semi-structured interviews with practitioners at the beginning and the end of the production process, namely, self-shooting Producer-Directors, who capture raw footage on location, and Edit Producers, who edit the footage into the final program. This approach enabled us to examine the impact of reorganization on different work roles and in different production stages.

Based on our findings, we argue for the persistent validity of Braverman's claims about alienation and exploitation in relation to process albeit with differences in nature and scale. We do not deny the specificity of cultural production as a form of work nor the subjectivity and agency of workers. Rather, drawing on our research in the British television industry, we argue that while the general principles for work under capitalism, as outlined by Braverman, can be observed in cultural production contexts, they materialize in distinct ways. We further argue that this impact is not challenged but heightened by the conditions workers face in the contemporary flexible labour market.

MIP02 Data, Platforms and Power in European News Media

PP 0211 Hollywood in Italy: Runaway productions, tax credit, and territorial impacts

Raoul Spiccia[1]

[1] Università Cattolica del Sacro Cuore, Dipartimento di Scienze della Comunicazione e dello Spettacolo / Ce.R.T.A. - Centro di Ricerca sulla Televisione e gli Audiovisivi, Milan, Italy

Over the past decade, Italian territories have increasingly been selected as locations for international runaway productions. According to reports issued by the "Direzione Generale Cinema e Audiovisivo" — the institutional body of the Italian Ministry of Culture responsible for supporting the national film and audiovisual sector — nearly 400 productions were hosted in Italy between 2016 and 2024, with approximately €2.7 billion spent on Italian executive production services. A decisive factor in this growth has been the introduction of the tax credit for foreign productions.

The phenomenon of runaway production — particularly in relation to Hollywood — has been widely addressed in the literature (Elmer and Gasher 2005; Wasko and Erickson 2008; Steinhart 2019), as have the artistic and economic drivers behind it (Goldsmith and O'Regan 2005; Cucco and Richeri 2013). By contrast, the specific relationship between runaway productions and Italian territories remains largely underexplored (with the notable exception of Cucco and Scaglioni's 2024 study on Bollywood productions in Italy). This paper examines the phenomenon through the interdisciplinary lens of location studies (Hansen and Waade 2017). Specifically, it draws on theoretical frameworks from media industry studies — particularly production studies and the political economy of media — as well as from film-induced tourism research.

The analysis focuses on productions that can be classified as Hollywood (in terms of cast and crew, origin, budget, and production structure) that were filmed in Italy from 2018 onwards and benefited from the national tax credit. Prominent examples include *Fast X*, *The White Lotus*, and *Ripley*. Across these titles, the paper analyses patterns in the use of Italian territories, the tax credits obtained, the investments made in Italy, and the main commercial actors involved.

The paper addresses two research questions: (1) how relevant are Hollywood runaway productions — particularly in terms of executive production companies involved and resource allocation — for the Italian audiovisual industry? and (2) does the attraction of a large number of high-budget productions with wide international circulation contribute to the global promotion of Italian territories? In the aftermath of significant changes to the Italian tax credit system, the paper advances a critical reflectionon the potential of international tax incentives, asking whether they represent an efficient use of public resources and an effective tool for repositioning Italy within the global audiovisual landscape

The study draws on the database of the "Direzione Generale Cinema e Audiovisivo" and on an original dataset developed as part of the author's doctoral research. The personal dataset includes over 50 records (Hollywood productions), reporting production-related, economic, territorial and narrative setting (on-screen location) data. To address the first research question, the analysis compares institutional data with the personal dataset. To address the second research question, all analyses are conducted on the full personal dataset — particularly with regard to territorial and narrative setting variables — and interpreted through film-induced tourism frameworks (Beeton 2016; Champion et al. 2023; Reijnders et al. 2024); specific cases are discussed only as illustrative examples where relevant.

MIP03 Generative AI and the Transformation of Creative Labour

PP 0320 A typology of processes. Distributed agency in audiovisual creative labour

Bertran Salvador-Mata[1], Claudio Celis Bueno[2]

[1] Universitat Pompeu Fabra, Communication, Barcelona, Spain
[2] University of Amsterdam, Amsterdam School for Cultural Anaylsis, Amsterdam, Netherlands

The adoption of artificial intelligence (AI) within the audiovisual industry is shaped by asymmetric relations that affect how creative decisions are made, how work is organised, and how value is allocated. This paper approaches AI adoption from a labour perspective, focusing on how agency is negotiated across creative workers, organisations, and non-human actors.

Most existing academic research on AI in the audiovisual field concentrates either on descriptive accounts of adoption processes, often centred on productivity gains, or on discussions about creativity framed through a dual lens that contrasts technological power with human agency. We claim that there is a lack of a more nuanced and granular vocabulary to better explain how agency is distributed and negotiated between human and non-human actors in creative labour. Drawing on a relational approach to creativity (Celis Bueno et al, 2024), the typology integrates three analytical dimensions. First, typologies of contracts distinguish between formal labour, informal labour, and platform mediated labour (content creators), highlighting how employment arrangements structure decision-making. Second, types of automation differentiate between replacement, humanly-extended automation, augmentation and control, allowing us to examine how different types of automations affect creative labour. Third, types of workflows distinguish between artisanal, industrial, and informational workflows, which is key to understanding how control is exercised along the production chain and how this shapes AI deployment.

To empirically test this framework, we complement this typology with an exploratory qualitative study based on in-depth interviews to producers and employees in television organisations (formal workers), film directors (informal workers) and content creators (platform-mediated workers). In this preliminary phase we present the results of the first six interviews, with an intended sample of fifteen (or until reaching thematic saturation).

Preliminary findings support the usefulness of the typology. First, we identified that contract type shapes AI adoption decisions. In formal contracts, adoption is driven by top down strategies focused on efficiency and productivity, alongside forms of delegated agency linked to dependence on standardised tools developed by large technology providers. In informal and platform mediated contexts, adoption is more case dependent, often guided by experimentation desire and, in some occasions, by ethical or sustainability concerns. Second, perceived regulatory uncertainty and the relationship with clients significantly condition creative decisions, as clients may have specific demands and constraints on each project. Third, AI contributes to a shift toward informational workflows, marked by feedback loops, overlapping of productive phases, increased iterative processes, and greater flexibility, although this shift is less pronounced in large organisations (that are still characterised by an industrial workflow). Finally, AI adoption is associated with reskilling (as new competencies might be required) and deskilling (as technical skills are perceived as less valued, partly due to lower barriers of entry to technology, hence reducing the negotiation capacity of workers).

In conclusion, the preliminary empirical results demonstrate the usefulness of the threefold typology for analysing AI adoption in the audiovisual industry, with specific attention to the asymmetrical distribution of agency, benefits, and risks within creative workers.

MIP03 Generative AI and the Transformation of Creative Labour

PP 0321 Slop shops, ghost artists and author avatars. AI and streaming services

Terje Colbjørnsen[1]

[1] BI Norwegian Business School, Department of Communication and Culture, Oslo, Norway

The emergence of generative artificial intelligence (Gen AI) has completely shifted the discussion around cultural production as Large language models (LLMs) for text and diffusion models for images, music, and video make the manufacturing of human-like creative output a straightforward task. AI-enabled content production at scale has repercussions for streaming as a media distribution model, particularly because it ties in perfectly with the promise of abundance from streaming services. While low-cost and low-effort content production presents a possibility to harness for platforms that require an influx of fresh content in large quantities, there are many challenges. Unbridled AI content production is already starting to challenge the authority and quality of digital platforms, most conspicuously in the form of "AI slop".

This paper provides a case-based discussion of how AI is shaping content production for streaming services and the challenges and policy responses that are starting to appear. It takes its starting point in three cases of AI-assisted content production by and for streaming services. Case 1 is connected to YouTube, where the User Generated Content (UGC) model comes with few restrictions, thus inviting a mass influx of AI generated videos. Some research suggests that more than 20 % of the videos that YouTube's algorithm shows to new users can be characterised as slop, despite Google's attempts to restrict "inauthentic content". Case 2 is related to the music streaming service Spotify. According to reports, Spotify has included thousands of tracks from so-called ghost artists and ghost labels, many of them likely AI generated. These ghost

artists provide royalty-free music, boosting the streamer's catalogue at a low cost. Many tracks are within genres like Lo-Fi and Chill, music to serve as background noise, sometimes termed functional music, or what Spotify itself calls a lean-back experience. Case 3 relates to the audiobook streamer Storytel, who initiated an experiment with AI story creation in 2024, inventing an AI "author" to develop a book using various generative AI models. The resulting anthology, called *New Horizon: Love in an AI World,* is available for streaming in both ebook and audiobook versions on Storytel's platforms.

Together the three cases shed light on AI-generated and AI-assisted content generation from different perspectives, including UGC and as part of streaming platforms' strategic and experimental collaborations with AI creators and tools. The paper will discuss how generative AI and the existence of slop and lean-back music, point to a radical change in the production and consumption of culture and media content. Finally, the paper will adress policy responses and pushback from artists and creators in the face of Gen AI.

MIP03 Generative AI and the Transformation of Creative Labour

PP 0322 Mapping the future media creator: A pilot study on human-AI workflows in audiovisual production

Àlex Valverde Valencia[1], Frederic Guerrero-Solé[1], Davinia Hernández-Leo[2], Maria del Mar Guerrero-Pico[1]

[1] Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain
[2] Universitat Pompeu Fabra, Department of Engineering, Barcelona, Spain

Generative AI (GenAI) is reshaping creative practices pushing media industries to reconsider the human role while re-imagining collaboration with AI models and the need to preserve the value and authenticity along these processes. Given the challenges this poses for the education of the future media professionals, and especially considering the widespread instrumental approach to AI in education, there is still a lack of understanding regarding how future media professionals perceive, experiment, negotiate and learn in audiovisual creative workflows with Generative AI.

The paper addresses this gap by presenting the results of a six-week pilot study implemented in an undergraduate audiovisual course in which thirty-eight students, twenty-five of whom completed the full protocol (n = 25), produced a narrative short film by combining multiple audiovisual generative AI models while documenting their processes. The course was structured around the basic competence framework for AI Literacy proposed by Ng et al (2021), which distinguishes knowing, understanding, using, evaluating and addressing ethical issues.

Findings emerge from a pre- and post-intervention mixed-methods approach including: (1) a self-reported AI Literacy questionnaire validated by Ng et al. (2024), (2) three open-ended questions regarding creative processes with AI and their own experiences and (3) a novel methodological framework named workflow mapping, where participants visually represent their expected workflow before the intervention and the executed afterwards, promoting metacognition and allowing results to be cross-referenced with the participants' narratives. In the findings, participants describe Human-AI workflows as iterative, bidirectional, negotiated, dialogical and emotionally charged processes where agency is distributed and human roles shift from operation to coordination, supervision and co-direction. Frustration arises when human intent cannot be expressed, but some participants overcome it over time through greater awareness of the underlying workings of the models. This awareness also comes with a more detailed vocabulary to articulate the dilemmas, problems, and opportunities of creating with AI.

This pilot study underscores the suitability of a mixed-methods approach for a meticulous understanding of how Human-AI Workflows are articulated in real scenarios, highlighting workflow mapping as an instrument with the potential to expose evolving mental models and the complex and relational nature of creativity with GenAI. In that sense, the workflow emerges as a critical unit of analysis that can guide a proper comprehension on how GenAI transforms media industries and professional identities. In summary, this paper contributes to the understanding of Human-AI creation by providing a significant case study with early career creators that expose the ways in which GenAI is being adopted, negotiated, contested and applied in audiovisual creation and pointing out to future trends in media industries such as the rise of multifaceted professionals or the increasing importance of soft skills.

MIP03 Generative AI and the Transformation of Creative Labour

PP 0323 Reconfiguring creative labour in media industries: Generative AI and cultural production

Claudia Solinas[1], Paola Panarese[1], Marta Grasso[1]

[1] Sapienza- University of Rome, Communication and Social Research, Rome, Italy

The rapid diffusion of artificial intelligence, and more recently of generative AI systems, is reshaping creative labour across cultural industries, particularly in fields such as art and advertising where symbolic production, aesthetic judgement, and authorship are central (Arielli & Manovich, 2022). Generative AI systems are increasingly embedded in professional creative routines as ideation supports, drafting tools, and visual generators. Rather than simply automating tasks, these systems intervene in how creative work is organised, evaluated, and accelerated, raising concerns about deskilling, standardisation, and the redistribution of creative agency.

This paper examines how creative workers experience and negotiate generative AI within everyday work practices. Moving beyond productivity-centred accounts, it approaches generative AI as a socio-technical and organisational infrastructure

that embeds norms, imaginaries, and evaluative criteria, redistributing agency across humans, models, datasets, and institutional constraints (Glăveanu, 2014). From this perspective, transformations of creative labour emerge through reconfiguration rather than substitution: tasks are decomposed, selectively delegated, and recomposed within AI-assisted workflows (Manovich, 2018).

Empirically, the study combines a scoping review of international literature on AI and creativity with semi-structured interviews conducted with creative professionals working in advertising. Interviews explore everyday uses of generative AI, perceived control and reliability, shifts in skill requirements, and negotiations around authorship, accountability, and aesthetic judgement (Zylinska, 2023). Artistic practices are used as a comparative reference to highlight alternative regimes of use, in which similar technologies are mobilised toward experimentation and critique rather than optimisation.

The analysis identifies three interrelated patterns. First, generative AI is commonly framed as an accelerator and exploratory device rather than a replacement for creative labour, intensifying temporal pressures while expanding the range of possible variations (Rosa, 2015). Second, creative work is increasingly organised around selective delegation and cognitive offloading: routine or repetitive tasks are assigned to AI systems, while human labour is repositioned around supervision, curation, and strategic sense-making. Although often described as empowering, these arrangements raise concerns about deskilling and the erosion of reflective time (Eslami et al., 2016; Bunz, 2023). Third, AI-assisted production contributes to the naturalisation of data-driven aesthetic norms, potentially reinforcing standardisation and bias while obscuring the organisational conditions under which creative outputs are produced (Arielli & Manovich, 2022).

By foregrounding ordinary creative practices, the paper shows that the implications of generative AI for creative labour take shape through incremental and negotiated reconfigurations of how work is organised, valued, and governed within media industries. It contributes to critical media industry studies by conceptualising creativity as a relational and distributed process, and by situating AI ethics within the everyday organisational arrangements through which responsibility, authorship, and value are practically redistributed.

MIP04 Rethinking Media Industries: Methods, Concepts and Futures

PP 0439 Popular pleasures of tomorrow? Projecting the Cultural Economy

Mark Banks[1]

[1] University of Glasgow, Cultural Industries- School of Culture and Creative Arts, Glasgow, United Kingdom

What kind of cultural economy might we anticipate for the future? An expanded and unbridled 'culture industry' of capitalist corporations – the present-future writ large – or perhaps something else? Maybe a shrunken or 'degrown' economy of locally sustainable but restricted arts? Or, in amidst public austerity and ecological collapse, a world shorn of *all* cultural possibility, as we know it?

This talk addresses the idea of cultural industries in the future, and, more generally, what the cultural economy of the future might look like, and *feel* like. If we look at the usual way that is being cast – by national and EU governments, in industrial strategies, universities, or research funding agencies– it's wildly fixated on technology, immersive and digital experiences, AI, or on increasingly anodyne takes on the digital humanities and heritage. Paradoxically, these 'innovative' projections tend to assume strong forms of continuity – established social arrangements benignly enhanced by more 'ethical', 'smarter' and 'greener' technology. But these projections about the future are quite limited – both politically and in the range of intellectual perspectives they recognise or value. It seems reasonable to assume that there might be more inclusive, socially just, less destructive and radical alternatives to be had – and with more plural notions of culture and cultural production.

Yet if we look at the range of other, alternative or heterodox models of economy that have sprung up in the last two decades or so – based in notions of the 'well-being' economy, the foundational economy, or doughnut economics, as well as more radical approaches such as degrowth, or post-growth economies, and so on – they too have a limited range of understandings of culture and cultural industries; and I would say there too are various problems with the way these supposedly radical approaches are thinking about the look and feel of the cultural economy – especially the *popular* cultural economy (see Banks, 2022; Meissner, 2026; O'Connor, 2024, Soper, 2020).

In this talk I therefore explore some of the potentials – and pitfalls – of current projections of cultural economy futures in governmental discourse, and in cultural and media studies. A key goal – as I see it – is to generate a progressive cultural economy that can not only more equitably share and sustain scarce resources, but also retain some sense of *organized* cultural production as being a source of different aesthetic needs and desires. This, I would argue, must include tastes and preferences that are rooted in shared and globally extensive forms of popular culture – but in an ecologically endangered world how might the shared and popular pleasures of the future be made legible, communicable or even possible?

MIP04 Rethinking Media Industries: Methods, Concepts and Futures

PP 0440 The benefits of breaking down silos – Discussing comparative studies of media industries

Mads Møller Andersen[1], Terje Colbjørnsen[2], Vilde Schanke Sundet[3]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark
[2] Norwegian Business School, Department of Communication and Culture, Oslo, Norway
[3] Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway

The field of media industry studies has seen an increasing convergence across different industries and geographical areas in recent years. These trends have made media industries more intriguing but also more complex to understand and delineate. This paper aims to highlight the valuable insights that can be gained from a type of study, which is still rare in the literature of this field: the comparative study of media industries.

With this, we are not referring to transnational comparisons of media systems (e.g., in the style of Hallin & Mancini, 2004) but to studies that compare the differences and similarities between different media *industries*, for instance, in the style of Miège (1987; 1989) and Herbert, Lotz and Marshall (2019). The latter argues that much research on media industries is produced within "silos" specific to each industry (ibid.: 350) and that there is "extremely valuable insight to be gained" from comparative studies (ibid.: 362). However, as our theoretical discussion will show, despite their recommendation, comparative media industry studies remain rare. We argue that this is perhaps due to the tricky concept of "industry" and the difficulties involved in defining and delineating "media industries".

Our paper follows a two-part structure: The first part discusses and positions the existing literature on comparisons between different media industries, providing valuable discussions of how notable "key works" in media industries literature have addressed these issues (e.g., Deuze, 2007; Havens & Lotz, 2016; Herbert, Lotz, & Punathambekar, 2020; Hesmondhalgh & Baker, 2011). The second part describes the various approaches and research designs employed in comparative studies, highlighting gaps and blind spots that need to be addressed in the future. With this two-part structure, we address the following research question: *What different approaches are represented in the existing literature on comparative studies of media industries, and what gaps should future contributions in our field aim to fill?*

A key point in our discussion is that several contributions in the literature have overlooked comparisons between various media (or cultural) industries. Instead, they tend to discuss these industries in broader terms or place individual industries in separate chapters in anthologies, thereby also ignoring the direct comparisons and their value. Additionally, we consider how media convergence, as a phenomenon and concept, connects to these issues and how a promising approach has emerged from the literature on "platforms" (e.g., Cunningham & Craig, 2019; Poell, Nieborg, & Duffy, 2021), offering certain comparative perspectives that we will also include.

Our central argument is that comparative studies of different media industries are essential for *two primary reasons*: First, comparative studies help clarify what characterises media industries in general, including identifying industry-specific logics and practices. Second, conducting more comparative studies facilitates greater exchange of insights across industries and helps prevent the siloing of subfields related to each media industry.

In the final part, we draw on our own experiences and discuss the advantages and disadvantages of doing comparative studies, hoping that this will be both valuable and motivating to scholars and students seeking inspiration for their studies.

MIP04 Rethinking Media Industries: Methods, Concepts and Futures

PP 0441 What we don't talk about when we talk about digitalization: Towards the "what" and the "who" of the "broad cultural-technological" process

Anders Fagerjord[1], Marius Øfsti[2]

[1] University of Bergen, Department of Linguistic- Literary and Aesthetic Studies, Bergen, Norway
[2] Aarhus University, School of Communication and Culture, Århus, Denmark

The impact of digital technologies has been a major theme in media studies during the past three decades, following on a long tradition of studies on the role of technology in media and society (see, e.g., Bolter 1991; Negroponte 1995; Murray 1997; Rasmussen 2000; Manovich 2001; Thompson 2005; Benkler 2006; Hayles 2012; Lotz 2014; Hesmondhalgh 2019; Lotz & Havens 2025). More recently, the term "digitalization" has frequently been invoked in reference to "a broad cultural-technological process" (Colbjørnsen 2015; Brennen & Kreiss 2016). As a result, there is a risk of conflating diverse digitalization processes with potentially opposing outcomes, as well as underplaying the agency of the entities involved.

Looking at the media industries, we find that while some of industries have been quite digital since the end of the 1970's, most research on digitalization focus on the disruptive changes brought in the the last two decades. We also find a wide

range of digital technologies and processes that have been applied by diverse set of actors, both within and outside of the traditional media industries, across the value chain.

This paper explores two questions in this regard: Given this long timespan, are significantly different processes being conflated by broad cultural-technological definitions of digitalization? Are there analytical benefits of a more nuanced concept of digitalization?

In the current study, we have surveyed the academic and industry literature on digitalization of the media from 1990 to the present day, with a particluar focus on the Norwegian film and music industries. We have been looking for descriptions and explanations of observed historical developments, rather than arguments for likely future developments. These findings are then analyzed from an industrial perspective, which part of the media value chain is affected, as well a technological perspective, what are the affordances of the new technologies.

We find that changes to the media industries in the first three or four decades hardly get any mention in recent literature, while developments after cirka 2010 are considered revolutionary, such as online news, social media, music and video streaming, and the «platformization» of media. Further, the changes that have been considered most impactful tend to be driven by industry external entities and relate to how audiences get access to content.

Based on this study, we argue that the right way to analyze the changes related to digital media technology is to ask what is digitized and by whom, a view of technology as not being a determining force, but rather a range of possibilities that are exploited by different actors with different motives. These perspectives are important to bear in mind also when studying current developments in media industries such as platformization and the influx of artificial intelligence.

MIP04 Rethinking Media Industries: Methods, Concepts and Futures

PP 0442 Studying media institutions in motion: Knowledge graphs as a method for analysing discursive choice and institutional change

Andres Kõnno[1], Indrek Ibrus[1]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

Public service media institutions (PSM) are increasingly expected to account for how their editorial choices shape public understanding of culture, the economy, and the environment over time. Yet existing methods for analysing media performance remain largely fragmented: they focus on individual programmes, genres, or topics, rely on limited samples, and struggle to capture long-term discursive change across platforms. This paper reports on the nearly final results of a two-year project that addresses this gap by developing a fundamentally new research instrument to study, at scale, the historical evolution of a media institution's discursive choices. The same instrument could also become part of a new kind of public value provision by PSMs.

The project is carried out by Tallinn University and the Estonian Public Broadcasting (ERR) in collaboration. It constructs a knowledge graph-based representation of ERR's television, radio, and online output over a 10-year period. Using natural language processing tools and LLMs, it identifies and links cultural, economic, and environmental themes, various entities (people, institutional actors, locations), and their evolving relationships. Rather than treating media content as isolated texts, the approach conceptualises PSM as a dynamic, relational system in which discourses emerge, stabilise, and transform through recurring associations among topics, actors, places, and formats. The resulting graph does not merely store content metadata, but functions as an analytical model of the public sphere as produced by a single media institution.

The paper argues that this instrument enables a qualitative shift in how media institutions can be studied. It allows researchers to move from snapshot analyses of representation to longitudinal analyses of discursive trajectories: how certain themes become central or marginal, how the relationships between themes and people (both journalists and public figures) and institutions change, and how domains such as culture, economy, and environment converge or decouple. Importantly, this methodology enables the study not only of what PSM cover, but also of how their internal discursive architecture and professional constellations change in response to social, political, and ecological pressures.

Beyond academic research, the paper emphasises the broader public value implications of this approach. By design, the knowledge graph is conceived as an open, reusable infrastructure accessible to journalists, policymakers, educators, cultural institutions, and citizens. It enables new forms of institutional self-reflection for PSM, supporting evidence-based editorial discussion and accountability. At the same time, it creates opportunities for external stakeholders to explore how public issues have been framed historically, fostering transparency and informed public debate.

The paper positions knowledge-graph-based discursive analysis as a methodological innovation for communication research and as a novel mode of public value provision by PSM. It concludes by outlining how such infrastructures may redefine the relationship between media institutions, research, and society, enabling more reflexive, accountable, and historically grounded forms of public communication. The presentation will discuss the processes of the production of the graph, the collaboration between the researchers and the ERR, and initial analytic results exploring the graph and relationships between cultural, economic, and environmental topics.

MIP04 Rethinking Media Industries: Methods, Concepts and Futures

PP 0443 The backend of public AI: Infrastructural dependencies in the digital welfare state

Sofie Flensburg[1], Signe Sophus Lai[1], Kamille Dimon Jakobsen[1], Eva Iris Otto[1], Christopher Haargaard Gyldenkærne[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

As a cornerstone of national and European digitalisation strategies, AI projects are being rolled out rapidly across the public sector as a key driver in developing high-quality solutions that uphold the principles of the EU and its vision of sovereignty (Mügge, 2024). With a consistent focus on accountability, quality, and economic growth, public AI is perceived as central to strengthening the position of national and regional IT sectors in a global market dominated by a handful of tech corporations (Coletti et al., 2025). However, the rapid pace of AI development, the surrounding infrastructural conditions, and the complex web of economic interests involved risk reproducing and reinforcing existing dependencies, vulnerabilities, and geopolitical asymmetries (Calderaro & Blumfelde, 2022). In other words, it is essential to critically consider and assess the stakes and possible lock-ins that accompany public AI procurement.

Contributing to this emerging research agenda, our paper presents an explorative analysis of the market structures, corporate interests, and infrastructural dependencies surrounding public AI projects in Denmark. Representing a heavily digitalised Scandinavian welfare state (Esping-Andersen, 1990), the implementation of digital technologies in the public sector balances between traditions of decommodification on the one hand, and market-based digitalisation strategies on the other. Our study provides empirical evidence of how these inherent tensions and conflicts of interest play out in the practical construction of the digital welfare state, while also providing an empirical and methodological baseline for future comparative studies of how AI-enabled welfare states might vary according to their institutional and ideological legacies as well as political and economic structures.

The study is based on a dataset comprising 147 public AI projects, developed and implemented across the public sector for a wide range of purposes. Developing a framework and methodology for identifying key market actors supplying AI infrastructure to the public sector, we first identify the official providers of AI solutions as they appear in public procurement notices, finding a landscape of largely national IT-firms and varying forms of public-private partnerships and collaborations (Laage-Thomsen et al., 2025). Zooming in on the technological design of these AI systems, including their embedded cloud infrastructures, model architectures, software dependencies, operating systems, APIs, and so forth, we uncover how global platform corporations act as inherent 'sub-contractors' for the public sector (Luitse, 2024; Van Der Vlist et al., 2024).

This approach allows us to cut across local "small tech" suppliers building and maintaining particular services, and global "big tech" corporations supplying the underlying infrastructural building blocks. A key focus in this investigation is the usage and implementation of, respectively, proprietary off-the-shelf software and open-source systems, and the different types of dependencies and power asymmetries they embed. As such, our study offers a bottom-up perspective on ongoing (top-level) discussions of digital sovereignty by foregrounding the dilemmas and path dependencies that local decision-makers and developers are faced with, while also situating specific AI projects in the global platform ecosystem where infrastructural power is obtained and exerted on multiple levels.

MIP05 Changing Patterns of Media Ownership: An Overview of the Evolving Landscape of Media Owners in Europe

PN 42 Media ownership in Portugal is evolving from media 'moguls' to entangled economic interests

Elsa Costa e Silva[1], Joaquim Fidalgo[1], Luís Loureiro[1], Luís Santos[1]

[1] University of Minho, Instituto de Ciências Sociais, Braga, Portugal

Media ownership in Portugal, in the democratic period, has, although with some delay, experienced the same trends visible in Western countries (Sousa & Silva, 2004), such as the consolidation of private interests and ownership concentration. The legal framework has been adapted to this scenario, with a few practical limitations to concentration (Silva, 2024). The Parliament has, in the meantime, issued one of the most advanced laws on media ownership transparency in 2015, anticipating some of the dispositions of the recently approved EMFA. Since the liberalization of markets, which began in the late 1980s, multimedia groups have grown through strategies of horizontal, vertical, and cross-ownership. These private, market-led, groups coexisted in a scenario with public broadcasting and with a Catholic radio-based group. These groups were initially led by a media-centric ownership chain, headed by media entrepreneurs. Private media is, however, facing significant challenges (Silva, 2019). The financial situation of most Portuguese media groups has deteriorated significantly over the last two decades. Profits are decreasing, negatively impacting the working conditions of journalists (Camponez & Oliveira, 2021). The competition with social media for consumer attention and advertising revenues has put media groups, which are unable to sustain alternative business models, under pressure. In this circumstance, a question arises: how has media ownership evolved in Portugal? This paper analyzes the media ownership trends of the last three decades to determine what challenges are now posed to news production. Based on a document analysis of the proprietary registry and further research on the economic and financial profiles of the companies that constitute the chains of ownership, this paper demonstrates that ownership is now characterized by a significant presence of non-media economic interests in the

ownership chain of the main Portuguese news outlets. Media groups are mostly owned by companies and businessmen with no prior connection to the journalistic world and limited knowledge of the specifics of media operations. The typical figure of a media mogul is vanishing in Portugal, and historical cases of media businessmen are no longer the pattern for media ownership. Non-media interests in Portuguese groups go from tourism to construction, goods distribution, and insurance companies, which entails significant risks of conflict of interest between the owners' position in some economic sector and the journalistic work to be performed by the outlets (Stetka, 2012). And, given that the Transparency Law does not cover economic operations not directly linked to the outlet, these interests may go undetected. The production of journalism thus faces new challenges that mandatory transparency of ownership, although necessary, does not address adequately.

MIP05 Changing Patterns of Media Ownership: An Overview of the Evolving Landscape of Media Owners in Europe

PN 43 Consolidation or concentration of media ownership: New challenges for pluralism and diversity in the Danish media system

Mark Blach-Ørsten[1], Aske Kammer[1], Mads Kæmsgaard Eberholst[1]

[1] Roskilde University, Department of Communication and Arts, Roskilde, Denmark

In this paper, we explore how changes in the Danish media market have led to higher ownership concentration in a market already characterized by concentration. This is a challenge that is exacerbated by a lack media specific legislation with a focus on securing media pluralism and diversity (Kammer, 2017; Simonsen, 2025). The paper draws upon data from the Euromedia Ownership Monitor and the Reuters Digital News Report. The changes and challenges of media-ownership concentration play out differently form media system to media system (Blach-Ørsten et al., 2024). However, a common conclusion is that media ownership concentration is on the rise (Meier & Trappel, 2022). One dominant reason for such increase in ownership concentration is the ongoing struggle of the news industry to adjust its income in a market where most advertising revenues go to digital platforms rather than newspapers (Garz & Ots, 2025). As a result, mergers, acquisitions, collaborations, chain formation, and centralization have created media markets with increased ownership concentration across the EU. In Denmark, media-ownership concentration has traditionally been high in the audio-visual sector where state owned public service news media account for around 80 percent of the audience share (Simonsen, 2025). Private ownership has traditionally been less concentrated. However, this is now changing: in 2025, Berlingske Media was acquired by Norwegian conglomerate Amedia, and specialty brands like Altinget and Zetland were acquired by established media corporations like Swedish Bonnier News and JP/Politikens Hus, respectively. From the perspective of the media owners, these new developments are necessary strategic moves of consolidation. But at a systemic level, these consolidations lead to increased ownership concentration, which challenges media pluralism and diversity. This way, the paper demonstrates empirically how business consolidation leads to increased ownership contraction among leading Danish media brands (Schrøder, Blach-Ørsten & Eberholst, 2025).

MIP05 Changing Patterns of Media Ownership: An Overview of the Evolving Landscape of Media Owners in Europe

PN 44 News media ownership arrangements and associated transparency risks in Austrian media landscape

Mariia Aleksevych[1], Tales Tomaz[1], Josef Trappel[1]

[1] University of Salzburg, Communication Studies, Salzburg, Austria

Media owners' power to shape media performance through strategy definition and resource allocation follows logics of institutional arrangements of news organisations (Benson et al., 2025; Sjøvaag & Ohlsson, 2019). On the one hand, the ownership forms give orientation to journalistic content (public service, amenity potential, profit); on the other hand, these arrangements can be coupled with different governance mechanisms that provide specific power constellations and entry points for influencing journalism. The Euromedia Ownership Monitor (EuroMo) assesses strict legal ownership as well as managerial, economic, and operational decision-making power risks to transparency. Using such a multidimensional approach, we explore transparency risks across different types of media ownership and sectors in Austria with EurOMo data on a sample of 30 influential mainstream media outlets and 34 news-related accounts on social media platforms. For the different types of media ownership, we rely on the categorisation by Benson and colleagues (2025), namely private, stock-traded market, public and civil society. Austrian public service media is strong, whereas, to a large extent, "private media companies in Austria either belong to the Catholic Church, the banking sector, or the super-rich (or a combination of those). In light of this diagnosis, the term 'independent media' seems increasingly threatened" (Pühringer et al., 2025, p. 19). With relatively well-developed and implemented legal ownership transparency requirements for media in all sectors and the four theorised media ownership forms present in its media system, Austria presents a good case for exploring risks hidden from the view through a strict transparency prism, that can be akin to a lesser or larger extent to different ownership forms. Thus, our contribution is two-fold. We first present media ownership types and their assets in Austria. Second, we analyse if multidimensional transparency risks are spread across the types in a balanced way or if some of the owner types gravitate to more risks in some dimensions. In this sense, the three most relevant conclusions that we will focus on are the following: (1) while all ownership forms share similar risks, public service media have some specific, unique ones, such as political interference via boards, which requires a deeper conceptualisation of Benson and colleagues' (2025) 'ownership complexes'; (2) on the other hand, all non-public ownership forms are evolving towards opaque ownership structures that make transparency of beneficial ownership ever unclear, at least in the formal sense; and (3) there are significant differences in risk levels in ownership and control transparency between national and regional media, indicating the continuing relevance of this differentiation in any account of media industries.

MIP05 Changing Patterns of Media Ownership: An Overview of the Evolving Landscape of Media Owners in Europe

PN 45 The duality of Poland's media ownership transparency

Katarzyna Gajlewicz-Korab[1], Michal Glowacki[1], Dagmara Sidyk-Furman[1]

[1] University of Warsaw, Faculty of Journalism Information and Book Studies, Warsaw, Poland

Media ownership transparency is a core value of the current EU legal framework and an essential driver of democratic societies. On the surface, recent European media regulation has underscored the critical importance of media plurality and relevant monitoring systems to combat concentration and enable the diversity of voices, including cultural, ideological, and political ones. While the European Media Freedom Act (EMFA), alongside the Digital Services Act (DSA) and the Audiovisual Media Services Directive (AVMSD), aim to disclose beneficial owners of both legacy and online-born media, media ownership transparency remains a challenge across Member States. This is due to the duality of regulatory systems and a culture of transparency, which can hinder the successful implementation of laws and policies (Donders, 2021). This paper examines the duality of media ownership transparency, using a case study of Poland, arguing that there is a mismatch between formal transparency compliance and persistent structural and cultural secrecy (Głowacki, 2025). The study draws on findings from the Euromedia Ownership Monitor 2025 (EurOMo 2025), a comparative research project co-funded by the European Commission that assesses risks to media ownership transparency across Europe. Focusing on Poland, the analysis covers 24 traditional news media outlets and 10 high-impact informational profiles operating on very large online platforms (VLOPs). Using EurOMo's multidimensional risk framework, the paper evaluates legal ownership transparency, economic control, management structures, relational influence, and public policy risks. Quantitative risk indicators are combined with

qualitative analysis of national regulatory arrangements, registry practices, and accessibility of ownership-related information. The findings reveal a moderate overall risk to media ownership transparency in Poland, with particularly elevated risks related to economic control and public policy. Despite extensive formal disclosure through company, court, and media registries, ownership structures are frequently fragmented, cross-border, and complex for citizens and journalists to interpret. These challenges are particularly relevant for platform-based news actors, whose visibility often relies on self-identification rather than on enforceable regulatory mechanisms, and who frequently fall outside traditional media regulation. The Polish case demonstrates how political polarisation, regulatory fragmentation, and platformisation complicate transparency in media ownership and control (Mikucki et al, 2024). By exposing the gap between legal transparency and meaningful public oversight, the paper contributes to debates on current developments in news media industries, highlighting the challenges posed by different media ownership forms (Mihejl & Stetka, 2024).

MIP05 Changing Patterns of Media Ownership: An Overview of the Evolving Landscape of Media Owners in Europe

PN 46 Media ownership transparency in Romania: Modes of control in a hybrid media environment

Andreea Mogos[1], Radu Meza[1], Hanna Orsolya Vincze[1]

[1] Universitatea Babeș-Bolyai, Communication Studies, Cluj-Napoca, Romania

The Romanian media system has undergone several structural transformations in the past three decades. Total state control of the communist regime gave way in the nineties to a model dominated by “press barons” or moguls, leading to strong institutional capture in the post-communist period, particularly concentrated around control of major news televisions in the 2000s. This system has now evolved into a more diverse, pluralistic and fragmented landscape, in which traditional broadcasters coexist with a varied sector of digital-native outlets. The increase in diversity and pluralism coexists with new forms of instrumentalization and control. These include the nontransparent flow of public funds, primarily via political parties, but also inconsistent ownership transparency across the market. While audiovisual license holders are required to disclose their shareholder structures, ownership for digital-only outlets is opaque. The 2024–2025 electoral cycle also exposed severe vulnerabilities to platform-based capture, with the illegal lack of funding transparency for the online campaign, including by foreign state actors, leading to the annulment of the first round of presidential elections. The contemporary media environment is characterized by the coexistence of major televisions and the rising importance of the platforms as news sources. In this context, new forms of editorial control emerge. On the one hand, media projects can operate under brand umbrellas of established international or national outlets, without this influence being visible in the ownership chain recorded in the standard registers. The registered owners also frequently possess other interests other fields of activities, which can include real estate or industrial production, but also public relations, market research and telecommunications infrastructure, the latter signaling an emerging trend of convergence of news media with the telecom sector. Media projects can also function as social media accounts or networks of news influencers, creating forms of disintermediated political communication bypassing ownership transparency requirements. These phenomena create regulatory challenges only partially addressed by EMFA. National regulators for example have recently expanded their interpretation of online media content providers, moving towards assuming a responsibility to monitor public discourse online, while the forms of ownership and control via funding remain invisible. Based on examples from the Romanian case, we argue that understanding contemporary forms of capture, as well as achieving the regulatory aims of EMFA regarding ownership transparency requires rethinking both the concepts of ownership and that of editorial control, including standardizing forms of content ownership. Such transparency requirements are central to fulfilling the democratizing role of media pluralism.

MIP06 Media Ownership and Management in the Platform Era

PP 0634 Currents of control: Ownership evolutions in the submarine data cable industry

Sofie Flensburg[1], Signe Sophus Lai[1], Kristian Sick Svendsen[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

With up to 99% of all intercontinental internet traffic travelling through fibre-optic cables below the sea (Mauldin, 2023), submarine networks constitute a critical backbone of digital societies. Creating significant dependencies and bottlenecks, submarine cables are objects of growing geopolitical and commercial interest, as exemplified by not only recent military interventions and espionage cases, but also by large-scale investments by global platform corporations. Expanding their market dominance from the application layer to the backbone layer, these new market leaders are not only “reshaping

the submarine cable industry" (Kang & Jacob, 2024) but also transforming the political economy of the global internet infrastructure in a broader sense.

In this paper, we present an empirical study of submarine data cable ownership from 1989 to 2028 (N = 804). Analysing the gradual buildout of new cable systems, shifts in market arrangements, and transformations of the underlying business models, we identify four main developments: first, we find a general proliferation of cables over time – even if some retire, many more enter, illustrating the growing demand for global internet traffic; second, we find an influx of companies from sectors outside of telecommunications reflecting the growing commercial and technological value of this infrastructural resource; third, we find a gradual decline in large consortia in favour of more concentrated ownership, often around a few powerful platform corporations, indicating a shift in the underlying business models and funding schemes; and finally, we see a rise in private cables, accompanying existing common-carrier cables, suggesting reconfiguration of the conditions for data routing.

Inspired by previous historical analyses of large-scale technological systems (Hughes, 1987), we interpret these empirical findings as reflecting three overarching phases in the evolution of the submarine data cable industry: an early phase from the 1980s to the early 2000s, characterised by the *transfer* of economic and technological resources from the legacy telecommunications sector to the emerging internet market; a middle phase of *growth* from approximately 2003 to 2018, marked by significant technological and commercial acceleration, increasing competition and disruption, and the appearance of new market entrants seeking to profit from the rising demand for data traffic; and finally, a third and ongoing phase of *momentum* where infrastructural power is stabilising around a new group of actors and the market conditions are being reconfigured. In extension of the already walled-off application ecosystems, the establishment of superior network infrastructure that can only be accessed through the usage of proprietary services suggests an emerging reintegration of the application and network layers that the internet originally separated.

MIP06 Media Ownership and Management in the Platform Era

PP 0635 Ownership matters: A cross-sectional study of the relationship between news media ownership and individual trust in media in EU Member States

Mariia Aleksevych[1]

[1] Paris Lodron University of Salzburg, Fachbereich Kommunikationswissenschaft, Salzburg, Austria

Amid technological disruption of media markets, growing concentration and proliferation of alternative media ownership forms as a response to financial pressures, concerns about media ownership's influence in journalism quality have intensified. While research links ownership to content influences stemming from consolidation processes and institutional logics of ownership types (Benson et al., 2025; Fürst & Vogler, 2023; Hendrickx & Van Remoortere, 2022; Theine et al., 2025), less is known about how media ownership patterns, as a feature of media system, relate to individual trust in media. This study joins structuration approach in analysing how media system characteristics relate to individual trust responses to media (Fletcher et al., 2025). It aims to advance knowledge about media ownership influences and contextual determinants of trust in media.

The study employs institutional logics approach to media ownership (Benson et al., 2025) and multilevel modelling with the data from the Euromedia Ownership Monitor, coded to reflect shares of public, private, market, and civil society ownership at the country level and disaggregated on Eurobarometer survey data (2023, N≈16 700–18 000 across 22–25 EU countries depending on specification), to uncover links between media ownership structures and individual media trust.

Institutional trust in media is measured as both a binary trust indicator and a latent construct based on four trust-related items (validated for cross-national invariance). To address the compositional nature of ownership data, analyses use ownership-specific models, log-ratio transformations with private ownership as the reference, and cluster-based ownership patterns.

Across models and trust measures, private ownership dominance is associated with lower media trust, while public and market ownership are associated with higher trust, though private and public effects lose significance once press freedom is controlled for. In addition, political differences in media trust vary widely across countries and are systematically moderated by ownership structure: higher public ownership is associated with a lower trust among right-leaning individuals, higher private ownership – with a greater trust among the right. Despite sensitivity to model specification, the finding is robust: media ownership structure predictably shapes general trust and its polarization across countries.

MIP06 Media Ownership and Management in the Platform Era

PP 0636 Media ownership across borders – The role of language in a cross-border acquisition of newspapers

Jenny Stenberg-Sirén[1], Jens Berg[2], Klas Backholm[3], Carl-Gustav Lindén[4]

[1] University of Helsinki, Swedish School of Social Science, Helsingin Yliopisto, Finland
[2] University of Helsinki, Faculty of Social Science, Helsinki, Finland
[3] Åbo Akademi, Faculty of Human and Social Sciences, Vasa, Finland
[4] University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

In 2023–2024, the ownership structure of Swedish-language newspapers in Finland changed significantly through a cross-border acquisition. The Swedish media corporation Bonnier News took control over six newspapers, leading to an ownership concentration with only a few Swedish-language newspapers currently remaining in domestic hands (Stenberg-Sirén et al., 2025). Acquisitions in the media sector are often driven by goals of cost consolidation and economies of scale (Sjøvaag & Ohlsson, 2019/2024), leading to ownership concentration. This offers smaller newspapers survival opportunities through group resources, but might also reduce editorial autonomy, create rigid structures, and decrease news diversity due to shared content (Ylikoski & Ala-Fossi, 2024; Lehtisaari et al., 2024).

Traditional media provide a platform for audiences to be informed, to be part of a community and to engage in democratic processes and public debate. This role is emphasized for audiences speaking a minority language, where the importance of media in the minority language is crucial for societal inclusion and language vitality (Cormack, 2013; Stenberg-Sirén, 2023; 2025). Research about media ownership changes seldom focuses on linguistic dimensions or minority media. While a shared language aids transnational collaboration, as shown by Hendrickx & Kammer (2024), research is lacking on how the owner's geographical and linguistic affiliation affects the media outlet's focus and role for the community.

In this study, we investigate what role language played in the decision-making about the acquisitions, how the shared language of Bonnier News and the Finland-Swedish newspapers influences the integration process and effects of the acquisition, and how the Swedish-speaking audience in Finland regards the change in ownership in relation to the vitality of the newspapers and the Swedish language in Finland.

First, through interviews with managers in Bonnier News, the Finland-Swedish newspapers and the foundations previously owning the newspapers (N = 18) we investigate the goals for the acquisition as well as the outcome. Our focus is on how the different stakeholders view the role of the shared language, the position of the newspapers as minority-language newspapers and what the newspapers might gain and loose by being part of a large media group in another country sharing their language.

Secondly, we analyse the views of the public. The study investigates whether a change from regional to cross-border newspaper ownership affects the media-audience relationship, and how the audience regards the possible effects of the change in ownership in relation to the vitality of the newspapers as well as the language. This is done through an online survey, with a representative sample of the Swedish-speaking adult population in Finland (N = 2469).

In the presentation, main findings of the audience reactions to the acquisition are discussed as well as management goals for, and results of, the acquisition that can be related to language aspects of the newspapers. We discuss if and how a commercial media owner in another country can strengthen the vitality of media working in a minority language.

MIP06 Media Ownership and Management in the Platform Era

PP 0637 Risky choice framing in media management: from "AI is coming" to "AI is infrastructure"

Carl-Gustav Lindén[1], Katja Lehtisaari[2], Villi Mikko[3], Mikko Grönlund[4]

[1] University of Bergen, Department of Information Science and Media Studies, Bergen, Norway
[2] Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland
[3] University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland
[4] University of Turku, Finland Futures Research Centre FFRC, Turku, Finland

This paper analyses the strategic shift in Nordic media management towards artificial intelligence (AI) during a period of four years, from 2023 to 2026. The analysis covers the changing framing in media organisations during a time period that

began with the launch of OpenAI's service ChatGPT in November 2022, a moment of awakening that can be labelled as "AI is coming", then rapidly leading to a dominant frame of "AI is infrastructure".

Nordic media companies are considered forerunners in the application of AI in newsrooms, especially when it comes to sharing best practices between organisations (Deck, 2025). Manifesting this spirit of open collaboration is the Nordic AI Journalism Network, which since 2023 has held the annual Nordic AI in Media Summit (NAMS) in Copenhagen, a key forum not just for regional media but also for global dialogue on the role of AI in the news industry.

The empirical data consists of six days (42 hours) of presentations and panel discussions at four NAMS conferences in 2023–2026. We apply qualitative framing analysis to examine how the discussion on AI in the Nordic media industry has evolved and what specific frames have been present. In addition, we use the same method to analyse blog posts, for instance on Linkedin, and industry reports making sense of the summit proceedings. The empirical material is well structured since the NAMS conferences proceedings follow the same design, with some of the keynote presenters having appeared every year. Because of the uncertainty around AI we focus on media management and risky choice framing, a field that calls for decisions in terms of risk options phrased as gains or losses (Kahneman & Tversky, 1979; D'Angelo, 2017).

The analysis is guided by two research questions:

RQ1 How has the framing of AI at NAMS conferences changed during 2023–2026?

RQ2 How do representatives from the Nordic media industry make sense of the frame "AI is infrastructure" and what visions are present?

In our analysis, we find a transition from a focus on specific tools and limited experiments with AI to improving efficiencies in editorial processes and then to a transformative shift ending in the recognition that AI is actually becoming the infrastructure of the media industry, underpinning a new information ecology and transforming publishing models. This awareness is in line with industry reports showing how AI is becoming embedded across the entire information chain—from how news is gathered to how it is produced, distributed, and ultimately consumed (Caswell & Fang, 2024).

However, we also critically scrutinize the seemingly shared vision that AI is mostly about generative AI and note that the tightened relationship with tech companies in Silicon Valley such as Open AI creates lock-in effects and path dependencies that might capture the future of media companies for many years to come. Finally our analysis presents a scenario where AI is emerging as a key mediator of information flows, shaping production and interpretation despite severe risks such as unresolved accuracy issues (Bender & Hanna, 2025; EBU, 2025; Simon et al., 2025).

MIP06 Media Ownership and Management in the Platform Era

PP 0638 Shaping Public Service Media strategies in the platform era: Negotiating dominant logics in managerial decision-making on public service online content curation in Flanders

Pieter Van der Elst[1]

[1] Vrije Universiteit Brussel, imec-SMIT, Brussels, Belgium

The competition Public Service Media (PSM) face is no longer limited to traditional broadcasting companies, as international streaming services, video-sharing platforms, and social media have come to dominate the media industry (Poell, Nieborg & Van Dijck, 2019). In response, PSM in Europe have been adopting digital-first strategies, in which their broadcaster video-on-demand (BVOD) services become primary gateways to content and online content curation becomes a strategic focal point (Iordache et al., 2024).

Such strategic shifts result from managerial strategic decision-making and are shaped by what Prahalad and Bettis (1986) call a dominant logic (DL): "the way in which managers conceptualise the business and make critical resource allocation decisions—be it in technologies, product development, distribution, advertising, or in human resource management" (p. 490). The DL is inextricably linked to the core activities of an organisation and must be revised when structural changes occur in these activities, as is currently the case for PSM (D'Arma et al., 2021).

However, a DL is also inherently path-dependent and not necessarily uniformly interpreted throughout the organisation (Lowe & Maijanen, 2019; Maijanen, 2015). Revising a DL for PSM organisations—some with a broadcasting legacy tracing back a century—through managerial strategic negotiations involving i.a. editors, public value strategists and technologists, can thus become a difficult endeavour. Therefore, our central research question is: what DL guides PSM managers shaping BVOD strategies in a rapidly evolving digital media industry? Unpacking the key components of the definition of DL by Prahalad and Bettis (1986), we answer the question by determining i) who is involved in strategic decision-making, ii) what their different conceptualisations of the core activities are, and iii) how managerial negotiations eventually result in strategic decisions. This study contributes to research on PSM adapting strategically to a platformised media environment, adding a new dimension to it by investigating the managerial thinking that shapes PSM strategies.

To obtain granular insights into the complex strategic negotiations at PSM, the research relies on a case study (Flyvbjerg, 2006) of the DL underlying the content curation strategy of the BVOD of Flemish public broadcaster VRT (VRT MAX). We rely on a qualitative mixed-methods approach combining a document analysis of relevant strategic texts (managerial contracts, year reports, parliamentary reports, press statements) and semi-structured interviews with approximately 10 top and

middle managers involved in the strategic decision-making processes in question. Despite VRT's introduction of a digital-first strategy, preliminary findings reveal that the organisation remains predominantly inspired by a broadcasting logic. The online curation is rather motivated by the idea of "keeping everyone in the company happy"—explaining the large share of editorial intervention—than by a public service rationale adapted to the platform era.

Through this study, we expand on the application of the managerial concept of dominant logic at PSM, as previously done by Lowe and Maijanen (2019). Ultimately, we aim to provide insight into how long-term delivery on the public service remit of PSM can be ensured in a context of digital disruption, financial precarity and societal polarisation.

MIP07 Media Production across Contexts: Creators, Platforms and Representation

PP 0735 The article provides insights into the creator economy in German-speaking countries, which has been little researched to date

Katharina Kirchpfening[1], Andreas Gebesmair[1]

[1] University of Applied Sciences, Department Media &- Digital Technologies, St. Poelten, Austria

Over the past years, the creator economy has developed into a lucrative sector within the cultural industry. Besides, major content creators are celebrated like superstars. Many children and young people aspire to become content creators. They are considered popular, well-known, have flexible working hours and do what they love. Nevertheless, content creators face similar uncertainties to those working in other cultural fields. Added to this are platform risks characteristic of social media, such as algorithmic control, very low barriers to entry and the need to present oneself as an independent brand. However, there is a significant research gap in this area in German-speaking countries. Even though social media is part of many communication science analyses, the creators themselves, i.e. those who have a significant impact on the social media economy, are rarely included.

This paper presents the results of the Creator Careers project, in which we focus on the careers of content creators. We explore the following questions: How is the creator economy shaping up in German-speaking countries? How do content creators operate in this highly uncertain market?

In this project, we examine the creator economy from the perspectives of critical media industry studies and economic sociology of cultural productions. We conduct expert interviews with content creators and agency employees and carry out quantitative channel analyses for selected channels. In addition, we research data on the three platforms YouTube, TikTok and Instagram. For YouTube, we can draw on data from a previous project that allows us to map the development of YouTube in Austria since 2017.

The individual paper focuses on presenting the results of the expert interviews (as of December 2025: 23 interviews; more planned) and the data collected on the three platforms. Based on the current status, first results from the channel analysis could also be included.

The results show that the institutionalization and recognition of the creator economy is at different stages of advancement in the DACH countries. In addition, the Austrian advertising market is smaller than the German one, which is why Austrian creators are less sought-after cooperation partners than their German colleagues. Furthermore, it is becoming apparent that the creator economy is not as diverse and entry into it is not as barrier-free as is often assumed. In addition, different globalization and localization trends can be observed on the platforms.

Within the Creator Sphere, there are platform-specific bubbles that are divided into further bubbles. Only in very few cases did creators pursue a career as influencers from the outset. They are aware of the uncertain work situation and therefore usually build up additional sources of income or continue to work to a limited extent in their trained professions. The existence of a monetization programme on the platforms has a decisive influence on the choice of platform used and the volume in which they are used. In Austria, for example, there is no Creator Fund for TikTokers, but there is one in Germany.

MIP07 Media Production across Contexts: Creators, Platforms and Representation

PP 0736 Production perspectives on children's television: In-depth interviews on representation and its emergence through micro-, meso-, and macro-level processes

Linde Bossuyt[1]

[1] Ghent University, Communication Sciences, Ghent, Belgium

Children's television is not only entertainment but also a site of meaning-making and formative upbringing of next generations. Research on media production predominantly focuses on adult-oriented content, downplaying the relevance and value of children's television. This ongoing study addresses this gap and researches how contemporary children's television is shaped and how current representational practices within this distinctive genre unfold. This study draws on 16 in-depth expert interviews with professionals working in children's television across diverse production roles, demographic backgrounds, and geographical settings. For the latter, a cross-cultural comparative approach was adopted, focusing on production practices in the United States and in Flanders, the Dutch speaking Northern part of Belgium, thus tapping into large and small industry markets. This approach provides direct insight into the lived experiences of creators and decision-makers,

including how they conceptualize children as an audience and how they define the core characteristics of children's content within their respective production environments.

Our interviewees situated their production practices within a rapidly changing media landscape, underscoring the need for continuous, production-focused research that keeps pace with evolving industrial and audience dynamics. They acknowledge that streaming services have disrupted traditional production and distribution models, while pointing out emerging challenges and opportunities such as YouTube, social media, and the increasing popularity of Asian media products. Across interviews, four interrelated themes emerged as central to both children's television content and its intended audience: recognizability, entertainment, connection, and social impact. Additionally, the analysis found a complex interplay of production factors, on macro-, meso-, and micro-level.

For this abstract, due to space limitation, we focus only on one of those themes, namely recognizability. Both American and Flemish producers emphasized the importance of content that children can easily recognize and identify with, yet they approached this goal differently according to their local contexts. At the micro level, American and Flemish creators drew on their own personal experiences and observations of children's everyday lives, highlighting familiar locations and use of language. At the meso level, production teams negotiate these insights during collaborative meetings, balancing creative ideas with economic considerations. In the U.S., decision-makers consider the large and diverse domestic market, whereas in Flanders, teams strategically integrate audience engagement practices, such as on-screen presenters and live events, to strengthen recognition and interaction. At the macro level, interviewees refer to broader cultural, policy and industrial factors shaping their production decisions: the scale and diversity of the American market facilitate global exportability, reflecting beneficial economies of scale, while Flemish institutional support and cultural priorities reinforce localized strategies that render children's content culturally specific.

In sum, our cross-cultural analysis demonstrates that in the post-streaming era of children's television recognizability is not merely a feature of content but emerges from the dynamic interplay of personal experiences, organizational structures, and wider cultural and industrial conditions of content creators. By mapping these interconnections, this study contributes to ongoing debates within production studies and children's media research, offering insight into the practices that shape the stories and characters that children encounter on screen.

MIP07 Media Production across Contexts: Creators, Platforms and Representation

PP 0737 Between desire and resistance: The multidimensionality of digital disconnection practices among Italian musicians in the platformed music industry

Leonardo Bindi[1]

[1] University of Siena, Department of Social- Political and Cognitive Sciences, Siena, Italy

The growing platformisation of cultural and creative industries poses significant challenges to creative workers, forcing them to maintain constant visibility and conform to algorithmic logic (Duffy, 2020). This pressure is perceived as a form of subordination to platform power, a condition considered "necessary" for self-promotion and establishing a professional presence within a highly competitive ecosystem. While extant literature (Duffy et. al., 2019; Poell et al., 2021) extensively details the consequences of platformisation on creative work, the specific disconnection practices employed by creative workers to cope with the algorithmic pressure remain largely unexplored. Framed as an intervention in the field of disconnection studies, this research examined the effective practices employed by Italian musicians to regain their work-life balance and reassert control over time and agency. Drawing on 20 semi-structured interviews (average length 45 minutes), conducted remotely between July 2025 and November 2025, the study categorized respondents into three structural types: solo artists, multi-level musicians and bands.

The findings reveal distinct approaches and practices based on structural positioning. For soloists, the fear of missing out job opportunities exerts a powerful nudge, making the desire to disconnect something unfeasible and anxiety-inducing. Indeed, the pressure to remain constantly connected to seek work and build a reputation may be more pronounced for emerging artists. Furthermore, the ethics of remaining present on certain platforms like Spotify is negotiated with the need to be connected for promotional or contractual reasons. On the other hand, multi-level musicians, operating on multiple contexts mediate the possibility of disconnection on their reputational capital. This variable enacts the discriminating factor in both voluntary (e.g. do not use Instagram on the mobile device) and involuntary disconnections (e.g. unexpected closure of a social media account). Finally, bands are more inclined to radically disconnect from streaming platforms or social media. In particular, the decision to remove their own music from streaming platforms is often interpreted as an act of resistance towards the dominant consumption model or against the platform itself. To counterbalance their permanent absence from mainstream platforms, bands adopt a range of alternative practices to communicate their activities or promote their music, including blogs, newsletters, or uploading their music for free streaming/download on platform deemed "more ethical" (e.g. Bandcamp).

The theoretical conceptualization of these disconnection practices yields a multidimensional continuum integrating four fundamental components: the nature of disconnection practices (i.e., desired versus enacted), their duration (i.e., temporary versus permanent), the underlying moral orientation (i.e., negotiation/optimisation of platform values versus

resistance to them), and the musicians' reputational capital (i.e., low versus high). The continuum is further shaped by the structural positioning of the musicians themselves, where the distinction between operating as a soloist, a multi-level musician or belonging to a band is substantial. Ultimately, this study argues that disconnection is not only an individual choice, but constitutes a political act shaped by economic power dynamics and the structural position of musicians within the increasingly platformed music industry (Bonini & Magaudda, 2024).

MIP07 Media Production across Contexts: Creators, Platforms and Representation

PP 0738 Filming historical fiction at traumatic heritage spaces in an era of cultural polarization: a production ethnography of WWII drama 'Breendonk' (2026)

Sofie Vermoesen[1], Kevin Smets[1]

[1] Vrije Universiteit Brussel, Communication Studies, Elsene- Brussel, Belgium

This paper examines how European television productions negotiate cultural trauma for historical fiction. The historical drama 'Breendonk', reimagines the complex history of Belgian collaboration, resistance, and passivity under the Nazi regime. It has been established in the fields of memory and media studies that in an era of crisis, where right-wing extremism is on the rise in the West, the need to revisit and mobilize history to understand the present is amplified (de Groot, 2015). 'Breendonk' refers to the namesake WWI military fortress that was repurposed by German occupation as concentration camp in Belgium during WWII. Today, the notoriously cruel Nazi Auffanglager central to Belgian collective memory, functions as human rights memorial site where curatorial strategies and guided tours aim to foster an emotional and 'realistic' representation of the 'Hell of Breendonk' (Spiessens, 2024). Yet, this is the first time Fortress Breendonk's story leaves the site in the form of historical fiction television.

The series is exemplary of how different social, cultural and political imperatives shape mnemonic myths but is also a reaction to global streaming pressures felt in small media markets such as Dutch-speaking Belgium (Raats & Jensen, 2021). The co-production is born form the NEW8 alliance, formed by eight European public service media, which aims to safeguard the quality of local fiction and its reach (VRT, 2025). However, access to such sensitive grounds symbolic for cultural violence, isn't straight-forward for filming (Hirsch, 2002). In fact, 'Breendonk' is the first fiction series to attain permission to film at the original concentration camp depicted. Incidentally Auschwitz-Birkenau, predominant setting of Holocaust narratives, released a 3D-rendering of its site destined for filming during field work for this study (Oltermann, 2025). Opening sites of cultural trauma for popular mythification still heightens concerns with ethics, authenticity, sensitivity and commodification. Even so, some critics resort to sacrilege as reproach. This shift proves a relevant but contested topic for exploration regarding TV production practises at cultural sites and places of traumatic memory.

The study contributes to production studies, European media studies, and critical memory studies and investigates how changing needs for collective remembering recourse attitudes regarding the presence and exploitation of popular media at historical sites of trauma. Further, it seeks to understand how European production of historical fiction functions with geographies and narratives marked by cultural trauma. Methodologically, the study addresses the gap in media production ethnography (Marinos, 2025) and combines on-site observations and expert interviews with both production workers and heritage practitioners associated with the filming locations (Jensen, 2013). Findings reveal tensions between dominant institutional strategies and personal tactics negotiating shifts in ethics, cultural responsibility, artistry and industry norms. By nuancing the broader structure-agency debate, the study contributes to critical dialogue on how creative and historical practises navigate social responsibility and globalization in times of crisis. Challenges concerning site management, display of contested symbolism, and representation are joined by ideological debates surrounding economic and political instrumentalization of cultural trauma.

MIP08 Generative AI in Media Industries: Work, Agency and Transformation

PP 0869 AI-infused talks: Adopting and adapting to Generative AI in everyday work of digital creative professionals

Anastasiia Varetsa[1]

[1] Malmö University, Department of Computer Science and Media Technology, Malmö, Sweden

In the rapid rise of generative artificial intelligence (GenAI), digital creative professionals have not only encountered GenAI as reshaping their industry but, as early adopters, have also begun shaping its practical applications. Existing research explores how creative professionals perceive GenAI in their work (Li et al., 2024), considers its general impact on workflows (Pearson, 2023), and examines emerging divisions of labour (Clarke & Joffe, 2025). While the latter highlights the workspace-dependent character of this phenomenon, these studies leave underexplored the everyday negotiations and sense- and meaning-making surrounding GenAI within professional practices in organisational contexts.

To understand how GenAI is adopted and adapted in situ, this paper asks: How do digital creative professionals integrate and naturalise GenAI use in their daily work, and how are these practices embedded within specific organisational contexts? Situating these processes within a broader context of digital disruption, shifting professional identities, and accelerating futures, the study draws on ongoing ethnographic fieldwork, including observations, qualitative interviews, and analysis of digital artefacts. It introduces a case study of art directors, designers, and copywriters working in selected communication,

creative, and advertising agencies in Malmö, Sweden. The paper thus examines both the digital material affordances of GenAI and how professionals actively constitute these as meaningful within their practices.

By investigating how professionals make sense of, resist, or embrace GenAI, this paper demonstrates that the integration of GenAI into everyday work is project-dependent and primarily occurs through what I term "negotiations." These negotiations unfold across four levels: (1) dialogue with one's professional self (and often with GenAI itself); (2) dialogue with the internal project team; (3) dialogue with the extended project team, including client representatives; (4) exchanges with peer professionals to share experiences and best practices. Such negotiations balance technological affordances with personal professional values, organisational priorities, budgets, team skills, aesthetic perspectives, and industry trends. Their outcomes are inherently unique, enabling the formation of situational, project-based configurations where human and non-human actors collaborate. Preliminary findings reveal emerging pathways through which creative labour is reorganised, mediated, and reimagined – demanding a high level of (self)reflexivity and flexibility from creatives and their workplaces. The paper argues that understanding these everyday engagements, which highlight not only vulnerabilities but also resilient strategies for navigating uncertainty, is essential for grasping how creative media industries are being reshaped. This study provides a situated account of how GenAI becomes meaningful in practice, offering media research a lens for examining the lived, negotiated realities of technological adoption and the trajectories along which professional practices evolve.

MIP08 Generative AI in Media Industries: Work, Agency and Transformation

PP 0870 Generative liveness: contingency and uncertainty in live coding and AI-driven performance

Alex Dellapasqua[1]

[1] University of Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

The increasing presence of generative algorithmic systems in today's media landscape reveals an ambivalent relationship with the management of uncertainty. On the one hand, the uncertainty produced by the overabundance of options that characterizing contemporary society (Luhmann, 1991; Beck, 1992) tends to be mitigated through probabilistic calculation: in everyday life, algorithms operate to reduce the indeterminacy of the present, guiding decision-making toward what is considered the optimal choice in a given situation. On the other hand, within the live performing arts, algorithms can become agents that allow practitioners and audiences to inhabit the contingency of the present and transform it into a shared experience. Indeed, given the current centrality of liveness within artistic and cultural production (Gemini & Brilli, 2023), uncertainty acquires a desirable and deliberately sought-after communicative value. It is within this tension – between algorithms employed as technologies of risk reduction in everyday life and algorithms reactivated as generators of unpredictability in performative contexts – that this contribution is situated. Despite the growing scholarly debate on algorithmic agents and live forms, their intersections remain underexplored from a sociological perspective, particularly with regard to the role these systems play in producing and valorizing uncertainty during the time of the live event.

Building on Philip Auslander's notion of *digital liveness* (2012), this research adopts the concept of *generative liveness* to refer to a form of liveness produced by generative algorithmic processes and sustained by the interactions they activate throughout the duration of the performance. On the basis of this definition, the paper addresses the following research question: what kind of contingency does generative liveness produce in the performing arts, and how does it differ from the contingency generated by human agents or other technical artifacts?

To investigate this question, the analysis is based on a comparison between two different performative modes of live interaction with algorithms: *AI-driven performances* and *live coding* practices. The former refers to artistic and theatrical performances grounded in live communication with an AI system that is trained and programmed prior to the event, while the latter consists of performances in which the very process of writing and programming the algorithm is carried out in real time as part of the performance itself.

In addition to the comparative analysis of these performative practices, the research draws on twelve interviews with artists, event organizers, and audience members. The plurality of perspectives collected allows for an in-depth examination of how algorithmic training and coding are configured both technically and methodologically, and enables an understanding of how the contingency produced by artificial communication (Esposito, 2017, 2022) is valorized and rendered meaningful within artistic contexts.

MIP08 Generative AI in Media Industries: Work, Agency and Transformation

PP 0871 House-training the AI-agent: A domestication perspective on AI-agents in a professional setting

Linus Andersson[1], Martin Danielsson[1]

[1] Halmstad University, Media and communication studies, Halmstad, Sweden

This paper draws on experiences from a series of workshops designed to train small and mid-sized businesses in building AI agents, using these experiences as a case study for discussing attempts at domesticating generative AI. An AI agent is an autonomous system that utilizes large language models to reason, plan, and act towards specific goals. 2025 has been described as "the year of the AI agent," as LLMs become better, cheaper, and faster; integration between different programs and tools is made simpler; and the launch of user-friendly tools enables the creation of agents. AI agents can be utilized for repetitive processes with multiple steps, with examples found in customer service and support, marketing and content, project management and follow-up, data analysis and reporting, and administration and scheduling. In the fall of 2025, the authors of this paper were hired to review and document a series of workshops where small and medium-sized businesses developed their own AI agents for business and consumer communication. This series of seminars – referred to as an "Innovation Sprint" – gives a unique opportunity to look into the process of domestication of a novel technology on a micro-scale, allowing us to explore how the assumedly disruptive force of generative AI is conceptualized and made sense of in a setting that is practice-oriented, and focused on finding ways to employ new technologies to solve or alleviate concrete problems.

This paper aims to draw on experiences and observations from the innovation sprint to engage in a broader discussion about domestication theory and sense-making, to contribute to a deeper understanding of the social and cultural implications of generative AI. Research questions: What prior AI competence did participants have, and what did they expect from an AI agent? What does the experience of building and training AI agents disclose in terms of generative AI as a medium? How can the activities in the AI agent innovation sprint be understood from a domestication perspective?

Participating companies were small, with 1–2 employees, and their budgets for marketing, as well as the time allocated for marketing, were limited. They lack the time and expertise to do it themselves, but they also lack the resources to hire professional services. It is in this gap that AI agents can appear as an attractive solution for automating and delegating difficult and time-consuming processes. However, the findings of our study show that, while participants' hopes were high, there is a gap between what is theoretically and technically feasible and what has actually been done in practice. One challenge with training an AI agent is that it fundamentally requires a different type of interaction with the computer and very different content production. To be successful, the user needs to think more like a programmer than a content producer, as it involves giving a computer program instructions that must be constantly corrected (i.e., debugging) to deliver the desired result. The paper ends with a discussion about these findings in the context of domestication theory and media ecology.

MIP08 Generative AI in Media Industries: Work, Agency and Transformation

PP 0872 A second stage of participation: Studying audience chats in participatory theatre projects

Francesca Giuliani[1], Laura Gemini[1], Lorenzo Giannini[1]

[1] Università di Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

In recent years, messaging apps like WhatsApp and Telegram have taken on an increasingly central role. Unlike traditional social networks such as Facebook or Instagram, which structure interactions around public posts and algorithmic visibility, messaging apps facilitate more private and continuous exchanges.

Beyond their role in everyday communication, messaging apps have been explored as methodological tools for qualitative research, including focus groups (Chen & Neo 2019; Colom 2022) and diaries (Schönbächler 2023). They can offer more flexible, inclusive, and sustainable environments compared to traditional data collection methods, though they are not without disparities in communication participation.

These platforms are becoming essential spaces for organization and engagement also within artistic and cultural contexts. Moreover, in the field of performing arts, they are being utilized as mediums for interactive performances. Projects like Teatropostaggio on Telegram by the Pallaksch Collective (2024) or the WhatsApp-based dance project Call My Name by

Fabrizio Favale / Le Supplici (2020) demonstrate that these spaces are not merely tools for coordination and discussion but also creative devices that shape new forms of digital liveness (Gemini, Brilli 2023; Giuliani 2023; Gemini, Giannini & Giuliani 2024).

Despite the growing use of messaging apps in the artistic landscape, research on their impact in facilitating discussion about performing arts remains limited. This contribution presents results from the research project Cultural Welfare Ecosystems for Wellbeing: Mapping Semantics and Practices, Co-designing Tools, and Raising Awareness, funded by the Italian Ministry of University and Research (MIUR) and NextGenerationEU. It analyzes WhatsApp's functions as a tool for coordination, staging, audience engagement, and qualitative research in participatory performing arts projects. Specifically, it addresses the following questions: 1) What are the limits and potentials of WhatsApp chats in action-research on participatory artistic projects? 2) How do the affordances of chats shape pre- and post-performance experiences? To answer these questions, we analysed through qualitative e quantitative content analysis and interviews with organisers three case studies of chats lasting from four months to one year: BAT - Bottega Amletica Testoriana, Sognando Apiria, and Dance Well, each characterized by different modes of audience participation. WhatsApp proves to be an effective tool for action-research and co-design, particularly in extending participants' experiences and reflective processes. Asynchronous exchange becomes a form of listening and co-constructing meaning, pushing back against the logics of impact-driven commodification that often constrain participatory projects built around short-term engagement.

However, challenges emerge in balancing focused discussions with off-topic conversations, freedom of expression with inhibition due to the research group's presence, and the dynamics between active users and lurkers. While the asynchronicity of chats provides more space for reflection on the experience, it may also generate an expectation of "competitive performativity" among users.

MIP08 Generative AI in Media Industries: Work, Agency and Transformation

PP 0873 Generative artificial intelligence and media ecosystems: Disruption, value reconfiguration, and creative agency in the digital economy

Juan Miguel Aguado[1], María del Mar Grandío-Pérez[1], Inmaculada J. Martínez[1]

[1] Universidad de Murcia, Facultad de Comunicacion y Documentacion, Murcia, Spain

Generative Artificial Intelligence (GenAI) has emerged in the first half of the 2020s as a profoundly disruptive force within the media and creative industries, reshaping not only production practices but also the economic, cultural, and regulatory foundations of contemporary media ecosystems. By automating and augmenting creative processes, enhancing personalization and recommendation systems, and transforming content distribution, monetization, and audience engagement, GenAI alters the traditional digital media value chain from creation to consumption. Its impact is particularly acute at the creative and consumption ends of this chain, where questions of authorship, value capture, and cultural diversity become increasingly contested.

This paper approaches GenAI as a technology-based disruptive innovation and examines its effects through a techno-economic ecosystems framework. This perspective emphasizes value creation as an outcome of interactions among heterogeneous actors—creative professionals, technology firms, platforms, users, and regulators—whose roles and interdependencies are being rapidly reconfigured. Rather than focusing on a single sector, the study adopts a cross-sectoral approach, arguing that common disruption vectors can be identified across advertising, music, audiovisual content, videogames, news media, and creator economies.

GenAI's influence is fundamentally ambivalent. On one hand, it lowers barriers to entry and democratizes access to creative tools, enabling broader participation in cultural production and potentially fostering diversity and experimentation. On the other hand, these same processes risk reinforcing new forms of re-intermediation, as value and control shift toward proprietary infrastructures, data ownership, and algorithmic governance. Creative agency increasingly takes the form of hybrid human–machine collaboration, where authorship is reframed as curation, prompting a redefinition of the creator's identity and professional status.

The paper identifies five transversal challenges affecting media ecosystems: (1) the redefinition of creative identity and authorship; (2) the transformation of business and distribution models and the redistribution of value; (3) the migration of value creation from creative labour to technological capacities; (4) unresolved regulatory dilemmas concerning privacy, intellectual property, and derivative works; and (5) growing tensions between expanded participation and aesthetic homogenization driven by algorithmic standardization and hyper-personalization.

Methodologically, the study adopts a mixed exploratory design with a strong qualitative emphasis. It combines a systematic review of academic and gray literature, a structural-functional analysis of selected media ecosystems, focus groups with users, and surveys and in-depth interviews with industry experts. This design allows for the identification and validation of disruption vectors across creative, economic, regulatory, and consumption dimensions.

The expected findings suggest that GenAI is accelerating a structural reconfiguration of the media ecosystem characterized by techno-creative intermediation, regulatory lag, and ethical opacity. While GenAI expands creative possibilities, it simultaneously concentrates power and value within technological actors, challenging existing governance frameworks.

The paper concludes that understanding GenAI's impact requires an ecosystemic, cross-sectoral perspective capable of informing more balanced regulatory and governance responses that reconcile innovation with cultural sustainability and creative diversity in the AI era.

MIP10 Vulnerability, Responsibility and Resilience in Cultural and Media Industries

PP 0975 Responsible digital practices in cultural and creative industries: Frictions, reconfigurations and socio-ecological imaginaries

Marta Severo[1], Lucas Fritz[1]

[1] University Paris Nanterre, Dicen, Paris, France

Recently, calls for "responsible" or "sustainable" digital practices have increasingly structured public discourse, regulatory frameworks and professional norms across media and cultural sectors. While these debates often focus on the environmental footprint of digital technologies, less attention has been paid to the ways in which cultural and creative industries (CCIs) interpret, negotiate and reconfigure these injunctions in relation to their specific modes of production, values and imaginaries. This paper addresses this gap by examining how responsible digital practices are articulated, appropriated or resisted within the field of CCIs, with a particular focus on digital arts and creative production.

The paper draws on empirical research conducted within the French research project *Renum* (https://renum.parisnanterre.fr/, *Reconfiguring Digital Practices for the Ecological Transition: Professions and Skills*), which investigates socio-ecological transformations of digital practices across sectors. Focusing on CCIs as a heuristic field, the study combines a mixed qualitative methodology. First, we carried out a digital ethnography of the online discourses and practices of 100 French cultural and creative organisations (theatres, festivals, art centres, artistic NGOs, professional networks, etc.) identified on the basis of national listings of digital arts actors. We then sent a questionnaire to these organisations, collecting 30 responses, which were complemented by fifteen semi-structured interviews with professionals working in these organisations. This methodological triangulation allows us to analyse both declared commitments and situated professional practices, as well as the tensions between symbolic positioning and operational constraints. The analysis aims to distinguish between corporate social responsibility commitments, ecological engagement, inclusive socio-ecological initiatives, accessibility policies, and queer and feminist engagements related to the uses of digital technologies, both by organisations and by the artists they host.

Our findings show that responsible digital practices in CCIs cannot be reduced to environmental optimisation or "green" technological fixes. Instead, they are embedded in broader socio-ecological framings that intersect with long-standing concerns around labour conditions, accessibility, territorial inequalities and cultural diversity. Professionals mobilise heterogeneous repertoires to make sense of responsibility, ranging from digital sobriety and infrastructural reduction to commitments against discrimination, queer and crip approaches to creation, and efforts to improve accessibility for marginalised publics. These engagements, however, are marked by persistent frictions: between artistic experimentation and technical standardisation, between economic precarity and ethical commitments, and between institutional frameworks and grassroots professional cultures.

By situating responsible digital practices within cultural production, this paper aims to outline possible futures for the sector as it copes with socio-ecological and digital transitions. It argues that CCIs offer a privileged observatory for understanding how these transitions are translated into professional identities, skills and cultural imaginaries, revealing both the limits and the transformative potential of current responsibility discourses in media industries.

MIP10 Vulnerability, Responsibility and Resilience in Cultural and Media Industries

PP 0976 Hands on data: Rural Chinese women's embodied and intersectional data labor in distribution centers

Lizhen Zhao[1]

[1] University of Massachusetts- Amherst, Communication, AMHERST, USA

Logistics systems are essential to the operation of platform economies, particularly e-commerce platforms, and they rely heavily on data for tracking and surveillance, automation, optimization, and "smart" decision-making in the allocation of logistical resources. Existing scholarship on data labor has primarily focused on precarious and invisible forms of "ghost work" that underpin digital platforms, including content moderation, data annotation, AI training, and the maintenance of digital infrastructures (Cant et al., 2024; Gray & Suri, 2019; Taylor, 2023). This literature has also highlighted global North–South inequalities that shape and are reproduced through the outsourcing of low-paid data labor (Le Ludec et al., 2023). However, little attention has been paid to data labor within logistics systems. This absence further sustains what West (2022) terms "distribution fetishism," whereby platforms obscure the labor and material infrastructures that enable frictionless consumer experiences. Moreover, intersectional inequalities shape logistics data labor in distinct ways: my fieldwork shows that data entry, repair, and maintenance work in distribution warehouses are largely performed by poorly paid rural women in precarious, part-time positions under intense surveillance.

This project examines data labor performed by rural Chinese women working in a distribution center on the urban fringe of Northwest China. Drawing on three months of ethnographic fieldwork as a temporary logistics worker—including

participant observation and interviews—I make three arguments. First, women in distribution centers perform intensive data labor that is both immaterial and physical. Their work includes communicative tasks such as coordinating with consumers, sellers, delivery workers, and platforms to clean and repair data, as well as embodied labor such as maintaining sorting machines and physically handling packages to ensure data capture. Second, this data labor is deeply platform-contingent and cross-platform in nature: workers rely on communicative platforms such as WeChat to sustain data flows while being monitored and managed through corporate platforms like DingTalk. Third, the exploitation of women's data labor both reflects and reinforces intersectional inequalities along gendered and rural–urban lines, rooted in China's longer histories of political and economic transformation.

By foregrounding the lived experiences of rural female logistics workers, this study contributes to critical data labor scholarship through an intersectional lens. It also challenges the assumption that data labor is purely immaterial or digital by revealing its embodied and physical dimensions. Finally, it disrupts distribution fetishism by making logistics data labor visible—thereby opening possibilities for regulation.

MIP10 Vulnerability, Responsibility and Resilience in Cultural and Media Industries

PP 0977 Digital excess and the hidden ecological impacts of digitalisation: A user perspective

Olga Dovbysh[1], Salla-Maaria Laaksonen[1]

[1] University of Helsinki, Center for Consumer Society Research, Helsinki, Finland

Our digital lives are characterized by the continuous availability and accumulation of superabundant digital goods such as information and content. It has also been established that digitalization does not come without environmental costs: in addition to long-debated hardware-centric issues like short product lifecycles and insufficient e-waste management (Parikka 2015), there is a surge in energy and water consumption (Istrate et al. 2024; Pasek et al. 2023), which is expected to increase further due to the explosive growth of GenAI (Brevini 2021; Bashir et al. 2024).

In this research, we problematize the environmental burden of the digital world through the notion of digital excess, referring to aspects of our digital lives that are "subjectively perceived not to carry meaningful value but, rather, appear as wasteful and superfluous, while also causing harm to individuals, society, or the planet" (Olsson et al. 2023: 2). Digital excess is a complex phenomenon emerging from the interactions and tensions within the sociotechnical system of users, digital services, platforms, and the material infrastructures of computing that constitute our information society. It results not only from human behaviour and economic incentives but also from designable user interface and service mechanisms (Olsson 2026). Environmentally, digital excess insidiously increases the footprint of digital services through the invisible demand for computing resources (Crawford 2024), often for uses lacking clear utility.

In this presentation, we examine digital excess and its ecological impacts from a user-centred perspective. Using reflective diaries with media users (N = 30), we explore how digital excess is experienced, understood, structured, and managed by Finnish consumers. The pilot diary data (N = 6) revealed users' imaginaries of excess, reflected in cases of digital welter (an excessive plurality of different things), such as endless catalogues of on-demand entertainment, and digital surfeit (an excessive plenitude of one thing), such as gaming, as well as other experiences of plurality, irrelevancy, and redundancy. The main stage of diary data collection is ongoing. This data will be complemented by subsequent semi-structured interviews (N = 30) to investigate respondents' perceptions of the environmental impacts of excessive digital consumption. We also chart how media users hold companies accountable for their environmental responsibility and what kinds of mitigation strategies they envision. The interviews will be conducted in spring 2026.

This presentation aims to contribute to the problematization of digital excess as a relational phenomenon formed at the intersection of Big Tech and platform companies' logics of oversupply—implemented through UI and service design mechanisms and marketing strategies—and users' perceptions and behaviours. The research opens avenues for further exploration of sufficiency and value in digital consumption, as well as pathways toward a more sustainable digital consumer society.

MIP10 Vulnerability, Responsibility and Resilience in Cultural and Media Industries

PP 0978 Facing the SLAPP disruption in media industries: Management and multi-level support for resilient media

Romana Biljak Gerjevič[1], Jožica Čehovin Zajc[2], Marko Milosavljević[1], Melita Poler[1]

[1] University of Ljubljana- Faculty of Social Sciences, Department of Communication, Ljubljana, Slovenia
[2] University of Ljubljana- Faculty of Social Sciences, Centre for Organisational and Human Resources Research, Ljubljana, Slovenia

Targeting media organizations and media professionals with strategic lawsuits against public participation (SLAPPs) to silence their critical reporting poses a significant challenge for contemporary media industries (Bodnar & Gliszczyńska-Grabias, 2023; Prather, 2023). Research shows such lawsuits disrupt media professionals' routines (Kerševan & Poler, 2023), thereby constraining media production and, for smaller, independent outlets, often posing an existential threat.

During crisis or particularly difficult events, media professionals express a strong need for greater support from their superiors (Hughes, 2021). This aligns with the Organizational Support Theory (Eisenberger, 1986), which emphasizes fairness, leadership support, appropriate human resource practices, and working conditions as key factors shaping employees' perceptions of organizational care.

However, in situations of general stress, a person's well-being is influenced by a wider range of support sources (LaRocco et al., 1980), highlighting the importance of support from colleagues and peers (for example through journalistic or similar associations), as well as family and friends (Taylor, 2011).

The paper examines SLAPPs from a media management perspective, focusing on support measures within media organizations that enable sued media professionals to continue their work and manage the negative consequences of such lawsuits. We conducted twenty in-depth semi-structured interviews between June 2024 and March 2025 with media professionals targeted by SLAPP lawsuits. The interviewees were based in four European countries with the highest incidence of SLAPP suits per 100,000 inhabitants (CASE, 2022): Malta (4 interviews), Slovenia (5), Bosnia and Herzegovina (6), and Croatia (5).

The findings show that management-led support plays a decisive role in shaping media labor conditions, fostering resilience, and sustaining media production and work. Media professionals emphasized the importance of legal and financial protection, as well as operational, logistical, moral, and psychological support as key protective factors. Even in contexts of limited resources, symbolic gestures from superiors (such as statements of support, expressions of solidarity, and collective identification) helped reduce stress and reinforce professional confidence. By contrast, when support was absent, targeted media professionals reported self-censorship, additional stress, loss of professional motivation, and, in some cases, leaving their jobs.

Beyond organizational measures, targeted media professionals also turned to professional networks and civil-society organizations, as well as family and friends. Journalistic associations, other media professionals' organizations and NGOs often stepped in to validate their work and mobilize resources when media management lacked the capacity or willingness to do so, and were in cases of smaller, independent outlets often crucial for their survival.

The paper draws on these findings to critically assess media management responses to SLAPP lawsuits, treating organizational support as a decisive management choice. The paper further situates organizational practices within broader networks of professional, civil-society, and personal support, demonstrating that sustaining media production in times of crisis is a fundamentally relational process. In doing so, the paper contributes to debates on the future of media production and media industries by showing how management and multi-level support shape the conditions for resilient media, thereby mitigating chilling effects that are often one of the key aims of SLAPP lawsuits.

MIP11 Platformization, Inequality and Governance in Media Industries

PP 0957 Larger, faster, harder, younger: Structural churn and the deepening inequality of YouTube (2019–2025)

Bernhard Rieder[1], Adrián Padilla[2], Adriana Matamoros-Fernández[3], Òscar Coromina[4]

[1] University of Amsterdam, Mediastudies Department, Amsterdam, Netherlands

[4] Universitat Autònoma de Barcelona, Faculty of Communication Studies, Barcelona, Spain

This paper investigates the structural transformation of YouTube's creator ecosystem by comparing the global population of channels with at least 1,000 subscribers (the threshold for monetization) in 2019 and 2025. Based on two exhaustive platform-wide crawls, the study argues that the platform is increasingly defined by two simultaneous, yet contradictory, pressures: elite capture, where a dominant upper class monopolizes attention, and a newcomer surge, where (algorithmic) preference for "freshness" drives relentless turnover. Creators, even established ones, are thus challenged both from above by the channel elite and from below by constant, high-velocity competition.

Our data reveals a substantial expansion of the 1k+ subscriber tier, which grew from 4.4 million channels in 2019 to over 22 million in 2025. However, this five-fold increase has resulted in a form of saturation that disproportionately affects non-elite incumbents. While the platform's total views have climbed, the median views per video across the dataset have declined by 65%. Instead of a democratized "middle class," we observe a continuous consolidation of power: the top 1% of

channels increased their share of total platform views from 59.1% to 68.2%, while the top 10% now command nearly 92% of all attention.

Simultaneously, our data indicates a "newcomer surge" that destabilizes the non-elite majority. By analyzing channel cohorts, we find a strong divergence in performance based on channel age. Channels less than one year old exhibit a median "velocity" (a metric of growth) that significantly exceeds that of established channels, suggesting a pivot toward Shorts and viral turnover, driven by an interplay of algorithmic shifts, audience preferences, and new interface affordances. This creates a highly volatile environment: almost 60% of the channels active in 2019 are now inactive or no longer on the platform. Consequently, established creators face a paradox where tenure offers no protection against the "revolving door" of high-velocity entrants who temporarily cannibalize visibility before potentially falling victim to displacement themselves.

This squeeze on the established majority is further intensified by a significant geographic shift. The 2025 data confirms that the platform's center of gravity has moved to the Global South, with India overtaking the US in both channel volume and viewership, and rapid growth in markets like Indonesia and Pakistan. This indicates that the pressure on the incumbent creator is driven not only by algorithmic sorting but by an increasingly competitive global labor supply and mobile-first consumption habits.

By synthesizing these trends, the paper argues that YouTube has transitioned, at least in part, from a logic of "audience building," where time on the platform correlated with stability, to a regime of "algorithmic survival." The ecosystem is now characterized by a struggling majority, trapped between an unreachable elite and the accelerated obsolescence of the existing creator population. These findings offer critical insights for researchers of digital labor, platform governance, and the political economy of social media.

MIP11 Platformization, Inequality and Governance in Media Industries

PP 0958 Making a living in the metaverse? Exploring content creation, monetization, and governance in emerging virtual world platforms

Miguel Barreda-Ángeles[1], Tatiana Somià[1]

[1] European Commission, Joint Research Centre, Ispra, Italy

Although the initial hype surrounding the metaverse has waned in recent years, virtual world platforms —often described as "proto-metaverses"— such as Roblox, Minecraft, or Fortnite, continue to attract massive user bases (for instance, Roblox alone is estimated to have around 380 million monthly active users). These platforms rely heavily on user-generated content (UGC) and support creator ecosystems that generate tens of millions of dollars annually. While existing research has examined creator economies primarily on social media and video-sharing platforms, content creation in virtual worlds remains largely underexplored. To begin addressing this gap, this study provides an initial mapping of the boundary conditions shaping creator ecosystems in virtual world platforms, focusing on how platforms enable content creation, structure monetization opportunities, and govern relationships with creators.

The study draws on a qualitative analysis of 103 publicly available documents, including terms of use, policy guidelines, and creator-facing materials, from eleven virtual world platforms. The sample includes both centralized and decentralized, blockchain-based, platforms, enabling comparison across different approaches to governance.

Our findings show that virtual-world creator ecosystems reproduce many structural features of the broader creator economy, including pronounced power asymmetries between platforms and creators, winner-takes-all revenue distributions, and high levels of economic uncertainty for most participants. At the same time, virtual world platforms introduce distinctive socio-technical dynamics. Content creation is often asset-based and persistent, encompassing virtual environments, items, avatars, and plug-ins, which requires advanced technical skills and enables new forms of collaboration and specialization. Performance-based and event-driven content also plays an important role, frequently intersecting with external platforms such as YouTube or Twitch. Monetization pathways are similarly diverse, ranging from direct sales and subscriptions to platform-driven incentives, in-world advertising, and cross-platform revenue streams.

Platforms exercise strong control over creators' activities through rules embedded in terms of use, proprietary marketplaces, in-platform currencies, moderation practices, and opaque content visibility and recommendation mechanisms. While decentralized platforms emphasize narratives of ownership and participatory governance, these approaches remain partial, often trading greater formal autonomy for significantly smaller potential audiences. Across governance models, limited interoperability and strong reliance on proprietary content creation tools constrain creators' ability to diversify their economic activity, while reinforcing their structural dependence on platforms.

Overall, these findings illustrate how platforms do not merely host creative activity but actively configure the economic, technical, and institutional conditions under which creators operate. Our results contribute to situate virtual world content creation within current debates on platform political economy and the creator economy, providing critical insight into the promises, limits, and distributional consequences of creative labor in emerging immersive digital environments.

MIP11 Platformization, Inequality and Governance in Media Industries

PP 0959 Predatory communities on platforms

Andreas Gregersen[1], Jacob Ørmen[1], Anne Mette Thorhauge[1]

[1] University of Copenhagen, Department of Communication, Copenhagen S, Denmark

This presentation introduces and substantiates the concept of predatory communities – communities engineered for value extraction – and we situate this concept within the overall platform economy. In contrast to conventional understandings of online communities as emergent social formations, we examine how individuals and organizations can exploit specific mechanisms to scaffold and facilitate community sentiments and commodification through predatory strategies. Grounded in a synthesis of sociological literature (Brint, 2001; Gusfield, 1975; Vaisey, 2007), internet studies (Baym, 2000), and platform scholarship (Cunningham & Craig, 2021; Poell et al., 2021; van Dijck et al., 2018), we define predatory communities and use three case studies involving social media influencers and finance-related platforms to illustrate the deployment of three predatory strategies: predatory inclusion (Besbris et al., 2022; Charron-Chénier, 2020), obscured identity and brokerage relationships (Goldstein & Eaton, 2021; Gregersen & Ørmen, 2024), and our own contribution, namely that of turning prey into predators. The presentation explores the inherent contradictions between the affective dimensions of community membership and the economic imperatives driving predatory practices, analyzing how individuals and organizations exploit platform infrastructures to construct and maintain predatory communities. As a contribution to critical political economy studies of platformized communication and culture, we argue for a renewed interrogation of the community concept, its related mechanisms, and the values and interests embedded within platformized communities.

MIP11 Platformization, Inequality and Governance in Media Industries

PP 0960 Who owns the map? Spatial authority and fan cartography in the Witcher

Helena Atteneder[1], Joan Ramon Rodriguez-Amat[2], Yulia Belinskaya[3]

[1] University of Tübingen, Institute of Media Studies, Tübingen, Germany
[2] University of Sheffield, School of Information- Journalism and Communication, Sheffield, United Kingdom
[3] University of Applied Sciences St. Pölten, Department of Media and Digital Technologies, St. Pölten, Austria

Maps are not neutral representations of space but powerful communicative devices that shape spatial imagination, mediate knowledge, and reproduce or contest authority (Harley, 1989; Crampton & Elden, 2008). In transmedia story worlds, mapping becomes particularly contested, as fictional geographies circulate across novels, games, screen adaptations, and online communities. This paper examines fan cartography in The Witcher universe as a spatially mediated practice through which authority, authenticity, and ownership are continuously negotiated.

Without an official map that establishes a "spatial truth" with the authority of the author, game developers, and screen adaptations have produced a proliferation of cartographic representations that seek to stabilise, visualise, and rationalise the fictional world. These maps do not merely illustrate narrative space; they function as what Abend and Harvey (2015) describe as geomedial action spaces, in which spatial coherence, narrative continuity, and legitimacy are actively debated. Drawing on Massey's (1999) concept of power geometries, we argue that these cartographic practices reveal uneven capacities to define space, with different actors holding unequal power to fix or contest spatial meanings. How do fan-created, game-based, and adaptation-driven maps circulate within the Witcher universe, influence one another, and function

as action spaces where spatial, temporal, and narrative consistency is negotiated, and how can these dynamics inform analyses of power relations and debates over authority, authorship, and ownership?

Methodologically, the study combines digital humanities approaches with qualitative content analysis. We trace the movements of key characters across the novels, video games, and Netflix adaptation, overlaying these trajectories with multiple fan-made and industry-produced maps. This spatial analysis is complemented by an examination of discussions in online fandom spaces, including fan wikis, Reddit, and Discord communities, where users debate distances, borders, landscape continuity, and the "correctness" of different cartographic interpretations. These discussions are thematically coded, with particular attention to arguments about spatial logic, canon, authorship, and ownership.

The analysis shows that fan maps operate as performative and discursive infrastructures rather than static representations. They mediate collective world-building, enable participatory sense-making, and foreground conflicts between proprietary transmedia production and crowd-sourced spatial knowledge. In doing so, Witcher cartographies become sites where broader questions about intellectual property, fan labour (Rodriguez-Amat & Sarikakis, 2012; Schiller, 2018), and spatial authority are articulated.

MIP11 Platformization, Inequality and Governance in Media Industries

PP 0961 How Netflix is creating a common European culture. A research on video pjatformization in ten European countries

Andrea Miconi[1]

[1] IULM, Arts and Media, Milan, Italy

"How Netflix is creating a common European culture", *The Economist* titled on March 31, 2021. In this respect, we will provide first-hand data on VOD movies and Tv-series, collected in the context of the Horizon 2020 project EUMEPLAT-European Media Platforms in Belgium, Bulgaria, Czechia, Germany, Greece, Italy, Portugal, Spain, Sweden, Türkiye. Data have been collected in the three major VOD platforms in each country.

To what degree the use of common platforms – Netflix, Prime, HBO- is making the Europeans *more European*, in fact, is still to be understood. To start with, the offer of the VODs significantly varies from country to country: the Netflix catalogue contains more than 5,000 titles in Romania, around 4,400 in Belgium, and 3,800 in Spain.

We will put into focus the impact of geo-blocking strategies, and stratifications internal to the European media landscape. Even though geo-blocking is a widely reported phenomenon, VOD offer is impacted in a particular way. According to available estimates, cross-border availability of European contents accounts for 80% of the catalogues in the case of music download and 93% in the case of e-books, while VOD libraries overlap each other only by 30–50% of their titles. An indication of the role of geo-blocking can be inferred from the fact that, movies produced in EU are distributed in VOD platforms in 3.9 countries, compared to 5.4 countries for US movies, 4.9 for the rest of the world, and – more surprisingly – to 4.8 countries for non-EU European productions. In a similar vein, the VOD distribution of TV-shows produced in the EU covers on average 2.7 countries, compared to 6.9 countries for those coming from the US and from the rest of the world, and 3.4 for other European releases. The only encouraging aspect for the European common market is that the data reveals a slight improvement, with respect to the Tv-on-demand market. Still, movies and Tv-shows produced within the EU have *the poorest distribution* in Europe in VODs, with these data confirming Bourdon's and Sassoon's idea, that a properly European media culture does not exist, with audiences either attracted by national or American titles.

As the data about VOD movies and Tv-shows circulation reveals the importance of regional markets (i.e., German titles in Austria), we repeated these analyses on a bigger sample, by working on the full archive of the Lumière VOD database: more precisely, 90,510 movies, produced in 31 countries in the region. The data visualization will show a series of trends: the minor roles of the majority of countries; the scarcity of pan-European successes; and the role of the Big Five. The quota of imported non-national movies, on the total of European movies, drops down in the strongest production countries: 53.2% in France, 56.4% in the United Kingdom, 64.9% in Italy, 66.6% in Germany, and 77.9% in Spain. In all the other nations, the percentage ranges from 81.3 to 99.4%, in a way that basically confirms, in the VOD market, the very same proportions of the theatrical movie market.

MIP12 Visibility, Legitimacy and Discoverability in Platformized Media Industries

PP 1056 Economic and epistemic constraints on recommender system use in small media markets: A qualitative study in Belgium and Switzerland.

Steve Paulussen[1], Michelle Kulig[2], Bruno Lefevre[3], Manuel Puppis[2], Tobias Rorhbach[2], Hilde Van den Bulck[4]

[1] University of Antwerp, Department of Communication Studies, Antwerpen, Belgium
[2] University of Fribourg, Departement of Communication and Media Research, Fribourg, Switzerland
[3] Université libre de Bruxelles, ReSIC, Brussels, Belgium
[4] Drexel University, Department of Communication, Philadelphia, USA

The rapid adoption of AI by media organizations is creating new opportunities for content personalization for news and streaming services (e.g. Cools & Diakopoulos, 2024; Blassnig et al., 2025). By implementing algorithmic recommender systems and using AI for automated summaries, translations, and text-to-speech features, these organizations aim to offer users more opportunities to engage with their content. At the same time, the development of recommender systems comes with economic and epistemic challenges, some of which are specific to small media markets.

To analyze these challenges, this study draws on the epistemic welfare framework proposed by Hyzen et al. (2025), which conceptualizes the conditions under which individuals can exercise epistemic agency in increasingly algorithmically mediated environments. In this study, we use this framework to systematically compare how media organizations in German- and French-speaking Switzerland and Dutch- and French-speaking Belgium – four small media markets with distinct cultural and regulatory characteristics – are developing strategies and internal policies for AI-enabled content personalization for their news and/or streaming services. For the empirical part, the study is based on a qualitative document analysis of 136 company documents and on 28 expert interviews with upper- and middle-management professionals with editorial and technological backgrounds from the major media organizations in all four media markets, including commercial news publishers, public service media, and streaming services. Data collection began in November 2025 and will be completed in January 2026.

Data analysis is ongoing. Preliminary findings suggest that the rise of AI seems to have strengthened confidence in the potential of content personalization, particularly as media organizations see opportunities to reach new audiences, optimize user engagement, and diversify their content offerings. Moreover, interviews show that closer collaboration between editorial and technical staff enhances the implementation of recommender systems. However, this optimism is tempered by economic challenges that are especially pronounced in small markets, such as economies-of-scope constraints and an increased dependency on large technology platforms. Alongside these economic pressures, media organizations also face epistemic questions, including what constitutes a good balance between (semi-)automation and human curation, which criteria should guide algorithmic selections, how transparent the use of AI applications like recommender systems should be, and to what extent and how users should be able to control personalization algorithms.

The preliminary results suggest a sector in transition and in need of guiding principles, which we relate back to the epistemic welfare framework. Such value-based guiding framework is particularly relevant in small markets where economic constraints require difficult choices.

MIP12 Visibility, Legitimacy and Discoverability in Platformized Media Industries

PP 1057 Hybrid regimes of legitimacy: Negotiating authority among cultural creators on social media

Gabriella Taddeo[1]

[1] University of Turin, Humanities, Turin, Italy

This study investigates the profound transformation of cultural authority in the era of platformization, focusing on the emergence of cultural creators as a new category of "networked intellectuals". As social media infrastructures increasingly become primary environments for information and informal learning, traditional markers of expertise -linked to stable institutional affiliations and titles- are being challenged by a landscape where visibility is governed by opaque algorithms and affective metrics (Duffy et al. 2021; Poell et al. 2022; Bishop 2025).

In this context, I propose the concept of *hybrid legitimacy* to describe how these creators act as reflexive cultural mediators, constantly engaged in a work of translation between institutional standards, platform imperatives, and diverse audience demands.

The research is grounded in a qualitative study conducted between 2022 and 2024, involving 40 semi-structured interviews with Italian creators, including teachers, journalists and science communicators. Theoretically, the work integrates the Boltanski and Thévenot's *Economies of Worth* framework (1991) to map how creators justify their practices across conflicting orders of value: the *civic* (public utility), the *mercantile* (monetization), the *industrial* (efficiency), the *inspired* (creativity), the *domestic* (trust) and the *opinion* (attention).

The analysis reveals five specific regimes of legitimation through which cultural creators negotiate their status across audiencies, institutions, and platforms. First, *clarity* operates as an ethics of shared understanding where authority is built on explicability rather than technical distance. Second, *connection* which translates into a willingness to be corrected and to co-construct knowledge with one's followers. Third, *coherence* functions as a moral compass, where creators rigorously select commercial partners to protect their intellectual integrity. Fourth, *infrastructure* marks a strategy of resistance against algorithmic volatility, as creators invest in durable assets like books, private academies, or theatrical shows to gain autonomy. Finally, *institutional recognition* remains a desired but ambivalent goal, where creators seek validation from traditional gatekeepers through collaborations and co-design of cultural projects.

The findings highlight that legitimacy for these creators is a dynamic practice involving a continuous process of justifying their work across the conflicting demands of civic, mercantile, industrial, inspirational, domestic and fame-based orders of value: simplifying and making cultural content attractive and engaging, for example, responds for the creators to the criterion of *clarity* and helps them to sustain popularity according to the platforms logics (*opinion* and *mercantile* orders), but often invalidates and delegitimizes on the *civic* and *inspirational* order. At the same time, building one's own assets outside of platforms, or accepting collaborations with cultural institutions for free, often requires a cost in terms of monetization (*mercantile* order), but helps to produce greater intellectual autonomy with respect to the platforms logics and therefore improves creators legitimacy based on *inspiration* and *civic* value.

In particular, the interviews reveal that these creators are subjected to a new mediation work: while the dynamics of *clarity, connection*, and *coherence* align with established influencer strategies (Hund 2023; Abidin 2021), the pursuit of *institutional recognition* and the creation of independent cultural *infrastructures* necessitate that cultural creators navigate-and often challenge- prevailing platform logics and their underlying economic and value systems.

MIP12 Visibility, Legitimacy and Discoverability in Platformized Media Industries

PP 1058 Modes of attention and the lifeworld of music streaming

Håvard Kiberg[1], Anja Nylund Hagen[2]

[1] Kristiania University College, Communication, Oslo, Norway
[2] University of Oslo, Department of Musicology, Oslo, Norway

In recent years, attention has become a key concern in music and media industry research, particularly in studies of digital platforms, streaming services, and algorithmic media environments. Across this literature, concepts such as the attention economy (Goldhaber, 1997) are frequently used to describe how platforms organise visibility, engagement, and the circulation of cultural content, by treating human attention as a valuable resource under conditions of informational abundance. While these perspectives have been central to analyses of platform power and the economic organization of contemporary media use, this article seeks to further develop how attention itself is conceptualized and analyzed in relation to platform-mediated practices – in specific those involving music and sound.

Theoretically, the article moves beyond approaches that treat attention primarily as cognitive focus or measurable engagement, and instead conceptualises attention as something that unfolds across multiple dimensions of everyday experience. Taking music and audio streaming as an analytical entry point, we adopt a phenomenological-sociological perspective to examine how attention is lived and organised in everyday encounters with platform media.

Building on Schutz's (1967) work on attentional modifications – foregrounding how consciousness shifts between different modes of relevance – and on van Manen's (1997) framework of lifeworld existentials, we introduce an expanded conceptualisation of attention in terms of four interrelated modes: the bodily, the temporal, the spatial, and the relational. Applying this framework to music streaming, we examine how platforms engage and organise modes of attention through features such as mood- and activity-based playlists, personalised recommendations, and continuous playback. This framework allows us to ask:

How do everyday users experience and navigate attention in their encounters with music and audio streaming?

Empirically, the article draws on qualitative interviews with twenty everyday users of music and audio streaming services. Our preliminary findings suggest that competition for users' sustained or fully focused attention captures only part of how streaming platforms engage users, as platforms also address bodily states such as relaxation or concentration, align listening with temporal patterns such as routines and transitions, situate music within specific spatial contexts such as commuting or working, and configure relational modes of attention involving both social connection and solitary engagement.

Taken together, the article proposes that the attention economy can be understood not only as a system oriented toward capturing discrete moments of focused attention, but as a sociotechnical arrangement that engages, organizes, and derives value from multiple modes of lived experience across everyday life. While this may point to an increasingly intensive platform

economy driven by the expansion of attention-based value extraction across an ever-wider range of activities, situations, and experiential domains, it also highlights the role of music and audio media as central elements of the lifeworld – through which everyday activities, moods, and situations are oriented, sustained, and rendered meaningful.

MIP12 Visibility, Legitimacy and Discoverability in Platformized Media Industries

PP 1059 Strategies for the visibility and discoverability of audiovisual works: The case of European animation

Anais De Potesta[1], Adelaida Afilipoaie[1], Heritiana Ranaivoson[1]

[1] Vrije Universiteit Brussel, imec-SMIT, Brussels, Belgium

Online platforms have created new opportunities for producers and rights holders, enabling them to distribute content directly to consumers, and reshaping the latters' habits. This shift represented a structural transformation across the production, distribution, broadcasting, and consumption of audiovisual content (Nieborg and Poell, 2018; Song, 2024). Market concentration has simultaneously intensified. Netflix, Amazon Prime, and Disney+ accounted for 85% of total viewing time on subscription video-on-demand (SVoD) services between September 2022 and September 2023 (Grece and Trans, 2023). Besides, while platform catalogues are extensive, audiences frequently encounter choice overload (Ranaivoson et al., 2024), which raises search costs for non-mainstream and niche content and reinforces demand for a limited number of highly popular titles.

In response to these limitations, academic and policy attention has increasingly shifted towards the concept of discoverability. It refers to the likelihood for a content to be engaged with by audiences. A growing body of scholarship has addressed discoverability, a concept that has migrated from information science and web design into film and television studies (McKelvey and Hunt, 2019; Salganik et al., 2024.

What are the obstacles and enablers for the discoverability of audiovisual works on online platforms?

The work is applied to the European animation industry. While animation remains dominated by the US audiovisual industry, European animation has demonstrated strong international circulation, internally and externally, compared to all other genres (Creative Europe Media et al. (2017). The analysis is based on a series of workshops with 60+ professionals of the European animation industry. A key topic was how, and where, audiences (particularly youth) find, access, and engage with European animation.

An expected finding is the taking into account of discoverability as the result of a temporal and strategic process shaped by platform governance, industry practices, and audience behaviour. This study argues that the central challenge facing European animation is **temporal discoverability**: the capacity of animated works to remain visible, to be re-encountered, and to generate meaningful engagement over time within algorithmically curated catalogues.

MIP13 Media Industries, Public Value and Cultural Expression in Transition

PP 1154 Narration in streaming fiction series: A quantitative content analysis of plot, style, and characters in Netflix Originals (2013–2024)

Thomas Spejlborg Sejersen[1]

[1] Danish School of Media and Journalism, Media Production and Management, Copenhagen S, Denmark

Keywords

streaming, fiction series, quantitative content analysis, narration, platformization

Digital streaming platforms shape the production and consumption of cultural content in modern society. Big tech companies such as Netflix are poised to gain from this transformation, as binge-watching has become the dominant type of consumption. These shifting grounds are caused predominantly by *platformization,* which refers to how logics of datafication and commodification affect 'the production, distribution, and circulation of cultural content' (Nieborg & Poell, 2018, p. 4275). Studies on production and consumption are arguably key to television and streaming research in the platform era; nevertheless, research on streaming *content*and its constitutive feature, *narration* (or storytelling), has been underdeveloped apart from a few recent exceptions (Heiselberg et al., 2026; Lotz & Lobato, 2023).

This paper examines longitudinal changes and continuities in the narration of the most popular original fiction series on Netflix (the world's leading streaming service) from beginning to present (2013–2024). It performs a quantitative content analysis of over 150 episodes selected through a stratified sampling strategy (Riffe et al., 2023). The focus is threefold: plot, style, and character. Taken together, these three dimensions are constitutive of narration, just like narrative is constitutive of a fiction series. Drawing on narratology, manuscript literature, and recent theory on serial narration (for instance Altman, 2008; Bordwell, 1985; Christensen, 2023; Field, 2005; Heiselberg et al., 2026), this article presents a quantitative

framework for analysing narration in fictional and serial platform content. The subject is relevant and timely given the growing production and consumption of such content in the platform age.

Being a work in progress, the paper will first perform statistical analyses of the constitutive variables of the three narrational dimensions. Secondly, it will compare the findings to popular hypotheses circulating in the academic and critical debate:Have Netflix's streaming fiction series become more complex and intensive? Or is it rather the opposite: simpler and extensive? Finally, it will discuss the usefulness of the framework for future studies on related, yet different, types of platforms, for instance, Broadcast Video-on-Demand services.

MIP13 Media Industries, Public Value and Cultural Expression in Transition

PP 1155 Spanish audiovisual production driven by US streamers: Titles, formats and trends

Juan Ignacio Fernández Herruzo[1], María Trinidad García Leiva[1], Luis A. Albornoz[1]

[1] University Carlos III of Madrid, Department of Communication and Media Studies, Getafe, Spain

The international expansion of US-based video-on-demand services since the mid-2010s has significantly reshaped production dynamics, market structures and power relations within European audiovisual industries (Johnson, 2017; Iordache et al., 2024). A defining feature of this transformation has been the strategic centrality of 'original' productions, understood as exclusive works commissioned, co-produced or branded by streamers in order to localise their services, differentiate their catalogues and strengthen subscriber acquisition and retention (Lotz, 2018; Iordache, 2022). In Spain, US-based streamers have moved beyond distribution to become key drivers of local original production, operating within a regulatory environment that mandates investment in European works. This paper analyses the scope and characteristics of Spanish audiovisual works driven by US streamers, engaging with broader debates on so-called 'originals', cultural influence and the control of intellectual property (Davis, 2021; Lotz et al., 2022; Lotz & Lobato, 2023).

The study focuses on six services operating in Spain: Netflix, Prime Video, Max, Disney+, Apple TV+ and SkyShowtime. It addresses two research questions: how many Spanish audiovisual works have been driven by US streamers since their arrival in the Spanish market, and what are the main characteristics of these works in terms of formats, production volume, industrial partnerships and release patterns. Methodologically, the research is based on a database comprising 407 Spanish titles released between 2015 and 2025. Data collection combined the analysis of corporate press releases, specialised trade media, institutional and industry reports, and audiovisual databases, complemented by a systematic review of production credits and service interfaces.

The findings reveal a sustained and growing involvement of US streamers in the commissioning of Spanish originals, particularly from 2018 onwards. Netflix and Prime Video account for over 85% of the titles and hours produced, confirming their dominant role in shaping the Spanish production ecosystem. In line with Iordache's (2022) analysis of differentiated localisation strategies across European markets, the Spanish case shows how streamers combine large-scale investment with selective partnerships involving a relatively small group of Madrid- and Barcelona-based companies. Serialized fiction constitutes the core of streamer-driven original production, as previously identified in studies on Netflix originals in Spain (Albornoz & García Leiva, 2022), while the growing presence of feature films, documentaries and partially scripted formats—such as reality and talent shows—points to an expansion of production strategies oriented towards audience engagement and service differentiation (Fernández-Herruzo & Pedrero-Esteban, 2023; Lang, 2023).

While the expansion of original production by US streamers has enhanced the international circulation, visibility and perceived quality of Spanish audiovisual works (Álvarez Monzoncillo, 2024; Parrot Analytics et al., 2024), the paper critically discusses its structural implications. In particular, it highlights how commissioning practices and buyout-based contractual models enable US streamers to retain ownership of intellectual property, reinforcing asymmetries in bargaining power and raising concerns about the long-term sustainability and cultural autonomy of independent production in Spain (García Leiva, 2023). The paper concludes by situating the Spanish case within wider European debates on regulation, market concentration and the future of local original production in the streaming era.

MIP13 Media Industries, Public Value and Cultural Expression in Transition

PP 1156 The ins and outs of cross-industry journalistic collaboration among small local newspapers

Ragnhild Kristine Olsen[1], Birgit Røe Mathisen[2], Karianne Sørgård Olsen[2]

[1] Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway
[2] Nord University, Faculty of Social Sciences, Bodø, Norway

Small local newspapers face multiple constraints in producing investigative and innovative journalism. Limited resources and expertise make it difficult to deliver in-depth reporting on complex issues. At the same time, expectations to produce content that audiences will engage with have intensified in an attention economy where advertising revenue increasingly flows to global technology platforms and subscription income has become a central component of local newspapers' business models. Against this backdrop, collaborative projects are emerging as an industry strategy to address the resource challenges confronting news media organizations (Jenkins & Graves, 2024). While previous research has primarily examined global collaborative initiatives in fact-checking (Belair-Gagnon et al., 2023) and investigative reporting (Konow-Lund & Olsson, 2021), collaboration at the local level remains comparatively underexplored within media industry research (Lincoln et al., 2025).

This study addresses this gap by examining inter-organizational collaboration in a Norwegian initiative - *the collaborative desk* – established by the Local Association of Local Newspapers (LLA), the public broadcaster NRK, and the Centre for Investigative Journalism (SUJO). The desk, partly funded through state support, produces data packages for more than 110 local newspapers across Norway, providing statistics and editorial resources that serve as raw material for locally produced news stories. Drawing on the theoretical lenses of institutional logics (Thornton et al., 2012) and epistemic authority and epistemic contests in news work (Ekström, 2002; Carlson, 2017; Carlson, 2025), the study analyzes the organizational and epistemic dynamics shaping collaboration between local newsrooms and a centrally positioned editorial desk. Specifically, we ask how organizational arrangements, resources, and institutional pressures influence collaborative workflows, and how authority, expertise, and professional credibility are distributed and contested across local and central newsrooms.

The study draws on qualitative interviews with news workers at the collaborative desk, representatives of LLA, NRK, and SUJO, and journalists and editors from participating local newspapers (N = 20). Findings reveal persistent tensions between the desk's project logic- focused on producing standardized data as editorial "raw material" – and the production logic of local newspapers, which must operate under severe time and staffing constraints. These constraints often limit local outlets' ability to fully realize the journalistic potential of the data packages. Moreover, the epistemic demands of producing news that is perceived as legitimate, accurate, and socially meaningful in local contexts generate friction between centralized data expertise and locally grounded journalistic knowledge. Nevertheless, informants express strong support for networked collaboration and identify several pathways for improving coordination and mutual understanding between the central desk and local newsrooms.

By foregrounding organizational logics and epistemic authority, this study contributes to media industry research by demonstrating how collaborative journalism operates as both an organizational strategy and a site of epistemic negotiation. It advances understanding of the conditions under which inter-organizational collaboration may strengthen or constrain local journalism and offers insights relevant to both scholars and practitioners concerned with the sustainability and quality of local news.

MIP13 Media Industries, Public Value and Cultural Expression in Transition

PP 1157 The public value created by public service media for and with the music industries in Estonia and Finland

Madis Järvekülg[1]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

The platformization and datafication of media service markets have raised challenges for the sustainability and diversity of local cultural industries, including music industries. At the same time, media scholars and practitioners are renegotiating the role of public service media (PSM) organizations in the digital age and the kinds of value they are expected to generate for their host societies, including their creative sectors (e.g. Túñez-López et al., 2021).

Bridging these two fields of inquiry, this paper asks: What kind of (public) value do Estonian Public Broadcasting (ERR) and Finnish Yleisradio (Yle) create for and with the local music industries? The two countries differ markedly in scale and level of institutional development, with Estonia representing a small and emerging music industry and Finland a larger and more established one.

The question is addressed through an exploratory research design that combines quantitative and qualitative approaches. First, the study investigates the presence – or absence – of music-specific programming principles, policies, and collaborative strategies at ERR and Yle through document analysis and interviews with PSM staff. Second, it examines the experiences and expectations of Estonian and Finnish music industry professionals regarding PSM through an online survey and around 40 semi-structured expert interviews.

The analysis maps how music-specific programming across channels, and collaborations between PSM and music professionals, generate different types of industry, cultural and societal value. Theoretically, the project synthesizes and advances the concepts of 'public value' (e.g. Mazzucato & Ryan-Collins, 2022) and 'national innovation systems' (e.g. Lundvall, 2010), drawing more broadly on innovation and institutional economics, systems and value theories, and public administration scholarship.

This paper forms part of a postdoctoral research project conducted in collaboration between Tallinn University and University of Turku, running until the end of 2027. The project's conceptual aim is to enhance understanding of how public and private institutions in the creative sectors interact. Specifically, for example, the project contributes empirically grounded insights to PSM scholarship on *market failure*, on the one hand, and *crowding out*, on the other (e.g. Donders et al., 2020), while foregrounding the social and cultural complexities of market shaping in national media economies. Ultimately, the findings aim to inform the development of more effective media and music policies in Estonia and Finland.

At the conference, the completed analysis of the Estonian case study will be presented, alongside preliminary comparative insights between the two countries.

MIP13 Media Industries, Public Value and Cultural Expression in Transition

PP 1158 The spiral of silence produced by the culture industry: Political expression and self-censorship among independent musicians in Turkey

Seyra Kestel[1]

[1] Istanbul Gelisim University, Advertising, Istanbul, Turkey

This study aims to examine how the culture industry produces a spiral of silence in Turkey by analyzing the experiences of non-mainstream/independent musicians, drawing on Adorno and Horkheimer's concept of the culture industry alongside Noelle-Neumann's spiral of silence theory. Adorno and Horkheimer's cultural industry criticizes the transformation of cultural production into an ideological apparatus that standardizes itself within the logic of the capitalist market and produces obedience under the guise of entertainment; Noelle-Neumann's spiral of silence theory, on the other hand, refers to individuals refraining from expressing their opinions in the public sphere for fear of being excluded by the majority.

In Turkey, the rapid increase in concert and festival cancellations in recent years, cultural event bans sometimes imposed through direct pressure from sects and communities, and the continuation of music bans during the pandemic even after the health justification disappeared, combined with digital platform algorithms and lynching/targeting practices, are spreading authoritarian cultural policies. This hegemonic environment demonstrates that the culture industry functions not only as an aesthetic production but also as a sphere of power that determines who can say what, how much, and how. However, critical cultural studies at the intersection of the culture industry and the spiral of silence are limited in the Turkish context. This study aims to fill this gap.

Within this scope, the study seeks answers to the following questions: (1) How do the structural and symbolic pressures produced by the culture industry create a spiral of silence for non-mainstream musicians in Turkey? (2) In which political and cultural themes does this spiral of silence turn into self-censorship? (3) How does this process differ for female and male musicians? Current discussions reveal that female musicians are targeted by moralistic discourse not only because of their politically charged lyrics, but also because of their bodies on stage, their clothing, their performances, and their feminist/body politics-related discourse; while male musicians face more economic and sectoral sanctions, such as concert/festival cancellations, blacklisting, and loss of livelihood.

The research field consists of 6 female and 6 male independent musicians who are not affiliated with major record labels and reach their audience through bars/small venues, alternative festivals, and digital platforms. Participants will be selected through purposeful and snowball sampling; data obtained from semi-structured focus group interviews conducted separately with female and male musicians will be analyzed through thematic analysis and critical theoretical reading. The study aims to offer a unique contribution to the cultural industry literature by discussing the current regime of pressure in the music field in Turkey from a critical cultural studies perspective, incorporating the dimensions of the spiral of silence and, to a lesser extent, gender/body politics.

MED01 Transformations of Mediatization in the Age of AI and Digital Infrastructures

PP 0011 Platformisation, datafication, automation… as well as other "ations". How do mediatisation researchers perceive successive transformative phenomena

Katarzyna Kopecka-Piech[1]

[1] Maria Curie-Sklodowska University in Lublin, Institute of Media and Communication Studies, Lublin, Poland

Contemporary research on mediatisation is undergoing a transformation. This concerns the subject of research, including redefinition of contemporary transformative processes, the methods used, as well as the structure of the research field. This prompts us to take a closer look at the condition and identity of the field of mediatisation research, while at the same time checking whether it complies with the principles of epistemology and the sociology of knowledge formulated years ago by such luminaries of knowledge theory as Fleck, Khun, Bourdieu and Knorr Cetina. What is a collective self-knowledge and collective self-understanding of the emerging new phenomena and the research field by its' creators themselves?

The aim of the presented research was to determine how researchers in the field of mediatisation perceive contemporary transformative phenomena such as platformisation, algorithmisation, datafication, automation, artificialisation, etc., and how they position them. The question was posted as to what extent they are facets of mediatisation and to what extent they constitute separate fields, and what significance this has for the identity of the field of mediatisation research. The opinions of the respondents on the relationship between new trends and the directions of transformation in the field were analysed. The perspectives of different generations of researchers (*founding fathers*, *continuators*, *innovators*) and their locations (Global North and Global South) were distinguished. The importance of science system and policy, institutionalisation and individual careers were emphasised for the direction of the research field. The latest developments were also confronted with the visions of the future of the field verbalised by researchers.

The study used individual, semi-structured in-depth interviews with mediatisation researchers. The data was collected in the first half of 2025. Fifty-six researchers from seventeen countries, including the northern and southern hemispheres, took part in the study. Fifty-three interviews were oral and three were written. First, researchers with the highest citation rates for their work on mediatisation were invited to participate in the study; then, individuals identified in interviews as key to the development of the field; and finally, individuals recommended by interviewees as potentially valuable informants.

The conclusions from the research point to the role of paradigmatic discussions, being *semi-paradigmatic game* within the field. Heterogeneous perception by the researchers of the role of new developments for the condition and identity of research on mediatization was identified. Specific mechanisms operating in the thought collective and thought style of mediatisation research, such as *combating anomalies through inclusion*, *the pursuit of novelty*, or *rushing ahead* were distinguished. The research also showed that institutional and financial elements of the science system are crucial for epistemic culture, including *career-driven practices* and *grant-oriented research environment*, as they determine the strategic and current decisions of the field's participants who decide on the future of the field.

MED01 Transformations of Mediatization in the Age of AI and Digital Infrastructures

PP 0012 Generative mediatization: How AI reconfigures discourse, authority, and public meaning

Katalin Feher[1], Bieke Zaman[2], Tomasz Gackowski[3]

[1] Ludovika University of Public Service, Department of Social Communication, Budapest, Hungary
[2] KU Leuven, Department of Communication Sciences, Leuven, Belgium
[3] University of Warsaw, Faculty of Journalism, Warsaw, Poland

Generative AI (GenAI) does not merely automate language; it reconfigures the conditions under which discourse, authority, and legitimacy emerge. Large language models increasingly co-author texts and simulate dialogue, reshaping not only communicative content but the infrastructural conditions of meaning-making. Mediatization theory provides a critical lens for understanding this transformation, given its long-standing focus on how media technologies—and, in deep mediatization, algorithmic infrastructures—reorganize communicative practices and institutional logics (Hepp, 2020; Couldry & Hepp, 2013). Yet the widespread adoption of algorithmic media and GenAI marks a deeper ontological shift: media no longer primarily mediate communication but actively generate meaning and even "new worlds" through algorithmic composition embedded in platform infrastructures (Feher, Gackowski & Zaman, under review).

Building on recent work conceptualizing this shift as generative mediatization (Feher, 2025), this present study argues that GenAI systems operate as automated discursive infrastructures (Monteiro-Krebs et al., 2024): material, computational, and institutional assemblages that shape what can be said, by whom, and with what perceived authority. Governed by probabilistic computation, platform logics, and corporate alignment regimes, these infrastructures remain largely opaque to

users (Bucher, 2018). At the same time, the computational foundations of synthetic text production reveal hidden material costs—from mining and energy consumption to digital waste—linking discursive power to ecological and infrastructural burdens (Haenens et al., 2024).

By filtering, remixing, and fabricating text, GenAI dissolves stable authorship, genre, and context, producing synthetic intertextuality without clear provenance or accountability (Noble, 2018; Benjamin, 2019). Drawing on platform studies and algorithmic governance, the present study shows how discursive power operates infrastructurally. Extending Gillespie's (2014) account of algorithms as socially constructed systems of relevance, GenAI creates fluent, institution-like discourse without epistemic grounding, producing simulative authority—an appearance of expertise generated through statistical patterning rather than accountable knowledge production, as conceptualized by the authors for Critical Discourse Studies (Feher et al., forthcoming, based on Bender et al., 2021 and Gillings et al., 2024). This authority is co-produced through the interplay of "warm" human practices and "cold" computational procedures (Hoes et al., 2024), reinforced by interface design and alignment mechanisms.

These dynamics fundamentally challenge established understandings of mediatization. At the intersection of mediatization and AI, public communication is increasingly co-produced by automated, stochastic infrastructures that lack social biography yet exercise classificatory, normative, and agenda-setting power (Gillespie, 2020; Włoch, 2025; Feher, 2025). This shift foregrounds discursive infrastructures as constitutive sites of mediatized power rather than neutral technical intermediaries, reinforcing the ECREA Mediatization Section's renewed focus on technologically driven societal transformation.

Taken together, these developments require a conceptual differentiation within mediatization theory. Mediatization captures how media technologies reorganize communicative practices and institutional logics; deep mediatization explains how algorithmic media infrastructures intensify and coordinate these processes across social domains. Generative AI, however, signals a further shift toward generative mediatization (Feher 2025), in which media systems no longer merely mediate or algorithmically structure communication but actively produce discourse, authority, and public meaning through automated, platform-based infrastructures.

MED01 Transformations of Mediatization in the Age of AI and Digital Infrastructures

PP 0013 Artificial Intelligence as a science communication challenge: On the need for and challenges of interdisciplinary collaboration across academia

Dennis Nguyen[1], Erik Hekman[1]

[1] Utrecht University, Media and Culture Studies, Utrecht, Netherlands

Artificial intelligence (AI) has become a highly visible and contested topic in contemporary public discourse. Current discussion around Generative AI (GenAI) and Large Language Models (LLMs) clearly illustrate the topic's relevance on public agendas worldwide. Media attention, political debate, and commercial interests have fuelled intense public discussion, often characterised by polarisation, hype, and competing claims about AI's capabilities, risks, and societal implications. While existing research has examined how AI is communicated in news media, governance, marketing, and social media, less attention has been paid to how public AI discourse relates to fragmentation and disagreement within academia and science themselves.

This study conceptualises AI as a science communication challenge and argues that current public debates around GenAI and LLMs cannot be fully understood without examining tensions within academic-scientific discourse. Empirically, it adopts a two-part research design that combines analyses of public-facing and academic-scientific communication. The first part draws on a qualitative analysis of social media discourse among academics and scientists to highlight frictions, disagreements, and competing knowledge claims in public GenAI debates. This analysis shows how disciplinary positions, normative commitments, and institutional affiliations shape public interventions by researchers, often reinforcing polarised framings rather than facilitating cross-disciplinary dialogue. Influential voices—particularly those operating at the intersection of academia and the technology industry—play a central role in structuring these debates.

The second part contextualises these public-facing dynamics through a large-scale computational analysis of academic publishing on LLMs. Drawing on 36,900 article abstracts retrieved from Web of Science, the study examines which disciplines are most actively publishing on LLM-related topics, the extent to which interdisciplinary exchange is occurring, and how different fields define key research questions and priorities. Methods include topic modelling, keyword analysis, and citation network analysis, enabling a comparative view of disciplinary emphases and patterns of intellectual exchange across the academic landscape.

By integrating insights from both parts, the study demonstrates how epistemic fragmentation within science contributes to confusion, contestation, and competing imaginaries in the public sphere. Differences in ontological assumptions, temporal orientations to risk, and evaluative criteria across disciplines help explain why debates about AI's present and future remain difficult to reconcile. The study concludes by reflecting on the implications of these findings for science communication and interdisciplinary collaboration, arguing that greater epistemic humility and sustained cross-disciplinary engagement are essential for fostering more coherent, balanced, and publicly meaningful discussions about emerging AI technologies.

MED01 Transformations of Mediatization in the Age of AI and Digital Infrastructures

PP 0014 Artificial intelligence and society: Comparative studies on attitudes, Opportunities, risks, and user practices in Germany and Poland

Karolina Brylska[1], Anna Mierzecka[1], Tomasz Gackowski[1], Caja Thimm[2]

[1] University of Warsaw, Faculty of Journalism- Information and Book Studies, Warsaw, Poland
[2] University of Bonn, Department of Language- Media Studies- and Musicology, Bonn, Germany

The rapid diffusion of artificial intelligence (AI) into everyday life has fundamentally altered communication practices, decision-making processes, and public discourse across societies. Since the release of large generative AI models such as ChatGPT in late 2022, AI technologies have become widely accessible and increasingly influential in domains ranging from media production and education to healthcare, finance, and political communication. While these developments offer considerable potential, they also generate profound societal concerns related to trust, transparency, bias, surveillance, and the legitimacy of automated decision-making. Understanding how AI is perceived, interpreted, and used in different European countries can be regarded as a key l challenge for contemporary social and communication research.

This paper presents a comparative, mixed-methods study investigating societal attitudes toward AI, perceived opportunities and risks, and emerging user practices in Germany and Poland. Empirically, the project combines three interrelated studies designed to capture AI perceptions at the levels of public discourse, stakeholder interpretation, and individual experience.

(1) Media Analysis: The first study adopts a comparative qualitative media analysis of AI-related coverage in major German and Polish online news outlets published between November 2022 and January 2025. The analysis takes the form of a discursive and narrative overview of media representations of artificial intelligence, anchored in key technological and regulatory moments (such as the release of GPT-4 and the adoption of the European AI Act). The study examines how AI is discursively constructed through recurrent interpretive frames, dominant narrative logics, evaluative repertoires, and thematic associations with risk, benefit, governance, ethics, and societal transformation. Attention is paid to patterns of meaning-making across texts, including implicit assumptions, metaphors, and argumentative structures that organize journalistic accounts. This approach allows for an in-depth understanding of how public meanings of AI are produced, stabilized, and contested within national media discourses.
(2) The second study employs semi-structured interviews with key stakeholders and experts from policymaking, industry, and civil society in both countries (n = 12). These interviews examine how actors involved in AI development, regulation, and advocacy interpret media narratives, assess societal readiness for AI, and negotiate tensions between innovation, regulation, and public trust. The qualitative data also serve a heuristic function by informing the design and interpretation of the population survey.
(3) The third study consists of a standardized online questionnaire conducted in Germany and Poland. Drawing on established measurement instruments, the survey captures multiple dimensions of AI acceptance, including trust, perceived usefulness, perceived risks, autonomy concerns, and willingness to use AI in specific application contexts (e.g., automated decision-making, generative AI, facial recognition). The survey enables comparative analyses across national contexts and socio-demographic variables, as well as alignment with existing European datasets.

By integrating findings from media content analysis, expert interviews, and population surveys, the project offers a data-driven, comparative account of how AI is socially constructed, evaluated, and practiced in Germany and Poland. The results contribute empirically to research on AI acceptance and trust in Europe, demonstrate the importance of context-specific application domains, and provide evidence relevant to ongoing debates on AI governance and regulation in Europe.

MED02 Artificial Intelligence and Professional CommunicationPractices

PP 0117 From declaration to reaction: How artificial intelligence transforms journalistic work – Findings from a biometric experiment

Marlena Sztyber[1], Tomasz Gackowski[1]

[1] University of Warsaw, Laboratory of Media Studies, Warsaw, Poland

Artificial intelligence (AI)'s growing presence in media production fundamentally reshapes journalism, from automating content creation to reorganizing newsroom workflows. These changes raise important questions about journalistic identity and professional autonomy, as well as about how journalists cognitively and emotionally respond to AI-supported work environments. Although interviews, surveys, and self-reports remain common in research on this topic, they often fail to capture unconscious or involuntary reactions to technological change (Karl, 2021).

This presentation reports findings from an empirical study combining traditional qualitative and quantitative methods with biometric analysis, offering a multidimensional perspective on how AI affects journalistic practice. The study was conducted among journalists in Poland, including both users and non-users of AI tools such as ChatGPT. By collecting physiological data - such as indicators of emotional arousal and cognitive load - the study captures psychological effects that remain inaccessible through self-reported measures alone.

The analysis addresses three main research questions:

(1) What differences emerge in the writing process between journalists who use ChatGPT and those who do not?
(2) How does AI influence task completion time and emotional engagement?
(3) Does chatbot use affect journalists' self-evaluation of efficiency and content quality?

Several hypotheses were formulated. It was assumed that participants using ChatGPT would complete writing tasks more quickly and exhibit lower levels of emotional arousal. At the same time, they were expected to report lower satisfaction with the quality of their written output compared to those working without AI assistance. These assumptions were based on previous research on automation and human-AI collaboration, which suggests that increased efficiency does not always correspond with positive evaluations of work outcomes. The hypotheses aimed to capture both the benefits and the potential limitations of AI-supported journalistic work. Testing these assumptions is important for understanding how journalists actually use AI tools in their everyday professional practice. Such knowledge is crucial for evaluating the impact of AI on journalistic quality and the future working conditions in newsrooms.

Triangulating biometric data with interviews and survey responses increased the credibility of the findings and reduced interpretative bias (Denzin, 2012; Fusch et al., 2018). Overall, the study demonstrates how biometric tools can enrich research on the human dimensions of technological transformation in journalism and media practice, contributing to a deeper understanding of journalists' embodied responses to AI-supported work environments.

MED02 Artificial Intelligence and Professional CommunicationPractices

PP 0118 From gatekeepers to interpreters: How AI reshapes information mediation practices and professional competencies

Tim De Winkel[1], Marieke Peeters[2], Stephanie De Smale[3]

[1] University of Applied Sciences Utrecht, Social Interaction in Public life communicatie in digitale transitie, Utrecht, Netherlands
[2] University of Applied Sciences Utrecht, Artificial Intelligence, Utrecht, Netherlands
[3] Independent researcher, Independent researcher, Amsterdam, Netherlands

The growing reliance on AI-mediated information systems threatens a crucial societal function: the provision of reliable, contextualised information by impartial experts, such as archivists and news analysts, who are trained in methodological rigor, bound by professional ethics, and accountable for their interpretations. We conceptualise their work as iterative hermeneutic information mediation: a recursive, expert-driven practice in which hypotheses are continuously formed, tested, and revised through contextualisation, repositioning, and engagement with data records and stakeholders. In archival studies, this mode of work aligns with the records continuum model — create, capture, organise, pluralise (Colavizza et al., 2021). Media analysts often use AI or data-driven methods and tools to make sense of the public discourse emerging around news and ongoing affairs, including crisis communication (Meißner & Diers-Lawson, 2022; de Winkel et al., 2026, forthcoming).

The introduction of AI into this workflow of information experts reconfigures the practice by relocating key moments of judgement downstream of algorithmic processing. Drawing on the notion of human-AI team design patterns (Van Zoelen et al., 2023), we observe that AI systems occupy an intermediary position between expert and stakeholder (e.g. citizen or government official), implicitly substituting direct interaction. This reconfiguration often spurs from implicit assumptions that AI mediation improves efficiency, rather than explicit workflow (re)design choices. In practice, however, this shift fundamentally alters the work of information professionals. Such interdependent sociotechnical changes raise pressing questions for professional training and workflow (re)design (Hernandez et al., 2024). Human experts require new digital, epistemic, and evaluative competencies, while simultaneously AI systems need to be designed as to foster meaningful human-AI collaboration — through explainability, traceability, and support for iterative (re)interpretation. Such a reconfiguration should thus be considered as a process of 'mediatization' (Hjarvard, 2008, p. 105) both forcing professional information work to adapt to AI driven media, as well as integrating itself in the workflow of the information expert.

This paper researches the evolving configurations of human-AI collaboration for information mediation. We discuss two use cases of changing epistemic authority from human information professionals, to interpreters of AI-driven systems: the Oorlog voor de Rechter project, in which the use of AI reconfigures the workflow and evaluation of digitised archival material, and the Bird's Eye Perspective (BEP) project, which supports communication professionals in analysing social media discourse using discursive psychology frameworks. Through interviews with information professionals and an analysis of learning goals, didactic approaches, and values, we examine changes in professional roles, expertise, accountability, and required competencies, as well as the functional requirements of AI systems, including explainability, trust, and support for iterative sensemaking. Our findings are used to inform the development of a robust sociotechnical design framework that integrates professional (re)training with AI-mediated workflow and human-AI interaction requirements, ensuring that expert judgement is strengthened rather than eroded. This research aims to guide and empower information professionals to navigate and shape the evolving information ecosystem, without losing their core contributions in the process.

MED02 Artificial Intelligence and Professional CommunicationPractices

PP 0119 AI usage, perceptions, and literacy across scientists, communicators, intermediaries, and citizens: Mapping the Swiss science communication landscape

Xiran Liu[1], Damiano Lombardi[1], Gerta Lokaj[1], Sophia Volk[2], Mike Schäfer[1], Daniela Mahl[1]

[1] University of Zurich, Department of Communication and Media Research IKMZ, Zurich, Switzerland
[2] Ludwig Maximilian University of Munich, Department of Media and Communication, Munich, Germany

Rationale

Artificial intelligence (AI) is said to fundamentally reshape science communication (AUTHOR, 2023), representing a new phase of deep mediatization caused by communicative AI. Yet, empirical evidence to support such claims is scarce, and comprehensive mappings across science communication actors involved is lacking (AUTHOR, 2025). Building on theories of sociotechnological adoption and change (e.g. Venkatesh et al., 2003), AI literacy (Ng et al., 2021), and mediatization approaches (AUTHOR, 2014), this study provides a comprehensive mapping of AI-related dimensions across the Swiss science communication ecosystem. Drawing on a comprehensive, large-scale, national study that surveys (1) professional science communicators, (2) scientists, (3) Wikipedians, (4) science content creators, (5) science journalists, and (6) citizens, we ask:

RQ: How do these groups converge and diverge in their use of, perceptions of, and literacy regarding AI in science communication?

Data

Data collection takes place from November 2025 to March 2026. Respondents are recruited through collaborations with institutions, professional associations, and communities of practice; curated mailing lists; snowball sampling on social media platforms; and third-party polling companies. Surveys are administered in German, French, Italian, and partly in English. The study is being preregistered, and the authors have not yet accessed the responses.

The citizen survey includes 2,000 respondents. All other groups are expected to have approximately 250 responses each, except for science journalists and content creators, resulting in an estimated total sample of at least 3,000.

Measures

All surveys share a common structure and assess the same constructs, with wordings adapted to each group. The following dimensions are included: *AI attitudes* are measured using established multi-item scales adapted from prior research (e.g., Greussing et al., 2025; Sohn & Kwon, 2020; Gillespie et al., 2023). *AI literacy* is assessed through a combination of subjective assessments and objective knowledge-based items drawing on validated instruments (e.g., Wissenschaftsbarometer, 2025; Henestrosa & Kimmerle, 2024; Klein-Avraham et al., 2025). *AI use* captures the frequency of AI use both in general and specifically for science communication, including the applications used, intended future use, and the purposes for which AI is employed (e.g., Henke, 2025).

Additional measures cover perceived current and anticipated *impacts of AI* on science communication, *sources of AI-related information*, and, where applicable, the availability of AI resources and their integration within *organizational contexts*. All surveys also include *sociodemographic variables* and relevant professional roles.

Analysis

We will provide descriptive analyses across the seven dimensions and all groups. We will conduct ANOVA tests for comparable measures across groups, with special attention to similarities and differences based on conceptual assumptions, such as that communication professionals and science journalists differ in their attitudes toward AI due to distinct institutional settings and professional roles (Guenther et al., 2025; Henke, 2024).

Contribution

This study offers the first comprehensive mapping of AI use, perceptions, and literacy across a national science communication landscape, offering critical insights into evolving intersections of mediatization, AI, and society. It thereby establishes an empirical baseline for understanding AI's role in science communication and provides a point of reference for future research.

MED02 Artificial Intelligence and Professional CommunicationPractices

PP 0120 Academic cosplay in code: A critical analysis of virtual research agents

Erik Hekman[1], Dennis Nguyen[1], Annette Markham[1]

[1] Utrecht University, Media and Culture Studies, Utrecht, Netherlands

Large language models (LLMs) are increasingly embedded in academic research, raising cross-disciplinary questions about epistemic authority and methodological practice. Across the humanities, social sciences, and media and communication studies, scholars are reflecting on LLMs' implications while a growing number of researchers use them for coding support, summarizing scholarly texts, and generating or refining research questions. Beyond task-level uses, some research projects

now assemble LLMs into multi-step pipelines presented as "agentic" research workflows. These workflows anthropomorphize LLMs through role labels (e.g., "research assistant," "reviewer"), while a human researcher "orchestrates" outputs through prompting to mimic a conventional process of knowledge production. For example, Stanford's *Virtual Lab* gives the role of "Principal Investigator" to the LLM, who, when prompted, coordinates specialist components and tool-based steps to generate SARS-CoV-2 nanobody candidates. Another example is the *Agent Laboratory* that produces literature reviews, collects data, proposes and runs machine-learning experiments, and drafts research reports, based on user prompts.

Despite the attention these systems attract, especially in STEM settings where research problems are allegedly more "structured", empirical research examining the agents themselves remains limited. We take this point of departure to study the concrete yet rhetorically powerful mechanisms through which "research" is formalized into roles, prompts, steps, and evaluation procedures. Our study begins from a Critical Code Studies premise: mechanisms implemented in source code and prompt/configuration files are not neutral. They reflect assumptions about credibility and authority and translate "proper" methodological procedure into operational decisions, while also functioning persuasively to guide—and delimit—how research ought to be conducted.

This contribution reports findings from our study of how academic research is mediated through code. We have developed a digital mixed-method approach that combines quantitative repository profiling with qualitative content analysis of programming code, treating source code as the primary "text" (alongside prompts, configuration, and documentation). We analyze 11 open-source GitHub repositories linked to academic projects that release working prototypes of multi-step pipelines with role/task decomposition and tool calls. Rather than evaluating performance, we analyze what these systems encode about research itself—how they model academic research into tasks and roles, and how assumptions about validation and credibility are built into workflows. Our goal is twofold: first, to provide a critical analysis suitable for researchers to understand and better interrogate what may be happening under the surface of their AI-enabled tools and automated workflow assistants. Second, we articulate a systematic and scalable methodological framework for tracing how epistemic cultures and imaginaries of academic inquiry are translated into computational form.

This study results in (1) a typology of how academic labor is operationalized, (2) a set of recurring design patterns of these agentic systems, and (3) a reusable digital method for studying agentic research workflows as GitHub repository artefacts. We conclude by discussing implications for trust and authority when particular visions of "good research" become packaged as reusable software and sketch the epistemological consequences if such LLM-based systems come to be used in humanities, social sciences, and media and communication studies.

MED02 Artificial Intelligence and Professional CommunicationPractices

PP 0121 Navigating visibility as reward, risk, and structural force: How Chinese editors negotiate with Weibo algorithms

Xi Wang[1], Zhang Shuhua[1]

[1] Zhengzhou University, Journalism &- Communication, Zhengzhou, China

In the Algorithm Age, algorithms increasingly assist or even replace human actors in allocating online traffic and mediating visibility. While recent scholarship has illuminated how various actors, including influencers (Bishop, 2019), fans (Zhang et al., 2023), and activists (Proferes & Summers, 2019; Treré, 2019), "play the visibility game"—a framework Cotter (2019) uses to conceptualize actors' pursuit of visibility as an algorithmically governed game—it has largely focused on strategic actors driven by commercial incentives. In contrast, journalistic actors are more often guided by a public-oriented logic.

Drawing on Weibo Trending Topics as a case study, this article addresses this gap through 15 semi-structured interviews with Chinese editors across four types of media institutions: Party-oriented Official Press (POP), Audience-oriented Official Press (AOP), Market-oriented Commercial Press (MCP), and Watchdog-oriented Commercial Press (WCP). **This study examines how these editors perceive Weibo's evolving algorithms and negotiate visibility, and investigates the factors driving the similarities and distinctions in their practices.**

Our analysis reveals a hierarchy of proactivity: MCPs demonstrate the highest initiative in playing the visibility game, followed by WCPs, AOPs, and finally POPs. While editors enjoy (1) privileged access to traffic allocation, (2) amplified visibility for "positive energy" content, and (3) occasional insights into adjustments of trending rules, these "algorithmic privileges" coexist with structural constraints—namely, internal tensions between platform logic and journalistic norms, and external pressures to cautiously manage visibility. **We demonstrate how three conceptualizations of visibility—as reward, risk, and structural force—collectively shape editors' varying algorithmic practices on Weibo.** Visibility operates first and foremost as a structural force, shaped by the "specific politics of arrangement, architecture, and design" (Bucher, 2012, p. 1165) of platforms. Weibo's algorithmic architecture systematically favors legacy media by granting them greater weight for "positive-energy" content. Meanwhile, by designating the "topic host" mechanism, Weibo simultaneously incentivizes editors to boost visibility and shifts liability from the platform to content providers. Within this framework, reward and risk are inextricably linked: while increased visibility may yield user attention, traffic, and influence, it also brings heightened surveillance, scrutiny, and potential penalties. This explains why editors, particularly those at POPs, tend to cautiously negotiate, manage, or even restrict the visibility of certain content, aligning with studies on marginalized actors who adopt strategic

invisibility for self-protection (Stegeman et al., 2024). Highlighting editors' agency to negotiate with, rather than merely cater to, Weibo's algorithms, we propose the concept of "steerable algorithms" to capture deliberate efforts that direct algorithmic systems toward specific ends. Contextualized by Chinese President Xi Jinping's directive to "steer algorithms with mainstream value guidance," this concept emphasizes the situatedness of editorial practices within China's socio-political context, where regulators play a key role in governing visibility dynamics. **Ultimately, by demonstrating how visibility is negotiated within a politically bounded arena rather than on a level playing field, we extend Cotter's framework to underscore the inherently political nature of visibility.**

MED03 Communication, Visibility, and Algorithmic Infrastructures

PP 0227 Mediatizing digital infrastructure: Sustainability, sensemaking, and the European welfare state

Joseph Doolen[1]

[1] University of Stavanger, Media and Social Sciences, Stavanger, Norway

This paper investigates how the expansion of data-intensive digital infrastructures is mediated and made meaningful within European welfare states, focusing on Germany, Norway, and Sweden. Building on mediatization theory, it conceptualizes digital infrastructure not only as a technical or economic resource, but as a communicative and symbolic object through which sustainability, sovereignty, and public value are articulated, contested, and stabilized. As European welfare states digitalize public services and administrative functions, they increasingly operate within media logics shaped by platformization, datafication, and infrastructural visibility. Data centers, cloud services, and high-energy digital systems emerge as simultaneously indispensable and opaque foundations of the digital welfare state. While governments in Germany, Norway, and Sweden formally align digitalization with economic, social, and environmental sustainability, these infrastructures are largely developed and controlled by multinational corporations whose logics of optimization, scalability, and profit operate across national boundaries. Drawing on qualitative interviews with actors involved in producing and circulating public meanings of digital infrastructure—including digital infrastructure industry representatives, government officials, journalists, and public service media professionals—the paper analyzes expert sensemaking as a key mechanism of mediatization. It shows how sustainability is framed through narratives of innovation, efficiency, and green transition, while questions of ownership, democratic control, and long-term societal dependence remain weakly articulated in public discourse. The analysis identifies a paradox of trust characteristic of what can be described as a media welfare state: strong normative commitments to equality, universality, and public service coexist with mediated forms of legitimacy that normalize the growing infrastructural power of global platform companies. Mediatization thus contributes not only to the visibility of digital transformation, but also to the selective obscuring of its political and material consequences. By foregrounding how infrastructures are communicatively constructed rather than merely implemented, this paper advances mediatization research by demonstrating how media logics actively shape the conditions under which welfare-state sustainability is imagined, negotiated, and potentially destabilized in a hyper-digitalized European context.

MED03 Communication, Visibility, and Algorithmic Infrastructures

PP 0228 From media logic to metric logic: Engagement-driven visibility in Norwegian leaders' COVID-19 Facebook communication

Roy Aulie Jacobsen[1]

[1] Kristiania University of Applied Sciences, Department of Communication, Oslo, Norway

Mediatization describes the process by which political actors adapt to media logic to secure public attention. Platformization extends this transformation by structuring visibility through algorithmic ranking, where engagement metrics serve as indicators of relevance. During prolonged crises, this dynamic produces a visibility dilemma: messages intended to inform and reassure may circulate less widely than those optimized for engagement-driven selection. This study investigates how crisis message strategies in Norwegian party leaders' Facebook posts, as indicated by reactions, shares, and comments, varied during the COVID-19 pandemic and how leaders' repertoires shifted across different lockdown phases and political roles. The central argument is not that platform metrics replace media logic. Rather, metric-based visibility constitutes an additional layer that can influence which aspects of a mediatized crisis message become prominent in users' feeds.

The analysis includes 7,264 posts from twelve parliamentary party leaders, spanning from six months prior to the outbreak of the COVID-19 pandemic and first national lockdown in Norway, until the beginning of 2022 with the end of the third national lockdown. All posts have been manually coded using an adapted nine-category crisis strategy typology, and negative binomial models are employed to estimate associations between strategy and engagement for reactions, shares, and comments. The categories includes both crisis-normative communication and established forms of political performance, including criticism, actionable steps, self-enhancement, crisis framing, accommodative, organizational, and interorganizational messages. Engagement modes are analyzed separately, as they likely represent distinct actions: a quick reaction, redistribution to one's network, or an invitation to discussion. The study does not directly observe Facebook's ranking system; instead, it examines public metrics visible to both leaders and citizens in real time.

The results demonstrate a distinct hierarchy of messages that becomes visible. Criticism emerges as the most likely to diffuse, particularly through shares. Self-enhancement predominantly increases reactions, which represent lightweight approval, but does not significantly enhance redistribution or discussion. Actionable steps are associated with increased shares but reduced reactions, indicating selective mobilization. Crisis framing and accommodative support yield neutral or negative engagement, as do organizational and interorganizational messages. Government leaders receive significantly less engagement than opposition leaders. Over time, guidance and reassurance peak during the initial lockdown and subsequently decline as contestation, mobilization, and leader-centered performance become more prominent. These engagement patterns do not necessarily indicate endorsement; for instance, comments may reflect frustration, conflict, or coordinated attacks, and shares may disseminate critique rather than support.

This article delineates how mediatized crisis repertoires are filtered by platform metrics. In prolonged crises, metric logic amplifies conflict and performance while diminishing consistent informational and supportive communication, thereby reshaping democratic visibility and scrutiny. Elevated engagement for criticism and mobilization may reflect increased citizen demand for accountability and participation as uncertainty and fatigue intensify. Regardless, engagement-driven visibility is an important part of the communication environment that leaders must navigate, influencing which messages are most likely to be encountered, debated, and retained during crisis governance.

MED03 Communication, Visibility, and Algorithmic Infrastructures

PP 0229 The mediatization and the construction of representations of autism: Strategies of actors, devices, and communication practices in the French-speaking YouTube

Robin Gaillard[1], Alix Guillaume[2], Zhuoran Ma[3]

[1] Université de Lorraine, Laboratory CREM, Nancy, France
[2] Université Grenoble Alpes, Laboratory GRESEC, Grenoble, France
[3] Jean Moulin Lyon 3 University, Laboratory ELICO, Lyon, France

Introduction

Controversy has long been a central element of the discussions on the definitions and representations of autism. In France especially, the dominance of psychoanalysis among the psychiatric field has amplified this phenomenon. Perspectives diverge across countries, cultures, and families (Chamak, 2018), the context of deep mediatization (Hepp, 2020) amplifying the tensions, mainly because of algorithmic logics intensifying the polarization of public discourse.

This research aims to show how the mediatization of diverse representations of autism on YouTube contributes to the construction of social representations within a fragmented public sphere. The study formulates three hypotheses:

1. Editorialized mediatization by institutional actors reinforces medicalized representations of autism.
2. Algorithmically oriented engagement broadens mediatization while contributing to the fragmentation of the public sphere.
3. Representations of autism lie at the center of tensions between editorialized and individualized mediatization.

In other words, the media provides a framework for discourses on health issues by shaping representations of autism (Dachez & Navarro, 2016), and they influence how audiences perceive this condition (Jones & Harwood, 2009; Nairn et al., 2001). In this study, "mediatization" refers to the forms of media coverage, but also to a broader "process of mediatization" (Lafon, 2019).

Methodology

The corpus consists of the 100 most visible YouTube videos retrieved with the French keyword "autisme", along with all associated comments. A mixed-method computational approach was deployed: automatic lexical–thematic analysis, sentiment and civility analysis using machine-learning models, extraction of salient informational elements, and network analysis of interactions.

Together, these methods offer insight on how heterogeneous perspectives shape representations of autism, how institutional and individual actors display specific communicational strategies, and where conflicts of interests and interpretations emerge.

Findings

Three main results stand out.

First, editorialized mediatization revolves around two dominant themes: scientific expertise (e.g., neuroscience, diagnostics) and experiential knowledge (e.g., lived experience). However, algorithmic visibility is uneven: YouTube tends to promote videos relying heavily on medical or scientific terminology, whereas experience-based videos appear predominantly in lower-ranked positions.

Second, individual actors expand mediatization toward broader socio-political arenas, including gender differences, vaccine debates, and political ideologies, circulating pseudoscientific claims or conspiracy narratives.

Third, videos with a stronger scientific orientation attract more toxic and hostile comments than those centered on subjective experience, revealing conflicts not only over knowledge but over authority and legitimacy in speaking about autism.

Discussion

The mediatization of autism emerges as both fragmented and broad. This dynamic results from the scientific complexity of the characterization of autism, the plurality of social interpretations, and the entanglement of the topic with wider societal debates (science vs. pseudoscience, gender politics, distrust in institutions).

Within this environment, platforms and algorithms operate as structuring devices. By modulating the visibility and circulation of content, they influence what counts as legitimate knowledge, they shape public understandings of autism, and ultimately they contribute to the ongoing reconfiguration of its social representations.

MED03 Communication, Visibility, and Algorithmic Infrastructures

PP 0230 Discourse Network 2000: Algorithmic Behavioral Environments and the 'So-Called Man'

Hui-Lan Chang[1]

[1] Tamkang University, Department of Information and Communication, New Taipei City, Taiwan Province of China

Contemporary discussions of mediatization increasingly foreground the role of digital platforms and their algorithmic operations in shaping social communication, cultural visibility, and political attention. Yet much of this literature remains focused on representational effects, discursive circulation, or questions of power and bias at the level of content, while leaving under-theorized the deeper infrastructural conditions through which perception, action, and intelligibility are pre-structured. This paper argues that such limitations call for a renewed engagement with German media theory, particularly Friedrich Kittler's concept of *Discourse Networks* (*Aufschreibesysteme*), as a means to rethink mediatization under conditions of algorithmic governance.

Kittler (1990) famously theorized *Discourse Networks 1800/1900* as historically specific configurations in which media technologies, institutional arrangements, and cultural techniques jointly determined what could be said, perceived, and archived. However, his framework remains anchored in inscription, storage, and transmission systems characteristic of literary, phonographic, and cinematic media. This paper contends that contemporary platform environments expose a historical blind spot in Kittler's model: discourse is no longer stabilized primarily through inscription and archival media, but through continuous computational modulation of behavior in real time. To address this shift, the paper proposes an extended framework '*Discourse Network' 2000* to conceptualize digital platforms as algorithmically governed environments that pre-structure conduct rather than merely mediate meaning.

Drawing on an analysis of algorithm-related patent documents from major social media platforms such as Instagram, the paper adopts a media-archaeological reading of patents as technical-institutional inscriptions. These documents articulate how platforms formally conceptualize recommendation systems, collaborative filtering, traffic pooling, model distillation, and seed-account mechanisms. Rather than treating these techniques as neutral tools of optimization, the paper argues that patents function as operative texts in which platforms explicitly define permissible relations between users, content, and visibility. In this sense, algorithmic patents constitute a contemporary form of *Aufschreibesysteme*: they encode anticipations of future behavior and render conduct calculable in advance.

Building on this analysis, the paper introduces the concept of behavioral environment engineering to describe how platforms orchestrate interfaces, ranking logics, feedback loops, and data models into a unified infrastructural regime. From a German media-theoretical perspective, platform algorithms should thus be understood as cultural techniques rather than symbolic representations. They are operational procedures that organize attention, temporal rhythms, and perceptual thresholds. Algorithms do not simply recommend content; they reconfigure the conditions under which action becomes likely, visible, or statistically valuable.

By extending Kittler's concept of Discourse Networks into the context of algorithmically governed digital platforms, this paper introduces *Discourse Network 2000* as a framework for understanding how platforms write, calculate, and regulate user behavior. In doing so, it advances mediatization research by moving beyond analyses of mediated communication toward a critical engagement with algorithmic behavioral environments, demonstrating how these infrastructures pre-structure perception, action, and experience for the so-called Man in the digital age.

MED04 Critical Perspectives on Mediatization And Communicative AI: Data Infrastructures and Markets, Democracy, Silence and Mediatized Expectations

PN 23 Communicative AI as knowledge capture and colonial landgrab

Nick Couldry[1]

[1] LSE, Media and Communications, London, United Kingdom

Communicative AI represents a fundamental new stage in the evolution of deep mediatization (Couldry and Hepp 2016), but, as such, it must also be connected to broader theorisations of what datafication signifies in terms of history and political economy. This paper furthers this agenda by interpreting communicative AI within the wider framework of data colonialism (Couldry and Mejias, 2019; Mejias and Couldry 2024). By connecting AI to sociology of knowledge, it also shows how AI works to reappropriate and reorganize social relations. The paper will argue that, while communicative AI has been developed as part of advanced capitalism, it is more fully understood as data colonialism (defined as 'an emerging order for the appropriation of human life so that data can be continuously extracted form it for profit'). Data colonialism continues five centuries of colonialism's interlocking relations with capitalism: it is just the latest in a long series of colonial landgrabs. AI's place in this trajectory is clear, since generative AI treats the whole world of communicative production as its input, or, in colonial terms, its territory. From the point of view of sociology of knowledge, communicative AI is much more than a technique of computation. Communicative AI attempts to alter the social construction of knowledge (Berger and Luckmann 1974). GenAI, in turn, involves its users in a new type of data relation (Couldry and Mejias 2019) from which further input to large language models is garnered via our interactions with the AI interface. Seeing generative AI from a colonial perspective enables us both to foreground the changed relation to knowledge and cultural production that it represents (consider the current lawsuit by the New York Times against Open AI and Microsoft), but also to consider critically the changed social relations that will result from adopting communicative AI, and particularly GenAI. These arguments allow us to rethink the communicative potential of AI: rather than discounting human intelligence (as discourse about commercial AI so often does), we should recentre the AI debate around a humanistic perspective. Once the ambition of corporate capture behind today's commercial AI tools has been exposed, the space to imagine a different vision of AI for public or social good, not merely commercial gain, emerges.

MED04 Critical Perspectives on Mediatization And Communicative AI: Data Infrastructures and Markets, Democracy, Silence and Mediatized Expectations

PN 24 What's the value of Communicative AI? A critique of valuation in mediatized communicative domains

Göran Bolin[1]

[1] Södertörn University, Media & Communication Studies, Huddinge, Sweden

The rise of communicative AI such as chatbots, virtual assistants, and other conversational agents has been discussed with increasing intensity over the last decade and can be considered a new phase in the mediatization of culture and society Hepp et al 2024). Previous research has explored its impact on everyday family life, automated social services, newsroom decision-making, and news evaluation. However, communicative AI also contributes to the expansion of markets in contemporary data capitalism. This theoretical paper examines the ways in which ComAI expands on markets within this new phase of capitalism by discussing the value-generating practices of ComAI, addressing the question: How can we understand the role of ComAI in the expansion of mediatized and datafied markets, and what implications does this expansion have for other societal valuation processes as they are subsumed mediatized dynamics in hitherto non-mediatized social domains (e.g. social, cultural and/or public value)? After placing data capitalism in relief to previous forms of capitalism and their production modes, the paper explains the ways in which data capitalism extends its ability to exploit the social by incorporating human communication into its extraction processes. Communication, it is argued, forms the foundation of all social relations, and until recently, communication research in the social sciences and the humanities has mainly centred on communicative interactions between humans. However, with the rise of communicative AI in various social spheres, one of these human agents is often replaced by a conversational agent. This shift enables machines to participate in the production of communicative acts, making these acts subject to extraction, processing, and commodification. The main part of the paper then explores how this market expansion extends into public sectors such as welfare, health, education and customer services – areas where communication has become technologically mediatized and transitioned from personal (non-extractable) interactions over the phone or in-person to (extractable) exchanges between individuals and chatbot systems. In these sectors, we see a growing automation of relationships between welfare workers and clients, medical staff and patients, teachers and students, and service providers and customers. Except the domain of customer services, these are not market relations, nor are they evaluated according to economic valuation standards. The central question is to what extent these interactions are influenced by market logics, and how this transformation will affect their underlying valuation practices within these different domains.

MED04 Critical Perspectives on Mediatization And Communicative AI: Data Infrastructures and Markets, Democracy, Silence and Mediatized Expectations

PN 25 Talking politics with Communicative AI: New opportunities or challenges for democratic discourse?

Simone Tosoni[1], Simone Carlo[1], Giovanna Mascheroni[1]

[1] Università Cattolica del Sacro Cuore, Dipartimento di Scienze della comunicazione e dello spettacolo, Milano, Italy

The presentation builds on the findings from two waves of experimental studies exploring the use of Communicative AI in playful debates around controversial public issues, specifically focusing on the performative environmental activism of the Italian movement "Last Generation" ("Ultima Generazione", UG) (Mascheroni, Tosoni & Colombo, 2025). The study critically examined the implications of interactions with Communicative AI for democratic discourse on three levels: (1) the form of public debates on controversial issues as framed by Communicative AI; (2) the rhetorical—and ideological—strategies enacted by Communicative AI; and (3) the contribution of Communicative AI to participants' understanding of the complexity of a specific controversial issues. Findings of the first experiments suggest that ChatGPT tends to structure political discourse within the boundaries of rationality and formal politeness (Lakoff 1973), which may appear more desirable than the often heated exchanges in TV talk shows or political conversations on social media. However, its clearly robotic nature results in reasoning that lacks empathy and embodied experience, which participants perceived as non-human and inappropriate for political debates (Papacharissi 2010, 2015). Second, participants identified "problematic" discursive strategies used by ChatGPT, such as instrumental use of historical examples and other non-transparent operations of persuasion, to undermine UG's credibility. Third, while participants judged their participation in the debate to be informative, thanks to the contributions of the other players to the discussion, they also regarded ChatGPT's role to increasing their own understanding of this controversial environmental movement as rather limited. Participants defined ChatGPT as a "search engine for common sense discourse" that uncritically reproduces mainstream views on environmentalist movements expressed by politicians and the media, despite its potential access to more diverse and in-depth knowledge. However, the capable simulation of a civil conversation may add a layer of trustworthiness to an otherwise superficial assemblage of information reproducing hegemonic discourses. Moreover, ChatGPT tends to avoid contradicting its interlocutors and gradually sides with their viewpoint in the course of the verbal exchange. To assess whether these findings are prompt- or issue-dependent we conducted a second round of experiments involving different prompts and other controversial issues that, similarly to environmental activism, were further polarised through a sensationalist media coverage. This helped us further discuss the implications of ChatGPT's built-in sycophancy for democratic deliberations, and more in general to assess its possible role in the mediatized public debate.

MED04 Critical Perspectives on Mediatization And Communicative AI: Data Infrastructures and Markets, Democracy, Silence and Mediatized Expectations

PN 26 The silent chatbot: On the democratic significance of silence in times of Communicative AI

Taina Bucher[1]

[1] University of Oslo, Department of Media and Communication, Oslo, Norway

This paper explores the concept of "silent" artificial intelligence (AI) and its democratic significance, offering a critique of current AI models that feed on textual input, prompts, and verbal interaction. A chatbot is expected to chat, a social robot to converse, a digital assistant to respond verbally. Yet, the absence of silence in AI models raises questions about their fidelity to human behavior. It argues that the pervasive focus on dialogic models of AI, which prioritize interaction and response, may lead to an incomplete and distorted understanding of communicative AI. Drawing parallels to Turing's works, the paper explores the dynamics of AI role-playing and the biases inherent in how AI is being conceptualized. By learning and replicating typical communication patterns, generative AI tends to gravitate toward the average or most frequent forms of expression. This tendency results in a paradox: the "silent" behaviors, such as indifference, inexpression, or even deliberate silence, are not adequately represented, accounted for or valued in communicative AI.The right to free opinion formation includes the right not to express an opinion, as well as the right to change one's opinion at any time and for any reason. Freedom of expression therefore also includes the right to remain silent, if one so chooses. Machine-generated expressions, on the other hand, are a representation of opinions that have already been expressed. Silence can be a form of expression, but silence means that one's opinions are not captured by large language models. As a result, the basis for the machine's production of expressions will not be representative of the diversity of opinions that actually exist. That is, those who choose to remain silent, or those whose voices are already marginalized, become even more invisible within AI-mediated spaces. This double erasure occurs because AI both overlooks the existence of the silent majority and amplifies the more vocal, creating a skewed and unrepresentative discourse. This paper critically examines how this omission of silence contributes to a broader undemocratic dynamic in AI-mediated environments. By favoring verbal interaction and neglecting the communicative potential of silence, large language models mediatizes the communicative situation and thus reinforce existing power imbalances and marginalize certain forms of expression. Ultimately, this paper calls for a reconsideration of what counts as communicative AI, making the case for silence be incorporated as a fundamental aspect of communication, to foster a more inclusive and democratic discourse in AI-mediated environments.

MED05 Mediatization and Platformed Cultures in Contemporary Society

PP 0444 Mediating Peace in War: Memes, Platform Logic, and Visual Resistance in Ukraine

Olena Zinenko[1], Victoria Bolotova[2], Liliya Zmii[3]

[1] Ruhr University Bochum, IFHV, Bochum, Ukraine
[2] Institute of Sociology and Media Communications V.N.Karazin Kharkiv National University, Department of Media Communications, Kharkiv, Ukraine
[3] V.N.Karazin Kharkiv National University, Public Relations Centre, Kharkiv, Ukraine

Peace in times of war is never neutral. Rather than a universal moral category, it is embedded in power relations, ideological frameworks, and communicative regimes shaping visibility and legitimacy (Pugh, Cooper, & Turner, 2008). In authoritarian and even democratic contexts, political peace can stabilize asymmetric relations and legitimize violence (Tanabe, 2019). The war in Ukraine has reinvigorated debates on peace practices sustaining social cohesion and negotiation (Lehti, Brylov, de Coning, & Kalenychenko, 2025; Kyselova & Landau, 2025).

From a media studies perspective, peace emerges not only as a political or ethical ideal but as a mediated construct shaped by platform architectures, algorithmic logics, and dominant narrative frames (Ortiz dos Santos, 2023). Media logics structure social and political life, influencing how social concepts are represented, circulated, and contested (Krotz, 2007, 2014). In digital environments, peace communication connects multiple discursive regimes and is conditioned by the positionality of communicators—ranging from authoritarian peace imposed by force, to transactional "peace deals," to justice-based peace grounded in human rights discourse.

This study explores how Ukrainian meme culture reclaims and redefines peace by intervening in these communicative regimes. Memes are conceptualized as mediated acts of resistance that transform peace from an instrument of domination into a justice-oriented horizon anchored in dignity, freedom, and political agency. While often dismissed as ephemeral artifacts of ironic or post-truth internet culture (Owens, 2019), memes function as "material-semiotic figurations" that actively produce, circulate, and contest political meaning (Johais & Meis, 2024). In hybrid war contexts, they operate as highly visible yet low-threshold media practices that counter propaganda, disrupt hegemonic narratives, and link everyday civic resistance with broader sociopolitical dynamics (Meis & Johais, 2023).

Empirically, the study draws on the funded project *Peace Meaning Streaming: Communication of Resistance in the Ukrainian War Context*, combining multimodal discourse and visual media analysis of: (1) large-scale monitoring of social media discussions about peace (n ≈ 1 million posts), and (2) a qualitative case study of a memes surrounding Donald Trump's and Volodymyr Zelensky's peace negotiation discourse (n = 120 memes).

Findings show that Ukrainian meme culture rearticulates peace across four media dimensions: identity construction, functional orientation toward social change, sociotechnical modes of visual communication, and spatiotemporal imaginaries of the future. Memes function as visual social critique, translating complex geopolitical conflicts into affectively charged, ironic, and highly shareable formats. Algorithmic amplification privileges sensationalism, polarization, and moral certainty, generating structural incentives that undermine deliberation and ethical accountability. From a media policy perspective, these memescapes highlight both the democratic potential and ethical risks of platform-mediated peace discourse, as visibility and virality remain deeply conditioned by algorithmic governance.

MED05 Mediatization and Platformed Cultures in Contemporary Society

PP 0445 Doing media generations within and across European families: Towards "platformised generations"?

Veronika Kalmus[1], Signe Opermann[1], Oana Benga[2], Victoria de Leon Born[3], Moises Esteban-Guitart[4], Noelia Hernando[4], Bogumila Mateja-Jaworska[5], Ionut Mone[2], Maja Nordtug[3], Mariya Stoilova[6]

[4] University of Girona, Department of Psychology, Girona, Spain
[5] Adam Mickiewitz University, Institute of Sociology, Poznan, Poland
[6] London School of Economics and Political Science, Department of Media and Communications, London, United Kingdom

One of the defining features of digital transformation is platformisation that can be defined as "the penetration of infrastructures, economic processes and governmental frameworks of digital platforms in different economic sectors and spheres of life, as well as the reorganisation of cultural practices and imaginations around these platforms" (Poell et al., 2019: 1). This transformation is deeply intertwined with the ongoing process of mediatization, in which media become increasingly embedded in and shape all areas of social and cultural life (Couldry and Hepp, 2017). By examining the embeddedness of platforms in daily routines, communication and familial dynamics, it is possible to better understand how these digital infrastructures mediate not only individual behaviours but also the evolving relationships between generations and how this kind of platformed mediation may be reshaping the self-identification and discursive construction of generations.

Although "media generations" is a well-known and widely researched concept (see, e.g., Bolin, 2016), there is less research on media generations in the most recent phases of "deep mediatization" (Hepp, 2020) that include the ongoing processes of datafication and platformisation. This paper aims to advance the conceptualisation of "media generations"

in the platform era by proposing the new concept "platformised generations" and outlining its theoretical dimensions and empirical substance. The uniqueness of our analysis lies in the combination of rich interview data from three kinship generations – children, parents, and grandparents (n = 313) – within the same families (n = 104) across six European countries (Estonia, Norway, Poland, Romania, Spain, and the United Kingdom) and an analytical approach that treats these kinship generations as social generations in the Mannheimian sense.

The paper seeks to provide answers to the following set of empirical research questions: How do members of the three kinship generations construct and negotiate generational identities in the context of mediatization and platformisation? How prominently do digital platforms and other media figure in the discursive constructions of generations? How do members of the three generations reflect upon their social position, agency, and generational roles in platformising societies and families?

Drawing on a grounded-theory–inspired analysis of individual and group interviews, we define *platformised generations* along three analytical dimensions: generational identification in relation to platforms, social positioning within platform-shaped hierarchies, and agency in navigating platformised social and familial contexts.

The analysis reveals largely consistent patterns across national contexts. Parents' dynamic media experiences and transitory social positioning characterise them as a *transitional platformised generation*. Grandparents' more limited involvement in platformisation and intra-generational disunity indicate a *partially platformised generation*. Children, who are becoming gradually involved in platformisation while experiencing restricted agency, emerge as the *future platformised generation*.

Our analysis also shows that on the micro-level of personal, family or community life, members of all generation groups play agentive roles. Participants' critical reflections reveal considerable individual attempts to resist, control, or appropriate the platformisation process, especially by acting as *resilient cultural anchors and guardians of traditions*, *gatekeepers* and *watchdogs*, or *critical guardians and self-regulators* in families.

MED05 Mediatization and Platformed Cultures in Contemporary Society

PP 0446 "Bringing a child back to life": Digital remains, AI, and the mediatization of death on TikTok

Nilou Davoudi[1]

[1] University of British Columbia, School of Information, Vancouver, Canada

"It is one thing to tell the story, I have not got a problem with that. Everyone knows the story of James anyway. But to actually put a dead child's face, speaking about what happened to him, is absolutely disgusting. It is bringing a child back to life. It is wrong. To use the face and moving mouth of a child who is no long here, who has been brutally taken away from us, there are no words."

In 2023, Denise Fergus, the mother of the murdered two-year-old James Bulger spoke out against the AI-generated videos of her son circulating on TikTok. The videos depict James' likeness and describe, in a child's voice, the horrific details of his abduction and death in 1993. Fergus' outrage is understandable: the videos of her deceased son exemplify how TikTok's platform logics (i.e., recommendation algorithms through the For You Page) and affordances (i.e., CapCut, filters, short form videos, audio library, etc.) enable forms of mediatization that violate the *digital dignity* of the dead. This study explores how TikTok mediatizes death through the analysis of 132 TikTok videos, collected through hashtags including, *#grief and #rip*. Employing visual analysis, the study examines how death content is created, curated, and narrativized, while thematic analysis traces recurring patterns and ethical tensions. Drawing on Michael Hviid Jacobsen's theorisation of *spectacular death*, where modern death is highly visible, mediated, and commercialized as public spectacle, the preliminary findings of this analysis reveal that TikTok extends mediatization of death in three critical ways: TikTok enables (1) co-creation of content with the dead through their *digital remains* – the data, including images, videos, messages, voice recordings of the deceased; (2) AI-generated content of deceased individuals, creating new digital representations; and (3) death-related content that exploits tragedy for engagement and revenue.

The analysis demonstrates that such content perpetuates the mediatization of death while exposing critical failures in protecting the dignity of the dead. Though mediatization examines how death circulates and is made visible, it offers limited insights for addressing questions of consent, harm, and posthumous rights. To address this gap, this paper draws from Luciano Floridi's information ethics to conceptualise digital dignity as the ethical treatment of informational entities, including digital remains and AI representations. Floridian ethics argues that informational entities possess moral considerations that demand ethical stewardship. The analysis reveals that TikTok fails to uphold this principle. For example, James Bulger's case demonstrates this violation where a murdered child is reanimated through accessible (and free) AI platform tools whilst his family has no recourse against the dissemination of such content. Current governance frameworks cannot address such violations, leaving families without options when their dead are exploited. This study argues for digital dignity as a necessary ethical lens through which scholars can assess governance in platformed and algorithmically-mediated environments, such as TikTok. In doing so, it contributes to scholarship on mediatization, ethics, and platform studies by centring the dignity of the dead and the rights of their survivors as a neglected subject of governance.

MED05 Mediatization and Platformed Cultures in Contemporary Society

PP 0447 Visible and invisible religion in platformed publics: Mapping Instagram hashtag networks in the Anglo-American sphere

Rebekka Rieser[1]

[1] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

Digital platforms such as Instagram are spaces where empowerment and creativity flourish, but where normatively problematic and harmful movements may also spread. Religion plays an ambiguous role within these dynamics. While debates about religion have often focused on institutionally recognizable traditions in the public sphere, contemporary religion increasingly appears in deinstitutionalized, hybrid, and culturally entangled forms that may remain unnoticed or unrecognized as religion.

In a platformed environment such as Instagram, these dynamics are deeply shaped by mediatized visibility regimes, including algorithmic recommendation, searchability, and aesthetic conventions. These factors privilege emotionally charged, identity-driven, and lifestyle-oriented forms of communication. Phenomena such as *tradwife* cultures, the *manosphere*, *witchy lifestyle* aesthetics, or *hijabi fashion* illustrate how content circulates and is aestheticized on Instagram while drawing—explicitly or implicitly—on religious language, symbolism, and moral frameworks, with important implications for identity formation and meaning-making across domains such as gender, ecology, politics, or health.

This paper maps traces of religion in the digitized public sphere by focusing on Instagram hashtag publics in the Anglo-American sphere. Conceptually, it connects mediatization research with scholarship on fragmented digital publics and the sociology of digital religion. It understands communities and identities as mediatized autobiographies: communicative formations embedded in the discursive, social, economic, and technological affordances of digital media. These dynamics continuously renegotiate relationships between old and new practices, forms of knowledge, and offline and online authorities.

The study proposes an analytical framework that distinguishes religion along two continua: decodability and public presence. Decodability captures whether religious references are readily legible (e.g., explicit markers such as deities, institutions, or scriptures) or implicit and ambiguous (e.g., spirituality- and morality-laden signifiers embedded in niches such as wellness, gender, eco-lifestyles, or politics). Public presence is conceptualized as a composite of perceptibility, amplified presence, and valuation (recognition, marginalization, or contestation), foregrounding the power relations that structure visibility and invisibility in digital publics. “Invisible religion” is thus not understood as absence, but as mediated meaning-making that travels through adjacent cultural fields and shapes moral imaginaries and identity work without necessarily being categorized as religious.

Empirically, the study draws on a two-wave dataset collected between September and October 2025. Based on 100 pre-defined root hashtags spanning explicit religion, spirituality, and non-religious issue domains (e.g., climate, health, lifestyle, gender, politics), I collected co-occurring hashtags and global frequency indicators. Methodologically, the analysis combines a semi-automatic annotation scheme distinguishing explicit religious, implicit religious/spiritual, and non-religious hashtags with co-occurrence network analysis. Bridging hashtags connecting religious and non-religious clusters are examined as potential gateways through which religious semantics are translated, normalized, or contested.

As an exploratory mapping project, the paper contributes to research on counterpublics and changing epistemic norms of knowledge production on social media. It demonstrates how hashtags function as technical and discursive infrastructures of publicity and how platform infrastructures and attention economies reorganize religious visibility beyond institutional communication and journalistic gatekeeping. In doing so, it shows how mediatized religion continues to mobilize identities, shape norms, and influence political discourse in contemporary democracies.

OSC01 Sustainability Narratives and the Politics of Transition

PP 0043 To mitigate or embrace division? How Finnish forest communication professionals navigate polarization in forest debates

Aino Koskenniemi[1], Markus Ojala[1]

[1] University of Helsinki, Faculty of Social Sciences, Helsinki, Finland

Polarization of public discourse has been identified as a key challenge for organizational communication in recent years. Research has found that, when communicating on polarized topics, organizations typically face negative and/or strongly divided reactions from stakeholders. However, there are mixed findings about how organizations respond to polarization or how they ought to communicate on polarized issues. Some studies find organizations resorting to evasion and ambiguity to avoid or mitigate public backlash (Denner et al. 2025). Some claim that organizations could alleviate polarization by fostering dialogue between different sides of the debate (Harrison et al. 2024). Conversely, others have questioned the feasibility of consensus-oriented communication in the contemporary polarized communication environment (Schoeneborn et al. 2024) and suggested that rather than mitigating polarization, certain organizational communication practices tend to amplify division in efforts to mobilize supportive publics (Gualtieri and Lunati 2024).

This study contributes to these debates by exploring how Finnish forest policy stakeholders engage in the public discourse over forest use and conservation. That the public debate on forests is increasingly polarized has become a widespread, commonsensical observation in the Finnish media discourse. By interviewing communication professionals working on forestry, forest policy and conservation, we aim to find out how this perceived polarization affects their communication practices and reasoning over those practices. In particular, we ask how communication professionals make sense of polarization and how this understanding is reflected in their work. While previous research has examined responses to polarization mostly through case studies of individual organizations, our study design makes a unique contribution by enabling a comparative analysis of how organizations differ in their reasoning and communicative strategies regarding issue polarization.

The research material consists of semi-structured interviews – conducted between December 2025 and February 2026 – with approximately 25 people directing communications in forest policy-related organizations, including forestry companies, advocacy groups, forest associations, environmental NGOs, activist groups, and governmental agencies. The analysis focuses on two main factors to explain variations in responses to polarization: (i) how actors perceive their position in forest debates and their (organization's) capacity to influence them; and (ii) how they make sense of polarization and its underlying causes. By demonstrating how particular understandings of polarization among communication professionals inform the communication strategies and tactics of their organizations, the findings make a significant contribution to research debates on the role of organizational communication in driving or mitigating polarization.

OSC01 Sustainability Narratives and the Politics of Transition

PP 0044 Emplacement through local strategic communication around renewable energy initiatives

Florentina Höhs[1], Franzisca Weder[1]

[1] Strategic Organizational Communication, Business Communication, Vienna, Austria

Both in (strategic) communication practice and in academic discourse on sustainability and socio-ecological transformation processes, communication is predominantly understood in a rather pragmatic way, limited to the transfer of information (Golob et al., 2023). The increasing urgency of the climate crisis and theoretical challenges have led to a critical 'turn' in sustainability communication research (Johansson et al., 2024; Weder, 2025), which also considers the spatial dimension of transformation processes and thus the local relevance of communication. The underlying assumption is that ecological challenges, energy transition projects or participatory processes of social or cultural change are always linked to specific places. Sustainability is therefore not just an abstract model or 'meta-narrative', but a lived, situated and place-based act of communication (Weder, 2024).

For the energy transition to succeed, a broad local acceptance is required (Görland, 2025): Residents of communities are attached to places through shared historical experiences, knowledge bases and value systems (Boyd, 2017), which should not be ignored in the implementation of renewable energy solutions (Elving, 2021). Particularly, communicative relationships between people, places and infrastructures need to be built and maintained (emplacement) through appropriate strategic

communication around renewable energy projects. Problems arise when projects are communicated in a displaced manner, e.g. as technical, abstract measures or without linkage to the local living environment (Höhs, 2025, pre-publication).

Based on a case study, this project primarily aims to conceptualize strategic communication surrounding renewable energy projects in terms of their contribution to emplacement and/or displacement, drawing on interdisciplinary approaches to space (Anderson, 2025; Glasze & Mattissek, 2021). The empirical case study covers three hydropower projects in Austria, a country heavily reliant on hydropower: a first power plant that provoked extreme local resistance (2012–2019), a second that received greater acceptance (2024), and a third that is yet to be built and is imagined to be even less controversial, however, surprisingly, is again part of a public discourse around energy transition.

For a qualitative, inductive content analysis of public discourse, strategic communication materials, local media reports, and observations from information events and power plant tours were used (Braun & Clarke, 2006) to examine whether meta-narratives such as energy transition, or communication practices rooted in the local community determine the communication discourse. Additionally, semi-structured guided interviews (n = 15) were used to reflect on the results of the thematic analysis of the textual materials. All texts and interview transcripts were two-step-categorized in QCAmap and interpreted according to Mayring (Fenzl & Mayring, 2017; Mayring, 2022).

The infrastructure projects' comparison illustrates that communication practices do not only establish connections to the existing space (emplacement, natural habitat, historical experiences, knowledge bases and value systems), but also enable placemaking, i.e. the communicative creation of new spaces ('recreational areas'), which in turn has a decisive influence on whether sustainable change finds resonance and acceptance or not. The study's limitations include its exploratory character and the limited number of interviews, but it nevertheless expands current sustainability and energy communication research by presenting an initial theoretical concept for local strategic communication.

OSC01 Sustainability Narratives and the Politics of Transition

PP 0045 The Constitutive role of Sustainability communication in shaping collective future-oriented mindsets through narrative and sense-making

Viktorija Jakubauskyte-Andriuliene[1,2]

[1] Vilnius Gediminas Technical University - VILNIUS TECH, Faculty of Creative Industries, Vilnius, Lithuania
[2] LCC International University, Global Business and Public Engagement Department, Klaipėda, Lithuania

In today's world, organizations face uncertainty in the regulatory environment, assessing risks related to climate change, and defining their role in poly-crisis situations. In such conditions, organizations are obliged to report on sustainability, while also communicating their long-term vision and commitment to creating more sustainable futures.

This study examines how sustainability communication, delivered through sustainability reports, plays constitutive role in shaping collective future-oriented mindsets within and around the organizations. Drawing on the Communicative Constitution of Organization (CCO) perspective and Sense-Making Theory, the study identifies sustainability reports as message framing tools with narratives for multiple stakeholders, as well as facilitating shared understandings of the responsibilities and futures.

The study is based on a qualitative content and thematic analysis of sustainability reports produced by the companies operating under evolving European sustainability reporting frameworks, such as the Corporate Sustainability Reporting Directive (CSRD) and European Sustainability Reporting Standards (ESRS). The analysis focuses on how organizations articulate long-term goals, define uncertainty and frame their role in the broader social transitions towards sustainable futures. Content analysis traces patterns of language that signal responsibility, organizational consciousness rather than formal compliance. The study also focuses on how organizations structure time-frame of the future (e.g. 2030 or 2050) and distribute agency among stakeholders, such as regulators, partners, suppliers, communities, even nature.

The findings suggest that sustainability reports can be communication tools that create and sometimes challenge collective future-oriented mindsets as organizations attempt to align and engage internal and external audiences with their visions for sustainable futures. Conducted thematic analysis of 50 EU companies' CSRD-compliant reports identifies three dominant communicated strategies: 1) an extended present narrative links the compliance with 2030 / 2050 targets or Sustainable Development Goals (SDGs); 2) scenario-based projections acknowledge constant changes and uncertainties; 3) positioning of legacy, which focuses on inter-generational responsibility with the future generations. Moreover, the narratives of the reports also demonstrate compliance-driven, resilience-based and transformative orientations, characterized by specific language, commitment to continuous learning and stakeholder co-creation.

This study, which identifies the principles of a future-oriented organizational sustainability mindset communicated in sustainability reports, contributes to the discussion about the role of communication in creating the future, shaping sustainability policies and reporting practices and supporting more resilient and equitable transformations. It also demonstrates communication's constitutive role in organizing the future, as well as how narrative and meaning-making processes in sustainability communication help organizations navigate regulatory uncertainty while promoting long-term orientation and ethical responsibility.

OSC01 Sustainability Narratives and the Politics of Transition

PP 0046 Trust-centric conversational agent design: Challenges of defining trust for public sector

Rhied Alothmani[1], Dennis Nguyen[2], Gerrita van der Veen[1], Nanna Verhoeff[2]

[1] University of Applied Sciences Utrecht, Digital Business & Media, Utrecht, Netherlands
[2] Utrecht University, Department of Media and Culture Studies, Utrecht, Netherlands

The recent surge of Conversational Agents (CAs), increasingly infused with GenAI, in public services raises important questions about their impact on trust in public institutions. New types of interactions—more flexible, dynamic, and "empathic"—are likely to occur, with potential implications for citizens' relationships with public institutions. Critical questions include how institutional trust is affected by CAs, and how critical design can support building such trust while avoiding risks (e.g., loss of trust in institutional capabilities and values). In particular, when simple CAs are replaced with GenAI systems, how does this shift reconfigure trust relationships with public institutions?

Existing research has examined how users trust technology, automation, and AI, and how this shapes their trust in CAs. Importantly, CAs are typically designed as highly anthropomorphic automated communication tools that interact with citizens on behalf of public institutions. This carries potential benefits and diverse risks for building relationships with citizens.

We identify two challenges in current approaches. First, trust conceptualisations for CAs are often one-dimensional, focusing solely on technological or social layers. Yet layers such as automation, communication, and anthropomorphism make CAs inherently multidimensional. CAs are complex socio-technical assemblages in which different stakeholders—institutes, technology companies, citizens—play important roles in varying constellations. Any definition of trust therefore needs to account for this inherent complexity of technology deployment in concrete contexts.

Second, relatedly, there is no clear academic (or professional) consensus on what trust means in the context of CAs in the public sector. Often, trust conceptualisations based on human-to-human relationships are applied without substantiation, if any consideration is given to definition and operationalisation at all. Arguably, both building for trust and evaluating trust are therefore considerably limited from the outset.

In this conceptual paper, we address the question: *How can digital trust be conceptualised, practically implemented, and evaluated in Conversational Agent design for Public Institutions?* We formulate four proposals based on the existing body of knowledge: (1) trust definitions for CAs need to consider citizens' perspectives and positionality, institutional values and objectives, and technology-specific affordances; (2) because CAs shape how citizens experience public services, experts from multiple fields (e.g. technology, design, and public administration) need to be involved during design and evaluation; (3) trust should be a primary consideration in design processes that go beyond immediate, task-centric purposes and account for wider contexts; and (4) critical AI literacy is essential for all stakeholders—citizens, public institutions, and designers—to steer CA-design in ethically desirable directions.

We propose a trust definition tailored to public institutions, advocate for assessing the use of CAs, and outline a trust-centric approach to CA-design. We critically examine what institutional trust means in interactions with CAs, and provide a framework to support institutions in implementing GenAI for external communication. This framework is examined through a case study of a Dutch public institution, which serves as an illustrative example throughout. Overall, we aim to contribute to ongoing debates by showing how design and deployment of CAs can align with public and institutional values in ways that strengthen trust.

OSC01 Sustainability Narratives and the Politics of Transition

PP 0047 Corporate sociopolitical positioning in annual reports of German companies

Anna-Katharina Wurst[1], Marc Jungblut[1], Lara Marie Witt[1], Nora Denner[2], Malou Detzel[2], Thomas Koch[2]

[1] LMU Munich, Department of Media and Communication, Munich, Germany
[2] University of Mainz, Department of Communication, Mainz, Germany

Companies are increasingly expected to take social responsibility for their business activities and the environmental and social consequences of their actions (Colleoni, 2013). Customers are considering the sustainability or ethical stances of companies when consuming their products and EU legislation requires extensive reporting on companies' sustainability activities. To meet customers' expectations but also to fulfill legal requirements, companies engage in activities summarized by the term *corporate social responsibility* (CSR) (Matten, 2012).

Simultaneously, with the recent increase in societal crises and polarization, companies are also expected to address various decisive sociopolitical issues like migration or LGBTQ rights and demonstrate their values through public statements on these issues. Corporate engagement in this area is referred to as *corporate social advocacy activism* (CSA) (Bhagwat et al., 2020). CSR and CSA refer to the relationship between companies and society, posing different challenges for corporate public communication.

Communication channels of companies have expanded considerably in recent decades with the advent of digitalization and social media. However, the annual report remains a central communication tool, particularly towards investors, providing

comprehensive information about the company's business activities. Companies fulfill a large part of their disclosure and reporting obligations in their annual reports (Stanton & Stanton, 2002). With the adoption of European law, German companies have been required since 2017 to additionally report on environmental, social, and governance (ESG) issues.

This study investigates the development of CSR- and CSA-related communication in the annual reports published by German DAX companies between 2015 and 2024. We apply a broad conception of positioning that includes both explicit statements with the corresponding verbal markers, e.g., for taking a side, but also implicit positioning through corporate actions. Actions involve more effort and resources but can also be considered more credible and connected with higher commitment of the company. We ask: Which socio-political topics are addressed in the annual reports? How (explicitly or implicitly) do companies position themselves on these issues? How do company characteristics such as industry sector and number of employees affect these positionings?

To answer these research questions, we apply an automated content analysis. For this, we first collected the official annual reports of the 40 companies currently in German stock index DAX. To train and test an automatic LLM-based text classifier, we will first manually code a random sample of 2000 paragraphs of the annual reports according to the coding scheme that defines the categories (1) whether and which socio-political issues are addressed, (2) whether a (pro-, contra-, or ambiguous) position of the company is expressed, (3) whether a position is expressed explicitly or/and implicitly by taking actions.

Initially, we found that topics required by the EU directive, most often related to the environment and employees' working conditions, were frequently addressed. Policy topics such as digitalization and the global economic situation are also relevant for companies, whereas CSA-related, more controversial topics such as migration were seldom addressed. In terms of positioning, implicit positioning by describing internal measures or activities dominates, while explicit positioning is rare.

OSC02 AI and Communicative Responsibility

PP 0152 Artificial Intelligence in strategic crisis communication: A mapping review of AI's impact on sense-making, accountability, and ethical governance (2000–2025)

Firas Saifi[1], Ileana Zeler[1]

[1] Universitat Autònoma de Barcelona, Department of Advertising- Public Relations and Audiovisual Communication, Barcelona, Spain

As Artificial Intelligence (AI) becomes embedded in organizational communication, crisis response is increasingly shaped by systems that detect signals, forecast escalation, and generate or recommend messages (Mayer, 2024; Mendes et al., 2025; Mintoo et al., 2022). This shift raises a governance problem that is still underdeveloped in organizational and strategic communication scholarship: when algorithmic systems participate in crisis sense-making and response, how are responsibility, transparency, and ethical oversight organized, and what are the implications for strategic communication practice?

This paper offers a mapping review of AI-mediated crisis communication research through a semi-systematic synthesis of peer-reviewed studies published between 2000 and 2025 (n = 51). Following PRISMA-aligned identification and screening (Page et al., 2021) across major bibliographic databases (Scopus and Web of Science), we extracted and compared how studies (a) conceptualize AI's role across crisis phases (detection, response, recovery), (b) connect AI functionalities to crisis and strategic communication frameworks, and (c) define ethical and governance requirements. In addition, thematic patterns were consolidated to capture dominant clusters linking AI to communication practices, organizational governance, and ethics.

The findings reveal four cross-cutting insights. First, the literature frequently treats AI as an efficiency enhancer (monitoring, sentiment analysis, conversational agents, early warning, predictive analytics), but rarely integrates these capabilities into crisis theory in ways that account for algorithmic participation in attribution, decision-making, or stakeholder evaluation. Second, "governance language" is widely used (e.g., accountability, transparency, risk management), yet operational guidance is inconsistent, particularly regarding the auditability of automated recommendations, the documentation of decision pathways, and the assignment of responsibility when AI-supported actions cause harm. Third, ethical concerns are recurrent but unevenly addressed: bias and fairness, opacity, privacy and data protection, misinformation and accuracy failures, and limitations in emotionally sensitive messaging emerge as critical fault lines for crisis legitimacy. Fourth, practitioner roles are portrayed as shifting from message production toward hybrid oversight: configuring tools, setting escalation thresholds, verifying outputs, and communicating boundaries of automation under time pressure.

Building on these results, the paper reframes AI in crisis communication as "communicative infrastructure. It proposes a hybrid accountability agenda for strategic communication: human-in-the-loop safeguards for high-impact messaging, traceable decision logs for automated outputs, transparency norms for disclosure of AI involvement, and sector-specific ethical standards aligned with crisis types. This work's contribution clarifies research gaps and provides a governance-oriented pathway for developing theory and responsible AI deployment in crisis communication.

OSC02 AI and Communicative Responsibility

PP 0153 AI-based epistemic support against synthetic disinformation

Stefano Pedrazzi[1], Diana Ingenhoff[1], Josef Demling[1], Viktoria Sommermann[1]

[1] University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

GenAI enables the rapid, large-scale production of manipulative content ranging from plausible texts and hyper-realistic images to deepfakes and doppelgänger or lookalike websites that mimic legitimate news outlets (Menczer et al., 2023). Recent investigations show how such AI-generated "local news sites" have been deployed in France at scale to disseminate disinformation (Krähenbühl, 02.11.2025). These developments raise new demands on digital resilience, the ability to navigate digital information environments critically, detect deception, and recognize manipulative mechanisms (Rodríguez-Pérez & Canel, 2023).

Against this backdrop, the study examines both the manipulative effects of synthetic disinformation and the counteracting potential of AI-based epistemic support.

RQ1: How do the information environment and the modality of synthetic disinformation affect credibility judgments and institutional trust?

RQ2: To what extent can an AI-powered chatbot serve as epistemic resource to counter disinformation?

Theoretical Approach

Research has identified content-, source- and presentation-related factors that increase the acceptance of disinformation, including emotionalized language, scapegoating, and credibility-enhancing design (Lewandowsky & van der Linden, 2021). Doppelgänger websites appropriate visual identity cues from trusted outlets to transfer institutional credibility and legitimacy (Winter & Krämer, 2014) to fabricated content, thereby putting organisational reputation at risk.

H1: Disinformation on doppelgänger sites will be perceived as more credible compared to lookalike sites or social media.

Visual disinformation, particularly synthetic images and deepfakes, increases perceived authenticity and complicates human detection (Peng et al., 2023). The TIME framework (Sundar, 2008) explains such effects through digital affordances that activate heuristics such as realism.

H2: Deepfake-enhanced disinformation will be perceived as more credible than text-plus-image formats.

GenAI offers new opportunities for verification, but with clear limitations. Chatbots can help identify falsehood (Kuznetsova et al., 2025) but do not automatically improve judgment accuracy (DeVerna et al., 2024), thereby remaining prone to hallucinations (Saju et al., 2025). Their epistemic potential therefore lies less in authoritative factchecking and more in fostering vigilance and reflective evaluation (Hornsey et al., 2025).

H3: A chatbot designed to proactively highlighting verification strategies will reduce the perceived credibility of disinformation more strongly than a standard chatbot.

Method

The study employs a randomized 2 x 2 x 2 x 3 between-subjects online experiment manipulating information environment (news website vs. social media), source (doppelgänger vs. lookalike site), modality (text+image vs. text+deepfake), and chatbot condition (none, standard, verification-oriented).

Participants in Germany are exposed to a fabricated story inspired by a real incident in summer 2025, claiming that the Swiss Federal Council is discussing a nationwide ban on foreigners' access to public swimming pools. The story is presented using emotionalized language and scapegoating, followed by optional interaction with the assigned chatbot.

Power analysis (small-to-medium effect size (f = .175)) indicates a required sample size of N = 744. Dependent variables include the credibility of the disinformation, trust in political institutions, and perception of Switzerland. Control variables include main news sources, attitude towards AI (Stein et al., 2024), political self-placement and xenophobia (Wilson-Daily et al., 2018). The instrument is currently under ethical review.

Expected Contribution

The study advances understanding of how different forms of AI assistance can function as epistemic resources to strengthen critical evaluation of content and can serve to protect organizational reputation in disinformation-prone communication environments.

OSC02 AI and Communicative Responsibility

PP 0154 Framing corporate social (ir)responsibility: A comparison between generative AI and the news media

Elizabeth Wang[1], Sarah Marschlich[1], Britta Brugman[1], Theo Araujo[1]

[1] University of Amsterdam, Faculty of Social and Behavioural Sciences, Amsterdam, Netherlands

The rapid adoption of generative AI like ChatGPT has fundamentally transformed how individuals access information (Hirvonen et al., 2024). As generative AI increasingly serves as an information medium alongside traditional news media (Zhao et al., 2025). According to framing theory (Entman, 1993), media's emphasis on certain aspects of issues over others, known as framing, has the potential to shape public perceptions of societal issues.

One particularly relevant domain for examining framing is Corporate Social Responsibility (CSR), which refers to organizations' efforts to address social issues and environmental challenges such as corporate misconduct and greenwashing, beyond their economic pursuits (O'Connor, 2022). CSR issues have become central to public debates about corporate accountability, challenging organizations' legitimacy (Fassin & Van Rossem, 2009). News media traditionally serve as primary information sources of CSR (Vogler & Eisenegger, 2021), previous research has examined frames used in CSR news (e.g., Van den Heijkant & Vliegenthart, 2018; Lee & Riffe, 2019), but little is known about how generative AI constructs narratives around CSR issues.

Despite its growing popularity, generative AI has been criticized for producing biased and potentially inaccurate content with questionable information sources (Weidinger et al., 2022), which is particularly problematic in CSR contexts where multiple stakeholders and viewpoints are involved (Vos, 2003). If generative AI frames CSR issues differently than news media, for instance, by omitting critical perspectives, or presenting unverified claims, it could distort public understanding and opinion-making of organizational responsibility and accountability, potentially allowing problematic corporate behaviors or unfairly damaging organizational reputations (Vogler & Eisenegger, 2021). Therefore, it is critical to understand:

To what extent and how do frames about corporate social (ir)responsibility in AI-generated information and news media coverage differ?

This study will employ quantitative content analysis. First, we will retrieve 300–400 CSR-related news articles from Dutch newspapers (e.g., *De Telegraaf*, *De Volkskrant*) via *LexisNexis*, following established CSR news framing approaches (e.g., Lunenberg et al., 2016). We will then draw on Van den Heijkant and Vliegenthart's (2018) six implicit CSR frames and code: economic performance & growth, society's welfare, environmental protection, global business activities & responsibilities, fair & sustainable products, and educational & charitable programs.

After coding the news articles, we will collect 300–400 matched AI-generated responses from ChatGPT using tailored prompts that mirror each news article's content focus. For instance, if a news article covers a specific greenwashing scandal involving a company, the prompt will ask, "Tell me about Company A and its greenwashing accusations". This sequential approach ensures we can develop and refine the codebook based on news media patterns before applying it to AI-generated content, thereby enhancing comparability between the two information sources.

By systematically comparing CSR frames across news media and generative AI, this study provides empirical evidence of whether and how generative AI portrays organizational accountability. Unlike news media with editorial and fact checking, AI operates through probabilistic models and can include biases. The findings advance framing research by examining the emerging information source, while addressing AI's growing role in information dissemination that may transform public opinion-making about organizations.

OSC02 AI and Communicative Responsibility

PP 0155 Human connection and artificial intelligence in strategic communication: A systematic review and professional perspectives

José Gabriel Andrade[1], Patrícia Dias[2], Dhemy Brito[3]

[1] UM, Communication, Braga, Portugal
[2] UCP, Communication, Lisboa, Portugal
[3] UM, Education, Braga, Portugal

The rapid integration of Artificial Intelligence into strategic communication has reshaped both academic debate and professional practice, raising questions about ethics, professional roles and the preservation of human judgement in increasingly automated environments. While a growing body of research addresses AI in communication, existing scholarship remains dispersed and only partially connected to the everyday realities of communication agencies. This paper addresses this gap by combining a systematic review of the international literature on Artificial Intelligence and strategic communication with empirical evidence drawn from a survey of communication and public relations professionals working in agencies. The systematic review identifies dominant theoretical perspectives, methodological trends and recurring themes in the field, with particular attention to ethics, transparency, human oversight and the transformation of professional competencies. The empirical component is based on a quantitative survey of agency professionals in Portugal, examining patterns of AI adoption, perceived opportunities and risks, impacts on professional autonomy and decision making, and attitudes

towards human responsibility and ethical judgement in AI-supported communication processes. Findings suggest a growing convergence between academic concerns and professional perceptions, especially regarding trust, accountability and the need to maintain human control over strategic decisions. At the same time, the results reveal significant tensions between normative ethical frameworks proposed in the literature and the operational constraints faced by agencies, including competitive pressure, efficiency demands and client expectations. AI is predominantly understood as a support technology rather than a replacement for human strategic thinking, yet its expanding role challenges established notions of authorship, responsibility and human connection in strategic communication. By integrating insights from scholarly research and professional practice, this study contributes to a more comprehensive understanding of AI as a socio-technical phenomenon in strategic communication. It argues for closer dialogue between academia and industry and for the development of context-sensitive governance and ethical guidelines that reinforce human agency while enabling the responsible use of AI in hybrid communication environments.

OSC02 AI and Communicative Responsibility

PP 0156 Negotiating trust in automated public services

Giulia Banfi[1]

[1] University of Ferrara, Department of Humanities, Ferrara, Italy

Over the past decade, the digitalisation of public services across the European Union has undergone a process of steady consolidation. While infrastructural availability has significantly improved, this transformation has revealed persistent socio-cultural and institutional challenges, particularly regarding citizens' digital skills and trust in public administration. The Italian case is emblematic of these tensions: despite rapidly surpassing the EU average in the provision of digital public services, levels of basic digital competence among citizens remain comparatively low (Eurostat, 2025). This misalignment suggests that digital transformation cannot be understood solely as a technical or infrastructural process, but rather as a socio-technical reconfiguration with profound implications for public value and institutional trust.

Drawing on the sociological tradition of trust (Luhmann, 1968; Giddens, 1990), this study examines how the platformisation and automation of local public services reshape the conditions under which public trust is produced, negotiated, and potentially eroded. Trust is conceptualised as a relational phenomenon that becomes particularly salient in contexts of uncertainty and systemic complexity, where citizens are required to delegate decisions and actions to expert systems. Building on Giddens' notion of trust in expert systems and on Grimmelikhuijsen's analytical framework (2012), institutional trust is operationalised through three dimensions-competence, benevolence, and honesty- allowing for an empirical investigation of how trust is assessed through everyday interactions with digital public services.

The analysis focuses on local and proximity-based services, understood as key sites of encounter between citizens and institutions. Historically grounded in face-to-face interactions and territorial proximity, these services are increasingly reorganised through centralised, standardised, and platform-based models. Such transformations are often accompanied by growing dependence on third-party technological providers, which can introduce new forms of opacity, organisational vulnerability, and accountability gaps. Rather than neutral tools of inclusion, digital infrastructures may thus contribute to the production of stratified forms of digital citizenship, where access to formally universal rights becomes conditional upon technical resources, skills, and digital capital.

The study adopts a mixed-methods design. The qualitative component consists of 41 in-depth interviews with local administrators, digital transformation officers, IT professionals, service managers, and public communicators, exploring how automation and artificial intelligence are implemented, governed, and discursively framed at the local level. The quantitative component draws on a 2025 survey conducted in Italy (N = 327), investigating citizens' perceptions of which public services are most suitable for automation and the opportunities and risks associated with these processes.

By integrating institutional and citizen perspectives, the study addresses two main research questions: how local governments negotiate citizens' trust in the context of automated public services, and which services are perceived as most susceptible to automation, with what implications. The findings contribute to ongoing debates on digital governance, public sector automation, and trust by highlighting the tensions between efficiency-driven digital agendas and the lived experiences of citizens. Ultimately, the paper argues that the automation of public services represents a critical "shifting ground" for public administration, where the future of trust depends not only on technological innovation, but on governance arrangements capable of ensuring transparency, accountability, human oversight, and social inclusion.

OSC03 Trust, Resilience and Public Sector Communication

PP 0484 Strategic communication under hybrid threats: A message and narrative life-cycle model

Ileana Rotaru[1], Ciprian Cucu[1]

[1] West University of Timisoara- Romania, Faculty of Governance and Communication Sciences, Timisoara, Romania

Democratic governments operate under increasingly difficult conditions, as the status of global affairs has been described as a "permacrisis", i.e., an extended period of instability and insecurity. Within this environment, hybrid threats (information

manipulation, cyber attacks, sabotage, election interference etc) represent a significant component, as they specifically target democratic values and aim to erode trust between citizens and governing institutions.

Elections, in particular, represent critical moments of heightened informational vulnerability, during which governments are simultaneously expected to safeguard an open and correct political competition, counter interference, and justify extraordinary measures when needed.

Responses to hybrid threats increasingly converge towards a "whole of society" response, with strategic communication at its core. Governments are expected not only to act, but to explain, justify, and defend their actions in real time, under intense scrutiny and in adversarial information environments.

Existing research and policy frameworks tend to approach strategic communication in a static or message-centric manner, focusing on message production, narrative content, or threat typologies. Less attention has been paid to what happens after official communication is released into contested information environments, how messages are reframed, challenged, or stabilized over time, and how institutions respond to these dynamics.

The proposed study addresses this gap by proposing and empirically testing a strategic message and narrative life-cycle model, tailored to hybrid-threat contexts, building on Kruijver, K., Finlayson, N.B., Cadet, B. et al (2025), Sergeeva & Winch (2021) and Holtzhausen & Zerfass (2014).

Drawing on strategic communication and strategic narrative scholarship, as well as framing theory, and hybrid threat/FIMI literature, the model conceptualizes governmental communication as a process rather than a discrete act. It distinguishes three analytically defined phases: (1) authoritative emission and initial sense-making, (2) mediated contestation and competitive reframing, and (3) institutional reaction, drift, or deferred closure. Central to the model is the concept of life-cycle closure, defined not as consensus or belief change, but as the stabilization of communicative dynamics once authorities cease introducing new frames and narratives persist without institutional fuel.

Empirically, the study adopts a qualitative, process-oriented multiple-case design. The primary case examines public communication surrounding the annulment of Romania's 2024 presidential elections, analyzed over a bounded 90-day phase following the first announcement. A secondary, contrastive case, Moldova's 2025 parliamentary elections, is used to verify whether the same life-cycle logic holds under conditions of more explicit attribution of foreign interference and earlier institutional intervention. Data include official statements, mainstream media coverage, and a purposive sample of high-engagement social media posts.

By tracing how strategic messages evolve across phases, the study aims to investigate how early framing choices and delayed or weak interventions contribute to narrative fragmentation and long-term polarization. The proposed contribution is threefold: advancing a process-oriented life-cycle model of strategic communication; operationalizing closure and non-closure as analytical outcomes; and providing an empirically grounded framework for evaluating governmental communication under hybrid threats.

OSC03 Trust, Resilience and Public Sector Communication

PP 0485 Building trust under hybrid threats: A community resilience barometer against disinformation

Lucia D'Ambrosi[1], Mariaeugenia Parito[2], Katerina Tsetsura[3], Xiaochen Angela Zhang[3], Laura Ardava Āboliņa[4]

[1] Sapienza University of Rome, Communication and Social Research, Rome, Italy
[2] University of Messina, Dipartimento di Civiltà Antiche e Moderne DiCAM, Messina, Italy
[3] University of Oklahoma, Gaylord College of Journalism and Mass Communication, Norman- OK, USA
[4] University of Latvia, Faculty of Social Sciences, Riga, Latvia

The use of digital technologies has enhanced the communication capacities of institutions and increased risks of disinformation as well as blurred the boundaries between institutional messaging and partisan discourse (Michailidou 2014; OECD 2024). In times of global uncertainty and shifting societal expectations, this phenomenon is exacerbated by structural distrust and non-transparency in institutional communication, particularly in post-authoritarian contexts where public trust in media is fragile (Tsetsura & Luoma-aho 2020). Several studies showed that hybrid public relations practices can reinforce opacity in communication environments, undermining citizens' ability to assess credibility (Tsetsura & Kruckeberg 2017; Lovari & Belluati 2023). State-sponsored operations—particularly from Russia and China —exploit weaknesses in institutional communication and target divided audiences with tailored narratives (Luoma-aho et. al. 2021).

Social media has become an arena for experimenting with new forms of public sector communication (Canel & Luoma-aho 2019; Ducci et al. 2021). These online strategies aim to enhance the quality of public debate, promote transparency, and foster engagement with citizens (Barisione et al. 2019; D'Ambrosi & Parito 2022). However, the effectiveness of transparency-driven communication faces a major challenge: the growing spread of disinformation, and the increasing influence of digital platforms and AI-driven systems on organizations, which further complicates efforts to improve the quality of public sector communication (Zerfass et al. 2023; Lovari & De Rosa 2025).

This project examines this complex phenomenon across three countries: Latvia, Italy, and the United States. Latvia is a frontline EU state bordering Russia, with Russian-speaking minorities particularly exposed to Kremlin-origin narratives (Rönngren 2025). Italy, despite being geographically distant, exhibits high vulnerability due to targeted disinformation

campaigns affecting Russian and Ukrainian-speaking communities (Porrino 2025). The United States, with its decentralized communication system and powerful online platforms, provides a global benchmark for understanding how unregulated digital ecosystems interact with public sector communication (Bradford 2023).

To respond to these complex challenges, the study focuses on youth as a critical demographic, within digital information flows (Wilska & Nyrhinen 2025). It examines how young people evaluate credibility, interact with institutional messaging, depending on their attitude profiles identified by previous research (Tsetsura et. al. 2025). The project aims to develop the first Community Resilience Barometer, which will function as a strategic tool for identifying vulnerabilities—mapping high-risk topics and channels—and for strengthening community-based resistance to disinformation, by translating these insights into proactive response actions.

Methodologically, the research combines comparative case analysis and a survey of university students enrolled in humanities and social sciences courses across Latvia, Italy, and the USA. By mapping communicative choices of selecting, perceiving, and reacting to public institution messages, the study will examine which messages are most trusted by different groups of young people and what factors could potentially predict misinformation efficacy. The study will help to shed light on the misinformation resilience mechanisms and to advance our understanding of how to build more transparent, inclusive, and trusted systems of public communication. By strengthening local resilience mechanisms, the project directly supports EU and NATO strategic objectives against foreign information manipulation (EEAS 2025).

OSC03 Trust, Resilience and Public Sector Communication

PP 0486 Strategic communication for sustainability and public health challenges: Bringing research and institutional and social cooperation in Spain

Ileana Zeler[1], Ángeles Moreno[2], Cristina Fuentes-Lara[3], Noelia Zurro[4]

[1] Universitat Autònoma de Barcelona, Department of Advertising- Public Relations and Audiovisual Communication, Bellaterra, Spain
[2] Rey Juan Carlos University, Group of Advances Studies in Communication, Fuenlabrada Madrid, Spain
[3] Rey Juan Carlos University, Departamento de Ciencias de la Comunicación y Sociología, Fuenlabrada Madrid, Spain
[4] Rey Juan Carlos University, Journalism and Corporate Communication Department, Fuenlabrada Madrid, Spain

Based on applications of evolutionary and cultivation theory to public relations, Werder (2023) introduces the concept of sustainability as an evolutionary framework in which strategic communication plays a significant role. Over the past few decades, various frameworks associated with sustainability in corporations and public sectors have gained popularity, even leading to the development of diverse greenwashing strategies. However, more recently, climate change has become one of the most controversial and polarising issues in the political arena, a context that also affects other topics associated with climate change, including certain health issues.

Skin cancer is one of the diseases associated with climate change, specifically high levels of UV exposure. It is considered one of the most prevalent types of cancer worldwide, with 1.5 million new cases in 2022 (World Health Organization [WHO], 2022), and it has a significant impact on national public health systems. Spain is a country that receives high levels of solar radiation throughout the year and currently faces an epidemiological situation concerning skin cancer. According to the Academia Española de Dermatología y Venereología (2023), more than 78,000 new cases are diagnosed each year, with an expected increase until 2040. Therefore, effective preventive communication is an urgent priority for health systems (Author1, Krstić & Ćorić, 2021).

This work presents the findings of the XXXXX project, which is part of a strategic approach aimed at social change within Sustainable Development Goal SDG 3: Good Health and Well-being, which contribute to improving communication in the prevention of skin cancer and recognises the role of strategic communication professionals in promoting preventive behaviours and combating misinformation in the field of health and the effects of climate change. This research project, funded by the Spanish Ministry of Science and Innovation, used an extended methodological triangulation. It made a concrete contribution to the selected challenge by generating knowledge about the attitudes, beliefs and behaviours of the at-risk population in relation to photoprotection and social media content; scientifically evaluating strategic preventive communication content and identifying areas for improvement; and developing evidence-based recommendations for specialist communicators, with direct transfer to patient associations, civil society associations and scientific foundations.

All project results have practical applicability for prevention communication agents. This has taken the form of recommendations and workshops that have been directly transferred to patient associations, medical foundations, health institutions—all project beneficiaries—and the Spanish Ministry of Health. Moreover, these outputs have engaged public health institutions in the creation of a collaborative network with civil society, medical and patient associations, working together on disease prevention in the context of increased UV radiation due to climate change.

OSC03 Trust, Resilience and Public Sector Communication

PP 0487 Gender-related issues as shifting grounds for public sector communication. Risks and constraints in EU institutional campaigns

Paola De Rosa[1], Gea Ducci[2], Lucia D'Ambrosi[3], Camilla Folena[2], Marica Spalletta[1]

[1] Link Campus University, Department of Human Sciences, Rome, Italy
[2] University of Urbino Carlo Bo, Department of Communication Sciences- Humanities- and International Studies, Urbino, Italy
[3] Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

In a context of deep societal uncertainty, digital fragmentation, and growing political polarization, public sector organisations are increasingly required to redefine their strategic communication roles. Public communication has progressively assumed the function of a strategic tool for fostering an inclusive society, particularly in the aftermath of the pandemic, as institutions have intensified the adoption of communication strategies aimed at promoting social inclusion and equal opportunities. Within this scenario, gender-related issues have emerged as particularly sensitive objects of public sector communication: while central to contemporary public policy agendas, they constitute highly contested and shifting grounds, exposing institutions to communicative, organisational, and reputational risks.

This tension is particularly evident in the European Union, where ambitious gender equality frameworks, integrated within a gender mainstreaming and intersectional perspective – as reflected in policy documents such as the *Gender Equality Strategy 2020–2025* – are frequently perceived as risky due to heterogeneous socio-cultural sensitivities across Member States, complicating their translation into institutional communication practices.

Based on these premises, this study investigates how, over the last five years (2020–2024), the European Union has communicated gender-related issues through institutional campaigns with the main aim of testing the hypothesis that the sensitive and contested nature of these issues represents a significant risk to the effective and intersectional translation of policy frameworks into communicative practices.

To address these issues, the study poses two research questions: (1) how are EU gender-related communication campaigns disseminated across platforms and channels, and which risks emerge in relation to dissemination strategies and audience engagement? (2) how are gender-related themes framed within these campaigns, and which risks arise in terms of inclusivity and representation?

Methodologically, the research adopts a qualitative approach based on media content analysis of a selected sample of EU institutional campaigns released over the last five years – *CharactHer* (2021), *Keep Your Eyes Open* (2023), *#EndGenderSte reotypes* (2023), and *Spot the Violence / Stop the Violence* (2024) – selected according to criteria of topical diversity, target audience segmentation, strategic variation, and dissemination practices.

The findings highlight recurring structural, socio-cultural, and political risks that limit the transformative potential of EU gender-sensitive communication. Structurally, campaigns often rely on fragmented dissemination strategies, limited cross-platform coordination, and predominantly one-way communication models, reducing engagement and adaptability to diverse publics. From a socio-cultural perspective, while inclusivity is a declared objective, intersectionality is only partially addressed, with a persistent reliance on binary gender representations and performative portrayals that risk reproducing stereotypes or symbolic inclusion. Politically, communicative choices are shaped by a cautious balancing of normative commitments and ideological sensitivities, resulting in diluted narratives and limited engagement with more contentious identity-related dimensions of gender equality.

By showing the persistent tension between ambitious EU policy goals and constrained communicative practices, this study opens up further research aimed at examining more closely the role of public communicators in mediating political sensitivities and institutional mandates in the framing of gender equality, as well as developing operational recommendation, moving toward a transformative project for gender equality in EU public communication.

OSC03 Trust, Resilience and Public Sector Communication

PP 0488 CISEELAP_2: The role of internal communication in public sector wellbeing

Joan Cuenca[1], Marc Compte Pujol[2], Eduard Vidal-Portés[1], Guillem Marca-Frances[3], Mario Sorribas-Fierro[4]

[1] Universidad Ramon Llull, Facultat de Comunicació i Relacions Internacionals Blanquerna, Barcelona, Spain
[2] Universitat Oberta de Catalunya, Estudis de Ciències de la Informació i de la Comunicació, Barcelona, Spain
[3] Universitat Autònoma de Catalunya, Facultat de Ciències de la Comunicació, Barcelona, Spain
[4] Universitat Internacional de Catalunya, Facultat de Ciències de la Comunicació, Barcelona, Spain

Objectives and conceptual framework

CISEELAP_2 extends the study initiated in Barcelona to Rubí, Terrassa, Viladecans and Girona city councils, to analyze and compare how internal communication (IC) strengthens organisational wellbeing in Catalan local public administrations.

CISEELAP_2 builds on the conceptual framework of the CISEELAP_1 project, which positions IC as an essential strategic function for emotional wellbeing and organisational cohesion. Grounded in social exchange theory (Homans, 1974) and dialogic communication (Habermas, 1984), it incorporates the PR models of Grunig and Hunt (1984, 2003) and the contributions of Verčič, Zerfass and Vercic (2015), Yue and Men (2019), and FitzPatrick (2022) on communicative leadership and two-way communication. CISEELAP_2 broadens the approach through a comparative and territorial perspective, examining how IC, understood as a relational and strategic practice (Heide and Simonsson, 2021), contributes to wellbeing and a sense of belonging across different local administrations, becoming a driver of legitimacy and institutional sustainability.

Hypotheses and methodology

(H1) IC positively influences workers' emotional health.
(H2) Good emotional health strengthens workers' sense of belonging.
(H3) IC positively influences workers' sense of belonging.
(H4) Good emotional health strengthens the influence of the different dimensions of IC (channel, content and communicative intentionality) on the sense of belonging with the city council.

The methodology is mixed, sequential and comparative, combining qualitative and quantitative techniques. It includes in-depth interviews and focus groups with IC managers and technical staff from the city councils, as well as a survey targeting municipal employees. The analysis integrates statistical procedures and thematic coding to ensure reliability and comparability across municipalities, making it possible to identify patterns, differences and common factors that explain how IC affects emotional and organisational wellbeing in Catalan local government.

Expected results

Although fieldwork is ongoing, the results are expected to show a positive correlation between the quality of IC and workers' emotional wellbeing, as observed in CISEELAP_1. Accessible channels, content oriented towards interpersonal relationships, and communication models based on active listening and transparency are expected to generate a greater positive impact. In addition, the study will identify levels of communicative maturity across local administrations, providing an overall view of the state of IC in the Catalan public sector.

This project strengthens the research agenda launched in CISEELAP_1, underscoring internal communication as a strategic lever for wellbeing and institutional cohesion. Expanding the study to additional municipalities, the second phase develops a comparative, people-centered model of public communication that can guide more empathetic, participatory, and sustainable organisational policies. Anticipated findings will help advance a wellbeing-oriented communication culture, where transparency, trust, and emotional connection become fundamental pillars of contemporary public leadership across local administrations and services.

The project is funded by the Agency for the Management of University and Research Grants of the Catalonian Government.

OSC04 AI, Governance and Organisational Futures

PP 0596 Strategic communicators' adoption of artificial intelligence tools through the lens of the technology acceptance model

Delia Balaban[1], Petra Kovacs[1], Veronica Campian[1]

[1] Babes-Bolyai University Cluj-Napoca, Department of Communication- Public Relations- and Advertising, Cluj-Napoca, Romania

Strategic communicators' adoption of artificial intelligence tools through the lens of the technology acceptance model

Artificial intelligence (AI) is reshaping advertising by enhancing efficiency, automation, and decision-making processes. While research has focused mainly on technical applications and consumer impact, little is known about how communication professionals themselves perceive and adopt these tools. This study addresses that gap by examining the experiences, attitudes, and challenges of marketers through the lens of the Technology Acceptance Model (TAM). By offering qualitative insight, the study proposes directions for extending TAM in the context of strategic communication professionals, suggesting that ethical concerns may act as additional determinants of AI adoption.

The present study uses a qualitative approach to explore how communication professionals perceive and adopt AI tools. With the help of in-depth interviews with seventeen participants (age 25–55 years) from France, Germany, Poland, and Romania, we aimed to explore the social phenomenon of AI adoption in the professional context. Given the exploratory nature of our study, we opt for a qualitative research design that captures rich narratives revealing participants' interpretations, thoughts, and feelings, offering insights. Data was collected from communication professionals working for multinational European-centered corporations. We reached out to professionals who fit our profile through LinkedIn, a social media platform highly used for professional communication. The interview data were analyzed using thematic analysis.

Thematic analysis reveals that AI is primarily valued for streamlining tasks, automating processes, and overcoming creative blocks, while also enhancing productivity and offering a competitive edge in workplace hierarchies. At the same time, participants voiced concerns about authenticity, loss of depth in communication, and the ethical implications of relying on AI. These concerns extend beyond the traditional TAM framework, raising issues such as content ownership, privacy, and trust, as well as the risks of bias, misinformation, and over-reliance on automation. Together, the findings show that AI is increasingly seen as an essential support tool, adopted with both enthusiasm and caution, as professionals navigate its opportunities and risks.

From a managerial perspective, the study underscores the importance of a balanced approach to AI adoption that aligns technological efficiency with ethical integrity and employee empowerment. Organizations should treat AI proficiency as a core competency, support continuous upskilling, and implement clear ethical and data governance guidelines to address ownership, privacy, and trust. AI-related performance metrics should still value human judgment and originality. In line with previous studies, prioritizing AI training can reduce risks and strengthen professionals' AI ethics expertise, reinforcing that AI adoption in advertising remains a double-edged sword.

OSC04 AI, Governance and Organisational Futures

PP 0597 From technical training to situated judgement: Reframing strategic communication for AI-ready workforces

Veronika Bak[1], Chantal Ho[1], João Gonçalves[1], Jason Pridmore[1]

[1] Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

As artificial intelligence (AI) becomes embedded across workplace infrastructures, a gap has emerged between policy ambitions for AI-ready workforces and employees' lived realities of using these systems. Healthcare professionals understand that decision-support systems can produce errors yet fail to identify inappropriate recommendations under time pressure. Customer-service representatives know that AI-generated responses may be contextually inappropriate but lack judgement frameworks to recognise problematic outputs in practice. Despite AI literacy training initiatives since 2020, employees consistently struggle when algorithmic systems become components of their work. These recurring failures reveal fundamental gaps in how organisations strategically communicate about and implement AI systems.

Drawing on critical perspectives on workplace technology that examine how algorithmic systems reconfigure worker agency and organisational control (Kellogg et al., 2020), this research examines three communicative tensions that sustain the implementation gap. First, technical instruction is framed as sufficient while empirical evidence indicates situated judgement requires different approaches, creating internal messaging that deflects responsibility for genuine capability development. Second, external accountability pressures constrain organisational communication strategies toward credential-based metrics that favour standardised knowledge over contextual competence. Third, discrepancies between management communication and worker expertise result in conflicting definitions of AI readiness. Organisations claim that contextual training is impractical to systematise, while employees identify it as what they need. These tensions produce a persistent outcome: employees who possess abstract algorithmic understanding but cannot evaluate outputs or integrate system behaviour with domain expertise.

Existing frameworks recognise both conceptual knowledge and practical competencies as essential (Long & Magerko, 2020), yet remain unclear about developing situated judgement in practice. This ambiguity enables a problematic organisational default: communication and training strategies systematically privilege technical knowledge while neglecting judgement-in-context.

The research employs a multi-method qualitative approach combining semi-structured interviews with AI professionals and training designers, comparative analysis of documented training practices, and systematic literature synthesis, enabling triangulation across professional expertise, documented practices, and theoretical frameworks. It proposes 'situated AI literacy' as a strategic communication reframing positioning literacy as judgement-in-context rather than abstract knowledge. The framework suggests three shifts: judgement-first communication design centring employee decision-making rather than technical features, contextual competence development through authentic decision scenarios integrated into organisational practices, and accountability reallocation from individual employees toward organisational systems. Professional fields routinely develop contextual capabilities through case-based learning and supervised practice, suggesting organisational communication can operationalise these approaches.

The implications challenge organisations to redesign strategic communication around AI deployment, prioritising employee competence development over compliance metrics and centring employee voice in defining readiness. As organisations navigate AI integration, communication practices must evolve from information transmission to capacity building, from individual responsibility to systemic accountability, and from technical expertise to situated judgement as the foundation of AI-ready workforces.

OSC04 AI, Governance and Organisational Futures

PP 0598 Mapping AI research in corporate communications

Michael Johann[1]

[1] University of Augsburg, Department of Media- Knowledge- and Communication, Augsburg, Germany

Artificial intelligence (AI) has become a major driver of change in corporate communications, reshaping how companies manage purposeful communication activities (Wang et al., 2025; Zerfass et al., 2020). We conduct a scoping review of AI research in corporate communications, conceptualised as all purposeful communication activities of corporate actors (Zerfass & Link, 2022). The review maps (RQ1) knowledge production (e.g., authorship patterns), (RQ2) theoretical foundations (e.g., definitions of AI and theoretical lenses), (RQ3) methodological approaches (e.g., study designs), and (RQ4) recurring research gaps.

Following the PRISMA guidelines for scoping reviews, we conducted a structured literature search in the academic databases Web of Science, Scopus, and EBSCO. We screened English-language journal articles using keyword combinations in titles and abstracts: ("artificial intelligence" OR "AI") AND ("corporate communication*" OR "strategic communication" OR "public relations" OR "PR" OR "internal communication" OR "external communication" OR "communication management"). After eligibility assessment, the final dataset comprises 125 articles published between 2018 and 2025.

Findings for RQ1 indicate a broad but geographically uneven knowledge base: research is strongly concentrated in the Global North, while comparative and Global South perspectives remain limited. The great majority of articles report empirical research, whereas conceptual and methodological contributions play a minor role. Regarding RQ2, theoretical foundations are fragmented, with recurrent reliance on technology acceptance and adoption frameworks (e.g., the Technology Acceptance Model and related models), complemented by socio-technical and human-machine interaction perspectives (e.g., Anthropomorphism, Computers as Social Actors). Notably, almost half of the articles lack a clear definition of AI. Research domains cluster around tool- and practice-focused topics such as workflow automation and the use of chatbots. Other prominent topics include AI adoption and questions of ethics and governance. For RQ3, empirical studies are dominated by qualitative interviews, cross-sectional surveys, and experiments. Longitudinal, computational, and mixed-method approaches remain rare. Regarding RQ4, the literature repeatedly highlights the need for replication, validated operationalisations, and stronger designs (e.g., controlled and longitudinal studies with more diverse, representative samples). Theoretically, authors call for greater consolidation (e.g., shared conceptual vocabularies and data ontologies) and for relational and governance-oriented perspectives on AI-mediated corporate communication.

Overall, the review provides a structured overview of a rapidly expanding but fractured field and outlines priorities for future research on AI's organisational, relational, and societal implications in corporate communications.

PP 0599 Generative AI as a contested institutional issue: A study of Swiss higher education institutions

Ilaria Falvo[1], Eleonora Benecchi[2], Colin Porlezza[2], Deborah Barcella[2]

[1] USI Università della Svizzera italiana, Faculty of Communication- Culture and Society - Institute of Communication and Public Policy, Lugano, Switzerland
[2] USI Università della Svizzera italiana, Faculty of Communication- Culture and Society - Institute of Media and Journalism, Lugano, Switzerland

This paper examines how Swiss higher education institutions (HEIs) have responded to the emergence of Generative Artificial Intelligence (GenAI) between late 2022 and early 2025. Drawing on a comparative qualitative policy analysis of 17 institutions, it investigates how institutional identity, strategic positioning, and projected image shape GenAI-related policies and public communication. While existing scholarship has explored GenAI's implications for teaching and learning (Radhwan, 2025), research practices (Yusuf, Pervin, Román-González, & Noor, 2024), and academic integrity (Bozkurt, 2024), less is known about how universities respond organizationally and communicatively to this technological shift. The paper addresses two research questions: (1) Which expectations and/or concerns do key stakeholders express regarding the use of GenAI by HEIs? (2) How have Swiss HEIs responded to external pressures linked to the rise of GenAI through institutional policies, public communication strategies, and other mechanisms? Conceptually, the study combines three theoretical strands. First, it adopts a multi-constituency perspective that conceptualizes HEIs as organizations embedded in stakeholder-dense environments characterized by plural, competing, and evolving expectations (Jongbloed, Enders, & Salerno, 2008). GenAI intensifies these dynamics: policymakers and funding bodies emphasize accountability and responsible innovation, industry actors stress employability and digital skills, academics express concerns regarding epistemic integrity and authorship, and students demand clarity and fairness. Second, drawing on institutional logics theory (Thornton, Ocasio, & Lounsbury, 2012), the study examines how responses vary according to institutional orientation and positionality. In Switzerland, federal institutes of technology operate in global scientific networks and tend to adopt innovation-forward framings, whereas cantonal universities and universities of applied sciences respond more directly to regional professional communities, labor market needs, and local legitimacy demands (Thoenig & Paradeise, 2016).Third, insights from organizational identity and projected image (Gioia, Schultz, & Corley, 2000; Gioia, Patvardhan, Hamilton, & Corley, 2013) inform how HEIs use GenAI guidelines and public statements not only as operational tools but also as symbolic acts of credibility, responsibility, and strategic positioning. As Alexander, Giesen, and Mast (2006) argue, institutions engage in performative communication to sustain legitimacy amid shifting expectations. Switzerland provides a particularly relevant case due to high institutional autonomy and the absence of a national AI strategy. While the federal government has issued broad framings on AI between 2019 and 2025, it has refrained from defining a centralized strategy, leaving HEIs considerable discretion (Stratey, 2025). This decentralization generates variation in interpreting external expectations and constructing guidelines.

Methodologically, the study adopts a comparative qualitative policy analysis (Christensen & Gornitzka, 2017). Seventeen HEIs were selected to capture the diversity of the Swiss system, including ten cantonal universities, two federal institutes of technology, and five universities of applied sciences. Data were collected from (a) the ETER database to map structural and academic profiles; (b) institutional websites to identify GenAI-related guidelines, strategy documents, and governance structures; (c) the Factiva database to analyze media coverage; and (d) the Wayback Machine to reconstruct the temporal emergence of GenAI-related communication. Stakeholder salience analysis (Mitchell, Agle, & Wood, 1997) was conducted to map pressures from policy actors, funding bodies, industry, students, academics, media, and civil society.

OSC04 AI, Governance and Organisational Futures

PP 0600 From hesitation to digital transformation. Paths of generative AI adoption and communicative challenges in Italian universities

Paolo Brescia[1]

[1] University of Cagliari, Political and Social Sciences, Cagliari, Italy

Among other organizations, higher education institutions are challenged by the rise of Generative Artificial Intelligence. Both platformization and AI technologies are reshaping teaching, research, and strategic communication across universities worldwide (Molina & Medina, 2025). Digital platforms and AI-based solutions now mediate the relationships between institutions, students, and society, also raising epistemic ethical concerns. UNESCO's report (2021) highlights the influence of digitalization in redefining curricula and pedagogical forms. Utopian promises and dystopian fears (Wang et al. 2024) about AI tend to dominate the debate both inside and outside the academic context, contributing to a fragmented scenario marked by hesitation and legitimization.

Within this broader dynamic, Italian HEIs are undergoing a particularly complex process of GenAI integration. On one side, there is enthusiasm for innovation and efficiency; on the other, concerns persist regarding academic integrity, transparency and privacy (Ciofalo et al., 2024; Farinosi & Melchior, 2025). However, Universities that articulate explicit, ethical, and transparent AI governance frameworks appear more likely to reinforce their institutional legitimacy within national and international academic ecosystems (Moorhouse et al., 2023).

Despite growing awareness, Italy ranks among the lowest EU countries in digital literacy and AI adoption (OECD, 2025). Eurostat (2025) also identifies a significant national lag in the use of generative AI tools for educational purposes compared to the European average. Given this scenario, Italian public universities represent valuable laboratories for observing how AI technologies are negotiated and framed in organizational activities, including communication.

Thus, the research aims to examine how Italian public universities are addressing the GenAI revolution within their institutional frameworks and communication practices.

This study draws on two theoretical frameworks, the institutionalization model (Mergel & Bretschneider 2013), to identify and classify the different stages and conditions of GenAI adoption across universities; the TOE model (Tornatzky et al., 1990) to explore environmental factors that shape adoption patterns, enabling a comprehensive interpretation of how Italian universities approach, integrate, and communicate AI.

Specifically, the study addresses three research questions:

1. Have Italian public universities developed policies, guidelines, or governance structures to regulate GenAI use?
2. How are these orientations reflected in their strategic communication strategies?
3. To what extent do university communication offices adopt GenAI tools in the creation of digital content?

Methodologically, the research consists of two different stages.

A comprehensive mapping of the websites of all 61 Italian public universities provides the first dataset, to identify the visibility of AI-related policies or guidelines, designated AI responsibles and communication initiatives. This mapping is followed by a content analysis of strategic plans, institutional guidelines, public statements, and official documents addressing the use of GenAI, including communication plans. Attention is placed on transparency concerning AI-generated communication contents and the strategic use of these synthetic systems.

Expected findings include the identification of Italy's fragmented yet evolving path in GenAI integration, marked by innovative practices, regulatory gaps, and uneven governance maturity. The study will also explore the impact of institutional alliances, as the Italian conference of rectors/OpenAI agreement, in strengthening legitimacy, trust, and public accountability within the landscape of the "new AI-driven" academia.

OSC05 Culture, Heritage and National Image

PP 0707 Cultural mega-events as a shield: How the Grand Egyptian museum shapes national image amidst global crisis

Basma Serageldin[1]

[1] Universitat Autonoma de Barcelona, Department of Advertising- Public Relations and Audiovisual Communication, Barcelona, Spain

In today's world of constant global tension, cultural mega-events have become more than just a way to make money or attract tourists. For developing nations, these events are now used as strategic tools to manage their international reputation during difficult times, such as the recovery from the pandemic and the ongoing instability caused by conflicts in Gaza for example. While Egypt has recently used highly produced events like the "Pharaohs' Golden Parade" to grab global headlines, the opening of the Grand Egyptian Museum (GEM) marks a major change in strategy. This paper studies how the GEM acts as a stable branding platform that has helped and keep on helping Egypt project an image of strength, historical consistency, and modern leadership, even when the surrounding region is volatile. This study adds to existing research by combining Anholt's (2007) "Nation Branding Hexagon" with a new focus on symbolic resilience. It asks a key question: How can a cultural project help a nation overcome the negative perceptions often caused by regional instability? The research examines how the GEM acts as a buffer, ensuring that when people think of Egypt, they focus on its cultural greatness rather than its proximity to global conflicts.

Methodology

This study uses a practical, multi-method approach to see how the event was planned and how people actually reacted to it. The data includes:

- Semi-structured Interviews (n = 9): Conducted with high-level decision-makers, including senior officials from the Ministry of Tourism and Antiquities, strategic communication experts, and event creators. These interviews provide a detailed description of the internal motivations and the intended state-led narrative.
- Social Media Analysis: A stratified sampling of 3,000 multilingual posts on Instagram and Facebook. Utilizing thematic coding, the study categorizes responses into three primary categories:
  1. *Civic Pride (Domestic sentiment);*
  2. *Nation Branding (International traveler sentiment); and*
  3. *lace Branding (Global discourse on the country).*
- Media Analysis: An analysis of 50 international news outlets to track narrative shifts during the museum's inaugural month and how it was talked about and about the country.

Findings & Academic Debate

The results show that the GEM is a core part of Egypt Vision 2030 for tourism sector specifically. It successfully promoted for the newly renovated Giza area that has been turned into a modern cultural hub that competing with other major cities within Egypt and around the world. The study opens an important debate: Can a cultural event like the GEM opening truly transform a nation's long-term reputation? The findings show that because so many different groups were involved, including private companies, global experts, and local communities, the museum became a shared success rather than just a government project. This research shows that when a country uses its heritage to build civic pride, it creates a more authentic and resilient national brand. The GEM serves as a lesson for other nations on how to use cultural landmarks to move beyond traditional tourism and instead build a sense of collective confidence and global leadership.

OSC05 Culture, Heritage and National Image

PP 0708 Strategic organisational and intercultural communication: Community radio stations and social change in the Nicaraguan Caribbean coast

Yulmar Montoya[1], Balbuena Palacios María Leonor[1]

[1] Universitat Autònoma de Barcelona, Departament de Publicitat- Relacions Públiques i Comunicació Audiovisual, Barcelona, Spain

This study examines how three community radio stations from URACCAN University—Rosita, Siuna, and Waspam—function as strategic communicative organisations. These stations operate as intercultural public relations laboratories (Grunig et al., 2007) capable of transforming structural issues into opportunities for dialogue, cohesion, and social change in the Caribbean Coast of Nicaragua (Servaes, 2012). In a territory marked by land conflicts, educational inequalities, and healthcare fragility, these media outlets develop organisational strategies for relationship management, knowledge articulation, and the strengthening of culturally diverse citizenships. This is achieved through strategic interaction with stakeholders—indigenous and Afro-descendant communities—(Freeman & McVea, 2001) who participate directly and indirectly in organisational governance, agenda-setting, content production, and the construction of communicative processes oriented toward social change.

This research operationalises the two-way symmetrical model (Grunig & Hunt, 1984) and stakeholder theory (Bourne, 2009; Freeman & McVea, 2001) within intercultural community organisations. In this scenario, community radio stations expand the scope of strategic organisational communication beyond corporate contexts into development-oriented settings (Guo, 2017; Wilkinson, 2017). Relationship management in these environments is both strategic and cultural, requiring linguistic, epistemological, and symbolic adaptation, thereby extending stakeholder theory toward organisational interculturality in community settings.

A mixed-methods approach and a multiple-case study design (Yin, 1994; Stake, 1998) were employed, focusing on three stations and three key issues: land conflicts, educational deficits, and weaknesses in the healthcare system. The study integrated a literature review; semi-structured interviews with staff, analysed using Atlas.ti; and participant observation of interactions between the audience and the station, in addition to a four-month cultural immersion program (Kawulich, 2005; Angrosino, 2012). Furthermore, a synchronic quantitative analysis (Rourke and Anderson, 2004) of the 2023 programming schedules was conducted, following Perona's (1996) model, to identify genres and content oriented toward social change. Data triangulation ensured the validity of the study (Lincoln and Guba, 1985).

The results reveal that the stations broadcast a combined 352 hours, dedicating 23% of total airtime to strategic communication and public relations for social change. By station, Waspam allocates 35.9%, Siuna 21.4%, and Rosita 16.5%. This percentage constitutes a deliberate organisational strategy with measurable objectives. Qualitatively, the radio stations implement applied strategic communication by managing land conflicts through campaigns on communal rights and intercultural mediation, which have facilitated the recovery of encroached lands. In education, they produce bilingual content that strengthens intercultural access in alignment with the Regional Autonomous Education Subsystem (SEAR). In healthcare, they lead prevention campaigns using multilingual messaging that, during the COVID-19 pandemic, facilitated coordination between traditional and Western medical practices. This research contributes to public relations and organisational communication theory by demonstrating that strategic models are transferable to community organisations in multicultural contexts, proposing a hybrid model that integrates strategic communication, interculturality, and community participation as agents of social change.

PP 0709 Does more say more? Organizational heritage communication and the amount of historic information

Britta Brugman[1], Miel Groten[2]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands
[2] Leiden University, Institute for History, Leiden, Netherlands

Through organizational heritage communication, organizations share their past to help stakeholders make sense of who the organizations are today and where they are headed. Companies, for instance, often emphasize family ownership across generations to highlight a foundation deeply rooted in tradition (Blombäck & Brunninge, 2013). A growing number of studies examines the effectiveness of organizational heritage communication. They typically draw from at least two contrasting theories. Based on signaling theory (Erdem & Swait, 1998), research found that heritage communication signals credibility and, consequently, benefits the organization's strategic goals (Pecot et al., 2018). Following construal level theory (Trope & Liberman, 2010), research showed that heritage communication increases psychological distance (i.e. makes the organization feel less close), which in turn leads to unfavorable effects (Scarpi, 2021). This implies that effects depend on competing underlying mechanisms.

Prior studies often operationalized heritage communication through logos or advertisements using indicators such as the founding year or organizational age. In practice, however, organizations not only share these numbers but also use storytelling to provide a richer narrative of their past (Pfannes et al., 2021). They *frame* their history in a way that best highlights their brand identity, core mission, and relevance to stakeholders. Yet, the effectiveness of increasing historic information about the organization, and the question which underlying mechanism may prevail when heritage framing is used, has remained widely unexplored. Our research therefore investigated both the main and indirect effects of the amount as well as the nature of historic information in organizational heritage communication on several relevant organizational perceptions (i.e., perceived heritage, perceived legitimacy, and perceived reputation).

We conducted a preregistered experiment in the Netherlands with a representative sample. Participants read an 'About us' text from either a fictional bank or steel company. The control condition contained only information about the organization's present, while the experimental conditions additionally included up to four heritage frames randomly (founding period, place of origin, founder, success). The second author (a historian) ensured all information was historically credible. Manipulation checks were also successful. We adapted existing Likert scales to measure our main variables on 7-point scales. The study was preregistered prior to data collection: https://osf.io/5byqn/?view_only=4c802069f057479abf86b6328aeb4bc2.

Our findings showed that increasing the amount of historic information through heritage framing positively impacted perceived heritage and perceived reputation. No such significantly effects were found on perceived legitimacy. We found that credibility increased with the amount of historic information and, in turn, positively affected the main variables, but only when at least three heritage frames were present. Increased information led to greater psychological distance and consequently lower scores on the main variables, independent of the number of heritage frames. Our findings, therefore, suggest that heritage communication enhances credibility only when a substantial amount of historic information is provided, while psychological distance consistently poses a risk that should be minimized. The founder frame emerged as the most effective heritage frame because it was the only frame that enhanced credibility perceptions without simultaneously increasing psychological distance. Organizations may use these insights to refine their heritage communication strategies.

OSC05 Culture, Heritage and National Image

PP 0710 How science information repertoires are related to university reputation

Daniel Vogler[1], Mark Eisenegger[2], Daniel Künstle[3], Mario Schranz[3]

[1] University of Zurich, Research Center for the Public Sphere and Society, Zürich, Switzerland
[2] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

[3]*commsLAB, commsLAB, Basel, Switzerland*

The relationship between citizens and higher education is highly mediated. Most people will learn about science and universities through the media (Schäfer, 2011). However, little is known about how media consumption relates to public evaluations of universities and their societal value. This study addresses this gap by examining how science information repertoires are associated with reputation, understood as the evaluation of universities by the public (Vogler, 2020). Theoretically, the study builds on the concept of media repertoires, stable patterns of media use (Hasebrink & Hepp, 2017), which have been shown to be related to evaluations of organizations (Schwaiger et al., 2020).

The study is based on a standardized online survey (n = 1,340) measuring university reputation and science information repertoires in Switzerland. We apply Eisenegger's (2005) three-dimensional concept of reputation, which is rooted in Habermas's three-world framework and, due to its level of abstraction, is applicable to different types of organizations. We apply the concept to universities using two items per dimension (scale 0–6), capturing evaluations of universities' research and teaching performance (functional dimension), their commitment to social standards and contribution to society (social dimension), and their emotional appeal and perceived uniqueness (expressive dimension). The study includes all

six universities in the German-speaking region of Switzerland. Each participant was randomly assigned two universities for evaluation. Respondents who indicated that they did not know a given university were excluded. The six reputation items per university were aggregated into a mean index, resulting in a total of 2,305 individual reputation assessments.

The reputation measures were combined with measures of information behavior. Participants reported the frequency of use (scale 0–6) of ten different channels for obtaining information about science, research, and higher education (e.g., newspapers, social media, television, radio, and university channels). We applied latent profile analysis (LPA) to identify five distinct science information repertoires, labeled *Heavy Users*, *Omnivores*, *Social Media & Online*, *Traditionalists*, and *Deprived*. Additionally, we included age, gender, education, and trust in science as covariates.

The results show that university reputation differs across science information repertoires. An ANOVA with post hoc tests indicates that reputation is significantly lower among the *Deprived* repertoire (M = 3.49) compared to all other groups. Reputation is highest among *Heavy Users* (M = 4.70), followed by *Omnivores* (M = 4.01), *Traditionalists* (M = 4.00), and the *Social Media & Online* repertoire (M = 3.83). Further analysis using linear regression shows that these differences between repertoires persist when covariates are included. Trust in science, gender (male), and age are positively related to reputation. Overall, the findings indicate that information behavior is an important factor shaping public evaluations of universities.

OSC05 Culture, Heritage and National Image

PP 0711 As feminists and public relations: A Proto-PR feminist model proposal

Sónia Sá[1]

[1] University of Beira Interior, LabCom - Communication and Arts, Covilhã, Portugal

This paper examines the intersections between feminist activism and the history of public relations by analysing feminist communicative practices developed prior to the institutionalisation of public relations (PR) as a professional field. While dominant PR historiography has largely focused on corporate, governmental and managerial trajectories, this study revisits feminist activism as a historically significant site of strategic communication practices oriented towards persuasion, visibility, mobilisation and public formation. Rather than retrospectively professionalising feminist actors, the paper approaches their communicative work as a proto-history of practices later formalised within PR.

Grounded in feminist communication theory and critical approaches to PR historiography, the study introduces the *Proto-PR Feminist Model* as an original analytical framework designed to examine how feminist activists organised communication to shape public discourse and collective action. The model integrates insights from feminist rhetoric, activist communication and critical public relations research, and is structured around six analytical dimensions: (1) framing processes, (2) publics and audiences, (3) narrative techniques, (4) authority and ethos, (5) calls to action, and (6) proto-PR functions, including agenda setting, counter-framing, opinion leadership, coalition building and media innovation. These dimensions function as interpretive categories that enable systematic and comparative analysis across historical and sociopolitical contexts, while remaining attentive to the conditions of exclusion and marginalisation in which feminist communication emerged.

Empirically, the study adopts a qualitative historical approach based on interpretative textual analysis. The corpus comprises speeches, pamphlets, investigative journalism and documentary materials produced by four feminist activists operating in different national contexts and periods: Ida B. Wells (United States), Emmeline Pankhurst (United Kingdom), Bertha Lutz (Brazil) and Maria Lamas (Portugal). These figures were selected because their communicative practices were sustained, publicly oriented and strategically deployed outside institutionalised PR structures, and because they exemplify distinct modes of feminist persuasion, including investigative, militant, diplomatic and documentary forms.

The comparative application of the Proto-PR Feminist Model reveals consistent patterns across cases. Wells employed investigative journalism and statistical evidence to reframe lynching as a national moral crisis and to construct counter-publics around racial justice. Pankhurst used spectacle, autobiographical narrative and militant rhetoric to generate visibility and mobilise collective action for suffrage. Lutz combined scientific authority and international advocacy to legitimise women's citizenship claims within institutional arenas. Lamas mobilised ethnographic testimony and documentary photography to expose structural gendered exploitation and to create empathy-based national audiences. Across cases, feminist activists engaged in deliberate framing, audience construction, narrative authority and calls to action that resonate with communicative functions later associated with public relations.

By foregrounding the analytical contribution of the Proto-PR Feminist Model, the paper expands PR historiography in two ways. First, it offers a transferable framework for examining strategic communication practices developed in non-institutional and activist contexts. Second, it challenges corporate-centred and androcentric accounts of PR history by demonstrating that key communicative functions emerged within feminist struggles for social transformation. The study thus contributes to a more inclusive and critical understanding of the historical development of public relations and strategic communication.

OSC06 Strategic Communication in Platformed and Algorithmic Environments

PP 0791 Beyond engagement metrics in strategic communication: Methodological innovations for analyzing algorithmic environments

Alina Bârgăoanu[1], Alessandro Lovari[2], Corina Buzoianu[1]

[1] National University of Political Studies and Public Administration, Communication and Public Relations, Bucharest, Romania
[2] Università degli studi di Cagliari, Department of Political and Social Science, Cagliari, Italy

As organizations increasingly operate within deeply mediatized digital environments (Couldry & Hepp, 2017), strategic communication is shaped not only by organizational intent but by algorithmic systems that structure visibility, emotional resonance, and contextual meaning. While organizations deploy a wide range of digital tools to create, monitor communication and evaluate performance, these instruments largely focus on observable content and post-hoc engagement metrics. This presentation argues that, despite this abundance of tools, organizations lack a coherent framework for exploring, analyzing, and understanding the digital environment itself—particularly the role of algorithms as infrastructural gatekeepers (Gillespie, 2014). Existing research has extensively examined digital strategies, platform use, and audience engagement. However, dominant approaches often remain in a state of methodological "stasis," prioritizing measurement over interpretation (Macnamara, 2018). Algorithms are frequently treated as background conditions rather than as dynamic actors that actively shape how organizational messages are circulated, clustered, amplified, or suppressed (Esposito, 2022), a perspective informed by relational approaches to communication and organizing (Kuhn, Ashcraft & Cooren, 2017). According to Bonini and Treré (2024), algorithms exercise power by embedding communication within broader meta-narratives and affective regimes that escape direct organizational control. In line with organizational communication research highlighting interpretive challenges in digital contexts (Locatelli & Lovari, 2021), this opacity creates a strategic risk: without understanding how automated systems shape communicative contexts, organizations struggle to distinguish between what is situational, what is silently omnipresent, thus ambient, and what is algorithmically produced. This study addresses this gap through a two-step research design. First, it conducts a critical review of a purposively selected corpus of peer-reviewed studies and policy and industry reports on algorithms, platform governance, and digital environment analysis. The review draws on key journals in strategic communication, media studies, and organization research, alongside reports from regulatory bodies and platform accountability initiatives, with a focus on publications from 2015 to 2024. Inclusion criteria required that studies explicitly examine algorithmic visibility, recommendation systems, or digital monitoring tools. A recurring limitation emerges from the review: despite widespread recognition of algorithmic influence, few studies offer concrete methods for empirically capturing these dynamics in action—a gap that the subsequent section of this presentation explores. Second, the presentation introduces analytical honeypotting as a methodological response. Adapted from cybersecurity and computational research, honeypotting involves simulating specific user behaviors to examine how recommendation systems categorize, prioritize, and associate content—without generating artificial engagement. This approach enables the observation of ambient narratives and emotional patterns that circulate independently of organizational actors. The method is illustrated through a case study on digital nostalgia, an emotionally charged and strategically mobilized theme in organizational storytelling. The analysis shows how nostalgic narratives are algorithmically clustered and embedded within broader meta-narratives that shape reception conditions before organizational messages are encountered. By combining a structured literature review with methodological innovation, this presentation advances understanding of algorithmically mediated communication and offers a rigorous framework for analyzing digital environments with both academic, organizational, and societal relevance.

OSC06 Strategic Communication in Platformed and Algorithmic Environments

PP 0792 Strategic communication, AI, and public value: Ethnographic insights into organizational paths and challenges of a municipal chatbot

Fabiola Fenili[1]

[1] Univerisity of Urbino, DISCUI - Communication and Humanistic Studies, Urbino PU, Italy

In a context of growing social uncertainty and an intensifying public debate on artificial intelligence, public organizations are required to rethink their communicative role in relation to the production of public value (Twizeyimana & Andersson, 2019) and the management of citizens' expectations toward digital technologies, tracing new paths, fostering meaningful connections, and orienting possible futures. Within this scenario, chatbots adopted by local administrations represent a privileged empirical field for observing how organizational communication is constructed, governed, and interpreted in practice (Lovari, Ducci, 2022). This paper analyzes the case of "Rimini Chatbot", a rule-based conversational system implemented by the Municipality of Rimini in Italy with the aim of supporting citizens in accessing digital public services (Larsen-Følstad, 2024).

The study is grounded in an organizational ethnography approach, based on seven months of participant observation conducted at the Municipality of Rimini. During this period, the everyday practices of public communicators, operational meetings, and coordination moments with the technology provider were observed, with particular attention to content update processes, the definition of tone of voice, and the conscious management of the system's limitations and of the

objectives of citizen-centered public communication. This ethnographic core is complemented by the results of a questionnaire administered to citizens through the chatbot itself and by an analysis of chatbot logs, which make it possible to relate the observed organizational practices to users' actual uses and perceptions.

From a theoretical perspective, the paper is situated within the field of organizational and strategic communication (Latour, 2002) and interprets the chatbot as a socio-material infrastructure (Orlikowski, 2007) through which forms of algorithmic bureaucracy materialize (Vogl, Seidelin, Ganesh, & Bright, 2020), understood as the partial automation of communicative and informational procedures traditionally carried out by human operators. From this perspective, the chatbot contributes to shaping communicative pathways, reconfiguring connections between the organization, the technology provider, and citizens, and redefining the conditions under which public communication produces public value in terms of accessibility, transparency, and information standardization.

The findings show that, from an organizational standpoint, public communicators and the technology provider implement careful and coherent management practices aimed at ensuring informational reliability, regulatory compliance, and the reduction of communicative risk. However, questionnaire data reveal only partial appreciation on the part of responding citizens. The analysis suggests that this gap does not stem from technical or communicative shortcomings, but rather from a tension between the logic of public value and users' expectations, which are often oriented toward generative, dialogic, and personalized models of artificial intelligence.

The case of the Rimini Chatbot thus enables a critical reflection on the possible future scenarios of automated public communication, showing how the legitimacy of algorithmic bureaucracy depends not solely on system efficiency, but on organizations' ability to govern sociomaterial expectations and to clearly communicate the boundaries of automation.

The main limitation of this study is that it focuses on a single Italian case; future research could address this issue by conducting comparative analyses across multiple cases at the European level.

OSC06 Strategic Communication in Platformed and Algorithmic Environments

PP 0793 From distance to closeness: How temporal and emotional proximity influence non-profit social media communication

Nils Gustafsson[1], Cecilia Gullberg[2]

[1] Lund university, Department of Strategic Communication, Helsingborg, Sweden
[2] Uppsala University, Department of Business Administraton, Uppsala, Sweden

The aim of this paper is to advance understanding of how and why non-profit organizations use social media for external communication by moving beyond both broad sector-level generalizations and micro-level studies on single organizations and platforms. Drawing on a manually coded dataset of 1,694 posts across Instagram, Facebook, and X/Twitter, we conduct a cross-platform and cross-organization comparison of two major Swedish fundraising organizations: the Swedish Red Cross and the Swedish Childhood Cancer Fund. Unlike prior research that typically focuses on a single platform or treats social media as a homogeneous technology (Lovejoy & Saxton, 2012; Lam & Nie, 2020), this study provides a fine-grained analysis of what is communicated, who is given voice, and who is addressed in social media posts.

Theoretically, we apply the concept of stakeholder closeness and distance (Gray et al., 2006) to understand observed differences in communication practices, demonstrating that variations are shaped not only by platform-specific affordances but also by the temporal and emotional closeness/distance between causes and stakeholders. Our findings reveal that while both organizations rely on Instagram and Facebook for visually rich storytelling, they differ markedly in narrative style and audience engagement: the Red Cross adopts an organization-centric approach emphasizing accountability and evidence of action, whereas the Childhood Cancer Fund employs a more inclusive strategy centered on beneficiaries and interactive campaigns. Twitter, in contrast, emerges as a distinct space for advocacy and direct interaction with niche communities.

By refining existing conceptual categories and introducing closeness as an explanatory lens, this study contributes to theory development and offers insights for non-profits. We argue that understanding platform-specific dynamics and stakeholder relationships is critical for designing effective communication, and we call for further comparative research across causes and contexts.

OSC06 Strategic Communication in Platformed and Algorithmic Environments

PP 0794 How misinformation by organizations affects trust: The role of intentions and consequences

Jolan Urkens[1], Sandra Jacobs[1], Alexander Pfeuffer[1], Christian Burgers[1]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Misinformation erodes public trust in organizations. Although organizations are often victims of misinformation, they can also be prominent sources of misinformation. Tobacco and oil companies have been accused of deceiving the public through coordinated disinformation campaigns. Other organizations may mislead their stakeholders inadvertently. A customer service chatbot of Air Canada, e.g., provided customers with false refund information.

Different forms of misinformation by organizations, varying in intent and consequences, likely have different repercussions for trust in organizations. In this study, we complement Situational Crisis Communication Theory with Correspondent Inference Theory (CIT), a type of attribution theory which postulates that evaluations of an actor hinge primarily on intentions and consequences of an action – two concepts prominent in misinformation debates. We therefore consider the effects of both the intentional spread (i.e., disinformation) and unintentional spread (i.e., misinformation) of false information by organizations on trust. Apart from intentions, the severity of the negative consequences also likely also affects trust – as evidenced in crisis communication research. Specifically, we expect that organizational disinformation (vs. misinformation) and severe (vs. limited) consequences lead to less trust in the organization.

Notably, little is known about whether intentions or consequences of misinformation are more decisive in shaping people's evaluations of organizations. Within CIT the relative influence of intentions and consequences indeed remains unclear. This study therefore disentangles their effects on trust in an organization (for the preregistered hypotheses, see: https://edu.nl/prejk).

Using a 3 (type of information: disinformation vs. misinformation vs. control) by 2 (type of consequences: severe vs. limited) between-subjects experiment, we exposed respondents (N = 603) to a news article about a fictitious organization that reportedly misled their customers either intentionally or unintentionally, which led to severe or limited negative consequences.

Two-way ANOVAs revealed significant main effects of type of information and type of consequences on perceived trust, integrity, benevolence, competence, and customer intent. Overall, disinformation led to more negative evaluations compared to misinformation, which also led to more negative evaluations compared to the control condition. Severe (vs. limited) negative consequences also led to more negative evaluations. Contrary to our expectations, no significant interactions between intentions and consequences were found.

We conclude that the intentions and consequences of organizational misinformation additively yet independently erode trust in the organization. Our study is the first to integrate CIT with debates on (organizational) misinformation and proves that CIT is valuable for explaining how organizational misinformation affects trust in organizations. In doing so, we contribute to the literature in three ways. First, while misinformation studies focus on the persuasiveness of misinformation and on its corrections, our organizational focus underscores the relevance of examining the reputational repercussions of misinformation for organizations. Second, for studies on the relation between organizations and misinformation, our findings show that perceptions of an organization are not only negatively affected when they are the victim of misinformation, but also when they are the source. Third, we add to the literature on corporate deception and trust, by showing that next to intentional deceit even unintentionally misinforming stakeholders undermines trust in organizations.

OSC06 Strategic Communication in Platformed and Algorithmic Environments

PP 0795 Who is responsible for the digital society? Public expectations of Corporate Digital Responsibility

Alexandra Schwinges[1], Hannes Cools[1], Sarah Marschlich[1], Anne Kroon[1], Olga Eisele[1]

[1] Amsterdam School of Communication Research- University of Amsterdam, Communication Science, Amsterdam, Netherlands

The digital transformation in society introduces unique organizational responsibilities such as Artificial Intelligence, datafication, and surveillance that go beyond traditional Corporate Social Responsibility (CSR) frameworks. In response, Corporate Digital Responsibility (CDR) has emerged as an extension of CSR "which takes into account the ethical opportunities and challenges of digitalization" (Herden et al., 2021, p. 7). Yet, organisations are under increasing scrutiny to act digitally responsible (Schwinges et al., 2023), which is important to gain and maintain competitive advantages in an era of organizational distrust (European Communication Monitor, 2025).

Despite growing attention in other disciplines that have led to early measurements and managerial approaches to CDR (Merbecks, 2024; Yang et al., 2025), these approaches are rarely grounded in communication theory or help us to empirically support CDR communication frameworks (Wang & Schwinges, 2025). There is a clear knowledge gap about how citizens assign digital responsibilities to companies relative to other social actors like the government or news media (RQ1); if and how they differentiate expectations towards companies across ESG domains (RQ2); or how digital competencies, and

environmental and social consciousness predict these accountability demands, and how institutional trust moderates these associations (RQ3).

To address these questions, we conducted a pre-registered survey with a representative sample of citizens in the Netherlands (n = 2196; 50.5% female, balanced for age and education). Based on Herden et al. (2021), we developed a scale measuring CDR along three dimensions: *environmental CDR* as the responsibility to reduce the negative impact of digital technologies (Covucci et al., 2024), *social CDR* as company's responsibility to minimize harm and promote well-being (Yang et al., 2025), and, *governance CDR* as companies dealing with the accountability of technology (Trier et al., 2023; Van Der Merwe & Al Achkar, 2022). In addition, we measured responsibility attributions towards environmental, social, and governance CDR relative to other social actors and other potential predictors of CDR.

Results show that citizens attribute greater digital responsibility to organisations compared to other societal institutions across all three ESG domains, aligning with the increasing visibility of companies as key agents in the digital society. Public perceptions of CDR broadly align with the ESG framework; yet we find that issues like privacy and personal rights are interpreted as governance-oriented rather than social CDR, reflecting a growing emphasis on oversight and accountability. Environmental and social consciousness, as well as digital competencies, are strong predictors of CDR. Corporate trust moderates these associations, demonstrating how epistemic distrust challenges the role that companies can play in the responsible digital transformation.

We contribute to prior research on CDR by providing (1) a conceptual, communication-science based integration of CDR with stakeholder theory and digital ethics; (2) a validated methodological measurement of a CDR along the ESG framework; (3) an empirical mapping of public expectations and testing of their predictors; and lastly, (4) we offer practical guidance for organizations to align CDR communication with stakeholder expectations.

OSC07 Internal Communication and Institutional Change

PP 0899 Organizational purpose communication showing the path: How mid-level managers make meanings amid shifting stakeholder expectations

Ilari Ceder[1], Leena Mikkola[1], Steve May[2]

[1] Tampere University, Communication Sciences- Faculty of Information Technology and Communication Sciences, Tampere, Finland
[2] The University of North Carolina at Chapel Hill, The Department of Communication, Chapel Hill- North Carolina, USA

Contemporary business practices have contributed to an increasingly unstable global context, where organizational actions pose significant risks to climate, ecosystems, societies, and human well-being (Ehrnström-Fuentes et al., 2025). In response, governments, NGOs, citizens, researchers and businesses have intensified scrutiny of corporate legitimacy and the reasoning behind organizational existence, often articulated through the concept of organizational purpose. Purpose is presented as a means to align business operations with societal good (Henderson, 2024), thus seeking to legitimize business operations through ethical grounds.

Despite extensive examination of organizational purpose across multiple disciplines (e.g. management and organizational studies, organizational psychology, leadership, CSR, business ethics, and corporate law), the organizational communication perspective remains underexplored with just few exceptions (e.g., Kuhn, 2024). This omission is critical because purpose communication can operate as a strategic discourse that legitimizes authority and managerial control, albeit frequently framed as social responsibility. From a communication perspective, purpose is not merely a declarative statement but an ongoing process of meaning-making: communication constitutes knowledge, social structures, and organizational realities (Craig, 1999). Therefore, a critical analysis of this discourse is essential, given the societal power of corporations and the far-reaching impact of their communicative practices on global well-being. Building on this gap, this ongoing study examines how organizational purpose, as a social construct, is continuously framed, negotiated, and enacted through communication. Specifically, we explore how social sustainability and the societal acceptance of business organizations are constructed internally and externally through purpose communication.

Employing a Straussian Grounded Theory approach (Strauss, 1987), we analyze how mid-level managers in a large Nordic industrial manufacturing company interpret and make meanings of organizational purpose, stakeholder expectations, and a shifting operational environment. Given the methodological design, the precise research questions will evolve as the study progresses. Our dataset consists of 20 interviews with mid-level managers, which have been initially coded. Further analysis of these interviews and codes, along with an in-depth literature review, is currently underway.

By the time of the European Communication Conference, we will present refined results, but the tentative findings suggest that for the mid-level managers organizational purpose communication operates as a guiding strategic narrative framing organizational transformation, as a reconciliatory force between societal expectations and organizational imperatives, and as a source of intra-organizational tensions. Our study contributes to understanding how organizations navigate complex and shifting societal expectations and operational environments through communicative practices of purpose.

OSC07 Internal Communication and Institutional Change

PP 0900 Mapping internal communication about organizational missions and work meanings in environmental NGOs

Tünde Taxner[1]

[1] Ludovika University of Public Service, Department of Digital Media and Communication, Budapest, Hungary

Internal communication plays a central role in non-governmental organizations (NGOs) because it constitutes organizational membership (Winkler & Schoeneborn, 2020), enhances work meaningfulness (Marchiori & Buzzanell, 2017), and aligns stakeholder expectations (Shumate & O'Connor, 2010). Creating shared work meanings and a clear mission is crucial for these organizations because these communication processes enhance employee engagement and motivation despite often limited resources and low wages (Berlan, 2018). The Instigatory Theory of NGO Communication (ITNC) defines internal relations as communication activities that create shared vision and legitimacy on the strategic level and participation, co-creation, and reproduction on the operational level (Oliveira, 2019). Despite this elaborate theoretical approach, few studies explore internal communication practices of NGOs and reflect on the ITNC model. Thus, this study aims to map internal communication practices that create paths for NGOs by constructing work meanings, reinterpreting organizational mission, and enhancing work meaningfulness. We ask: How do employees of NGOs communicate about meaningful work and organizational mission internally?

The thematic content analysis of n = 20 semi-structured, in-depth interviews with employees of five Hungarian environmental NGOs uncovers internal communication tools, channels, and practices. The sample strives for diversity and includes NGOs of various sizes, institutional forms, and backgrounds working in different areas of environmental protection ranging from water pollution to youth education and climate activism.

The results show that participating NGO employees feel a need to reflect on shared work meanings and discuss the organizational mission; however, these initiatives are sporadic and not integrated in daily operations. The results reflect on the differing levels of professionalism, building on the concept of nonprofit marketization (Sandberg et al., 2020), and show that as NGOs grow, their internal communication becomes more structured, and shared meaning-making of work becomes strategically planned. The study enriches the ITNC framework by mapping communicative ways of shared meaning-making in NGOs. From a practical point of view, the study provides professionals and leaders communicative ways for creating shared work meanings and enhancing work meaningfulness to successfully retain employees and keep NGOs on their strategic paths.

OSC07 Internal Communication and Institutional Change

PP 0901 Bringing the CALM to organizational change: A communicative alignment and legitimacy model for co-created change narratives

Ester Conings Vanvik[1], Audra Diers-Lawson[1]

[1] Kristiania University of Applied Sciences, Communication, Oslo, Norway

Organizational change research increasingly recognizes that transformation is not only a structural or strategic endeavor but a fundamentally communicative process through which meaning, legitimacy, and action are continuously negotiated. Building on this communicative turn, and especially on Lewis's Stakeholder Communication Model of Change (2007), this conceptual paper proposes the Communicative Alignment and Legitimacy Model (CALM) as a refinement that centers communication as the generative infrastructure of change rather than a downstream implementation tool.

CALM responds to two key limitations in existing models: first, the tendency to treat communication as a set of discrete strategies chosen by managers, and second, the under-specification of how internal legitimacy, alignment, and shared narratives actually emerge over time. Drawing on scholarship in strategic communication, sensemaking/sensegiving, and organizational change, as well as empirical insights from sustainability transitions in the energy sector, the model reconceptualizes change as a layered communicative system.

The model unfolds across three interconnected layers. Layer 1 identifies four core communicative processes: change legitimacy, sensemaking/sensegiving, communication, and co-creation as foundational conditions that make change meaningful, believable, and participatory. Layer 2 describes emergent relational conditions like change alignment, organizational change narrative, stakeholder dialogue, and shared purpose that develop when these processes interact, creating a social infrastructure for collective orientation and ownership. Layer 3 specifies four strategic communicative mechanisms. i.e. institutional efficacy, co-orientation, framing the change, and framing the organization through which organizations guide, stabilize, and recalibrate alignment and legitimacy in practice.

Together, these layers culminate in a co-created change narrative: a shared, evolving story of why change matters, what it entails, and who the organization is becoming. CALM is intentionally idealized, offering both a theoretical framework and a diagnostic lens for examining where change communication breaks down—for example, when legitimacy is fragile, dialogue is absent, or framing diverges from lived experience. The paper outlines CALM's contributions to refining SCMC, advancing stakeholder-centric strategic communication, and enriching processual understandings of organizational change, and suggests avenues for empirical research on legitimacy formation, narrative development, and participatory communication in complex change contexts such as sustainability transitions.

OSC07 Internal Communication and Institutional Change

PP 0902 Digitalization pathways and their impact on organizational communication in local authorities: A case study of digital workplace practices in an Italian municipality

Giorgia Gianotti[1], Gea Ducci[1]

[1] University of Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies., Urbino, Italy

In a context of global uncertainty, public administrations are facing a digital transition that impacts both services and governance models (Lovari&Ducci, 2022). The post-pandemic acceleration in digital media adoption (Faccioli et al., 2020; Boccia Artieri, 2023) has established public communication as a strategic pillar for institutional trust (Oliveira&Gonçalves, 2023) and the safeguarding of democracy (OECD, 2021, 2024). In today's hybrid and convergent media ecosystem (Jenkins, 2006), traditional communication methods coexist with digital tools and Artificial Intelligence (Desouza et al., 2020). This evolution is ambivalent: while digital environments can foster participation, transparency, and accountability (Canel&Luoma-aho, 2019; Ducci et al., 2021), they also expose institutions to risks such as polarization and information disorder, presenting new challenges for public sector communication (Bessières, 2024).

To be strategically managed rather than merely endured, the digital transition requires technology adoption to be virtuously integrated with new organizational practices and human capital management (Macnamara, 2024). In internal communication, technology can stimulate motivation and participation (Invernizzi, 2000; Mazzei, 2018; Beniušis, 2023), creating public value (Twizeyimana&Andersson, 2019) by nurturing relational and emotional dimensions. By adopting a sociomaterial perspective (Orlikowski, 2007; Leonardi et al., 2012), it is possible to analyze how the social/human element and technological tools are inseparable, moving beyond the distinction between technology, work, and organization (Plesner&Husted, 2022).

Following this approach, a study was conducted in Italy regarding the adoption of a digital workplace in the Municipality of Santarcangelo di Romagna - a significant example of a small municipality receiving European funding via the National-Recovery-and-Resilience-Plan (PNRR). The research aimed to monitor the adoption of this tool within the organization to identify the potential creation of public value through the analysis of internal communication practices and the role of communication professionals.

The research was carried out between March 2024 and October 2025 using a mixed-methods approach (Krippendorff, 2018) and was divided into two phases. In the first phase (March-September 2024), which was quantitative, the digital architecture of the platform was analyzed by monitoring employee activity and usage (quantity and types of content classified inductively; engagement levels). In the second phase (January- October 2025), based on the initial results, semi-structured interviews were conducted with the provider and ten key employees involved in the digital transition, supplemented by focus groups with employees across various organizational levels.

The results show a generally positive reception of the digital workplace among employees, who perceive it as a simple tool that facilitates collaboration and information exchange. While the implementation process led by the communication staff was largely viewed positively, significant critical issues remain: the adoption of the tool is not uniform across departments, and those with less digital literacy face usage difficulties. While workplace functions related to work tasks are appreciated, more relational spaces remain underutilized or undervalued. Specific, profile-based training is needed to complete the digital transition.

Although this study has limitations inherent to a single case study, it highlights useful reflections for formulating research hypotheses for the analysis of other small municipalities within the Italian and international contexts.

OSC07 Internal Communication and Institutional Change

PP 0903 Communication offices of Portuguese central hospitals: Organizational additions and challenges in strategic communication

António Rodrigues[1], Paula Campos Ribeiro[2]

[1] Coimbra University, Communication Sciences, Coimbra, Portugal
[2] Social Communication School of IPL, Social Communication, Lisbon, Portugal

This study aims to understand strategic and organizational communication in Portuguese central hospitals. Hospital Communication and Health Communication are topics that have been growing in interest within academia and gained even more strength with the pressures imposed by the pandemic on health institutions. Hospitals had to reinvent themselves and alarms sounded about the need for good communication.

We established as the main focus of this study, know how communication in these large hospital centers constitutes an organizational added value and listen, through the eyes of those responsible, what are the main challenges they face.

As an object of study, we chose 5 large hospital structures: São João Hospital and University Center, Santo António Hospital and University Center, both in the city of Porto, Coimbra Hospital and University Center, Central Lisbon Hospital and University Center and North Lisbon Hospital and University Center. Using qualitative case study methodology, information was collected through document analysis and semi-structured interviews, carried out via video call to representatives of the Communication Offices of these hospitals. Information processing follows the content analysis method.

The fact that there are no known studies in Portugal on this particular topic, made the construction of this one truly interesting. In this study we were able to characterize these communication consultancies in terms of the nomenclature adopted and the years of existence. We were allowed to learn about the human resources allocated to each of them, their specific functions, their training, and also the type of professional relationship with the institution. At the same time, we drew important conclusions about the practices of communication offices, the position of communication in the organization, and the dominant strategic lines of internal and external communication. Our conclusions regarding the main challenges and added value of their strategic communication were divided into organizational gains, challenges faced, and factors that enhance the performance of Communication Offices.

PP 1005 From service-driven visibility to collective organisation? A two-wave qualitative longitudinal study of labour activism on TikTok in Italy (2023–2026)

Francesco Nespoli[1]

[1] LUMSA - Libera Università Maria Ss. Assunta, Human Studies, Rome, Italy

This paper presents a two-wave qualitative longitudinal study of labour-related communication and digital activism on TikTok in Italy, with a specific focus on the opportunities and constraints faced by trade unions in platform-mediated environments. The study is situated within broader debates on platform society and political participation (Fenton & Barassi, 2011; Murru & Vicari, 2021), the mobilising potential of social media for labour movements (Panagiotopoulos & Barnett, 2015; Ford & Sinpeng, 2022; Hau, 2022), and the growing prominence of influencer and microcelebrity practices in public engagement with social issues (Abidin, 2018; Alperstein & Alperstein, 2021; Riedl et al., 2021; Murru et al., 2024). Particular attention is paid to TikTok as a platform characterised by multimodality and imitation-based practices, whose affordances

foster highly individualised and visibility-driven forms of participation, posing both opportunities and challenges for collective actors (Le Compte & Klug, 2021; Zulli & Zulli, 2022).

The first wave of the research (February 2023–June 2024) adopted a qualitative mixed-methods design combining systematic platform mapping with semi-structured interviews. A keyword-based exploration of TikTok led to the identification of 680 Italian profiles discussing labour-related topics. The last 30 videos published by each profile were collected, resulting in a corpus of 2,852 videos from 225 active profiles. In parallel, 15 semi-structured interviews were conducted with communication officers and leaders from confederal and non-confederal trade unions at national and territorial levels.

The platform analysis revealed a heterogeneous but predominantly service-driven ecosystem of labour-related visibility. The most active and visible profiles were mainly labour professionals — such as labour lawyers and employment consultants — who combined rights advocacy with professional self-promotion. Trade union accounts were present but marginal in terms of visibility and engagement.

The interview analysis allowed for a systematic identification of barriers and enablers shaping trade unions' engagement with TikTok. Key barriers included organisational unawareness and limited internal motivation to invest in social media communication, a strong normative resistance to personalisation and leadership-centred visibility, and the perceived incompatibility between TikTok's informal, entertainment-oriented culture and the complexity or seriousness of union issues. Collective mobilisation was perceived as difficult to achieve in highly individualised platform environments.

At the same time, several enablers emerged. Interviewees consistently identified service-oriented communication — particularly related to fiscal benefits, social security, and welfare — as the most effective and legitimate form of union presence on TikTok. Limited but significant forms of personalisation, especially through recognised leaders or experts, were acknowledged as algorithmically effective when embedded within organisational channels. Furthermore, bottom-up experiments involving workers' own profiles and performative content were cited, pointing to a potential for worker involvement in communicative practices

The second wave of the study (2025–2026), currently underway, replicates both the platform analysis and the qualitative interview component using comparable procedures and a partially replicated interview guide. The research aims to assess persistence and change in the Italian TikTok labour ecosystem. The follow-up focuses on whether the service-driven configuration observed in the first wave represents a stable structural pattern, or whether new forms of organisational learning, personalisation, and collective mobilisation are emerging over time.

OSC08 Activism, Identity and Counterpublics

PP 1006 Digital influencers with disabilities in strategic communication: A systematic literature review

Andreia Amaro[1], Dora Santos Silva[1], Cristóbal Fernández Muñoz[2]

[1] Universidade NOVA de Lisboa, Faculdade de Ciências Sociais e Humanas/ Icnova, Lisboa, Portugal
[2] Universidad Complutense de Madrid, Facultad de Ciencias de la Información, Madrid, Spain

As principles of diversity, equity, and inclusion (DEI) gain prominence across organisational agendas, strategic communication increasingly engages with social actors who mediate values, visibility, and legitimacy within complex media environments. Among these actors, digital influencers (DIs) with disabilities have emerged as visible participants in organisational communication practices, particularly on social media platforms. While prior research recognises their potential to challenge ableist representations and foster inclusion, scholarship on this topic remains dispersed across disciplinary fields, with limited consolidation within organisational and strategic communication research.

This study presents a systematic literature review examining how DIs with disabilities have been conceptualised and analysed in academic research, with particular attention to their relationship with strategic communication. Three research questions guided the review: RQ1) How have DIs with disabilities been defined, approached, and discussed in academic research, particularly in digital media contexts? RQ2) Which theoretical perspectives, methodological approaches, and contexts underpin research on DIs with disabilities in relation to organisational and strategic communication practices? RQ3) What dominant debates, emerging trends, and persistent gaps characterise this body of literature? To the authors' knowledge, this review represents one of the first systematic efforts to synthesise research at the intersection of disability and digital influence, mapping how and to what extent these actors are examined within organisational and strategic communication contexts.

Following PRISMA guidelines, searches were conducted in the Web of Science and Scopus databases, focusing on peer-reviewed journal articles published between 2008, when the term "digital influencer" first appeared in academic literature, and the second quarter of 2025. Articles written in English, Portuguese, or Spanish were included. The search strategy combined keywords related to digital influencers and disability, applied to abstracts and author-provided keywords. The initial search yielded 152 records. After duplicate removal and independent eligibility screening by three reviewers, 63 articles were retained for analysis. Of these, only nine studies directly addressed DIs with disabilities in relation to organisational or strategic communication practices.

The analysis identifies three overarching patterns. First, research on influencers with disabilities is predominantly grounded in marketing, advertising, and consumer behaviour perspectives, prioritising outcomes such as brand perception, purchase

intention, and audience responses. Second, disability is frequently treated as a representational category rather than as a structural and socio-political dimension shaping communicative processes, power relations, and access. Third, only a small subset of studies engages with broader strategic communication concerns, including organisational responsibility, ethical governance, and sustained inclusion strategies.

Taken together, these findings indicate that prevailing research paths privilege short-term instrumental effects over systemic communicative implications. This imbalance constrains understanding of how strategic communication contributes to durable organisational trajectories, meaningful engagement with historically marginalised communities, and credible communicative futures.

This review contributes to organisational and strategic communication scholarship by mapping an emerging yet fragmented field and outlining directions for future research that foreground disability as a central analytical lens. It underscores the need for interdisciplinary and critical approaches addressing how communicative choices shape organisational legitimacy, social participation, and inclusive communicative futures in times of societal transformation.

OSC08 Activism, Identity and Counterpublics

PP 1007 Illuminating affective belonging: Critical digital ethnography and the study of passionate publics in public relations

Naíde Müller[1]

[1] Universidade Católica Portuguesa, Faculdade de Ciências Humanas, Lisboa, Portugal

Contemporary public relations scholarship has increasingly questioned rationalist, instrumental, and campaign-centred models of publics, highlighting their limitations in communication environments shaped by affect, relational intensity, and digitally mediated continuity (Edwards, 2018; Pieczka, 2019). Yet methodological tools capable of empirically engaging with publics organised around care, vulnerability, and affective belonging remain underdeveloped. This paper advances *critical digital ethnography* as a methodological orientation for studying such formations, arguing that affective publics require sustained, reflexive, and ethically attuned forms of inquiry.

Empirically, the paper draws on a longitudinal digital ethnography conducted between 2021 and 2025 within a contemporary spiritual communication ecosystem centred on the monthly "Energy Updates" produced by Lee Harris. The corpus comprises two interrelated components. First, 39 long-form YouTube videos were observed in full, amounting to over 20 hours of immersive viewing. These videos constitute a recurring communicative ritual through which themes of care, vulnerability, collective uncertainty, and existential orientation are articulated over time. Second, a dataset of 500 Instagram posts published between October 2021 and November 2025 was analysed, alongside 254 audience comments extracted from a curated subset of posts. Instagram data were used to contextualise patterns of engagement, thematic emphasis, and temporal distribution, while comments were analysed qualitatively as interactional sites of affective disclosure, recognition, and reciprocal care. The case is approached as a demonstrative site through which broader methodological and conceptual issues in public relations research are examined, rather than as an exceptional or marginal phenomenon.

Rather than treating platform data as indicators of effectiveness or persuasion, the study approaches videos, posts, and comments as ethnographic traces of lived public experience. Quantitative descriptors (such as post frequency, engagement distributions, and category prevalence) are mobilised to situate scale and rhythm, while interpretive analysis foregrounds repetition, anticipation, and relational continuity as key mechanisms of public formation.

Conceptually, the paper engages with affect theory (Ahmed, 2004; Massumi, 1992) and recent work on *passionate publics* (Kozinets & Gretzel, 2025) to argue that belonging, desire, and trust operate as infrastructural forces sustaining publics over time. Publics are conceptualised not as episodic or issue-driven collectivities, but as relational formations organised through shared temporal horizons, affective witnessing, and ethical presence. Desire is understood as a connective and productive force that enables endurance rather than as a transient motivational impulse (Kozinets, Patterson, & Ashman, 2017).

Methodologically, the paper reframes digital ethnography as an ethics of affective listening, emphasising longitudinal immersion, reflexive positionality, and ethical attunement to vulnerability (Pink et al., 2016; Fassin & Harcourt, 2019). It demonstrates how care-oriented and spiritual communication can be analysed critically without romanticisation or exterior dismissal. In doing so, the paper speaks directly to debates in organizational and strategic communication concerning how publics are conceptualised, engaged, and ethically interpreted beyond instrumental and campaign-centred logics.

The paper contributes to public relations research by challenging instrumental models of publics, offering a transferable methodological framework for studying care-oriented publics across domains such as wellness, activism, and promotional culture, and expanding the discipline's capacity to engage empirically with affective belonging as a central dimension of contemporary public formation.

Sustainable companies have long been recognized for attracting and retaining employees, thereby gaining a competitive advantage. Greening and Turban (2000) show that positive corporate social performance (CSP) increases organizational attractiveness to potential employees, and Backhaus, Stone, and Heiner (2002) identify environmental performance as a particularly influential CSP dimension. While this relationship is well established, a critical gap remains in understanding how employee engagement influences long-term retention. Given the challenges in directly measuring the extent to which employees drive organizational change, it may be more insightful to examine how sustainability commitments affect workforce stability and how companies integrate sustainable or circular practices in response to employee expectations. Accordingly, this study explores: *To what extent does corporate commitment to social responsibility and circular practices influence employee advocacy and enhance organizational legitimacy?*

As traditional sources of competitive advantage diminish, workforce calibre has become pivotal for sustaining success(P-feffer, 1994; Snell et al., 1999). A skilled and motivated workforce supports innovation and competitive advantage (Teece, 1998), and investments in well-being, fair compensation, and career development improve job satisfaction, retention, and performance(Qawasmeh et al., 2022). Aligning corporate culture with sustainability initiatives further strengthens management maturity and business outcomes(Fok et al., 2021). Beyond formal roles, employees contribute through advocacy voluntary behaviour in which they promote or defend organizational values and initiatives (Men, 2014). This organizational citizenship behaviour is not explicitly required or directly rewarded(Burmann & Zeplin, 2005; Tsarenko et al., 2018; Walden & Kingsley Westerman, 2018) and has been linked to reputation and commitment(Walden & Kingsley Westerman, 2018; Yeh, 2014), yet remains underexplored in sustainability and circular economy contexts. From an organizational and strategic communication perspective, employee advocacy functions as a key mechanism through which sustainability meanings are interpreted, shared, and amplified to internal and external stakeholders, shaping legitimacy.

Employee perceptions often diverge from corporate narratives. PLAY-a white paper research reports that 77% of employees expect greater transparency, yet only 14% perceive sustainability initiatives as consistently impactful or genuine (9% among general employees versus 34% among business leaders). Prior research shows that CSR authenticity perceptions influence emotional commitment (Kim & Lee, 2022), and scepticism weakens pro-environmental behaviour(Bhattacharya et al., 2023) . Building on these insights, we propose a model in which corporate sustainability initiatives drive employee advocacy, enhancing organizational legitimacy, with employees' trust in CE innovations as a moderator and information availability on CE innovations as a control variable.

We use a survey-based design (Dillman et al., 2014) targeting employees in waste management, manufacturing, architecture, social sciences, innovation management, and standardization. Participants are drawn from Horizon 2020 REINCARNATE organizations using purposive sampling(Patton, 2014), spanning Germany, Poland, Spain, Sweden, and the Netherlands as well as employees worldwide to capture cross-cultural variation in CSR and CE implementation.

PP 1109 Beyond one-size-fits-all: Diversity perceptions among employees in German-speaking Europe vs. the United States

Vivien Marx[1,2], Ingrid Wahl[2], Sabine Einwiller[2]

[1] FERNFH - Distance-Learning University of Applied Sciences, Department of Business and Psychology, Wr.Neustadt, Austria
[2] University of Vienna, Department of Communication, Vienna, Austria

In times of shifting political and societal grounds, diversity has become contested terrain in organizational communication. While some organizations advance diversity, equity, and inclusion (DEI) initiatives as pathways to more equitable futures, others give in to growing backlash and resistance (Murray & Bohannon, 2025). The cultural context also shapes diversity discourses. European discussions often center on gender equality and language, while United States debates emphasize cultural and ethnical differences. These divergent contexts complicate communication for multinational corporations navigating legal requirements, cultural expectations, and diverse workforces. Thus, understanding employee perceptions of diversity is critical, which raises the fundamental question: What do employees associate with "diversity in organizations"?

This study employs social representation theory (Moscovici, 2001) to examine how employees in German-speaking countries (Austria and Germany) and the United States construct meaning around "diversity in organizations". Social

representations capture collectively shared meanings that emerge through social negotiation, distinguishing between stable core elements (universally shared across groups) and flexible peripheral elements (context-dependent and malleable). This theoretical lens enables comparison across countries and demographic groups while identifying strategies for organizational communication.

Within an online questionnaire, employees in Austria and Germany ($N = 322$) and the United States ($N = 280$) provided free associations with "diversity in organizations" and rated them as negative, neutral, or positive to capture perceptions and evaluations, respectively. This approach reduces response bias by avoiding predetermined response categories. In the analysis we distinguished between a stable core—frequently and early-mentioned associations—and peripheries of less spontaneous or rare associations.

Results reveal that inclusion and equal opportunity form the central core across all groups and are consistently evaluated positively. However, in the United States, race and the inclusion of different cultural backgrounds constitute stable core associations whereas in German-speaking countries, gender diversity and equality are more central. Notably, while men and women associate identical content in the core, men's evaluations are generally more negative. Furthermore, U.S. participants evaluate their associations—and thus the entire concept of diversity—considerably more positively than German-speaking respondents.

These findings offer both theoretical and practical contributions. Theoretically, this free association approach extends theoretical applications in the communications field. Practically, results provide guidance for organizational communicators for developing diversity messages in an era of deepening social divisions. Communication should anchor to shared core elements for comprehensibility while acknowledging group-specific emotional evaluations. Messages contradicting the communicative core risk triggering reactance; change is more effectively initiated through peripheral elements that remain open to new content. By understanding how different groups construct diversity meanings, organizations can move beyond one-size-fits-all approaches toward communication strategies that acknowledge diverse realities, serve pluralistic societies, and resonate across shifting grounds.

PP 1110 AI, strategic public sector communication, and natural disasters in Czechia, Italy, and Spain

Alessandro Lovari[1], Francisco Fernández Beltrán[2], Miloš Gregor[3]

[1] University of Cagliari, Department of Political and Social Sciences, Cagliari, Italy
[2] Universitat Jaume I, Departament de Ciències de la Comunicació, Castelló de la Plana, Spain
[3] Masaryk University, Faculty of Social Studies, Brno, Czech Republic

The increasing use of generative artificial intelligence (GAI) in public sector communication (Canel & Luoma-aho 2019) is changing the way governments communicate in ordinary situations but also convey risk, uncertainty, and authority during times of crisis and emergencies (Lovari & De Rosa 2025; OECD 2025). This transformation is particularly crucial in the strategic communication of natural disasters and climate-related emergencies, where governments and public sector organizations must inform, reassure, and mobilize citizens amid rapidly evolving information environments (Schwarz et al. 2025). This paper, part of the activities of a EDUC WIDE Seed research project, examines how the adoption of AI-enabled communication tools is reshaping public strategies, public trust, and susceptibility to disinformation environments (Madan & Ashok 2023; World Economic Forum 2025), in a context where, despite broad social recognition of the severity of climate change and strong scientific consensus, structural governance deficits and limited trust in institutions continue to hinder effective collective responses (Intergovernmental Panel on Climate Change, 2023).

This research in progress study uses a mixed-methods research design to triangulate public attitudes, institutional perspectives, and policy practices in three European democracies: Czechia, Italy, and Spain. First, the paper analyzes Eurobarometer (2024, 2025) data from these three countries to evaluate citizens' perceptions of digital government communication, levels of institutional trust, perceived polarization about climate change, and sensitivity to disinformation during environmental risks and disasters' situations. Second, a comparative desk analysis examines digital government communication initiatives related to natural disasters and climate change. This analysis maps if any AI-supported strategy is implemented for public sector communication activities, and deployed to counter disinformation, frame risk, and coordinate the public response. This analysis reveals shared strategic logics and country-specific adaptations influenced by political culture, administrative capacity, and media systems. Third, in-depth interviews (Knott et al., 2022) with public-sector communicators explore the incorporation of GAI into strategic communication during climate-related crises and natural disasters that recently affected the three countries, as well as its adoption for future events. The focus is on institutional goals, perceived benefits,

communicative innovations and ethical concerns (Bowen 2024; Bright et al. 2024). The interviews shed light on how communicators navigate the tension between speed, personalization, and credibility when using AI-assisted tools in high-stakes situations, and polluted and problematic information environment (Gregor & Mlejnková 2021; Junk & Kim 2025).

The paper identifies key structural tensions in contemporary strategic public sector communication by integrating these data sources (OECD 2021). Although GAI can improve governments' ability to communicate on a large scale and in real time during emergencies, its use coincides with a decline in external verification mechanisms and increased distrust and public skepticism toward official institutional messaging (Edelman 2025; Smillie & Scharfbillig 2024). This paper contributes to the field of strategic and organizational communication by situating AI-driven communication within broader debates on digital platform governance and democratic legitimacy. From an empirical standpoint, it offers an underexplored cross-national comparison of AI-enabled public sector communication regarding natural disasters and disinformation practices around it.

OSC09 Organisational Communication in Mediated Public Spheres

PP 1111 Reinventing the message? A systematic review on reshaping storytelling through artificial intelligence in strategic communication

Lukni Burhanuddin Ahmad[1], Jens Seiffert-Brockmann[1]

[1] Vienna University of Economics and Business, Business Communication, Vienna, Austria

Humans are often characterized as *Homo-Narrans*, a term emphasizing our inherent capacity for storytelling and symbolic creation (Fisher, 1984). Historically, storytelling has been expressed in diverse media, spanning from cave walls of Altamira and Lascaux, the Egyptian Westcar Papyrus, the Javanese Wayang leather puppetry, and the Greek communal feasts (Schabert & Heyking, 2020). As media technology has evolved from analog machines like the printing press to digital computers and now to Large Language Models (LLMs), storytelling has become a more transformational phenomenon than ever. These storytelling machines are no longer dependent on humans as storytellers; they now also serve as active co-creators through their algorithmic constructions. AI is progressively replacing humans when it comes to managing the storytelling process, from pre-production to post-production (Manu, 2024). Given that storytelling is a crucial technique for achieving organizational objectives, this raises a critical question: how do these AI tools fundamentally reshape the process of storytelling in strategic communication?

Although exploring storytelling in today´s AI era is timely and highly relevant for strategic communication (Gregory & Smith, 2025), the field lacks a systematic review to understand the impact of AI at the intersection of strategic communication with storytelling. Existing state-of-the-art research has predominantly concentrated on the content generation capabilities of AI (Yu et al., 2025), making it difficult to derive conclusions or a comprehensive picture of AI storytelling in strategic communication. Weller and Lock (2025) and Sutherland (2025) sought to create a holistic overview of AI in strategic communication. However, the topic is constrained to strategic communication in general, with a primary focus on the process of using algorithms to generate content automatically. Furthermore, several closely related topics have been examined, for example, by Fang et al.(2023), who focus on story-writing or Quah and Ng (2022), who concentrate more on digital storytelling rather than specific integration of AI.

Therefore, this article provides an overview of the current state of research in AI storytelling in strategic communication and highlights research desiderata. This research employs a systematic literature review, analyzing 2,030 papers from international peer-reviewed journals listed in renowned scientific databases (Business Premier, PsycArticles, Scopus, and Web of Science), relevant to storytelling, strategic communication, and artificial intelligence. The study provides a critical examination of the current state of the field, enabling scholars to contribute to the development of a distinctive body of knowledge on the implementation of storytelling in AI-driven strategic communication. It will also add to theory-building in the field. As a remedy, this study provides (1) multi-dimensional typologies of AI-enhanced storytelling rooted in an interdisciplinary analysis, (2) a conceptual definition of artificial strategic storytelling, (3) an overview of factors relevant to the process, (4) core texts, authors, and publication outlets, and (5) a discussion of the implementation of this topic for strategic communication research and practice.

OSC09 Organisational Communication in Mediated Public Spheres

PP 1112 Trust in practice: The application of trustworthiness in Dutch health campaigns

Elise Alkemade[1], Aviv Barnoy[1]

[1] Erasmus University Rotterdam, Media & Communication, Rotterdam, Netherlands

Introduction

Trust is widely regarded as a key mechanism for increasing the uptake of health advice in strategic communication. A dominant operationalization of trust is the ability, benevolence, and integrity framework (ABI, Mayer et al. 1995), yet it is unclear to what extent such theoretical models are actually used in the design of real-world campaigns. This study examines how public health communication professionals understand and operationalize "trustworthiness" in the production of Dutch mass media health campaigns.

Methods

We conducted reconstruction interviews with a diverse sample of Dutch communication professionals (n = 20) working in for-profit, non-profit and governmental organizations. Between April and July 2025, participants systematically reviewed specific campaigns they had recently produced, covering a range of behaviors and risk levels (e.g., smoking cessation, childhood vaccination, sexual health). The reconstruction method anchors reflections in concrete outputs and decisions rather than abstract ideals. Interviews were extensively analyzed using inductive thematic coding in Atlas.ti.

Findings

Our findings show that the "ability" dimension of trust is applied by communicating facts and invoking authority. Campaigns in our sample highlight evidence of effectiveness (e.g., reduction in hospitalization risk), draw on medical authority (e.g., images of GPs, references to experts), and are often disseminated via trusted intermediaries such as doctor's offices.

Benevolence and integrity are frequently translated into a broader notion of authenticity. Professionals emphasize "real people with real stories," familiar and realistic scenarios, and identifiable characters as ways to enhance perceived sincerity and moral alignment.

At the same time, trust does not consistently guide all stages of campaign development. When working with creative agencies, participants describe a tension between portraying trustworthiness and producing "thumb-stopping" content for crowded platforms, in which attention-grabbing aesthetics sometimes override trust-related considerations.

A third recurring theme that falls outside of the ABI framework is the importance attributed to audience autonomy. Many professionals express reluctance to give direct behavioral advice, instead framing campaigns as facilitating "informed choice" through transparency and high-quality information. In this framing, individuals are invited to decide for themselves, which sits uneasily alongside explicit goals such as increasing vaccination uptake. Stressing autonomy can be seen as a distinct mechanism for behavior change that diminishes the reliance on trust in health campaigns.

Overall, the strategies described reflect predominantly one-way communication and reveal a persistent tension between informative and persuasive aims.

Conclusion

By opening up the production processes of contemporary Dutch health campaigns, this study illustrates how trust models, particularly the ABI framework, are selectively translated, stretched (e.g., via authenticity), and sometimes sidelined in practice. The findings highlight both conceptual gaps (e.g., the role of autonomy) and practical constraints (e.g., platform logics, creative agency priorities) that limit the systematic application of trust theory. Future research should further align trust models with practitioners' realities and explore more dialogic, two-way campaign approaches that can foster trust without obscuring strategic objectives.

OSC09 Organisational Communication in Mediated Public Spheres

PP 1113 Chatting with the organization –are AI-agents as organizational representatives part of its strategic communication?

Sandra Bergman[1]

[1] Mid Sweden University, Media and communication, Sundsvall, Sweden

The importance of AI for organizations is hardly something that can be ignored. However, there is a tendency to focus on the technological, ethical and legal aspects, rather than the communicative. The need for organizational communication scholars to engage with AI as a communicative agent, have recently been highlighted (Guldbrandsen et al., 2024, Laapotti & Raappana, 2022). Much of earlier research have missed the organizational perspective, and tend to focus on the micro-level instead of the organizational level (Syvänen & Velentini, 2020).

In an attempt to remedy the lack focus on communication, organization, and practical examples, this study is an empirically driven study based on ethnographic observations withing a large governmental organization. The 16 months of recurring observations have followed the team of AI-trainers that not only train the AI, but author all of its responses themselves.

These AI-trainers were all previously customer service agents in the organization, who began training the AI after receiving basic training in the AI-platform. During the observations, the communication department faced several challenges regarding how the AI agent in question could be implemented on an external, cross agency, website. The discussions between the communication department and the AI-trainers, as well as interviews and documentation, inform this study.

During the discussions, it became obvious that the communication department members lacked knowledge about how the AI agent in question worked. They expressed disbelief when they realized that the responses were not made through generative AI, but rather they were written by the AI -trainers. This highlights a need for more insight and knowledge regarding the organizations AIs. Recently, research regarding AI as spokesperson in crisis communication have been highlighted (Olbermann & Nagl, 2025), as well as their eligibility within different types of advertisement (Yim et al., 2025). However, much more attention is required for its strategic importance for organizational communication. The results of this study showed that despite internal expertise, the communication department deferred to the AI-trainers regarding strategic choices surrounding the AI agent. This poses several questions, such as "what kind of support and competencies are required to ensure that AI-trainers are able to align with the organizations strategic communication?". And, "how much of the AIs impact on organizational communication is currently missed by communication departments due to lack of knowledge?"

PHC01 Theoretical Frameworks

PP 0058 Rhetorical conversation analysis: A new methodology for language and communication research

Johan Siebers[1]

[1] Middlesex University, Language and Communication Research Cluster, London, United Kingdom

This paper develops and illustrates **Rhetorical Conversation Analysis (RCA)** — a new method for studying speech as lived rhetoric. RCA integrates the micro-analytic rigour of **Conversation Analysis (CA)** with the interpretive range of **rhetorical theory** to reveal how people **articulate themselves** in dialogue and conversation.

RCA is designed to investigate how speech acts operate simultaneously on multiple levels: as interactional structures, rhetorical forms, and expressions of stance, affect, and imagination. By combining detailed transcription with rhetorical interpretation, the project establishes a bridge between the humanities and the social sciences and demonstrates how meaning can be studied empirically without reductionism.

The methodology rests on the principle that **rhetorical form is empirical**. Pauses, hesitations, tropes, and echoes are not psychological traces but observable phenomena through which people **articulate** relations, values, and orientations. RCA thus resists both the positivist reduction of meaning to form and the post-structuralist dissolution of form into indeterminacy.

RCA proceeds in **four analytical layers**, each corresponding to a level of empirical engagement:

1. **Temporal Layer (CA-based transcription)** Captures the sequential organization of talk: pauses, overlaps, intonation, prosodic contours, and timing. This layer ensures analytic precision and reproducibility, following Jeffersonian conventions as a starting point.
2. **Textual Layer (rhetorical patterning)** Identifies tropes, figures, and compositional features — metaphor, irony, repetition, metonymy, citation — as manifestations of reasoning-in-interaction. Here, rhetoric is not decoration but the *logic of speech as relation.*
3. **Interpretive Layer (analytic commentary)** Situates rhetorical acts within broader affective, ethical, or cultural frames, treating each conversational turn as a moment of self-articulation. The interpretive act is transparent, justified by evidence from the transcript, and open to intersubjective discussion.
4. **Reflexive Layer (analytic writing as dialogue)** Recognises that the researcher's description continues the conversation rather than standing outside of it. The analysis is written rhetorically — as an act of engagement with the material — embodying the method's epistemology. RCA treats speech not as data extracted from subjects but as acts of expression demanding ethical listening. The analytic process mirrors the conversational ethic it studies: attentiveness, responsiveness, and respect for individuality. Reflexivity is therefore not an add-on but intrinsic to the method's structure.

Rhetorical Conversation Analysis offers a new way to study human communication: one that is empirically rigorous, theoretically generative, and ethically attuned. By uniting the analytic precision of CA with the interpretive insight of rhetoric, **RCA transforms how we understand what it means to speak** — and what it means to listen. By rethinking the relation between speech, writing, and mind, RCA reclaims rhetoric as a living, empirical discipline and offers a new paradigm for studying how humans — and intelligent systems — live in and with language. RCA contributes to the need for an explicit language to analyse the **dimension of articulation** within communication. In this way it helps us to become aware of the irreducible, personal and "owned" dimension of communication. At a time of shifting grounds in linguistic communication as a result of the rise of AI, a methodologically precise way of studying our existence as speaking beings is crucial, not only scientifically but also existentially.

PHC01 Theoretical Frameworks

PP 0059 Factuality as freedom: Defying algorithmic inevitability

Lydia Sanchez[1]

[1] Universitat de Barcelona, Biblioteconomia- Documentació i Comunicació Audiovisual, Barcelona, Spain

Leopold von Ranke's famous dictum that the historian must "simply show how it really was" has long been critiqued in philosophy of communication as an aspiration to naive positivism. However, the current inquiry into whether futures will rely on human decisions or machine-based constructions demands a radical re-evaluation of Ranke's mandate. Today, the shift from the physical archive to the digital dataset represents an ontological rupture: the past is not merely recorded for reflection; it is datafied to train algorithmic models that preemptively construct the future. In this ecosystem, truth is displaced by engagement metrics, and historical factuality is dissolved into probabilistic modeling.

This paper addresses these "technical shifting grounds" by revisiting Ranke through the lens of Timothy Snyder's philosophy of history, specifically integrating his critique of the "politics of inevitability" developed in *The Road to Unfreedom* (2018) with his recent reconceptualization of liberty in *On Freedom* (2024). I argue that the algorithmic environment realizes the darkest potential of a non-correspondence view of truth. If we accept the postmodern premise that reality is merely a linguistic construction, we are left defenseless against "algorithmic constructivism," where truth is nothing more than a statistical output optimized for behavioral modification.

Central to this analysis is Snyder's redefinition of freedom not as a negative state, but as positive positive work comprising five interconnected forms: sovereignty, unpredictability, mobility, factuality, and solidarity. Digital platforms, driven by the attention economy and surveillance capitalism, actively erode this entire ecosystem. Algorithmic prediction embodies the "politics of inevitability," eliminating human unpredictability by enforcing past patterns on the future. The "politics of eternity" destroys sovereignty and restricts mental mobility, trapping users in static loops of grievance and ideological echo chambers that prevent perspective-taking. Furthermore, by atomizing reality into personalized feeds, these systems undermine the solidarity required for collective action.

Crucially, this paper posits factuality not just as an epistemic preference, but as the sine qua non of democracy. Snyder argues that democracy is inherently a conversation about resolving common problems, a process impossible without a shared factual reality. When algorithms fragment reality into personalized fictions, the demos disintegrates. If we cannot agree on "how it really was" (Ranke), we cannot build the solidarity required for self-governance nor hold power accountable. Thus, the defense of the correspondence theory of truth becomes an act of civic resistance: a moral realism necessary to prevent the public sphere from collapsing into a machine-generated hallucination.

The analysis concludes that the "future" depends on our ability to assert a reality independent of the code. By integrating Snyder's ethical demand for factual grounding with a realist philosophy of communication, I contend that objectivity must be reclaimed as an ontological anchor. Only by insisting on a realist stance, where truth is found, not made, can we disrupt the algorithmic prediction loop and ensure that the future remains a domain of open human decision rather than a calculated inevitability.

PHC01 Theoretical Frameworks

PP 0060 Theories for a shifting world and how to construct them

Steffen Göths[1]

[1] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

In communication studies, there are regular complaints about the lack of genuine theories and the reliance on approaches from other disciplines. This goes hand in hand with the fact that there are hardly any approaches to theory development that go beyond modifying existing approaches. Theories are often understood only as a basis for empirical work and are therefore not themselves the subject of consideration. Suggestions for theory development that deviate from the logic of statistical testing usually remain vague and tend to provide only general guidance.

To address this problem, an approach to theory development is proposed here that makes it possible to grasp a social phenomenon theoretically and classify it in terms of social theory. Here, theories are understood as means that make it possible to grasp and comprehend reality. The often presumed contradiction between social theories and theories of middle-range is addressed by Merton (1967), who describes a complementary relationship in which social theories are necessary to interpret the results of empirical work based on middle-range theories. The approach described here moves between both levels and mediates between them.

Three logics are used in this process:

1. Concept formation

Theory formation is based on a description of the phenomenon to be theorised, which ends in a defined concept. This concept must be clearly distinguished from its everyday use on the one hand and from its scholarly use in other disciplines on the other. The description is based on both existing theoretical considerations of the phenomenon and empirical findings.

2. Theorizing

According to Swedberg (2016), theorizing is a practice that uses a concept and the associated findings to make assumptions about the phenomenon, whereby existing knowledge can also be used for differentiation and not merely for affirmation. Scientifically guided speculation is not only permitted but necessary in order to be able to conceive new aspects at all. The goal is to arrive at generalisable abstractions of the phenomenon that serve to sharpen the concept.

3. Grounded theory

The circular logic of grounded theory is used to address the problem that the knowledge process cannot take place linearly. Already before the actual examination of the phenomenon, that phenomenon must already be described with a theoretical concept. This form of theory formation is therefore based on the continuous updating and testing of the concepts found and the re-evaluation of the underlying literature.

The following steps can therefore be derived:

1. Describing the phenomenon in detail
2. Developing a concept
3. Re-evaluating literature and concept
4. Placing the phenomenon in a perspective of social theory

This approach allows a phenomenon to be captured in a theory-forming way, and the choice of a public sphere theory perspective, for example, also enables a genuinely communication science theory. This proposal is intended to provide an opportunity for discussion of further options for communication theory formation.

PHC01 Theoretical Frameworks

PP 0061 History as a form of dialoguing: The erotic and the postal paradigm of communication

Jose Gomes Pinto[1]

[1] Lusofona University/Cofac, School of Communication/CICANT, Lisbon, Portugal

When we attempt to approach the nature of dialoguing as a philosophical method and its historicity, the straightforward way to do so is to write a letter to an open audience, one that is both temporal and spatially biased. If we take Plato's definition of what a dialogue is, as in the Seventh Letter, for instance, we can come across this assertion: «No treatise by me concerning it exists or ever will exist. For it does not admit of exposition like other branches of knowledge, but after long-continued intercourse between teacher and pupil, in joint pursuit of the subject, suddenly a light, as it were, is kindled in one soul by a flame that leapt to it from another.» The openness and closeness of this perspective entail the very notion of Language as speech and writing and its tokens. But both are intriguing and must be due to a rethinking of the process of language utterances themselves. If speech is considered its face-to-face form, then we must acknowledge that the whole mystery of the 'other' in arguing is set aside. I address you as if you will address me with no restraints. Subjects address the other here in a manner that does not assess the 'other' as different, thus as being in the same existential position. The fear of…, the anxiety facing with…, the *Angst* (the things in the world that are primarily *my* world) and *Furcht* (the things only in *my* world) (Hegel, Kierkegaard), is neglected in dialoguing through face-to-face Plato's paradigm. The beautiful mystery is that this *erotic* flux and drive to dialogue often leads to conflict. Thus, dialoguing can be confronting. The *erotic* principle of communication is on the edge of violence. Instead, the *postal* paradigm of communication, viz., that when an I address the 'other' conveyed by written words, the face is elapsed, the 'other' is not in the 'face' and on the same presupposed level, and what is addressed to the addressee is not intersected by empirical process's, sometimes too much empirical, pollution (*miasma*) of the utterances one is about to take. Plato had experienced both ways. What we are dealing with is the intersection between orality (*Speech*) and writing (*Letter*). Both are kept alive in some sense in the present day. But who or which will take the position in this new present situation where *erotic* and *postal* systems have already eroded? *The other,* as in dialogue, is too much present. In the *postal* system, the addressee is often unknown. In dwelling on these two extreme positions, we seek to acknowledge whether addressing the 'other' is a challenging or open address. If friendship (*philia*) is on one side, love (*agape*) is on the other. Therefore, we will investigate whether kinship or desire can be incorporated into forms of dialoguing. We will take a position on the *postal* paradigm and show that historical endeavour concerns a special form of dialoguing: sending without expecting any feedback. What is sent is done for its own sake

PHC01 Theoretical Frameworks

PP 0062 Fate, Image and Narrative: Past Futures and the Critique of Historical Inevitability

Jacinto Godinho[1]

[1] CICANT/ LUSÓFONA UNIVERSITY, Communication Science DCC/ECATI - ULL, lisboa, Portugal

One of the fundamental categories for the historical discernment of past futures (Vergangene Zukunft, in Reinhart Koselleck's sense) is the notion of fate. Koselleck conceives historicity through the tension between the space of experience and the horizon of expectation; past futures are the images of the future that, in a given present, orient action and organise temporal meaning. This paper argues that fate functions as a decisive semantic operator within that horizon, shaping how certain past futures become thinkable, necessary, or inevitable in specific historical contexts

As a central category of Greek philosophy, fate designated a necessity inscribed in the order of the cosmos, irreducible to human will. With Christianity, this necessity was refigured as providence, shifting the problem from cosmology to theology. Enlightenment reason rejected providential determination not by denying necessity as such, but by contesting heteronomous constraints on the human future as incompatible with autonomy and freedom. Fate was not eliminated as a philosophical problem; it was displaced from the explicit vocabulary of modern philosophy, persisting mainly in cultural, narrative, and symbolic forms.

Within Portuguese culture, deeply marked by fado as both song and moral value, fate retains particular relevance as a narrative mode of relating to historical time. Far from operating merely as belief in a future predetermined by a transcendent agency, fate functions as a narrative device for closing the past. Common formulas such as "what happened, happened because it had to happen" or "it was already written" retrospectively convert contingency into necessity, offering a stabilising account in the face of tragedy and limiting the disruptive force of events for which no satisfactory causal or moral explanation is available. Fate thus appears less as a cause of the future than as a way of producing meaning for the past.

Building on this claim, the paper analyses the Portuguese writer and poet Jaime Rocha, particularly his Trilogy of Evil, in which the character Mateus, a fisherman, confronts a fate that seems to condemn him to shipwreck. Here, fate does not appear as resigned fatalism, but as a horizon of conflict: it fixes reality precisely so that struggle and resistance become legible, reopening a field of possibilities within what appears inevitable.

Walter Benjamin's notion of the dialectical image provides a critical counterpoint to destinal narratives that organise history as necessary continuity. In the Theses on the Concept of History, Benjamin criticises the integration of the past into a homogeneous temporal continuum that legitimises the present and naturalises certain futures as inevitable from the standpoint of the victors. The historical images produced in this way function as images of fate: they enclose contingency and transform past expectations into retrospective necessity. The dialectical image interrupts this continuum by bringing heterogeneous times into a critical constellation, freeing the past from the function of justifying the present and making visible unrealised expectations and interrupted past futures. In this way, it opposes the narrative of historical inevitability.

PHC02 Digital: Pasts and Futures

PP 0167 Neither black nor box: Unwrapping human agency in AI algorithms processes

Łukasz Wojtkowski[1]

[1] Nicolaus Copernicus University, Department of Communication- Media and Journalism, Toruń, Poland

This paper tackles the pressing question of how to ensure human agency and oversight in AI systems, moving beyond the notion of algorithms as incomprehensible "black boxes." Modern AI algorithms (especially complex machine learning models) are often criticized for their opacity, which can undermine users' autonomy and trust. In response, the research aims to explore methods to open up or re-design these systems to better incorporate human insight, values, and control. This aligns closely with international ethical guidelines: for instance, the European Commission's AI ethics guidelines. By examining frameworks such as explainable AI, algorithmic transparency, and human-in-the-loop design, the paper seeks to ensure that AI tools enhance rather than erode human decision-making power.

The title "Neither Black Nor Box" thus reflects an ambition to go beyond treating AI as an inscrutable magic box – instead, unwrapping algorithm through a thorough analytical process based on XAI engineering step-by-step instruction. When it comes to robotics, algorithms, and AI, the contemporary social sciences focus strongly on moral agency (Himma, 2009; Gunkel, 2012), normative and legal aspects (Bryson, 2010; Jiang et al., 2021; Mamak, 2022), politics (Coeckelbergh, 2022), or even theology (Smith, 2022). There's also a developing body of works that deal with the relations between human and non-human social actors, social bots (Coeckelbergh, 2021; Guzman, 2018; Guzman & Lewis, 2020' Johansson, 2022).

In this study, I analyse the problem of human agency interactions with technological agency in the optics of relational ontology. Thus, I consider relations - based on primal communication mechanism - as the primary ontological premise affecting what the objects of interactions are (Pleszczyński, 2013, 2020). Communication is not only the method of the agency but also the basic ontological premise with agential power. Objects of the human - tech relations are inseparable in the relation and do not exist outside it (Barad, 2008; Orlikowski, Scott, 2008). Moreover, agency in a human-technology

relation is a discursive practice that operates on meaning and power. However, what seems crucial for relational ontology is the perception and understanding of technology by human actors in terms of *alterity*, that is, to what extent technological agents became 'the other' or the 'quasi-other' (Idhle, 1990; Frijns et al., 2020). Since the relation is based on power disproportions and may follow the 'the uncanny valley factor' (Ciechanowski et al., 2018; Mori, 2012), human actors need to anthropomorphize and reduce the complexity of non-human actors in the process of meaning-making (cf. Sundar, 2008).

Hence, I analyse three algorithms and the process of their construction following a specific framework deployed from programming and IT to social sciences in a step-by-step instruction based on: creation of database, data model, initial data processing, statistical analysis, data filtering, data training and validating, variables mapping, vector space creation, algorithms training and validation, data filtering and fine-tunning of the model. In this procedure, I combine strictly algorithmic methods of analysis with the social sciences one including: XAI modelling based on recommendation systems, surveying, IDIs, critical analysis and algorithmic netnography.

PHC02 Digital: Pasts and Futures

PP 0168 Exploiting the prompt: operativity and cultural techniques in large language models

Manuel Bogalheiro[1]

[1] Lusofona University, School of Communication/CICANT, Lisboa, Portugal

Prompting in Large Language Models (LLMs) is typically framed as a merely instrumental form of input. This paper challenges that framing by reconceptualizing prompting as an operative cultural technique (Siegert, 2015). We argue that this practice fundamentally reorganizes the act of writing, reconfigures human-machine relations, and reshapes contemporary subjectivity. We contend that a reflexive, tactical approach to prompting constitutes a productive practice of critical digital literacy.

Conceived as the set of instructions formulated to trigger algorithmic generative processes, prompting cannot be adequately described as a purely linguistic process. Rather, it constitutes a techno-symbolic operation, insofar as it produces operative conditions from which text emerges as a contingent effect of pre-existing, data-trained technical processes. Instead of a continuous authorial gesture, writing is reorganised through iteration and adjustment, marked by a recursive relation between human activation and the statistical combinatorics of LLMs, in a form of "calculation of meaning" (Hayles, 2019).

As a cultural technique, like others such as counting or mapping, prompting functions as a practice that precedes the medial concepts it itself generates. In operating, it articulates fundamental distinctions – such as question and answer, intention and execution, human and machine, which are instituted operatively, even prior to any reflexive thematisation, thereby stabilising regimes of action.

Writing is not only transformed into a practice of command, but what has been discussed since post-structuralism as the problem of the subject of writing and communication is further complexified. In a text entitled *"Subjectivity as Medium of the Media"* (2011), Boris Groys argues that the contemporary subject is no longer one who fully masters the formulation and transmission of messages, but rather one who channels information flows, intervening less at the level of meaning than at the material level of their direction, intensity, and circulation: "this subject becomes the medium of the media – the messenger that transmits the message of the media" (p. 8). Groys, nevertheless, emphasises that such channelling is not innocent: by editing and organising flows, the 'operative subject' produces meaning, while simultaneously rendering the workings of the medium observable.

In a mediascape populated by summary acts of activation and feedback, prompting can thus be configured not merely as an instrumental action of command aimed at ready-made results—a 'means to an end'—but as a form of tactical media (Critical Art Ensemble, 2001) that can be mobilised to expose, or even subvert, the functioning of LLMs, including their biases, discursive uniformity, and automation of writing. Exploring limits, variations, and deviations, or even inducing system hallucinations- not against the system, but from within it, in the form of an exploit (Galloway & Thacker, 2007)- constitutes a potentially disruptive gesture capable of rendering the human–system interaction auto-reflexive.

Based on a conceptual and mediological analysis of prompting, together with experimental practices of interaction with LLMs (Rumbelow, 2023), this paper advances the hypothesis that, when understood in this way, tactical prompting configures a form of critical digital literacy (Gerlich, 2025), capable of displacing or disarticulating distinctions crystallised in automated cultural techniques.

PHC02 Digital: Pasts and Futures

PP 0169 Patterns of the past misremembered: Digital media and disjointed modellings of imagined pasts

Susanne Kass[1]

[1] Charles University, Institute of Communication Studies and Journalism - Faculty of Social Sciences, Prague, Czech Republic

The modelling possibilities AI can quickly create visual and textual representations of past events and scenarios which are both unreal but also sometimes uncannily realistic. Using the metaphor of a time machine, how might these artificially generated simulacra be compared to embodied memory or historical accounts as a mode of shifting between temporalities

of past, present and future? Memory and history are entangled through cultural practices, and the practice of prompting an AI to envision or describe the past brings together the future orientation of semiosis and the informational nature of visual and textual archives to open a speculative window on the curiosity of AI creations and to satisfy the visual and narrative hunger of the curious. What might be the role of generative technologies when coupled with imagination and the desire to see what was never documented when trying to understand collective and personal history? Multidisciplinary artist Laurie Anderson has long experimented with AI as a dialogical creative tool to create speculative worlds as a place to encounter other versions of her own voice and speech, or to create virtual reality worlds for herself and others as a performative experience. Anderson's approach both embraces the mysterious black box of how AI generates outputs while being explicit with her artistic intentions and desires in generating material. This includes visualising the tall tales of her grandfather Axel Anderson to create a photo album of his life as he told it, rather than how it actually was. While these disjointed experiments with an obviously fictional life history make no claims to show how her grandfather's undocumented childhood really looked or how events in his life actually unfolded, the artificially generated images speak instead of the complex relationship between the ways our imagination desires to see what was never documented or invents alternate narratives for how the past could or should have been, and how these are entangled with wishes for the present and future. These artistic experiments are a rich exploration of why we desire to use the affordances of modelling technologies and the subjunctive aesthetics they afford to act 'as if' they were a time machine and visualise and write the documentation of fictional virtual histories that can only be met through media technologies. with the capacity to externally visualise and model them for collective contemplation. Anderson's engagement with AI as a world-building tool raises many interesting questions regarding how unreal pasts can be entangled with the present and provide an authentic, yet often also absurd, imaginary of a past that never was. Her work shows how entering into a playful dialogue with generative technologies helps maintain an outlook toward the future and the past that is free and indeterminate.

PHC02 Digital: Pasts and Futures

PP 0170 Rethinking flow in digital communication: A conceptual and methodological framework

Jacob Ørmen[1], Sofie Flensburg[1], Árni Már Einarsson[1], Signe Sophus Lai[1]

[1] University of Copenhagen, Communication, Copenhagen S, Denmark

'Flow' has long been an essential concept in media and communication studies, emphasizing the movement, exchange, and consumption of information and content across individuals, organisations, markets, and societies. Coined by Raymond Williams (1974) to denote both the technological feature and cultural form of broadcasting, the concept has been equally important for understanding the spread of information through a two- or multi-step *flow* of communication (Lazarsfeld and Katz, 1955). From a more technical perspective, the physical transmission of a message from a sender through various transmitters and channels to the receiver (Shannon & Weaver, 1948) can also be described as a *flow*. Likewise, the circulation of information between apps and platforms can be described as "data flows" (Helmond 2015) and "money flows" capture the financial exchanges within companies and with external partners (Investopedia 2025). On the macro-scale, Castells (2001) argued that a core feature of information societies is the "space of flows" organized through networks, protocols, and infrastructures rather than geography.

While concrete conceptualisations and applications differ across traditions and analytical points of departure, a common denominator for studies of flows is a dynamic emphasis on *interchange* as a central characteristic of communication. In contemporary research, this perspective appears in studies of how digital content is continuously reproduced and shared, how users move between sites and interfaces, how data is collected and distributed, how money is generated and reinvested, and so forth. Regardless of whether we seek to understand the sociocultural, institutional, or infrastructural circumstances around communication, the transfer of value – in symbolic or material form – is imperative. This makes *flows* an equally fundamental and opaque object of analysis for media and communication researchers, calling for theoretical as well as empirical and methodological development of the concept and strategies for studying it.

In this paper, we present a framework to guide empirical studies of the various types of flows that shape digital communication and discuss the epistemic implications of employing different research strategies. That is, we develop a typology for gauging concrete units of analysis, distinguishing between flows of information, users, money, data, and, finally, energy as a vital, and increasingly scarce, resource in the communication economy. For each of these analytical units, we identify available methods and research instruments for studying them, pointing out the economic, legal, and infrastructural conditions that enable and constrain our capabilities as researchers. We illustrate the framework through a case study of the various flows in OpenAI's services from the circulation of data and money, the organization of information and users, and the operation of infrastructures and data centres.

In summary, the paper offers a rethinking of flow through a novel conceptual and methodological framework that can be operationalized in studies of digital communication across platforms and services.

PHC02 Digital: Pasts and Futures

PP 0171 The work of art in the age of its technical generativity: How visual media theory illuminates Generative AI

Joana Bicacro[1]

[1] Universidade Lusófona, ECATI / CICANT, Lisboa, Portugal

In the growing field of Critical AI Studies, it has been claimed that the humanities are failing to understand so-called 'AI' by resorting to "traditional humanistic theoretical frameworks that simply do not suffice anymore" (Offert in Bajohr, 2025, p. 115). While not disagreeing entirely, I argue that the study of the history of media sheds light on 'AI' in general, since this object entails certain aspects whose mediatic ground was not only laid many decades ago, but is even more evident through media theory works either not central today or simply not properly considered in this context.

In this presentation, I would like to propose several ways in which Walter Benjamin's *oeuvre* illuminates crucial aspects of images made by stable diffusion processes or other stochastic machine learning (ML) processes within artificial neural networks, hereafter referred to as Gen AI images. This author is frequently named in passing in the context of AI aesthetics (Manovich & Arielli, 2024; Ramos & Ferreira, 2024), and his theory been reviewed in the AI era (Ambrosini, 2025), but its relevancy for understanding the field of Generative AI remains insufficiently explored.

That ML and neural networks-based technologies were quickly capable of generating images can be explained, on the one hand, by the collapse of the image/text distinction these systems bring about, as proposed recently by Bajohr (2024). These systems work with interchangeable tokens and function as black boxes to themselves. This poses no particular problem to pictures, since, as Benjamin helps explain, the collapse of the representational model arrived much earlier in visual arts (through mechanical or technical image reproduction) than to other fields in poetics, creativity and communication.

On the other hand, and more relevantly, Gen AI images come about by virtue of what computational image archives constitute (and have constituted for a long time) as extensions of information organization systems containing mechanical or technical reproductions.

The non-representative character of LLMs imbues this process of statistics and pattern recognition with a productive irrationality, accelerated by programmed sycophancy and agreeableness, to the point of a form of psychosis. Not far off was the non-specialist public, or Benjamin's "absent-minded examiner,"(Benjamin, 1969, p. 19) producing judgments devoid of critical value, making collages of figures whose origin they did not know, joining the vast masses that throughout the 20th century and up to today have been making the world's appearance. In both cases, these processes result from forms of loss of aura or rupture with the tradition that, before the age of exhibition value, gave rise to the work of art.

I will conduct comparative case studies of Gen AI images (to be determined) and montage or collage art (e.g., *Pictures at an Exhibition*, by Chris Marker). Other texts by Benjamin on images, art and history will be analysed.

PHC03 Art and Communication: An Interface

PP 0275 Rage Against the (prompt) Machine. Large Language Models and shifts in authorship, meaning-making, and creative process

Jakub Nowak[1]

[1] Maria Curie-Sklodowska University, Institute for Social Communication and Media Studies, Lublin, Poland

The paper offers a critical reflection on the development of artificial intelligence (AI), with particular emphasis on generative language models and content-generation algorithms, in the context of contemporary culture industries and creative practices. It intervenes in the ongoing debate on how technology called AI contributes to shifts in traditional understandings of authorship, meaning-making, and creative process.

The point of departure (and the obvious title reference) is an analogy with a declaration made by the band Rage Against the Machine in 1992. The sleeve notes of their debut album state "no samples, keyboards, or synthesizers used in the making of this record." The instrumentation was meant to be organic, and the sound was to originate from a human performer. The statement can be read not only as a bold manifesto of artistic self-confidence but also as another, yet unexpected, voice in a debate on the relationship between art and technology dating back at least to Romanticism. Contemporary artists' declarations that they "do not use AI" repeat this gesture. However, their conditions, technological and market, are radically different.

The paper's point of departure is a critique of the language used to describe "AI". Drawing on the concept of the double articulation of media (Roger Silverstone, after Raymond Williams), the paper argues that the discursive status of medium is culturally as significant as mediation it performs. The term "artificial intelligence" obscures the actual nature of large language models as tools of statistical data processing devoid of consciousness or intention. This linguistic shift facilitates the naturalization of the technology and weakens critical reflection on its economic background – all discussed in the paper.

AI appears as a part of a broader processes of mediatization and datafication of social life, driven by global technology corporations. A key issue in this context are the ethical foundations of LLMs, since their training on copyrighted works is widely perceived as an unprecedented form of appropriation or theft. Against this backdrop, the paper problematizes

the status of the creative work in the age of AI. Drawing on Walter Benjamin's concept of aura, the socio-cultural status of (radically decontextualized) model-generated texts is analyzed. This process of "de-auralization" of culture is amplified by the market and institutional effects of AI in the field of culture industries. Within the literary one, for instance, one can observe accelerated publishing cycles, the rise of "fast literature," the proliferation of machine-generated content, and the blurring of authorship.

The paper also discusses how LLMs affect broader cultural phenomena in digital capitalism. In this light, following Vilém Flusser's concept of apparatus acting upon its actor, the author traces shifts in criteria of evaluation of human creative work regardless of whether individual authors make direct use of AI: the potentiality of a particular culture text to be (co-) generated by LLMs changes the very act of reading (or listening, or watching). In a similar manner, the use of AI-generated slop to illustrate documentary materials undermines the ontological status of photography and film as technologies of remembering.

PHC03 Art and Communication: An Interface

PP 0276 The elimination of technological determinism through antihumanism?

Kestas Kirtiklis[1]

[1] Vilnius University, Faculty of Communication, Vilnius, Lithuania

Accusations of technological determinism are perhaps the greatest challenge facing theories that seek to conceptualize communication, society and their change from a mediacentric perspective. The "hard" version of technological determinism presumes, that introduction of technology inevitably leads to changing social processes, i.e. technological changes determine social changes (e.g. the printing press leads to Reformation, the cotton gin - to the persistence of slavery in Southern states, thus to the American Civil War, etc.). The critics, however, argue that this hard form of technological determinism has numerous shortcomings, because it is based on the monocausal explanation, which is suspicious in terms of historical research. Therefore, more widespread is the "soft" form of technological determinism. It argues that technologies influence social change by responding to social needs. This version of technological determinism might be found in various theories explaining the role of the media in social change (M. Castells' theory of Information society, the institutional version of mediatization, the idea of mediated construction of reality, etc.)

All these theoretical approaches share the humanist assumption that humans and their agency play the key role in the formation of the social world, softening the hardcore technological approach.

But what if the emphasis on humanism is not the only way out of technological determinism? Media materialism championed by Friedrich Kittler challenges such humanist approach. From the media-materialist point of view the very problem of technological determinism arises because media theories start with humans and analyze the impact of technology on them. The mistake of technological determinism lies not in the undervaluation of humans, but on the contrary, in their exaltation! Kittler criticizes the primacy of human subjects, the idea of communication as mutual understanding, the notion of history as a continuous process. He argues that we should rather perceive history as series of successive discourse networks (Aufschreibsysteme), determining our situation. These networks essentially are media regimes, which aim at storage, processing and transmission of information. They have nothing to do with meaning or worldview; therefore, we should not humanize them or the media. On the contrary the human mind is a wetware optimized in accordance with the prevailing discourse network and for the purposes of the latter. "So-called humans" are the appendages of the media with rather technological functions.

From the first sight Kittler's theory might look like a radical version of technological determinism. However, I will argue that through the elimination of human component, Kittler theorizes the world where technologies determine technologies and the very idea of technological determinism becomes meaningless.

PHC03 Art and Communication: An Interface

PP 0277 Thinking otherwise together: Counterfactual cognition, games, and meaning

João Carrilho[1]

[1] Universidade Lusofona, CINEMA AND MEDIA ARTS, Lisbon, Portugal

This paper proposes a philosophical account of communication in which meaning emerges through the structuring of counterfactual cognition rather than through the transmission of information or the expression of pre-existing intentions. It argues that communicative understanding depends on how interlocutors orient themselves toward unrealized possibilities: what could have been said, how others might have responded, and which alternatives are treated as live or irrelevant in each context. Communication, on this view, actively organizes a shared space of cognitive possibilities.

Core thesis: *To communicate is to shape a space of counterfactual cognition by guiding attention toward certain possible moves, interpretations, and responses while rendering others invisible or unintelligible.*

The paper integrates three philosophical resources to develop this claim. First, it draws on Ricard Solé's notion of a space of cognitions to model the structured set of conceptual distinctions and transitions that are available *intersubjectively* to

agents engaged in communicative interaction. Second, it engages a philosophical conception of games inspired by Thi Nguyen, treating games as literal cognitive framings that cultivate specific modes of agency by organizing attention, valuation, and sensitivity to possibilities. Third, it brings these perspectives into dialogue with core concerns of the Philosophy of Communication and pragmatics, particularly the counterfactual dimensions of implicature, illocutionary force, and communicative framing.

The "2/3 of the average" game plays a key theoretical-argumentative role. While Nguyen's account provides a philosophical framework for understanding games as cognitive framings of agency, the analysis of concrete games such as the "2/3 of the average" allows this paper to trace how such framings operate in practice by structuring recursive counterfactual expectations. Unlike games that foreground competition or payoff maximization, the "2/3" game exposes the structure of recursive counterfactual reasoning: participants must anticipate not merely others' choices, but others' anticipations of possible choices across multiple unrealized levels. Philosophically, the game makes visible how coordinated action depends on navigating a shared space of imagined alternatives rather than on explicit communication or stable conventions. A structurally similar dynamic appears in Kripke's analysis of the surprise paradox, where shared reasoning progressively eliminates possible outcomes, illustrating how expectations themselves can collapse a space of possibilities without the introduction of new information.

On this basis, the paper advances three contributions. First, it offers a counterfactual account of meaning as the reconfiguration of cognitive possibility spaces rather than as the exchange of semantic content. Second, it reconceptualizes communicative coordination as alignment within these spaces, where agents converge on which possibilities matter, rather than on what is simply true or intended. Third, it reframes misunderstanding and communicative breakdown as failures of counterfactual alignment—cases in which interlocutors inhabit differently structured spaces of imagined alternatives.

By foregrounding counterfactual cognition and its game-like organization, the paper contributes a conceptually grounded philosophy of communication that clarifies how meaning is shaped, stabilized, and contested in contemporary communicative environments, particularly those characterized by reflexivity, polarization, and strategic anticipation.

PHC03 Art and Communication: An Interface

PP 0278 Visual communication on shifting grounds: Speed, meaning, and interpretation

Tijana Dedic[1]

[1] Singidunum University, Faculty of Media and Communications, Belgrade, Serbia

Communication practices today take place in conditions of rapid, continuous, and often unpredictable change, which destabilise established ways of understanding, interpretation, and meaning-making. In such an environment, communication increasingly operates in a mode of immediacy, where messages must be recognised and interpreted almost instantly, within contexts in which attention, audience expectations, and interpretative frameworks are constantly shifting. This instability of the communicative ground makes visual elements particularly relevant, as they enable quick orientation of attention and the structuring of meaning under conditions of limited time for reflection.

Starting from the assumption that speed and constant change are key characteristics of the contemporary communication environment, this paper problematises the role of visual communication as a primary means of meaning transmission in situations where verbal and discursive elaboration becomes secondary. In this context, visual elements are not understood as mere aesthetic additions to messages, but as carriers of meaning that activate existing cognitive and cultural patterns, enabling rapid recognition, orientation, and interpretation. Attention is not approached as a result of visual attractiveness alone, but as the outcome of alignment between visual form, conveyed meaning, and the audience's interpretative frameworks.

The paper develops a theoretical framework for understanding visual communication as a cognitive and meaning-making practice, in which the selection of visual elements represents a point of decision-making under unstable communicative conditions. In contemporary media environments, where messages are produced and distributed under the pressure of speed, visual elements such as composition, typography, colour, and form function as tools of rapid meaning organisation. They do not operate neutrally, but as cultural codes that pre-structure interpretation, limit possible meanings, and shape the communicative experience before the audience becomes aware of the interpretative process.

Methodologically, the paper is based on a conceptual and theoretical analysis of approaches from the philosophy of communication, cognitive information processing, and theories of meaning. Particular attention is given to the ways in which visual elements function as cognitive shortcuts under conditions of information overload, enabling fast interpretative judgments. Within this framework, the role of visual stereotypes is also examined. Rather than being analysed normatively, stereotypes are understood as existing interpretative resources whose function depends on context and communicative intent. They are viewed as tools that can stabilise meaning under conditions of instability, while at the same time limiting the interpretative horizon.

The paper contributes to philosophical debates on communication by shifting the focus from aesthetics as form to the visual as a means of rapid meaning organisation in conditions of continuous change. Visual communication is understood as a response to shifting communicative ground, in which the need for instant message transmission increases the responsibility involved in selecting visual elements. This perspective opens questions about the ethical and epistemological implications of visual communication in contemporary societies, where speed becomes a dominant value and meaning is produced under conditions of ongoing instability.

PHC03 Art and Communication: An Interface

PP 0279 An Accelerationist-Parmenidean reading of the tragedy of social media

Chris Miles[1]

[1] AFG College with the University of ABerdeen, School of Business, Doha, Qatar

In this paper I argue that the shifting grounds that digital communication technologies are ever more rapidly exposing us to, in terms of what constitutes reality, what constitutes time, and what constitutes the human in thought, can all be seen as manifestations of what Gorgias might call *apate*, or aesthetic deception (Grethlein, 2021). In Gorgias' theorisation of tragedy, the audience's intelligence is elevated through their willing suspension of disbelief, their willingness to go along with the story 'as if' it were true – they partake in deceit for an aesthetic purpose and so exercise what Grethlein (2021) calls a "special, culturally refined species of attention" (p. 19). In this sense, our choices to take part in doom-scrolling, to consume absurdist and non-absurdist generative AI content, and to embrace the deceptions of fake news and outrage-mongering expose our conceit in placing ourselves in the position of elevated audience at the performance of the tragedy of social media. We know social media is full of all forms of deception, but we nevertheless chose to immerse ourselves in it, confident of our elevated ability to harmlessly suspend our disbelief, to treat these deceptions as aesthetic confections that take us up, transport us. While we *can* (and by now countless scholars have done so) choose to regard this realm of deception as something to educate and counsel against, I will explore alternative accelerationist, neo-Parmenidean approach to this thraldom. The more filled our world of discourse is with deception, the more we might begin to recognise it as the *doxa* of Parmenides, false opinion with no connection to the truth of being. Parmenides' poem implies that it is only through an embodied revelation that we can realise the truth of being – so can this revelation be encouraged by an acceleration towards peak deception? Might an immersion in deception hasten the revelation that all discourse is deception?

PHC04 Pasts and Futures: Polical Dimensions

PP 0392 From templates to AI-driven multiplication: Rethinking visual aura in contemporary web design

Aliz Szőke-Vajas[1], Hanna Orsolya Vincze[1]

[1] Babeş-Bolyai University, Communication- Public Relations and Advertising, Cluj-Napoca, Romania

This paper examines the concept of multiplication in visual communication design, with a particular focus on web design as part of a broader design history shaped by reproducibility, standardization, and automation. The study forms part of a doctoral research project investigating the evolution of visual communication in web design, particularly in relation to AI-generated content and human-centered design.

The theoretical foundation of the paper draws, among others, on the work of Walter Benjamin, especially his essay The Work of Art in the Age of Mechanical Reproduction. Benjamin argues that technological reproduction diminishes the "aura" of the artwork—its uniqueness, authenticity, and situated presence in time and space. While originally formulated in relation to photography and film, this concept offers a productive framework for examining contemporary design practices characterized by repetition and scalability.

The paper argues that multiplication in design did not originate with artificial intelligence but can be traced back to the emergence of templates, modular systems, and standardized visual solutions in graphic and web design. Templates introduced efficiency and consistency while simultaneously reshaping the role of the designer, shifting authorship from singular creation toward recombination and adaptation. Web design, from its early days, has relied heavily on such structures, making it a particularly relevant field for examining the cultural and aesthetic implications of multiplication.

This logic of reproduction is further intensified by AI-driven website generators such as Wix ADI, Framer AI, and Webflow AI. These systems automate not only layout creation but also visual hierarchies, typography, and content structure, relying on learned design patterns and large-scale data. As a result, multiplication becomes algorithmic rather than mechanical, raising new questions about originality, visual diversity, and experiential depth.

The paper addresses the following research questions: Does AI-driven multiplication in web design further erode visual uniqueness, or does it represent a transformation of authenticity rather than its loss? Can AI-generated interfaces still facilitate human-oriented, meaningful visual experiences, or do they primarily result in functional, homogenized solutions? And how does the role of the designer evolve within template-based and AI-assisted environments?

By situating AI-generated web design within a longer theoretical trajectory of multiplication in design, this paper contributes to debates in visual communication, design theory, and philosophy of communication. It proposes that the question of "aura" in digital design is not solely technological but deeply connected to design intent, contextual framing, and human interpretative practices.

PHC04 Pasts and Futures: Polical Dimensions

PP 0393 The paradox of communication: Memory, difference, and the problem of the common

Jan Babnik[1]

[1] IRRIS, Digital Humanities, Ljubljana, Slovenia

This paper reconsiders the relation between communication, memory, and understanding through the lens of cultural semiotics, theories of multimodality – taking the work of Juri Lotman as its central theoretical reference. Against the dominant assumption in communication theory that the aim of communication is mutual understanding, the presentation advances a different claim: communication does not primarily seek understanding but rather sustains itself as a process, with understanding emerging – if at all – as a contingent by-product. This shift has significant implications for how we conceptualize memory, subjectivity, and the political horizon of communication in digitally mediated cultures. The argument begins with Lotman's metaphor of the dream, where the dream appears as a primordial form of communication marked by polylingualism and semiotic uncertainty. For Lotman, the dream inaugurates culture by introducing a pause between impulse and reaction, a space in which memory, translation, and meaning become possible. The dream is thus not a narrative structure but a topological field of coexisting semiotic potentials – a "reserve of uncertainty" that demands interpretation without guaranteeing correctness. The paper proposes that contemporary digital memory environments function in an analogous way: as fields of accumulation and circulation in which storage and transmission converge, and where meaning is continuously generated through recombination rather than stabilized through narrative closure.

Building on this analogy, the paper introduces the concept of *mnemo-modulation* to describe a condition in which memory operates less as retrospective organization and more as ongoing modulation within algorithmically mediated communicative flows. Drawing on Lotman's distinction between gradual cultural evolution and explosive moments of semiotic transformation, it is argued that the contemporary digital condition normalizes explosion itself. Cultural "explosion" no longer resolves into a new stable order; instead, it becomes a permanent state, driven by accelerated intersemiotic translations of multimodal artefacts. Communication intensifies, while shared frames of understanding recede. This situation foregrounds a paradox already identified by Lotman: the value of communication increases with the difficulty of translation between distinct semiotic spheres. The more alien spheres involved, the more informative – and disruptive – the communicative act becomes. In digital environments, this tendency is amplified structurally, privileging the proliferation of communication over the consolidation of common meaning. The result is a form of collective communicative intensity without shared understanding, reshaping memory, publicness, and political subjectivity.

By reframing digital memory through cultural semiotics, the presentation contributes to philosophy of communication debates on trust, understanding, and the normative assumptions embedded in liberal-democratic models of communication. Rather than diagnosing the present solely in terms of loss or deficit, it argues for a semiotic re-description of contemporary communication as a field of modulated memory and ongoing translation, in which the question is no longer how understanding can be restored, but how communication continues to generate meaning in the absence of stable common ground.

PHC04 Pasts and Futures: Polical Dimensions

PP 0394 "Become the CEO of your own body": Biohacking and the new care of the self

Thomas Neumann[1]

[1] University Klagenfurt, Department of Media and Communications, Klagenfurt am Wörthersee, Austria

Contemporary biohacking discourses increasingly frame self-care as a managerial task in which individuals are called upon to optimize their bodies, attention, and performance through media technologies. Popular biohacking literature condenses this imperative in slogans such as "Become the CEO of your own body" (Breitfeld 2025), articulating a broader transformation of self-relations under conditions of digital capitalism. Biohacking thus emerges as a cultural formation in which care, optimization, and control converge.

This contribution investigates how biohacking operates as a media-based technology of subjectivation that reconfigures the Foucauldian *care of the self* into a data-driven regime of self-management. Central questions concern how biohacking texts conceptualize the relationship between body, media technologies, and subjectivity; which communicative and

technological practices are mobilized to govern the self; and how ethical self-care is transformed into a neoliberal imperative of optimization and responsibility.

The theoretical framework draws on Michel Foucault's analyses of governmentality (Foucault 1978; 1982) *technologies of the self*, and the *care of the self* (Foucault 1986; 2007). Whereas ancient practices of self-care aimed at ethical self-formation and the cultivation of a way of life, contemporary biohacking reframes self-relation as continuous self-monitoring and performance management. This shift resonates with Ulrich Bröckling's concept of the *entrepreneurial self*, which describes neoliberal subjectivity as a permanent project of self-investment, responsibilization, and optimization (Bröckling 2007), as well as with Gilles Deleuze's notion of control societies characterized by continuous modulation, data flows, and self-regulation (Deleuze 1992). From a media-theoretical perspective, Bernard Stiegler's theory of grammatisation and attention helps to conceptualize biohacking technologies as dispositifs that externalize cognitive and bodily processes, rendering subjectivity calculable and governable (Stiegler 2010). Wearables, tracking apps, and dashboards function as interfaces that reorganize attention and translate self-care into algorithmic self-administration. Read against Jung's distinction between ego and non-conscious dimensions of the self, biohacking appears as a practice that privileges visible, communicable, and data-readable aspects of subjectivity, while structurally marginalizing non-transparent dimensions (cf. Jung 1968).

Methodologically, the analysis follows a qualitative discourse-analytical approach inspired by Foucault. Selected passages from biohacking books by Andreas Breitfeld and Stefan Wagner are examined as communicative artifacts that address readers as self-governing subjects. Four analytical dimensions structure the analysis: body discourse, media and technology discourse, self-relation and governmentality, and the economization of self-care. Biohacking appears, in this reading, as a media-based reconfiguration of the care of the self in which ethical self-formation is displaced by managerial self-governance. Situated at the intersection of media and communication studies and philosophy, this perspective contributes to critical debates on self-tracking, datafication, and the transformation of self-care in contemporary control societies.

PHC04 Pasts and Futures: Polical Dimensions

PP 0395 Revisiting Marx in the age of new media: Media alienation, digital subjectivity and the struggle for agency in platform capitalism

Wanqiu Lu[1], Xinzhu Wu[1], Ouwen Ma[2]

[1] ShanghaiJiaoTong University, School of Media and Communication, Shanghai, China
[2] ShanghaiJiaoTong University, School of USC-SJTU Institute of Cultural and Creative Industry, Shanghai, China

Marxist media criticism acquires renewed relevance in an environment where algorithmic governance and platform infrastructures increasingly mediate perception, relation, and agency. Rather than treating media as a secondary element of the ideological superstructure, the discussion foregrounds alienation as a lived and embodied condition. Classical motifs—alienated labor, commodity fetishism, and the inversion of subject and object-reappear today in forms shaped not by the factory but by the interface, the feed, and the logic of data extraction. Platform capitalism thus generates multi-level alienation that is not only economic or institutional, but ontological, experiential, and intersubjective.

Methodologically, the analysis proceeds through critical phenomenological inquiry, attending to how digital communication environments reorganize the Lebenswelt and modulate the grounds upon which subjectivity becomes possible. Alienation is examined not as a metaphor but as a mode of being-in-relation that is prefigured by infrastructure. This conceptual investigation is situated through indicative case vignettes-algorithmic visibility and its asymmetries; monetization pressures within influencer economies; and platform-dependent news encounters in moments of public crisis. These cases are not deployed as evidence in a positivist sense but as phenomenological apertures that expose how users are acted upon, formatted, and rendered legible to systems that exceed their intentional control.

The findings reveal three intertwined forms of media alienation:

First, experiential alienation, where digital routines and data-driven personalization produce a mode of perception shaped by platforms rather than by intentional agency, weakening the ability to inhabit one's own experience.

Second, technological alienation, where infrastructures such as recommendation systems and content moderation algorithms operate as quasi-autonomous forces, absorbing judgment and decision-making and rendering users dependent on machinic rationality.

Third, intersubjective alienation, where communicative practices within social media environments encourage instrumentalized interaction and dehumanized relations, reducing others to data points, audiences, or monetizable attention.

In response, we proposes a shift from media critique as institutional reform to media critique as phenomenological praxis: reclaiming the primacy of the human not through rejection of technology, but through cultivating forms of mediation that affirm agency, reciprocity, and the opacity of the other. This perspective reframes media not as a neutral interface but as a condition of experience, requiring ethical responsibility in the design and governance of digital systems.

Bridging Marxist political economy with critical phenomenology clarifies how alienation is reconfigured under platform capitalism, and why the struggle for subjectivity—rather than access, literacy, or participation alone—constitutes a central problem for twenty-first-century media theory. The horizon implied is not the restoration of a pre-digital subject but the cultivation of forms of mediation in which technology serves the human, rather than consuming it.

PHC04 Pasts and Futures: Polical Dimensions

PP 0396 Trusting the past? Memory, narrative, and the hermeneutics of artificial intelligence

Barna Kovacs[1]

[1] Sapientia - Hungarian University of Transylvania, Applied Social Sciences, Corunca, Romania

This paper investigates the conditions under which trust in the past remains possible in an age increasingly shaped by digital and algorithmic systems of communication. While historiography has always relied on mediations—archives, narratives, documents, and interpretive frameworks—the emergence of artificial intelligence introduces a qualitatively new form of mediation, one that challenges not only historical knowledge but the very hermeneutical relation between past, present, and future. The central question guiding the paper is therefore the following: *to what extent can we still trust that the past has actually happened as it is narrated and communicated today?*

Drawing on Paul Ricœur's philosophy of memory, narrative identity, and historical reference, the paper conceptualizes trust in the past as a fragile and ethically charged achievement. For Ricœur, historical knowledge is neither a direct access to past events nor a free linguistic construction; it emerges through a mediated process in which testimony, narrative configuration, and critical distance mutually correct one another. Trust, in this sense, is inseparable from responsibility: it presupposes identifiable interpreters, contestable interpretations, and a shared horizon of meaning in which claims about the past can be challenged and revised.

The contemporary digital communication environment profoundly destabilizes these conditions. Algorithmic systems and generative AI increasingly participate in the selection, organization, and re-description of historical materials, often with an appearance of immediacy and objectivity that conceals their interpretive operations. Building on recent developments in digital hermeneutics, particularly Alberto Romele's Ricœur-inspired account, the paper argues that AI systems function as *quasi-interpreters*: they do not merely transmit historical narratives but actively pre-structure the field of interpretation through data selection, pattern recognition, and narrative recombination. Unlike human interpreters, however, these systems lack experiential belonging, temporal situatedness, and ethical accountability. As a result, interpretation risks becoming opaque, automated, and detached from reflexive awareness of its own conditions.

This transformation recalls the dystopian logic articulated in George Orwell's *1984*, where the past is continuously rewritten through linguistic manipulation. Yet the danger today lies less in overt falsification than in the erosion of interpretive responsibility. When historical narratives are generated or modified without clear attribution, contestability, or narrative accountability, trust in the past collapses into either radical skepticism or uncritical reliance on machine-generated objectivity. In both cases, the communicative bond between past and present is weakened.

The paper concludes by proposing a normative reorientation of philosophy of communication toward the ethical governance of technological mediation. Trust in the past can be sustained only if human agency remains central in the interpretive process, preserving narrative plurality, critical distance, and responsibility for meaning. Artificial intelligence, from a hermeneutical perspective, must therefore be understood not as a substitute for historical interpretation, but as a powerful medium whose interpretive effects demand explicit philosophical, ethical, and communicative scrutiny.

POL01 TikTok and Embodied Political Performance

PP 0025 Platform governance, emotion, and extremism: A TikTok-Centered model of political Communication. Evidence from Romania

Eduard-Claudiu Gross[1], Andreea Stancea[2], Tanjev Schultz[3]

[1] Lucian Blaga University of Sibiu, Social Work- Journalism- Public Relations and Sociology, Sibiu, Romania
[2] National University of Political Studies and Public Administration- Bucharest- Romania, Department of Communication, Bucharest, Romania
[3] Johannes Gutenberg University, Department of Journalism, Mainz, Germany

Despite being a central infrastructure for political visibility, researchers are still struggling to explain how TikTok architecture reshapes ideological conflict, leaving an important theoretical direction unexplored. Following approaches from affective publics and algorithmic governance theories, this paper argues that (politicial) polarization on TikTok is not only a reflection of societal division, but also a phenomena produced due to the platform's architecture. Thus, this paper aims at examining how TikTok's recommendation architecture shapes ideological polarization and facilitates the circulation of extremist discourse. More specifically, this paper analyzes how platform affordances and affective storytelling contributed to the emergence of two antagonistic political clusters: a sovereigntist-populist field and a pro-European-institutionalist one in the contest of the Romania's 2024–2025 presidential election, characterized by a campaign disrupted by coordinated inauthentic activity and ultimately marked by the annulment of the first-round vote.

To test the formulated assumptions, the study adopts a mixed-methods design combining Critical Discourse Analysis (CDA) with computational network and content modelling. A dataset of 50 high-engagement TikTok videos (from a larger corpus of 50,000+ posts) was examined to identify the symbolic, emotional, and stylistic repertoires structuring each ideological camp. Network modelling based on shared hashtags (n = 1,037 nodes; 60,505 edges) used Louvain community detection and assortativity to measure polarization, while lexical analysis and logistic regression assessed how specific features (hashtags, sounds, engagement metrics) predicted the diffusion of extremist versus institutional narratives.

The results indicate an important feature: TikTok's multimodal affordances enable antagonistic ideological worlds to crystallize around emotionally charged repertoires. Sovereignist–populist narratives on the platform employ crisis framings and high-arousal affect, while pro-European–institutionalist messages rely on procedural legitimacy and ethos-based appeals.

Therefore, the paper offers at least two main theoretical contributions. First, it reconceptualizes polarization as infrastructural: ideological distance becomes encoded into network structures and visibility logics, rather than emerging solely from attitudinal predispositions. Second, it advances multimodal political communication theory by demonstrating how short-form storytelling acts as core mechanisms of meaning construction. Overall, the study reframes TikTok not merely as a distribution channel for political content but as a political system that co-produces ideological boundaries and democratic risk.

Keywords

TikTok; digital political communication; elections; algorithmic visibility; Sovereigntist; pro-European

POL01 TikTok and Embodied Political Performance

PP 0026 Trumpdancing on TikTok: Trends, performance, and political fandom

Antonio Martella[1], Cristopher Cepernich[1], Alice Fubini[2]

[1] University of Turin, Cultures- Politics and Society, Torino, Italy
[2] University of Bologna, Political and Social Science, Bologna, Italy

This study investigates how embodied political performances circulate on TikTok as platform-native trends (Powers, 2025), focusing on the Trumpdance (Donald Trump's distinctive dance to the song YMCA) during the final month of the 2024 U.S. Presidential campaign. As Boffone (2022) has shown, TikTok is a dynamic environment where digital subcultures emerge and evolve, and it is not limited to entertainment but serves as an active space for the expression of cultural, social, and political identities. Indeed, TikTok can be understood as a performative media environment in which political communication is increasingly shaped by platform vernaculars, such as trends and challenges, privileging bodily imitation, repetition, and affective visibility. Within this environment, the body operates not merely as a vehicle of expression but as a central resource through which political meanings are enacted, negotiated, and circulated (Gerbaudo & Moreno, 2023). Drawing on theories of political fandom and imitation publics (Dean, 2017; Zulli & Zulli, 2022), the analysis frames participation in the Trumpdance as a form of ritualized, trend-based engagement in which users mobilize embodied performance to articulate affiliation, irony, or contestation into repeatable templates (Abidin, 2020). Through algorithmically driven circulation, these embodied templates enable the co-presence of support, critique, and playful appropriation, blurring the boundaries between political participation and cultural performance (Cervi & Divon, 2023). This aligns with the concept of 'political fandom,' where engagement with political figures involves elements theorized in media fandom, including productivity, affective sentiment, community, and contestation (Macnaughtan & Trott, 2024).

Against this background the following research questions arise:

RQ.1 How is the Trumpdance trend articulated on TikTok through both fan and counter-fan practices?

RQ.2 How do different practices and performances contributing to the Trumpdance trend differ in terms of visibility and interactions on TikTok?

Methodology

Through TikTok Research API we collected a dataset of 6,799 videos tagged with Trumpdance-related keywords and hashtags between October 5 and November 6, 2024. A stratified daily sample of the 20% most-viewed videos (1,347) was analyzed by two trained coders and subjected to multiple correspondence analysis and hierarchical clustering to identify distinct participation streams. Negative binomial regression models were used to test the relationship between cluster-defined practices and engagement metrics (views and comments).

Results

Results reveal six distinct streams of participation ranging from from ritualized affirmations of political belonging, to critical re-mediations, and to playful or depoliticized appropriations, demonstrating that the Trumpdance trend has been simultaneously approached as an object of political fandom, a discursive resource, and a performative template. Interestingly, videos that remediate offline rally performances achieve the highest visibility, indicating that offline-produced spectacle continues to shape algorithmic distribution, thus reinforcing the relevance of the territorial dimension of the campaign (Chadwick, 2013) also for scrolling politics. By contrast, videos oriented toward reinterpretation and critique attract greater discursive engagement but lower overall reach. Not fully aligned with expectations derived from the concept of imitation publics, our sample shows that user reenactments of the Trumpdance function predominantly as sites of identity expression rather than as a primary trigger of large-scale diffusion.

POL01 TikTok and Embodied Political Performance

PP 0027 Populist communication strategies on TikTok: Party differences and engagement effects in the 2025 German Federal Election campaign

Theo Granzin[1], Nico Spreen[1]

[1] Hanover University of Music- Drama and Media, Departmen of Journalism and Communication Research, Hanover, Germany

Populist communication has become a salient feature of political discourse on social media, particularly on TikTok, where algorithmic amplification, personalization, and short, emotionally charged video formats shape political visibility and user engagement. Research suggests that populist are especially successful in such environments, as platform affordances favor simplified messages, affective appeals, and identity-based communication, enabling them to disproportionately reach younger and less institutionalized voter. This dynamic was particularly visible in Germany during the 2025 federal election campaign, when populist parties gained notable attention and electoral support among younger voters (Jost et al., 2025).

Populist communication is characterized by comprising ideological core messages—people-centrism, anti-elitism, exclusion—and characteristic stylistic features such as negativity, emotionalization, and sociability (Ernst et al., 2019; Jagers & Walgrave, 2007). These elements may occur independently or in combination and are commonly assumed to activate emotional and evaluative responses that foster political attention and engagement in digital environments (Jost et al., 2020). Thus, TikTok constitutes a relevant context for examining how populist parties employ populist communication strategies and whether these translate into higher user engagement.

Empirically, the study applies a quantitative content analysis of TikTok videos published by major populist parties in Germany (AfD, Die Linke, BSW) during the hot phase of the 2025 federal election campaign (January 12 to February 23, 2025) from twelve official party and leading politician accounts (N = 296). Unit of analysis is the individual TikTok video, operationalized through transcribed spoken content generated using OpenAI's Whisper speech-to-text model and subjected to AI-assisted text classification. All transcripts were manually checked, and the validity of automated classifications was assessed using theory-based validation procedures. The analysis captures populist key messages (people-centrism, anti-elitism, exclusion) and stylistic features (negativity, emotionalization, sociability), which were linked to a normalized engagement index based on platform metrics (Oviedo-Garcia et al., 2014).

Results show that populist key messages occurred in 20% of all videos, with clear party-specific patterns. AfD relied most heavily on populist content (56%), compared to BSW (10%) and Die Linke (11%). Thin populism and anti-elitism dominated overall, while exclusionary messages were rare and ideologically structured along party lines, reflecting distinct strategic emphases in party communication on TikTok. Party differences were statistically significant ($\chi^2(10) = 85.51$, $p < .001$, Cramér's V = .38). Populist stylistic features appeared more frequently—especially negativity (41%) and emotionalization (45%)—whereas sociability cues remained rare (13%) and showed no systematic party differences. However, neither populist key messages nor stylistic features were associated with higher engagement rates.

Overall, the findings indicate that populist parties differ markedly in their use of populist communication strategies on TikTok, but these strategies do not systematically enhance user engagement. This suggests that populist success on the platform is likely driven by other content characteristics or platform-specific features beyond populist messaging itself. Methodologically, conclusions are constrained by the limits of content-analytic approaches, including the abstraction of complex communicative cues into predefined categories, partial automation of coding, and the focus on spoken content and aggregate engagement metrics.

POL01 TikTok and Embodied Political Performance

PP 0028 Gendered body representation in political TikTok videos: A cross-national comparison of Norway and Romania

Cristina Monzer[1], Anders Olof Larsson[2]

[1] University of Pennsylvania, Annenberg School for Communication, Philadelphia, USA
[2] Kristiania University of Applied Sciences, Department of Communication, Oslo, Norway

As political communication shifts toward visual social media platforms, understanding how politicians present themselves through embodied cues becomes essential. While research demonstrates that male and female politicians face different evaluative standards (Huddy & Terkildsen, 1993) and that body language conveys gendered social information (Neumann et al., 2022), the embodied dimensions of digital political messaging remain understudied. This study examines gendered patterns in body orientation and body emphasis in political TikTok videos across two distinct electoral contexts: Norway and Romania.

Drawing on 1,036 videos collected during the 2025 Norwegian parliamentary election and the 2025 Romanian presidential election (Norway *N* = 304; Romania *N* = 732), we use state-of-the-art computer vision methods to systematically analyze body presentation patterns at scale. Videos were sampled from verified accounts of political parties, party leaders, and presidential candidates across the ideological spectrum. We use YOLOv11 for pose detection and skeletal keypoint analysis, and OpenAI's CLIP model for gender classification. Body orientation is classified as frontal, side, or back-facing based on body width-to-height ratios and facial visibility metrics. Body emphasis is categorized as full body, upper body, lower body, or close-up, based on the visibility patterns of key skeletal points.

This comparison leans into the "most different systems" approach (Przeworski & Teune, 1970), which contrasts the highly gender-egalitarian Norway (with 45% female parliamentary representation) with the more traditionally gendered Romania (with 22% female representation) (European Institute for Gender Equality, 2022). Additionally, with different political systems in place, comparing the role of the individual politician in a parliamentary and a presidential election can provide further insights into the supposed individualized nature of social media campaigns (Karlsen & Skogerbø, 2015). Preliminary analyses demonstrate substantial cross-national variation. Romanian videos averaged Romanian political content received eight times more engagement (avg. 317,705 views; 23,616 likes) compared to Norwegian videos (40,513 views, 2,773 likes)--suggesting different platform reach or content strategies. A pilot analysis of 100 videos per country shows that women appeared as the central person in 31% of Norwegian videos compared to 18% of Romanian videos. Body orientation patterns show that women politicians predominantly used front-facing presentations in both countries (Norway: 89%, Romania: 84%), with men showing somewhat lower front orientation rates. Notably, Norwegian women exhibited the lowest side-orientation rates (8.1%), while Romanian women used side orientation nearly twice as frequently (15.2%).

Body framing choices also showed cross-national variation: Norwegian women predominantly used upper-body framing (90.4%) with minimal full-body shots (8.2%), while Romanian women used full-body framing more frequently (28.2%). The full analysis will employ multilevel regression models to test whether body presentation features predict audience engagement differently by politician gender, while controlling for follower count, hashtag use, video duration, and ideological position. This research extends body language scholarship beyond hand gestures to broader embodied self-presentation, addresses calls for cross-national research on gendered communication patterns (Neumann et al., 2022), and demonstrates how automated visual analysis can contribute to investigating the gendered visual representation on social media.

POL02 Generative AI and the New Visual Politics

PP 0020 Who speaks for politics now? The disruptive potential of artificial Intelligence in identifying new actors within the digital political communication ecosystem

Rocio Zamora Medina[1], Shahira Fahmy[2]

[1] UNIVERSITY OF MURCIA, DEPARTMENT OF COMMUNICATION, Murcia, Spain
[2] American University in Cairo, Department of Journalism and Mass Communication, Cairo, Egypt

The political communication ecosystem is currently experiencing an accelerated phase of transformation driven by the rapid diffusion of Artificial Intelligence (AI) technologies and their capacity to reshape all stages of the communicative value chain. Within the broader framework of computational politics (Tufekci, 2014), AI-driven systems are not merely enhancing existing practices but fundamentally altering the roles, capacities, and power relations of both established and emerging actors. This study examines the disruptive and structural implications of AI for the identification and redefinition of actors operating within the digital political communication ecosystem.

The analysis focuses on how AI reconfigures traditional forms of political mediation and introduces new modes of agency that challenge established understandings of authorship, responsibility, and legitimacy in political communication. In this context, political actors, communication professionals, platforms, and audiences increasingly interact with automated systems that generate content, optimize strategic decisions, and shape the visibility and circulation of political messages. These developments give rise to new professional profiles and hybrid actors—such as algorithmic advisors, automated

content generators, campaign bots, and data-driven intermediaries—whose influence extends across electoral campaigning, agenda-setting, and political persuasion.

Conceptually, the study draws on the theory of techno-economic ecosystems (Mercan & Götkas, 2011; Vasconcelos et al., 2016; Barykin et al., 2020) as an interdisciplinary framework capable of capturing the systemic and relational effects of technological innovation. This approach enables the analysis of political communication as an ecosystem in which technologies, actors, value logics, and institutional arrangements co-evolve. AI is thus examined not as a neutral tool but as a structuring force that redistributes resources, reshapes dependencies, and transforms the balance of power within the ecosystem.

Methodologically, the research applies a functional–structural analysis to map the AI-driven political communication ecosystem in a systematic and relational manner. This mapping identifies productive and non-productive actors, their functions, technological interfaces, and mutual dependencies. Beyond descriptive classification, the analysis examines how communicative power is organized and exercised, which actors gain or lose influence through automation, and how AI mediates, amplifies, or constrains political interaction.

The study contributes to political communication scholarship in two main ways. First, it offers a conceptual and analytical model for understanding the reorganization of communicative power in the algorithmic age. Second, it proposes a typology of actors based on their capacity for intervention, mediation, or resistance vis-à-vis automated processes. Overall, the research advances a structural understanding of the contemporary political–digital ecosystem, highlighting the dynamic interplay between human agency and algorithmic agency as a defining feature of political communication in the age of Artificial Intelligence.

POL02 Generative AI and the New Visual Politics

PP 0021 Political beliefs or trust in AI: What affects the perception of AI-generated responses about migration

Victoria Vziatysheva[1]

[1] University of Bern, Institute of Communication and Media Studies, Bern, Switzerland

Being used by millions of people worldwide, AI chatbots such as ChatGPT are becoming a major source of information on various issues, including politics. However, with their capability to quickly generate answers to user questions and high anthropomorphism, such tools affect the way political information is perceived. For instance, recent research shows that AI chatbots, on the one hand, can be particularly persuasive in the electoral context, and, on the other hand, can increase attitude extremity. Furthermore, AI chatbots provide high personalization and are prone to sycophancy—behavior in which a model tends to agree with the user even if it comes at the cost of information accuracy. These factors have the potential to amplify politically motivated reasoning, which occurs when individuals interpret new information in line with their ideology and existing beliefs. Yet, little research has been done on the relationship between motivated reasoning and AI chatbot use.

In this preregistered online experiment with 591 Swiss participants, I examined whether users evaluate AI-generated responses about a contested political issue—migration—according to their political beliefs. Specifically, I tested whether participants found AI responses more trustworthy and objective and agreed with them more when these outputs were consistent with their attitudes. I found that motivated reasoning, indeed, affected the perception of AI responses in terms of agreement and perceived objectivity, whereby participants tended to rate outputs more favorably if they were aligned with their migration beliefs. This result was additionally confirmed using other measures of political orientation, such as political leaning and the propensity to vote for the Swiss right-wing political party SVP.

This study also shows a nuanced role of cognitive factors in the perception of AI responses on political issues. In particular, I found that a preference for effortful thinking amplified motivated reasoning, although overall it had a negative effect on perceptions of AI responses. In other words, while more analytical individuals were generally critical of AI responses, they also accepted these responses more easily, as soon as they aligned with their beliefs. By contrast, higher levels of intuitive thinking in some cases reversed the effects of motivated reasoning.

Finally, I demonstrate that perceptions of AI responses are largely driven by attitudes toward AI. Specifically, users who considered AI chatbots a credible information source and reported a higher understanding of how they work tended to judge specific responses more favorably in all aspects. Importantly, AI attitudes affected the perceptions of AI responses independently of their ideological congruency and had more consistent effects than motivated reasoning. This suggests that users who strongly rely on AI chatbots may trust their responses even if they contradict their own political views.

POL02 Generative AI and the New Visual Politics

PP 0022 Visualizing harm: The effects of AI-generated political attacks

Franz Reiter[1], Viorela Dan[1]

[1] University of Innsbruck, Department of Media- Society and Communication, Innsbruck, Austria

Political disagreement has traditionally been articulated through verbal criticism and argumentation. Increasingly, however, political actors and their supporters rely on technical means to produce visual representations that depict adverse outcomes

they wish upon political opponents. Advances in generative AI have intensified this practice, enabling a wide range of actors to create images portraying political adversaries as humiliated, arrested, hospitalized, or dead.

Rather than engaging directly with an opponent's arguments, politicians and their supporters stage imagined consequences and circulate them on social media. Highly visible examples include portrayals of Donald Trump (U.S.) crying in public or being taken into custody, William Ruto (Kenya) resigning or depicted in a coffin, and Vladimir Putin (Russia) shown as imprisoned. These depictions thus span a continuum from mild portrayals (e.g., sadness), through moderate forms (e.g., arrest), to extreme depictions involving illness or death.

Despite the growing visibility of this emerging genre—here termed *symbolic-harm depictions*—little is known about its effects on citizens or how these effects vary with the severity of the harm portrayed. Research on negative campaigning and political incivility suggests that such variation in severity should matter, as negativity can either persuade or backfire depending on how it is perceived by audiences.

To investigate these dynamics, we conduct a web-based experiment in Austria (planned $N = 240$). Participants are randomly assigned to one of four conditions: low symbolic harm, moderate symbolic harm, high symbolic harm, or a neutral control condition. In all experimental conditions, participants are exposed to selected items from the X feed of a fictitious local politician. The first fifteen posts are neutral in nature, while the final post is a repost of content originally shared by another user, which the politician appears to endorse by adding the comment, "Pichler might want to reflect on what has driven public frustration to the point that people are sharing AI-generated images like this of him." The reposted content depicts symbolic harm directed at a political opponent, referred to as Stefan Pichler.

Severity is manipulated through the outcome depicted (low, moderate, high). The control condition features an otherwise comparable repost containing neutral content. The study examines effects on citizens' evaluations of both the sponsoring politician and the targeted opponent, operationalized through attitudes, emotional responses, and voting intentions.

A pretest and manipulation check are underway. We are in the process of pre-registering the main study on OSF. Data collection will be carried out by a professional survey provider (Dynata) in March; funding has been secured.

We pose four main hypotheses. First, increasing severity of symbolic harm is expected to reduce evaluations of the sponsor. Second, severity may simultaneously increase evaluations of the target by eliciting sympathy. Third, we expect backlash against the sponsor to be stronger when the symbolic harm is perceived as excessive. Fourth, target benefits are expected to be conditional, emerging primarily when the depiction is perceived as excessive.

The study contributes to research on political incivility, negative campaigning, and AI-mediated political communication by examining how visualized symbolic harm shapes political evaluations.

POL02 Generative AI and the New Visual Politics

PP 0023 Contested futures: Power, visibility, and AI-generated political imagination in post-uprising Iran

Mitra Shamsi[1]

[1] Center for Advanced Internet Studies CAIS, CAIS, Bochum, Germany

Political imagination plays a central role in how social movements envision future transformation. The emergence of AI-generated visual technologies promising new possibilities for enabling and visualizing imagined futures calls for critical examination of how such imaginaries mediate political futures, particularly in contexts of political and social transformation. This study examines how AI-generated visuals function as contested public spaces for visualizing alternative futures during and in the aftermath of moments of upheaval.

Taking Iran following the Women, Life, Freedom movement (WLF) of 2022–2023 as a case, this study analyses how competing political actors use AI-generated media to visualize divergent futures, asking whose imaginaries become visible through these mediated artifacts, what political vocabularies they draw upon, and how issues of power and visibility shape which imagined futures are legitimized and which are marginalized.

For decades, Iran's political environment has been marked by structural constraints on civic engagement and the systematic suppression of dissent. The WLF temporarily disrupted this order, opening hybrid spaces where new forms of visibility, solidarity, and political imagination emerged. After its suppression, digital spaces became platforms for imagining alternative futures of the nation—most visibly through AI-generated images and videos circulating across digital media platforms.

Drawing on Chiara Bottici's concept of imaginal politics, I approach AI-generated visuals as part of the imaginal sphere through which politics is mediated and practiced. Following Nataliia Laba, I treat them as socio-technical practices—not purely technical outputs, but part of broader cultural and social practices that shape meaning, identity, and collective memory. Rather than asking how these images are technically produced, I examine how they operate as cultural and political texts. Employing visual framing analysis, I analyse an archive of widely circulated AI-generated visuals on Instagram and X (Twitter) between 2022 and 2025, studying how they frame alternative political futures, what cultural and political choices shape them, and how they operate as social practices within broader discursive struggles.

The analysis reveals three distinct framings of Iran's imagined futures. First, *restoration and technonationalist modernity*, where WLF symbols are appropriated while the movement's feminist, grassroots and participatory character is

erased—futures imagined as elite-led transformation and neoliberal promises. Second, *pluralist yet depoliticized futures*, where diversity and social demands become visible as lifestyle and individual rights, but liberation is framed as the ability to live normally rather than collective power to reshape political and economic structures—the process of transformation and people's agency remain invisible. Third, *disciplined imagination*, where future scenarios are narrowed to restoration, collapse, or regime continuity, collective agency is systematically erased, and transformative possibilities are foreclosed while state narratives of order and chaos are reproduced. Across these framings, a pattern emerges: the radical feminist and transformative possibilities opened by WLF are symbolically invoked yet structurally erased. I argue that while AI-generated imaginaries enable diverse visions, actors with institutional backing achieve wide circulation, and dominant political vocabularies—not progressive alternatives—gain visibility. Power and visibility hierarchies determine which imagined futures gain circulation and legitimacy in moments of transformation.

POL03 Algorithmic Visibility and Cross-Platform Attention

PP 0132 From routine to campaign mode: Temporal dynamics of political communication on TikTok and Instagram

Pablo Jost[1], Hannah Fecher[1], Yannick Winkler[1]

[1] JGU Mainz, Department of Communication, Mainz, Germany

Election campaigns have traditionally been understood as distinctive phases of heightened competition and strategic pressure, in which political actors intensify their communication efforts to maximize visibility and mobilization (Strömbäck & Van Aelst, 2013). When viewed through the lens of digital platforms, however, this temporal distinction becomes less clear-cut. Digital platforms are often associated with a "permanent campaign," in which political actors seek continuous presence and engagement beyond formal election periods (Chadwick, 2017). Under these conditions, adaptation increasingly refers to platform-specific logics of visibility and distribution, shaped by algorithmic curation and user engagement (Klinger & Svensson, 2015). Against this backdrop, it remains unclear whether permanent campaigning leads to largely uniform communication over time, or whether election phases continue to constitute distinct moments that further restructure political communication on platforms such as TikTok and Instagram (RQ).

This study examines longitudinal change in political short-video communication in the run-up to the 2025 German federal election. Drawing on a content analysis of 30,164 TikTok videos and Instagram Reels published by German parties and members of parliament between June 2024 and February 2025, we analyze how three dimensions of communication evolve over time: (1) established campaign strategies such as attacks and acclaims, (2) mobilization cues including calls to action and direct audience address, and (3) platform-specific affordances—conceptualized as technical and social opportunities that shape expectations of visibility and engagement (Nagy & Neff, 2015)—including performative practices such as dancing, interaction with embedded platform content (e.g., duets, stitches, and on-screen references), and the use of comment stickers to incorporate audience interaction into videos.

Video content was classified using a multimodal large language model (Gemini 2.5 Pro) based on structured prompts derived from a theoretically grounded codebook. A manually coded dataset (N = 1784) served as basis for the iterative prompt refinement and for validation (all F1-scores < .69). Temporal dynamics in communications strategies were assessed using segmented time-series analyses and multilevel regression models accounting for platform, party, and account-level heterogeneity.

The findings show that election proximity does not lead to a uniform intensification of all engagement-oriented features. While overall activity and mobilization cues increase sharply in the late campaign phase, strategic attacks peak earlier and subsequently stabilize. In contrast, the use of performative platform affordances follows a non-linear trajectory and remains comparatively restrained during the decisive phase of the campaign. This pattern suggests that political actors selectively activate platform affordances, balancing algorithmic incentives for visibility against considerations of strategic focus, credibility, and appropriateness under heightened electoral pressure (Bossetta, 2018; Jost, 2023).

Taken together, the study demonstrates that short-video campaigning is temporally structured rather than continuous. Even under conditions of platformized political communication, routine and election phases remain analytically distinct. While election proximity intensifies strategic communication and mobilization, it does not translate into an unrestricted uptake of platform-specific affordances. Instead, campaign periods are characterized by selective alignment with visibility-oriented logics and a cautious, constrained use of platform-native practices. By foregrounding temporal dynamics, the paper thus identifies clear limits to platform-driven campaigning in high-stakes electoral contexts.

POL03 Algorithmic Visibility and Cross-Platform Attention

PP 0133 TikTok's tribal drums in the Romanian Presidential elections – A multimodal analysis

Radu Meza[1], George Adrian Prundaru[1], Andreea Alina Mogoș[1], Hanna Orsolya Vincze[2]

[1] Babes-Bolyai University, Journalism and Digital Media, Cluj-Napoca, Romania
[2] Babes-Bolyai University, Communication- Public Relations- and Advertising, Cluj-Napoca, Romania

The surprising result of the 2024 presidential elections in Romania in the first round by an independent far-right candidate, to anti-fascist protests in major cities and a full vote recount followed by the annulment of the election and a complete

redo of the elections, brought TikTok's political influence potential into the limelight of European politics. On the platform, meaning is constantly reframed by how text, sound and image are sequenced and recontextualized, thus necessitating a multimodal approach of digital political communication. Drawing on the media ecology paradigm, this research employs Nabi's emotion-as-frames model and Tagg's musical communication model to explore the interplay of popular culture and political expression on TikTok. The analyzed dataset is comprised of 742 videos and metadata from the calingeorgescuoficial TikTok account, 1400 video metadata using aural meme templates and 150 videos using the most popular memetic sounds used to support Călin Georgescu. Quantitative analysis is used to analyze thematic patterns in textual messages, while a new proposed layered multimodal qualitative analysis model is employed to study meaning making through sound, image, video and intertextuality. Results show the use of a wide range of memetic sounds (from hip-hop and pop-folk to military marches and religious chants) to mobilize people dissatisfied with the establishment and galvanize "souveranist" sentiment around the candidate by offering a platform for communal performances of outrage, grievances, national pride, quasi-religious adoration, but also hope, activating the topoi of oppression and resistance. The visuals anchor emotions in diverse contexts, from everyday life to protests in TikTok's mediated reality, while the sounds construct affective publics as scripts for communal performances which feed the majority illusion. TikTok's memetic function is used to create "a complex ecology of users' imitation, affective attunement, and attention hijacking" (Bösch & Divon, 2024) through automated indexing and amplification based on users' previous engagement. The grievances of farmers and transporters, the military ethos, and especially the feeling of disenfranchisement of the sizeable Romanian diaspora are effectively hijacked through use of relatable memetic templates. The sounds used as memetic templates by supporters of the campaign attune to the identities of specific categories from which they emanated in previous months or years – the military, the police, the diaspora, the farmers, the transporters, the young etc. Support for the candidate is expressed through participation in memetic phenomena that use the official campaign sound or reuse sounds that were previously attached to rituals of passage, memorialization and nostalgia, participation in mobilization for a previous cause, a specific group identity, older or relatively newer anthemic "wake up calls".

POL03 Algorithmic Visibility and Cross-Platform Attention

PP 0134 Fragile flows of attention: Temporal dynamics of political issue competition on TikTok across 27 European countries

Jana Johanna Klapproth[1], Said Unger[1], Thorsten Quandt[1]

[1] University of Muenster, Department of Communication, Muenster, Germany

TikTok has rapidly become an important arena of political communication for politicians seeking to reach younger audiences, reshaping how political issues gain visibility and compete for attention. Unlike follower-based platforms, TikTok organizes visibility through algorithmically generated interest clusters (Gerbaudo, 2024), in which political actors compete by embedding their content into trending topics rather than addressing stable audiences. In this environment, hashtags function as strategic issue labels that position political content within algorithmic publics and enable politicians to enter, sustain, or redirect attention flows.

While existing research has documented politicians' adoption of TikTok and the platform's affinity with populist communication styles, it is still underresearched how issue competition evolves over time. In particular, it remains unclear how political issues, operationalized through politicians' hashtag use, interact dynamically: which issues gain momentum first, how sudden increases in attention to one issue reshape the trajectories of competing or adjacent issues, and how these temporal dynamics vary across national political contexts. Addressing this gap, this study examines the temporal structure of issue competition in politicians' TikTok communication across 27 European countries.

We draw on a dataset of 272,756 TikTok videos posted by national deputies of the 27 EU-member parliaments (6.359 MPs). For each country, we track the temporal evolution of the twenty most frequently used political hashtags and construct normalized time series of issue attention. Multivariate time-series models with Granger causality tests and impulse response functions are used to examine how attention to one issue shapes the trajectories of others over time, accounting for election-related periods as exogenous shocks.

Across countries, the results reveal that politicians' issue competition on TikTok unfolds through structured yet highly fragile flows of attention. Rather than forming stable issue agendas, attention concentrates temporarily around a small set of dominant issues and shifts rapidly in response to impulses from related topics. These fragile flows are characterized by asymmetric temporal dependencies: some issue labels consistently function as short-term attention hubs that trigger cascading responses, while others remain largely reactive and episodic.

These dynamics are most pronounced in issue domains associated with populist rhetoric. Hashtags related to migration, border control, internal security, geopolitical conflict, and cultural identity function as temporal catalysts, setting off self-reinforcing cycles of attention. Impulses in these issue areas generate escalating feedback loops in which attention becomes increasingly intense and tightly coupled. As a result, attention flows around these topics become heated and volatile, crowding out adjacent issues.

These patterns indicate that issue competition is prone to producing fragile and escalating attention structures. Such dynamics create conditions under which polarized interpretations are more likely to emerge, as algorithmic visibility repeatedly amplifies issue structures. Overall, the study advances an actor-centered, temporal perspective on issue competition by demonstrating that politicians compete for algorithmic attention on TikTok through fragile, rapidly shifting flows of issue escalation and displacement rather than through stable or isolated issue promotion.

POL03 Algorithmic Visibility and Cross-Platform Attention

PP 0135 Algorithms, attention, polarization: Understanding the drivers of political visibility on Instagram during elections

Bruna Paroni[1]

[1] University of Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

In recent years, the global rise of political polarization and the role of social media in shaping public discourse have become central themes in political communication research. While scholarship has extensively covered platforms such as X/Twitter, Facebook, and TikTok, a significant gap remains regarding the algorithmic amplification of political content on Instagram, specifically concerning its contribution to "destructive polarization". This form of polarization is defined as a communicative practice characterized among others, by a lack of deliberation, exacerbated space of extreme voices and erasure of complexities (Esau et al., 2024).

We used the 2024 São Paulo (Brazil) mayoral election — a contest involving nearly 10 million voters and marked by cycles of violence, disinformation, and court-ordered account suspension — to examine the interplay between political content and platform's attention dynamics during elections. We investigate how patterns of visibility evolve (RQ1) and what factors drive this visibility (RQ2) using a dataset of over 7,500 Instagram posts from five leading candidates during the campaign (August–October 2024).

We employed a three-step analytical approach. For RQ1, we conducted a changepoint detection on time-series data for views and engagement (likes and comments) followed by peak analysis. For RQ2, we utilized a negative binomial regression to estimate the predictors of visibility, controlling for likes and comments, candidate identity, content type, timing, follower count, and posting frequency.

The analysis reveals radical attention asymmetry. The PELT algorithm identified nine distinct temporal segments. For instance, during the initial phases of the campaign, a single candidate captured 90% of the views. Visibility peaks were identified by applying a threshold of two standard deviations above the mean for each specific segment. To illustrate, on Segment 4, a single candidate accounted for 170 visibility peaks, while his main competitors generated zero visibility peaks. In multiple segments, this same candidate captured 100% of peak-related views.

The regression results demonstrate that user engagement — specifically comments more than likes — and candidate identity are the strongest predictors of visibility. Both follower count and posting frequency had a limited or even significant negative explanatory impact on average visibility per post. Most temporal segments (specifically Segments 3 to 8) were significant negative predictors of visibility, indicating a general decline in average post reach as the race progressed. Regarding content type (Reels, photos, and carousels), the model indicates that carousels maintain a higher average baseline of visibility. When crossing the model's predictions with the peak analysis, we observed a dual-track algorithmic logic, where Reels act as the primary engine for extreme visibility, accounting for over 90% of the identified peaks.

These findings indicate that Instagram's architecture fuels destructive polarization by algorithmically incentivizing much space for a single voice. While the candidate's strategy of personal attacks and disinformation secured near-total attention hegemony, even when banned from the platform, his electoral defeat underscores a critical disconnect between algorithmic visibility and democratic consensus. We conclude that polarization studies must prioritize platform architecture, since these governance mechanisms enable a scale of amplification that may reflect a global systemic logic transcending specific political contexts.

POL03 Algorithmic Visibility and Cross-Platform Attention

PP 0136 Entertainment as gateway: How lifestyle influencers unlock political participation on TikTok

Christian Pipal[1], Morgan Wack[1], Eva-Maria Vogel[1], Frank Esser[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Note: This is a Stage 1 Registered Report. Study is conducted January–June 2026.

The algorithmic architecture of TikTok has fundamentally transformed pathways to political participation. While research has documented the rise of "political influencers," we lack causal evidence on whether they truly empower citizens or merely amplify existing engagement. This pre-registered study investigates a counterintuitive mechanism: that entertainment-focused creators are not diversions from politics but essential gateways to it.

Theoretical Framework

We introduce the Parasocial Gateway Hypothesis, proposing that lifestyle influencers who sporadically "interlope" into political discourse mobilize the politically disengaged more effectively than dedicated Political News Influencers. Drawing on parasocial relationship theory, we argue that trust bonds established through non-political content (e.g. beauty tutorials, gaming streams, lifestyle vlogs) transfer to political advocacy, bypassing selective avoidance mechanisms that typically filter out overtly political material. Unlike News Influencers, whose political identity triggers defensive processing among the disengaged, Interloping Influencers leverage pre-existing affective trust to reduce resistance. This reframes entertainment consumption as preparatory infrastructure for political mobilization rather than its competitor.

Research Design

We conduct a longitudinal quasi-experiment tracking 300 influencers (100 Political News, 100 Interloping, 100 Pure Lifestyle controls) and approximately 55,000 new followers across the US and Germany. Using the TikTok Research API, we monitor users who begin following these influencers during January–March 2026, tracking behavior through June 2026. Influencers are classified using a manually validated multimodal BERT-based model analyzing video transcripts, captions, hashtags, and visual content to determine the proportion of political versus lifestyle content in their output.

Measurement

We operationalize political empowerment through four behavioral indicators: (1) political content creation (posting videos with political hashtags/topics), (2) active engagement (likes, comments, shares on political content), (3) network expansion (following new politically diverse accounts), and (4) cross-platform amplification (sharing TikTok political content to other platforms). All measures are captured via API at weekly intervals.

Causal Strategy

We use propensity score matching using pre-treatment covariates: prior political engagement frequency, following network composition, content consumption patterns, account age, and activity levels. Matched users who follow political influencers are compared to users following Pure Lifestyle influencers or no influencers. Difference-in-differences estimation isolates the causal effect of the follow event, controlling for time-varying confounds and platform-wide trends.

Hypotheses

H1 (Main Mobilization Effect): Following a political influencer causally increases users' active participation (posting, sharing, liking, and network expansion).

H2 (The Gateway Effect): Mobilization effects will be significantly stronger for users following Interloping Influencers compared to Political News Influencers, supporting the theory that trust transfer serves as a gateway for the less engaged.

H3 (Cross-National Moderation): Reflecting distinct political cultures, empowerment man ifests differently: US users will show increased behavioral expression (posting/sharing), while German users will show increased network diversity (following diverse accounts).

H4 (Dose-Response): Following multiple influencers creates a cumulative effect, strengthening the algorithmic feedback loop.

This study provides the first large-scale causal test of influencer-driven empowerment in algorithmic environments, challenging conventional boundaries between entertainment and political communication.

POL04 AI, Trust, and Authenticity in Political Information

PP 0127 The algorithm of anxiety: Deconstructing the link between populist sentiment and fear of artificial intelligence in Europe

Teodor-Mihai Cosma[1], Mihnea S. Stoica[1], Ioan Hosu[1], Jessica A. Eke[2]

[1] Babeș-Bolyai University, Department of Communication- Public Relations and Advertising, Cluj-Napoca, Romania
[2] Independent researcher, Independent researcher, Cluj-Napoca, Romania

In the rapidly evolving landscape of technological advancement, Artificial Intelligence (AI) acts as a paradigm-shifting force that promises to revolutionize industries while simultaneously generating profound anxieties regarding job scarcity, privacy,

and inequality. These uncertainties create fertile ground for populist rhetoric, which often frames technological disruption as a conflict between the vulnerable 'People' and the detached 'elite', such as software developers and venture capitalists, who benefit from these systems. However, empirical evidence linking specific dimensions of populist sentiment to AI-related fear remains scarce, particularly in a comparative European context.

This paper addresses this gap by investigating the conditions under which populist attitudes exacerbate the fear of AI. We propose a theoretical distinction between 'outward-looking' populism (OLP), characterized by anti-elitism and hostility toward minorities, and 'inward-looking' populism (ILP), which centers on self-perception, specifically feelings of status deprivation and the need for protection.

To test these hypotheses, the study draws on a unique large-N dataset (N = 7,755) collected in 2023 across five European countries: France, The Netherlands, Poland, Hungary, and Romania. The data was gathered using an innovative online "political compass" Voting Advice Application (VAA), allowing for the analysis of policy preferences and political attitudes across a broad demographic spectrum.

Using a series of linear regression models, we assess the explanatory power of ILP versus OLP variables on the dependent variable: the belief that "Artificial Intelligence is harmful for humankind". Contrary to the expectation that fear of AI is primarily driven by hostility toward elites (OLP), our findings reveal that 'inward-looking' populism is a significantly stronger predictor. Specifically, 'status deprivation', the belief that one is being left behind or marginalized by the economy, emerges as a primary driver of technological anxiety.

These results suggest that fear of AI is not merely a product of conspiracy theories regarding how "others" use technology, but rather a reflection of personal helplessness and perceived social peripherality. By demonstrating that economic and social grievances are more potent than anti-elite rhetoric in fueling AI-related populism, this research offers critical insights for political communication scholars and VAA developers aiming to understand how public perceptions of emerging technologies are formed and how their negative effects might be mitigated.

POL04 AI, Trust, and Authenticity in Political Information

PP 0128 The perceived illegitimacy of epistemic authorities and expertise

Michael Hameleers[1]

[1] University of Amsterdam, ASCoR, Amsterdam, Netherlands

Contemporary digital information ecologies are rife with epistemic disputes, where common sense, alternative experts, and gut feelings seem to win the battle for legitimacy from expert knowledge and mainstream epistemic authorities– at least among segments of society that increasingly become distrusting of established institutions of knowledge. To understand how this contemporary battle for legitimacy and the status of epistemic authority is understood by citizens, this study maps the perceived (il)legitimacy of expertise and authoritative sources of knowledge vis-à-vis alternative modes of truth-telling.

Our paper aims to extend beyond established concepts of science-related or epistemic populism and post-truth repertoires. It also extends beyond "fake news" as a blame-shifting label assigned to journalists or established media. Hence, beyond the attack on scientific knowledge and news media versus the emphasis on people-centric knowledge, the delegitimization of expertise and epistemic authorities reflects a broader crisis of legitimacy related to the status of various authoritative sources of information. As case in point, radical right-wing populists who gained political power (i.e., Trump in the US, Wilders in the Netherlands) often cast doubt on epistemic authorities and experts by questioning the validity and honesty of empirical facts, or the independent status of experts and institutions of authoritative knowledge. Using the affordances of social media, and the resonance of hyper-partisan alternative media with delegitimizing narratives, these actors play a key role in mainstreaming the delegitimization of authoritative experts across domains.

As a major contribution to literatures on post-truth discourses and repertoires, the epistemic dimension of populism, and delegitimizing epistemic discourses, we suggest that contemporary digital societies and public opinion host a wider crisis of legitimacy that is reflected in the beliefs of disenchanted and distrusting citizens. Using representative survey data in contrasting country cases (the US and the Netherlands reflecting high and low polarization, respectively), we explore whether a wider perceived crisis of legitimacy related to authoritative expertise is mainly reflected among people who are disenchanted with politics, media and society. Are segments of society that distance themselves from democratic institutions most likely to question the legitimacy of authoritative expertise? The comparative survey captures the perceived illegitimacy of epistemic authorities, preferences for alternative sources of truth, and the extent to which citizens still care for the truth and facts. By assessing the correlates of the perceived illegitimacy of epistemic authorities, this study establishes the profile of citizens with alternative preferences for truth: Can we distinguish citizens who deem epistemic authorities and experts as illegitimate based on their media preferences, populist attitudes, and general levels of distrust in democratic institutions?

By mapping these profiles of perceived illegitimacy, this paper aims to make a contribution to the literature on democratic resilience and pathways to interventions in light of post-factual discourses, disinformation, and the erosion of the legitimacy of epistemic authorities. Hence, our findings on perceptions of (il)legitimacy can help to identify segments of the digital

audience that are no longer reached by epistemic authorities and help to tailor interventions related to disinformation to different preferences for truth and factual coverage.

POL04 AI, Trust, and Authenticity in Political Information

PP 0129 Are political opinion leaders still good for democracy? A cross-country study of political opinion leaders' media repertoires and trust in information sources in high-choice information environments with low/high polarization

Miriam Brems[1], Jessica Gabriele Walter[1], Anja Bechmann[1]

[1] Aarhus University, Department of Media and Journalism Studies, Aarhus N, Denmark

High-choice information environments and increased social information curation have reignited interest in political opinion leaders' (hereafter POLs) roles as intermediaries of information (Strömbäck et al. 2023). The term denotes ordinary citizens who share political information with others and attempt to influence their opinions (Lazarsfeld et al. 1948). Assuming they passed on quality information, their role in public opinion formation was traditionally conceptualized as normatively good, but this assumption does not necessarily hold today (Mangold & Bachl 2018): POLs may relay information from influencers, partisan alternative news media, and alternative social media like Telegram and Truth Social where misinformation and alt-right narratives circulate. This gives POLs potential to inform *or misinform* others (Strömbäck et al. 2023).

Prior studies of POLs' media diets predominantly focus on traditional news media and mainstream social media. We advance knowledge in three central ways.

1) We explore POLs' use of a *broader scope of information sources*, including professional *and partisan alternative* news media, mainstream *and alternative* social media, *and influencers*.
2) We investigate *what information sources POLs (do not) trust* (news media/social media/research).
3) We compare countries with high (US) and low (Denmark) media polarization. To our knowledge, this is the *first comparative study* of POLs' media diets.

We use survey data representative of the adult populations in the US and Denmark, collected February/March 2025 (N = 3980). We identify media repertoires using Latent Profile Analysis and investigate associations between media repertoires and political opinion leadership using OLS regression.

In both countries, we find a group of POLs that may be 'normatively good' for democracy. They rely on a media repertoire characterized by high (DK) or fairly high (US) use of professional news media, limited use of alternative news and alternative social media, relatively high trust in news media, and high trust in research. However, in both countries, we also find a group that may be 'normatively bad' for democracy. In the US, their media repertoire is characterized by use of Conservative news (Fox News, Breitbart), use of alternative social media, and low trust in news media and research; in Denmark, it is characterized by a mix of professional and alternative news media, high use of alternative social media, and relatively low trust in news media and research. These 'normatively bad' POLs may pass on low-quality information, extreme views, and negative sentiments towards professional news media and research. They constitute smaller parts of the population than the 'normatively good' POLs but might have greater impact on public opinion as additional findings show they participate more in political discussions. Contextual factors/differences are discussed in the presentation.

POL04 AI, Trust, and Authenticity in Political Information

PP 0130 Do we trust politicians who let AI speak for them? AI-mediated communication, perceived authenticity and trust in politicians

Tobias Kaas[1], Jakob Zaar[1], Arjen van Dalen[2]

[1] University of Southern Denmark, Department of Political Science, Odense, Denmark
[2] University of Southern Denmark, Centre for Journalism, Odense, Denmark

Recent technological developments have created widespread concern about the effects of artificial intelligence on trust in politicians. The use of generative AI as a tool in political communication has become widely accessible, yet the implications remain largely unexplored. This paper asks: How does AI-mediated communication by politicians affect public trust in these politicians? Literature on the effects of AI-mediated communication on trust and credibility is still emerging, with

context-dependent studies that yield divergent findings. It is crucial for society to understand how politicians' use of AI affects political trust, and whether it can serve as a legitimate communication tool, especially because trust constitutes the very foundation of cohesion in democratic societies.

Combining literature on AI perceptions, trust, and authenticity, we expect lower trust in politicians who post AI-generated content on Facebook. Authenticity is an important aspect of political communication and often functions as a carefully crafted performance, governed by an implicit "authenticity contract" between politicians and their audiences (Enli, 2015). This contract sets expectations about what content should appear genuine, and violations can damage trust. We expect that the publication of AI-generated texts challenges this contract, making politicians posting AI-mediated messages appear inauthentic and therefore trusted less.

We conducted an experiment with data gathered by Danish polling company Epinion through their representative panel (N = 507). Participants saw a Facebook post by a politician and were informed that the post was written by the politician themselves or by ChatGPT. After exposure, participants indicated their trust in the politician and the perceived credibility of the text.

The results show that AI-mediated communication diminishes trust in politicians and lowers credibility. When we exposed respondents to posts authored by a political staff member, trust levels did not significantly decline, indicating that the effect is specific to AI rather than due to outsourcing content writing in general. Mediation analysis confirmed that politicians who use AI are perceived as less authentic, and inauthentic politicians are judged as less trustworthy. Effects also varied by text type: impersonal AI-generated posts reduced trust, whereas personal posts did not. Our contribution is twofold: (1) demonstrating that decreases in trust are primarily driven by reduced perceived authenticity, and (2) advocating for a revised conceptualization of the public's perception of AI in political communication. While algorithms are often perceived as neutral, our study suggests growing public awareness of biases embedded in generative AI.

[1] Leibniz Institute for Media Research - Hans-Bredow-Institut HBI, RP1, Hamburg, Germany

Generative AI (GenAI) tools such as ChatGPT are rapidly becoming integrated into everyday life. Their core affordances—hyper-personalization, intuitive dialogue-based interaction, and the ability to serve as a universal information gateway—have fueled hopes that GenAI might lower barriers to political information and news consumption. At the same time, they have sparked concerns that GenAI could displace journalistic news and becoming an opaque, biased, and unreliable (Augenstein et al., 2024; Motoki et al., 2024; Rudin, 2019) intermediary between citizens and political information. Yet, despite intense debate, little is known about how GenAI is used for political information and news.

This study provides one of the first population-level assessments of GenAI use for news, focusing on Germany in the run-up to the 2024 European Parliament elections. Conceptually, we build on affordance theory (Gibson, 2014) and contemporary discussions around inequality in news use (Betakova et al., 2024; Strömbäck et al., 2022) and ask, first, whether GenAI attracts those who typically consume little news or actively avoid it (RQ1). Second, we investigate whether GenAI use for political information is associated with reduced reliance on journalistic news sources (RQ2), thereby assessing fears of a displacement effect (Reisner, 2025).

Empirically, we draw on a representative online survey of the German population aged 16+ (N = 1,461), conducted in June 2024. The survey measures three distinct forms of GenAI news use (for general political information, as a substitute for news, and for election-related information), overall news consumption, intentional news avoidance, and the use of journalistic news sources. We employ multiple linear regressions to examine how patterns of news use and avoidance relate to GenAI news use, and whether GenAI is associated with the reduction of journalistic news use.

Our findings show that the mean usage of GenAI for news among GenAI users is low, and nearly two-thirds never use GenAI for this purpose. Controlling for socio-demographics and other covariates, low news consumption and intentional news avoidance are unrelated to GenAI news use. Instead, established predictors of news engagement such as political interest and media trust emerge as strong positive correlates of GenAI news use.

Addressing RQ2, we find no evidence that GenAI displaces journalistic news. On the contrary, Regression analyses confirm that GenAI use for news is positively, not negatively, associated with journalistic news use, even when accounting for political interest, media trust, and attitudes toward GenAI. In its current stage, GenAI thus appears to complement rather than replace journalistic news within the information diets of news-engaged citizens.

Overall, our results suggest that the affordances of GenAI have not yet translated into a fundamental disruption of existing patterns of news consumption. GenAI does not currently draw in low news consumers or news avoiders, nor does it crowd out journalistic sources. Given GenAI's rapid evolution and integration into major platforms, continued research is needed to track whether these patterns persist or change as the technology and its use mature.

POL05 Misinformation: Audience Perceptions and Resilience

PP 0236 Platform-specific patterns of deceptive content exposure during the COVID-19 pandemic: A comparative analysis of social media users

Lena Zils[1], Florian Wintterlin[1], Julia Metag[1]

[1] University of Muenster, Department of Communication, Münster- Deutschland, Germany

Social media platforms have been identified as key drivers in the dissemination of misleading content (Allcott & Gentzkow, 2017; Del Vicario et al., 2016; Nelson & Taneja, 2018). Consequently, individuals who rely on social media as a news source are more likely to encounter such content (Lecheler & Egelhofer, 2021; Tucker et al., 2018). However, social media platforms do not function uniformly in this respect. Platform architectures—including algorithmic curation, content moderation policies, and communication structures—shape information flows differently (Napoli, 2014; Thorson & Wells, 2016). These structural differences may produce varying levels of exposure to misleading content, warranting platform-specific analysis.

RQ1: Does the likelihood of encountering misleading content vary with the use of specific social media platforms?
RQ2: How do users exposed to misinformation differ from non-exposed users across platforms?

Based on survey data from Germany (n = 2,953) that captured attitudinal variables, media use patterns, and self-reported exposure to misleading content about COVID-19 (misinformation and/or conspiracy theories), we employed logistic regression analysis to identify differentiated associations across platforms.

The analysis reveals substantial variation in the strength of associations between platform use and exposure to deceptive content. YouTube usage showed the strongest significant relationship ($\beta = 0.158$, $p < 0.001$), followed by Telegram ($\beta = 0.127$, $p = 0.005$), WhatsApp ($\beta = 0.126$, $p = 0.001$), and TikTok ($\beta = 0.103$, $p = 0.008$). No significant effects emerged for Facebook, Instagram, Twitter (X), or other platforms examined.

Comparative t-tests between those exposed to deceptive content and non-exposed users revealed both common patterns and platform-specific nuances. A consistent finding across all platforms was significantly lower trust in established institutions (political institutions, science, traditional media) among those who encountered misleading content. The intensity of distrust varied considerably: Telegram users exposed to misinformation exhibited the lowest trust in political institutions ($M = 3.54$, $p < 0.001$) and science ($M = 4.21$, $p < 0.001$), while TikTok users showed the lowest trust in traditional media ($M = 4.27$, $p < 0.001$).

Political orientation distinguished users on some platforms: those encountering misinformation on YouTube, Telegram, and WhatsApp were significantly more right-leaning (all $p < 0.001$), most pronounced among Telegram users (M(exposed to deceptive content) = 4.17; M(not exposed to deceptive content) 3.67). Age differences emerged on TikTok, YouTube, and WhatsApp, with exposed users being younger (all $p < 0.05$).

These findings suggest that exposure to deceptive content during the pandemic followed platform-specific patterns associated with distinct user characteristics. The consistent erosion of institutional trust across all platforms highlights critical challenges for democratic discourse in digital environments. The pronounced association between right-leaning political orientation and misinformation exposure underscores the importance of examining how platform-specific affordances, in combination with user communities, structure political information ecologies. Future research should explicitly account for the differentiated affordances and architectures of social media platforms to develop platform-tailored strategies that strengthen institutional trust and foster informed political participation in fragmented media landscapes.

POL05 Misinformation: Audience Perceptions and Resilience

PP 0237 Testing network-based media literacy interventions against the spread of online misinformation: A simulation approach

Daniel Siormanolakis[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

Misinformation poses a significant threat to democratic processes, public health, and evidence-based policymaking (Ecker et al., 2025). Media literacy interventions (MLIs) have proven effective in improving discernment between misinformation and factual content (Droog et al., 2025; Huang et al., 2024). However, their large-scale deployment on social media remains challenging due to high costs and difficulties in ensuring repeated exposure, which is crucial for their effectiveness (Huang et al., 2024; Roozenbeek et al., 2023). This study proposes a network-based targeting strategy to deploy MLIs more efficiently and cost-effectively, thereby addressing the limitations of random deployment or targeting based on scarce individual susceptibility data.

Drawing on a formalized network intervention framework (Valente, 2012), this study argues that strategically targeting users based on their relational position within social media follower networks can maximize the reach and impact of MLIs. The study first synthesizes three theoretical approaches to network targeting and then compares them, using suitable algorithmic implementations: the *Opinion Leader Approach*, providing interventions to influential opinion leaders with a large reach (Katz, 1957; Valente & Pumpuang, 2007), the *Weak Tie Approach*, targeting individuals that act as bridges

between different communities (Granovetter, 1973), and a *Combinatory Approach* that integrates multiple measures or objectives to mitigate biases inherent in single metrics (Bucur, 2020; Sekara et al., 2025).

To evaluate the cost-effectiveness of these strategies, we employ an agent-based modeling (ABM) simulation approach, a method well-suited for linking micro-level interactions to macro-level patterns in communication science (Smaldino, 2023; Squazzoni, 2008; Waldherr et al., 2021). The base model simulates the spread of online misinformation via sharing, incorporating agent-level mechanisms such as partisan bias, source trust, and belief updating, informed by existing computational models (e.g., Acemoglu et al., 2024; Rabb et al., 2022). This model will be documented using the ODD protocol to ensure transparency and replicability (Grimm et al., 2020).

The simulation experiments will first test the effectiveness of random MLI deployment, conducting a parameter sweep on the percentage of nodes receiving an intervention. These results will then be compared against various network-targeted deployments. Crucially, we introduce a cost function that penalizes targeting nodes with a very high number of ties (network hubs), allowing for a direct assessment of whether network interventions offer a genuine cost-benefit advantage. This study aims at identifying the most efficient strategies for containing misinformation spread with minimal resources. This research addresses recent calls for more simulation studies in misinformation intervention research (Spampatti, 2025) and contributes to developing scalable, theory-driven solutions for combating online misinformation.

POL05 Misinformation: Audience Perceptions and Resilience

PP 0238 Media trust as epistemic orientation: Rethinking susceptibility to misinformation

Luisa Gehle[1]

[1] University of Mainz, Department of Communication, Mainz, Germany

Research on susceptibility to political misinformation often assumes that individuals evaluate claims in isolation, based primarily on cognitive ability, knowledge, or situational cues. Yet belief formation is inherently relational: judgments about truth depend on which actors are trusted as epistemic authorities. Media trust therefore positions individuals within the information environment prior to evaluation, shaping not generalized gullibility or skepticism but the selective allocation of credibility across competing narratives. Susceptibility to misinformation thus reflects a stable epistemic orientation alongside momentary evaluative judgments.

Study 1 examines this argument using survey data from Germany collected during the Russian invasion of Ukraine (N = 1,000). Study 2 replicates the framework across two political topics and extends it experimentally by testing whether baseline media trust conditions responses to fact-checking interventions (N = 1,275). Respondents assessed the truthfulness of pro- and anti-Russia as well as pro- and anti-migration claims. Using signal detection theory, we distinguish evaluative capacity (sensitivity), capturing individuals' ability to discriminate between true and false claims, from evaluative orientation (response bias), capturing systematic tendencies to judge claims as true or false regardless of their veracity. All analyses adjust for sociodemographic characteristics and topic-specific attitudes and involvement.

Across studies, media trust showed little association with sensitivity: individuals with higher trust in mainstream media were generally no better at distinguishing true from false claims. By contrast, media trust was systematically related to response bias. Higher trust predicted reduced skepticism toward claims aligned with mainstream media narratives (e.g., anti-Russia and pro-migration claims) and increased skepticism toward opposing claims. This pattern emerged consistently across topics and studies, indicating that media trust primarily shapes how credibility is allocated rather than how accurately information is evaluated. When response bias was aggregated across opposing narratives, these effects canceled out, demonstrating that media trust does not induce a general tendency to believe or disbelieve political information, but instead redistributes belief across narratives in line with perceived epistemic authority.

Study 2 further examines whether corrective information is more effective among individuals with higher trust in the media, given that fact-checks and corrections in the experiment predominantly originated from mainstream news outlets. Contrary to expectations, media trust did not moderate the effectiveness of corrective information. This null finding likely reflects the generally high and weakly dispersed levels of media trust in the sample, which constrain variation in epistemic skepticism, and suggests that corrective interventions may operate independently of generalized media trust when mainstream media function as a broadly accepted epistemic reference.

By integrating media trust into a signal-detection framework, this paper reconceptualizes susceptibility to misinformation as an outcome of trust-based epistemic alignment rather than isolated misjudgments. The findings underscore that media trust shapes which political claims are believed rather than how much political information is believed overall, with important implications for diagnosing misinformation vulnerability and designing corrective interventions.

POL05 Misinformation: Audience Perceptions and Resilience

PP 0239 Overwhelmed or biased? Exploring profiles of citizens based on their misinformation threat perceptions

Ellen Linnert[1], Toni van der Meer[1], Michael Hameleers[1], Linda Bos[1]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Citizens tend to overestimate both the prevalence of misinformation and its effects on others. While nuanced assessments of information are considered desirable, intense worries about falsehoods could cultivate generalized distrust (van der Meer et al., 2023). Especially heightened misinformation threat perceptions (MTPs) – the belief that misinformation will have severe, detrimental consequences – may have harmful implications for trust in media and politics.

Although people's perceptions of what constitutes misinformation differ, MTPs have often been treated as a unidimensional concept. We argue instead that MTPs are multifaceted, varying not only in their intensity but also in perceived threat objects. Building on earlier inductive research, we distinguish between MTPs regarding democracy, social cohesion, the information environment, and personal lives. To understand potential implications of these perceptions, it is crucial to investigate how MTPs manifest across individuals and what factors may play a role in shaping such manifestations.

To unravel MTPs, we set out to identify distinct profiles of citizens based on their MTPs across the different domains. This may shed light on who may under- or overestimate misinformation threats and which aspects of society might be more vulnerable to spillover effects of MTPs. Afterwards, we investigate how cognitive and ideological factors may explain membership to certain profiles. Additionally, to explore contextual factors, we test how the prevalence of the specific MTP profiles may change over the course of an election campaign.

This study investigates MTPs against the backdrop of the Dutch general elections on October 29, 2025. Given the Netherlands' comparatively high resilience to misinformation (Humprecht et al., 2020) it functions as a least-likely case, which makes investigating the *perceptual* dimension of misinformation threats particularly relevant. We use original data from a panel survey with a rolling cross-section design conducted between September 25, 2025, and November 4, 2025. A representative sample of N = 3400 Dutch citizens was randomly divided into 21 batches averaging n = 160. We will use Latent Profile Analysis to identify groups of citizens with distinct MTP patterns, and regression analyses to explore which factors may explain profile membership. Data analysis is expected to be completed by February 2026.

With this study, we contribute to misinformation research twofold: First, it advances our theoretical understanding of important subjective concerns about misinformation by conceptualizing MTPs as multidimensional and identifying factors that may explain variation. Second, it adds empirical evidence for the role of misinformation as a perceptual phenomenon within high-stake contexts by investigating MTPs during an election period. These insights can guide the assessment of potentially negative effects of disproportionate MTPs needed for a comprehensive understanding of misinformation's role in democratic societies.

PP 0240 Information disorders in information-orderly societies: Identifying weak spots of informational resilience

Eva Mayerhöffer[1], Chris Peters[1], Kim Andersen[2], Sofie Filstrup[3], Sine Nørholm Just[1], Jakob Bæk Kristensen[1], Claes de Vreese[3]

[1] Roskilde University, Department of Communication and Arts, Roskilde, Denmark
[2] University of Southern Denmark, Department of Political Science and Public Management, Odense, Denmark
[3] University of Southern Denmark, Digital Democracy Centre, Odense, Denmark

Information disorders such as misinformation, polarization, and hate speech are a pressing issue for democratic public debate in all societies (Bennett and Pfetsch, 2018). Some societies, including the Scandinavian countries, have however proven to be more resilient to digital information disorders than others (Humprecht et al., 2020), which makes incidents of information disorders more sporadic and less widespread. Studying information disorders in such context poses both a risk of at the same time underestimating and overestimating the phenomenon: one finds little in comparison to other countries but keeps looking until something is found.

Instead of trying to gauge the absolute extent of information disorders, we argue that information disorders in these contexts are best approached through an identification of potential weak spots in societal informational resilience. Moreover, we add to existing research focusing on the resilience of organizations (e.g. Uusikylä et al., 2024) or individual citizens (Humprecht et al., 2023) to information disorders by focusing on the resilience of the digital public sphere. To do so, we

combine citizens' perceptions and self-reported behavior of engaging in the digital public debate with an analysis of (dis) information flows, news communities and topical patterns present in the digital information environment.

We seek to answer the following research questions:

RQ1: How can we adequately measure and describe incidents of information disorder under "least likely" conditions of a highly resilient country context?

RQ2: Which potential weak spots in societal resilience to information disorders become manifest among citizens and in the digital information environment in a highly resilient country context?

To answer these research questions, we combine survey data with digital trace data. To measure citizens' perceptions, attitudes and self-reported digital behavior, we draw on representative survey data of 6,320 Danish citizens age 15 and above, collected in 2024. To trace digital information flows and other characteristics of the digital public debate, we map the Danish political information environment on Facebook, which here still represents the most widely used social media platform. We analyze about 21 million Facebook posts from 14.294 public pages and groups, published in the period August 2023 to August 2024. Facebook posts have been collected through a two-tier snowball sampling approach, with posts containing an URL to a Danish established or alternative news media outlet as the starting point.

We use these two data sources to develop and test indicators for weak spots in resilience of the digital public sphere, building on measures for the prevalence of digital misinformation, polarization, topical diversity, digital trust, digital (dis) connection, and citizens and stakeholders' engagement in the digital debate. These weak spots can, e.g., become manifest through diverging and conflicting attitudes and digital behavior between different sociodemographic groups, the formation of outlier segments detached from mainstream public debate, or the existence of information flows and conditions prone to the spread of misinforming or otherwise harmful content.

POL06 Cross-Platform News Exposure and Digital Trace Methods

PP 0231 Online political content 'in the wild': A street-intercept study of political exposure on social media across platforms, countries, and generations

Michael Bossetta[1], Janne Parkkila[2], Lina Auškalnienė[3], Oscar Barberà[4], Felix von Nostitz[5]

[1] Lund University, Department of Communication, Lund, USA
[2] LUT University, School of Engineering Sciences, Lappeenranta, Finland
[3] Vytautas Magnus University, Department of Public Communications, Kaunas, Lithuania
[4] University of Valencia, Constitutional Law- Political and Administrative Sciences, Valencia, Spain
[5] Lille Catholic University, European School of Political and Social Sciences, Lille, France

This study introduces an exploratory methodology to examine online political exposure on social media. We develop a street-intercept method that recruits participants in public spaces to perform a scrolling task and follow-up survey lasting no more than 15 minutes. For the scrolling task, participants open their preferred social media and scroll until they come across a post that they consider 'political'. A short follow-up survey combines open-ended responses with scaled items to capture contextual information such as participants' platform use, digital literacy, political interest, and efficacy.

While non-representative, the approach extends research into online political exposure in two key ways. First, outside of direct collaboration with social media companies, few methodologies directly assess how citizens are exposed to political content on social media. By directly observing and measuring citizens' scrolling behavior, we overcome existing challenges of recall in surveys (Haenschen, 2020), mock-up feeds in experiments (Sülflow, Schäfer, & Winter, 2019), and limitations to tracking online behavior within platforms (Clemm von Hohenberg et al., 2024).

Second and importantly, our design allows participants to self-define what counts as 'political'. This allows researchers to compare self-perceptions of politics across generations and national contexts. In most studies, researchers define political by phrasing survey questions or devising classifiers (e.g., Wojcieszak et al., 2024). Yet, alternative citizenship models point to different understandings of political (Kligler-Vilenchik, 2017), suggesting that political content online may not conform to one-size-fits-all operationalizations.

This study is a work-in-progress. The methodology has been piloted in Lithuania and Spain, and the authors will meet in March to finalize the methodology and produce training materials. As part of a wider COST Action network, we aim to recruit researchers and students in several countries to perform data collection in different cities to understand real-world patterns in: 1) frequency and timing of political exposure across platforms; 2) self-perceptions of 'political content' across young and old citizens; and 3) how these patterns converge or diverge across cities.

Understanding when—if at all—citizens are exposed to political content is particularly important due to recent platform changes. Although social media have become key sources of information for political news and commentary, platforms like Facebook and Instagram have recently taken steps to downrank the visibility of political content. In addition, our sampling approach specifically targets youth and the elderly, in order to assess whether these groups have different perceptions and exposure patterns of 'political' content (with older citizens privileging institutional/formal understandings and younger citizens more aligned with cultural/extra-parliamentary forms). We aim to run the data collection across several cities in parallel over a two-week period. Doing so allows us to probe for patterns and correlations across platforms, age groups, and national contexts.

At ECREA, we will present the final methodology alongside preliminary field insights into citizens' engagement and responsiveness to the scrolling task and survey.

POL06 Cross-Platform News Exposure and Digital Trace Methods

PP 0232 Mapping mobile news pathways: Investigating cross-platform news exposure via mobile in-app tracking

Patrick Zerrer[1], Paul Pressmann[1], Cornelius Puschmann[1]

[1] Universitity of Bremen, Zentrum für Medien-- Kommunikations- und Informationsforschung, Bremen, Germany

In a functioning democracy, the normative expectation is that citizens stay informed to participate in political discourse. However, the way of news consumption has shifted. With the spread of smartphones, the device has become one of the main ways of accessing news in Germany (Hölig et al., 2020), allowing users to access news through various apps and social media platforms (Behre et al., 2025).

Most individuals use a banquet of pathways to inform themselves about politics (Hasebrink & Domeyer, 2012). Therefore we adopt a user-centered approach to conduct a comprehensive, cross-platform analysis of mobile news exposure. We address two key questions: (RQ1) What characterizes the political information environment on mobile platforms? and (RQ2) What factors predict exposure to such content? Our analysis focuses on three distinct pathways to news: News Apps (journalism-oriented), YouTube (mixed-length video), and TikTok (short-form video), allowing for a comparative view across different platforms.

The literature shows that individual characteristics such as socio-demographics or political interest, as well as news curation practices, influence how much news a person consumes (Merten, 2021). These news curation practices include the avoidance of news (e.g. Skovsgaard & Andersen, 2020), the belief that one can stay informed through peer networks and algorithmic curation without actively seeking news (e.g. Zúñiga et al., 2017), and a sense of duty to keep oneself informed (McCombs & Poindexter, 1983).

However, these studies are often based on self-reports, which is typically subject to recall bias (Parry et al., 2021). Therefore, We employ a mixed-methods design combining survey data with mobile in-app tracking as a more precise measurement of media usage (Stier et al., 2021). Data was collected between September 1 and September 21, 2025 and consists of 805 German participants. We utilized a commercial Android tracking application provided by murmuras that recorded app logs as well as in-app activity for TikTok and YouTube.

To ensure comparability across platforms and content formats, we defined the unit of analysis as the exposure per second. Given the journalistic focus of news apps, we consider the total usage of news apps to be relevant exposure. The content consumed within TikTok and YouTube was labeled as political or news related using a zero-shot classification (ModernBERT-large-zeroshot-v2.0 by Moritz Laurer).

To answer the first research question, we look at the distribution, the frequency, and the sources of news exposure (journalistic, influencers, political actors, etc.). Further, we conduct a zero-inflated negative binomial regression model (Fávero et al. 2021) to identify the predictors of exposure to political and news content across News Apps, TikTok, YouTube. We model four groups of predictors: We account for sociodemographics. Further, we include political predispositions and news curation practices. Additionally, we controlled for total smartphone, TikTok and YouTube usage. Finally, the model includes news exposure on the respective other platforms as well as offline news use as a predictor to examine how news consumption on one platform relates to others.

This enables us to gain a comprehensive insight into the nature of mobile news exposure and the factors that influence it.

POL06 Cross-Platform News Exposure and Digital Trace Methods

PP 0233 Comparing Subjective and Objective Measures of Online Political Exposure: A Validation Study from Survey and Web Browsing Data

Milin Zhang[1], Emese Domahidi[1]

[1] Technische Universität Ilmenau, Department of Media and Economy, Ilmenau, Germany

In today's convergent media environment, internet users are exposed to political information from a plethora of sources, ranging from mainstream media, alternative media, or other platforms such as government or political party websites. The extent of exposure to online political information is central to many communication studies, allowing researchers to draw relations between political information usage and other traits, such as preexisting political views, voting choices, and the frequency of social media use. Such measurement work has commonly been defined by the duration or frequency of exposure to certain types of content and measured via survey data.

However, despite the variety of survey tools used to gauge the intensity of media exposure, the reliability of such measurements has been questioned by both empirical and review studies. These examinations are often achieved by linking survey and digital trace data to examine the extent of overlap between the two sources. Although such misalignment has been corroborated regarding general online exposure, current scholarship rarely visits the reliability of specific types of media exposure—in our case, political content. Even less frequently has scholarship tested whether exposure from different

sources, such as mainstream or alternative news, influences the validity of survey measurements, despite the popularity of such variables in social science research design.

In the present study, we use survey data and web browsing data to explore to what extent political information consumption from different sources contributes to people's everyday media exposure in survey and web browsing data (RQ1). Further, we ask how well people are able to recall their political consumption from different online sources, including mainstream news, alternative news, and other sources, compared to web browsing data (RQ2), where we hypothesize (H1) that people tend to be less reliable in self-reporting political consumption from alternative sources than from mainstream news. Finally, to explore the consequences of potential misalignment, we examine the well-tested relationships between alternative political information exposure and 1) voting choice and 2) social media use across both data sources to see if results are consistent within data types and findings from previous literature (RQ3) .

Our survey and browsing data were collected from N = 678 German residents over six weeks in 2025. By conducting a survey focused on specific types of political consumption via different sources to the tracking period and classifying the websites in the tracking data through manual coding, we first present the variety of information sources for political content online. We then examine the validity of survey measurements in gauging political exposure to different sources compared to web browsing data. Our study contributes to the examination of validity in measuring political consumption with both subjective and objective measurements, how measurement choice affects empirical conclusions related to media use, and the possibilities of measuring online political exposure via web browsing data.

Note. this paper is a work in progress, the results will be published after the data analysis.

POL06 Cross-Platform News Exposure and Digital Trace Methods

PP 0234 Are individual pathways of engagement with political content on TikTok a supply or demand issue?

Felix Gaisbauer[1], Lion Wedel[1], Jakob Ohme[1]

[1] Weizenbaum-Institut e.V., Digital News Dynamics, Berlin, Germany

TikTok has become an imporant arena for competition for political influence. The platform is fast-paced, reaches predominantly young users and its algorithm can elevate content to massive visibility almost instantly without the need to build a large follower basis first. While the share of political videos among all the content to be encountered on the platform is not particularly large (Katzy-Reinshagen & Barth, 2024), the average user is exposed to nearly 100 videos a day (Zanettou et al., 2023).

Yet, there is still little understanding of the interplay between the political content that is created on the platform, the algorithm that is displaying it to users in their feeds and the users that decide to engage with the content or not. Is the algorithm reactive to the amount of content produced by different political actors? Which political videos do users *actually* engage with? Does this translate into future algorithmic recommendation?

We think that research has hitherto done too little to disentangle issues of demand, supply and algorithmic recommendation in order to tackle the above questions. One approach are studies with so-called 'social research bots.' Yet, due to their research design that employs artificial agents, these studies cannot distinguish between actual user demand and algorithmic recommendation, since they do not have data about which videos real users *actually* watch and interact with.

Hence, in this work, we *first* conceptually disentangle content supply, algorithmic supply and user demand. Content supply is provided by users of the platform, while whether this content is actually shown to users (and to which subset of them) is determined by the algorithm. Especially to what extent the algorithm is reactive to user demand (watched videos fully, interacted with them) is an important question.

Secondly, we investigate this distinction empirically. Disentangling the three levels is only possible with user-level exposure data. We use Data Donation Packages (DDPs). These data provide extremely fine-grained measures of TikTok usage: Individual, user-level trajectories of watched videos, likes, shares, etc. We collected DDPs from 637 TikTok users that also answered questions about, e.g., their political views. We additionally collected metadata from all videos containing political keyphrases in their descriptions. We classify videos into non-political and political according to their descriptions and audio transcripts, which we also use to estimate the political videos' leaning. We test (RQ1) how much content is created by and/or mentioning different political actors on TikTok. We then use information on donors' political leaning to investigate (RQ2) whether the algorithm tends to recommend content congruent with their political leaning or not, (RQ3) whether donors' political leaning is reflected in their demand, and (RQ4) whether their demand is reflected in future algorithmic recommendation.

POL06 Cross-Platform News Exposure and Digital Trace Methods

PP 0235 Classifying far-right ideology based on digital trace data: A systematic literature review

Kilian Bühling[1], Heidi Schulze[2], Simon Greipl[2], Julian Hohner[2], Pablo Jost[3], Annett Heft[1]

[1] University of Tübingen, Institute for Research on Far Right Extremism IRex, Tübingen, Germany
[2] LMU Munich, Department of Media and Communication, Munich, Germany
[3] University of Mainz, Institute for Communication Studies, Mainz, Germany

Digital communication venues have enabled fringe and partisan political actors to circumvent traditional gatekeepers (Engesser et al., 2017) and directly address their audiences at lower costs. As early adopters of online communication technologies (Conway et al., 2019), far-right actors leverage social media's capabilities and affordances to strategically mainstream radical and extreme ideologies (Rothut et al., 2024). Non-institutionalized actors, such as political influencers and social movements, have benefited from the anonymity of fringe social media platforms that provide from surveillance by security and public surveillance (de Keulenaar, 2023). Current research highlights the successful utilization of these platforms to mobilize (Simon et al., 2023, Zhong et al., 2024) and radicalize (Schulze et al., 2022). At the same time, non-institutionalized anti-democratic actors are able to continually politicize contemporary societal cleavages by seizing discursive opportunities (Wahlström & Törnberg, 2021) and societal crises, such as the COVID-19 pandemic or the European energy crisis following Russia's full-scale invasion in Ukraine (Greipl et al., 2024).

While the ideological dimensions of more institutionalized political actors, such as parties, are routinely classified through quantitative content analysis of party manifestos (Lehmann et al., 2024) or expert surveys (Rovny et al., 2024), approaches to classifying non-institutionalized far-right actors on digital platforms face several challenges. The diversity and hybridity of frequently anonymous actors, as well their issue flexibility in online environments, complicate a valid ideology classification based on digital trace data. Current approaches aimed at addressing this challenge, such as quantitative content analysis (Buehling & Heft, 2023), expert ratings (Jost & Dogruel, 2023), computational dictionary analysis (Curley et al., 2022), or network-based methods (Zehring & Domahidi, 2023), have not yet been systematized, nor is there a standardized procedure for far-right ideology identification based on digital trace data.

In response to the lack of a consolidated and comparable framework for identifying far-right actors, this systematic literature review seeks to systematically map how far-right ideology is attributed to actors in existing research. To this end, we address two guiding research questions:

RQ1: Which criteria and measurements are employed in the theoretical, empirical, or hermeneutical studies to classify or infer a far-right ideology at the actor level based on observed online behavior?
RQ2: How are these criteria operationalized across institutionalized and non-institutionalized far-right actors in digital communication environments?

This study is based on a corpus of 2,690 scholarly publications, queried from Web of Science, EBSCO Communication Source, ACM Digital Library, and Google Scholar. Relevant studies are identified through a multi-stage screening process in compliance with the best practices outlined in the PRISMA guidelines (Page et al., 2021) and are analyzed using a combination of quantitative content analysis and close reading. By systematically mapping existing classification criteria, operationalizations, and data sources, the study aims to contribute to greater conceptual clarity and methodological comparability in research on far-right actors in digital communication environments, and to provide a foundation for more transparent and cumulative future research.

POL07 Selective Exposure, Avoidance, and Conspiracy Audiences

PP 0349 User agency in navigating and avoiding political content in Facebook's news feed

Krisztina Burai[1,2]

[1] ELTE Centre for Social Sciences, Institute for Political Science, Budapest, Hungary
[2] ELTE Eötvös Loránd University, Doctoral School of Political Science, Budapest, Hungary

Social media platforms have become central gateways to political information, often exposing users to news and political content without deliberate seeking. While algorithmic curation plays a crucial role in shaping social media feeds, users are not passive recipients: they can actively engage with, ignore, or avoid political content through a range of individual curation practices. However, it remains unclear to what extent users can meaningfully regulate their exposure to political content in a multi-actor curation environment in which algorithms, media actors, political elites, and social ties simultaneously shape visibility. This paper examines user agency in navigating and avoiding political content on Facebook, focusing on the relationship between individual curation practices, political avoidance, and perceived political exposure.

The study builds on research on incidental news exposure, selective exposure, and curated flows to investigate how active engagement and deliberate avoidance coexist within Facebook's News Feed. In line with this literature, exposure is not treated as a direct outcome of algorithmic processes, rather conceptualized as the result of an interplay between user behavior and other curatorial forces. In this study, special attention is paid to politically disengaged and avoidant users, for whom social media may nevertheless remain an unavoidable site of political encounter.

Empirically, the paper draws on a nationally representative face-to-face survey conducted in Hungary in November 2021 (N = 1000), during a period of intense political communication. Data were collected shortly after the Hungarian opposition primary elections and during the governing party's high-profile "*Stop Gyurcsány! Stop Márki-Zay!*" campaign, two highly salient political events that dominated both offline and online political discourse. This context provides a particularly suitable setting for examining the limits of individual avoidance under conditions of heightened political visibility.

The survey includes detailed measures of perceived political exposure on Facebook from different sources, including friends, political actors, media outlets, groups, and paid advertisements, alongside indicators of political engagement, content preferences, and avoidance behaviors. User agency is operationalized through self-reported curation practices, such as engagement with political content, tendencies to ignore or disengage from politics on Facebook, and preferences regarding political information.

By focusing on perceived exposure, this paper contributes to ongoing debates about the effectiveness of individual curation and the persistence of political visibility on social media. Using two highly salient political events as most-likely cases, it examines how individual curation practices and avoidance behaviors are associated with perceived political exposure on Facebook, and whether politically disengaged or avoidant users can meaningfully limit political visibility during periods of intense political communication.

POL07 Selective Exposure, Avoidance, and Conspiracy Audiences

PP 0350 How do multidimensional and fluid news avoidance patterns relate to political participation: Evidence from a longitudinal Swiss referendum study

Zhengyi Xu[1], Anne Schulz[1]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

News consumption is widely seen as significant for democracy, as citizens rely on news to stay informed and make democratic decisions. Against this background, the growing prevalence of news avoidance in recent years has raised concerns about its potential threat to democratic societies. Although many studies have examined the factors influencing news avoidance, research directly investigating its relationship with political participation remains underexplored.

Recent studies suggest that news avoidance is not a simple yes-or-no behaviour, but a multidimensional practice. Within individuals' news use, avoidance may vary in intensity, involve different strategies, target different types of news content, and coexist with different levels of baseline news consumption. These dimensions, i.e., avoidance intensity, avoidance strategies, avoidance content, and baseline news consumption, may combine to form distinct news avoidance patterns, which may relate differently to political participation. Accordingly, we ask: **(RQ1)***When collectively considering these dimensions, what news avoidance patterns can be identified?* and **(RQ2)** *How do different news avoidance patterns differ in referendum participation?*

Moreover, existing research indicates that news avoidance is not necessarily stable over time, but can be fluid. Individuals' avoidance behaviours may change across dimensions, and people may shift from one avoidance pattern to another. We therefore further ask: **(RQ3)** *How stable or fluid are news avoidance patterns over time?* and **(RQ4)** *Is change in news avoidance patterns associated with referendum participation?*

To address these questions, we draw on three-wave panel survey data collected in Switzerland before, during, and after a nationwide referendum campaign period, between July and October 2025. More than 1,500 respondents completed all three waves, providing longitudinal measures of news use, news avoidance, and referendum participation.

We will use clustering approach to identify news avoidance patterns to answer **RQ1**. Rather than estimating wave-specific clusters, we pool observations from all three waves and treat each wave-specific observation as a separate input to the clustering procedure. This strategy allows us to identify a common set of avoidance pattern structures that are defined consistently across time, ensuring the comparability of patterns between waves. This will also help with answering **RQ3**. Across three waves, intentions of participating (W1 & W2) and actual turnout in referendum were asked. Combined with the patterns identified in RQ1, and the pattern change in RQ3, we can investigate how different patterns differ in their participating intentions to answer **RQ2** and investigate how pattern change will correlate with actual turnout to answer **RQ4**.

We expect that distinct news avoidance patterns will differ in their association with participation intentions. Patterns characterized by high avoidance intensity may show lower participation, patterns show selective avoidance and high news use baseline may still show relatively high participation. Regarding fluidity, we expect that fluidity itself may not significantly influence participation. These insights can help to understand how multidimensional and fluid news avoidance shapes political participation in a direct-democratic context.

POL07 Selective Exposure, Avoidance, and Conspiracy Audiences

PP 0351 Conspiracy Theories and Audiences of Social Networking Sites' News: A Systematic Review of Literature

Lucie Čejková[1], Jakub Macek[1], Alena Pospíšil Macková[1]

[1] Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Beliefs in conspiracy theories among citizens have potentially detrimental implications for democratic societies (Uscinski et al., 2022). Notably, the role of social networking sites (SNS) in the spread and adoption of conspiracy theories has become a vital topic in both public debate and academic research (Mahl et al., 2022). However, how these processes unfold among news audiences remains to be systematically mapped. The need for such an overview is especially pertinent now, as the dependence on SNS for news and information keeps increasing (Newman, 2025).

The presented study-in-progress addresses this gap by examining 47 peer-reviewed empirical studies in English from various disciplines, published between 2004 and 2025, and indexed in the Web of Science and Scopus databases, which have been previously acknowledged as suitable sources of data for such systematic reviews (Gusenbauer & Haddaway, 2020). Specifically, we examine how reliance on SNS for news and information is associated with beliefs in conspiracy theories and conspiracy thinking. Concurrently, we summarize the concepts, methods, and topics present in the research, as well as the biases and research gaps present in the current conspiracy scholarship regarding SNS news audiences.

Preliminary findings suggest that the associations between SNS news and conspiracy theories vary across platforms and form diverse patterns, preventing any straightforward interpretation. We also identify conceptual inconsistencies in how conspiracy theories and conspiracy thinking are defined and operationalized in the existing research, similar to previous findings (Mahl et al., 2022). Moreover, the reviewed literature exhibits a strong thematic focus on COVID-19 and a geographic concentration in Western contexts, which may introduce a bias in the available knowledge.

The results highlight the need for more articulated conceptualization, broader geographic representation, and caution when generalizing claims about dependence on SNS for news and beliefs in conspiracy theories. In addition, our findings inform media literacy education, platform-specific policies, as well as future research aimed at understanding and addressing conspiratorial engagement in online environments and its impact on democratic processes and societies.

POL07 Selective Exposure, Avoidance, and Conspiracy Audiences

PP 0352 Taming the long tail: Identifying alternative information exposure in users' digital trace data

Jakob Bæk Kristensen[1], Leif Hemming Pedersen[1], Frederik Møller Henriksen[1], Eva Mayerhöffer[1]

[1] Roskilde University, Department of Communication and Arts, Roskilde, Denmark

The dissemination of alternative political information, including hyperpartisan content and conspiracy theories, often tied to alternative news media and other low-credibility sources, has been widely linked to declining trust in democratic institutions. Research on exposure to such content has traditionally focused on a fixed set of previously known news outlets and sources. Recent studies suggest that this approach substantially underestimates exposure, as alternative political information increasingly appears across a diffuse and heterogeneous online information environment, including non-news and non-political spaces (Green et al., 2025; de Leon et al., 2025). Furthermore, the majority of online exposure to political content does not occur through dedicated news sites but comes from various sites and actors including entertainment and commercial sites (Wojcieszak et al., 2024).

This study examines exposure to alternative political information to assess the extent to which such exposure occurs beyond previously identified news sources. Data were collected through a nationally representative survey in Denmark in which participants were given the option to donate to donate their desktop browser history and their Facebook activity data. A total of 289 respondents donated at least one type of data. In line with previous studies, we find a large amount of online activity concentrated on a small number of domains pertaining to categories such as webmail, search engines, banking and large national news outlets. However, there is also a long tail of websites and public Facebook pages that rarely receive much attention in research on exposure to political content. The respondents have accessed more than 16,000 websites

and 4,000 Facebook pages or groups at least once. By analysing the long tail of URLs rather than only considering websites at the domain or actor level we can identify and classify sites and social media pages that provide alternative political information beyond just those specific actors, news outlets or other online domains that brand themselves as such.

Our preliminary results show that exposure to alternative political information takes up only ~0.3% of total exposure when assessing users' exposure based on domains known from previous research. To identify substantively similar information appearing outside of these known sources, we employ a two-step content-based approach that separates discovery from conceptual classification. First, we collect content from all URLs and public Facebook pages accessed by participants and assess their semantic similarity to a large reference corpus of Danish alternative news media that cuts across many topics and partisan perspectives using a state-of-the-art embedding model. Second, we apply a few-shot, theory-driven classifier to identify content that closely aligns with conceptual definitions of alternative political information in a Danish context. Together, the two approaches leverage recent advances in LLM-based natural language processing enabling content-level measurement of alternative information exposure in otherwise non-political and previously unclassified online spaces.

POL08 Far-Right and Anti-Liberal Mobilization Online

PP 0344 Far-right settlers on Telegram: Connections, locations, and communication

Maximilian Zehring[1]

[1] Ilmenau University of Technology, Computational Communication Science, Ilmenau, Germany

The deindustrialization of East Germany in the 1990s, coupled with the subsequent devaluation of real estate and property, made rural areas in the region particularly attractive to far-right extremist projects. Since February 2020, far-right initiatives have campaigned for an influx of West German neo-Nazis into East Germany on the messaging platform Telegram, placing interested participants into suitable völkisch (ethnic-nationalist) settlement projects. Far-right völkisch settlers exert influence in local parliaments, while settlements contribute to the normalization of far-right traditions in structurally weak regions. While settlements can be expected in all (East) German counties, their exact number, locations, and support structures remain unknown. However, due to the far-right völkisch settlers' increased activity on Telegram and their willingness to expand the network, I propose to extrapolate from the network and community structures on Telegram towards structures in the offline world. I demonstrate how to sample far-right völkisch settlers on Telegram, analyze their network structure, map settlements and support structures spatially, and identify key topics within their network.

I present a network- and content-based snowball sampling strategy that includes a round-by-round manual actor classification, resulting in a dataset of 17,785,639 Telegram messages from 683 manually categorized entities. A network analysis was then conducted on this dataset. Backbone extraction and manually curated community detection led to 48 communities, categorized into six overarching groups. The spatial analysis relies on manually extracted locations of entities' traceable imprints on their websites or locations provided in their Telegram messages. Key-topics were extracted from 8,046,570 text-only messages using BERTopic.

Actors supporting far-right völkisch settlements are the most active in referencing other entities. The settlements themselves play a subordinate role in terms of popularity, activity, and importance in the Telegram network. Communities and supporting actors dealing with esoteric practices or Germanic neopaganism and völkisch culture act as bridges between far-right extremist communities and those focused on settler networking and knowledge transfer. Actors from my network operate in nearly all German counties as well as northern Switzerland, northern Austria, parts of Hungary, and additional settlements in Sweden, Poland, and the Canary Islands. Network-based spatial analysis reveals a pipeline of mutual references linking entities in north-west Germany to actors in Austria and onward to multiple settlements in Hungary. The network's key topics revolve around politics, governance, and power, such as international and national politics and conflicts; esotericism and spirituality; alternative approaches to health, nutrition, and an autarkic lifestyle; conspiracy theories related to science and technology; civil resistance; and mutual affirmation and promotion.

The implications of the findings are discussed, particularly with regard to the methodological challenges in this context. The discussion also addresses the internationalization of the settler movement, the presence of far-right völkisch ideology in esoteric content, and the discrepancies between the findings of existing research on the offline activities of settlers and my quantitative insights into their digital communication behavior.

POL08 Far-Right and Anti-Liberal Mobilization Online

PP 0345 Political sharenting and its value affordances: An Italian case study

Tommaso Trillò[1], Giovanni Daniele Starita[2]

[1] The Hebrew University of Jerusalem, Communication and Journalism, Jerusalem, Israel
[2] Scuola Normale Superiore, Political science, Pisa, Italy

Populism and social media share an elective affinity. The affordances of social media platforms encourage the performance of a populist political style and accelerate the circulation of populist tropes. However, while several studies have demonstrated how social media enable the performance of a populist political *style*, little is known about the extent to which they enable or constrain the circulation of populist ideological *content*. We address this gap through the conceptual

lens of value affordances—the principles emerging from interactions between stakeholders and technology. As values are commonly described as the building blocks of ideology, focusing on value affordances unlocks the possibility to investigate the interactions between populism's "thin" ideology, the "thick" ideologies accompanying it, and the norms regulating expression in digital sphere. We illustrate the usefulness of this approach through a case study from Italy, focusing on how party leaders Matteo Salvini and Carlo Calenda stake their "claim to ordinariness" by posting photos of their time off with their children (a practice known as sharenting). In this sense, our case study "controls" for *style* to focus on populism as *content*. Our analysis of the values expressed in 100 sharenting posts circulated by the two politicians on Instagram revealed what follows. Salvini and Calenda converge towards the expression of values typically associated with sharenting: *happiness*, *togetherness*, *care*, and *authenticity*. However, the two leaders diverge in the invocation of values reflecting their respective brands of populism. Salvini's sharenting images display mundane weekend or holiday activities in the company of his daughter. They commonly feature cues for the values of *simplicity* and *conformity*, which we relate to his "everyday" brand of celebrity politics and his right-wing political affiliation. In the captions, Salvini frequently addresses the audience directly with good day wishes and wishes for religious holidays, thus expressing the values of *affiliation* and *civility*, as well as *faith*. In contrast, Calenda's images normally depict visits to places of "high culture" (e.g., museums, archaeological sites) in the company his large nuclear family. They disproportionately feature cues for the value of *wealth*, which we relate to his brand of "managerial" populism modelled after business executives. The associated captions often adopt a *solemn* register, praising the *distinctiveness* of Italian cultural heritage as they try to *persuade* his followers to visit specific sites. Overall, our findings demonstrate that the values associated with sharenting exert a homogenizing effect that constrains the self-presentation of populist politicians. This notwithstanding, we also found that politicians use sharenting as an opportunity to promote their respective understandings of "the people." While Salvini promotes a low brow form of nationalism based on religious holidays and participation in mundane rituals such as Christmas fairs, Calenda adopts an equally nationalist narrative that presents high brow art as cultural heritage that all Italians should know and celebrate. We conclude that the value affordances of vernacular social media genres like sharenting both enable and constrain populist content, imposing value-inflected frameworks within which politicians enjoy some room for maneuver to express their own ideology.

POL08 Far-Right and Anti-Liberal Mobilization Online

PP 0346 Misogynists, Protectors and Critics: Teenage males' engagement with the manosphere in the Czech Republic

Jana Rosenfeldová[1], Lenka Vochocová[1], Julia Gottstein[1]

[1] Charles University, Faculty of Social Sciences, Praha 1, Czech Republic

Anti-gender mobilisations have recently been analysed across Western liberal democracies as a far-right political strategy challenging the liberal democratic status quo. Anti-feminist or anti-gender discourses have also been increasingly studied beyond formal politics, mainly with regard to online influencers of the so-called mano- and femosphere. Scholars are concerned with their strategic employment of anti-gender ideas as a symbolic glue or "metalanguage", serving as a form of collective identity-building in the online sphere and an effective business model. Studies typically focus on the adoption of anti-gender and misogyny across various profiles targeting specifically young men ("the manosphere") and on the potential impact on gender relations among the youngest age cohorts.

While research on the manosphere and its ideological content thrives, we still know little about how teenage males, the primary target group of the manosphere, actually consume, interpret, and experience its messages. We address this gap through a three-stage qualitative study of young males' reception of manosphere discourses in the Czech Republic. The research builds on identity theory perceiving anti-gender online ideological mobilizations as a symbolic glue, connecting young men who may feel isolated or marginalised. It also draws on literature on affective and attention economies of social media to understand their role in the popularity of manosphere among youth, as it offers them hegemonic role models of masculinity, dating advice, entrepreneurial skills, and humorous content serving as a potent homosocial currency. Our research aims to capture (a) how young men engage with the manosphere, (b) what motivations and gratifications they derive from this content and (c) how they reflect on possible impact on their attitudes towards women, men and gender issues. The design comprises three consecutive phases: (1) focus groups at Czech secondary schools, (2) diary entries by manosphere consumers identified through focus groups and (3) follow-up in-depth interviews reflecting on the diaries.

This paper presents findings from the first phase, which involved 12 focus groups with 75 teenage males (aged 15–19) in six secondary schools located in diverse geographical and sociodemographic settings. The discussions explored participants' exposure to manosphere content and interpretations of its key messages. To prompt reactions, we employed brief vignettes depicting typical manosphere claims and situations. Preliminary findings based on inductive qualitative coding suggest that teenage males engage with manosphere content in heterogeneous ways. Based on emerging patterns, we propose a typology of four recurring profiles: the "Conservative Protector" (normative, binary masculinity framed as strength and protection of women), the "Toxic Misogynist" (explicit hostility and claims of female inferiority), the "Self-improvement Reformist" (attracted to self-improvement, strength or leadership narratives while rejecting misogyny), and the "External Observer/Critic" or "Alarmist" (distancing himself from the content, critically reflecting on algorithmic exposure and perceiving it as a threat).

The proposed typology serves as a starting point for the next research phases, shifting focus from the manosphere producers to its reception, enabling a more nuanced investigation of personal motivations and gratifications shaping engagement with manosphere content. These insights may be crucial for developing more effective social and educational interventions.

POL08 Far-Right and Anti-Liberal Mobilization Online

PP 0347 Citizen influencers in public diplomacy during wars: The case of Israel-Hamas war

Dor Eldar[1], Eytan Gilboa[1], Ilan Manor[2]

[1] Bar-Ilan University, Communiction, Tel Aviv, Israel
[2] Ben-Gurion University, Communiction, Beer-Sheva, Israel

This study presents an innovative theoretical framework for analyzing the activities of citizen influencers in public diplomacy during threat situations and warfare. While existing literature has primarily focused on official digital diplomacy during crises, this research fills a critical gap in understanding the role of non-state actors in shaping international discourse independently of official channels during security threats. The paper presents a conceptual framework integrating theories of crisis communication, reputational security, public diplomacy, and digital platforms. It focuses on the ways citizen influencers leverage digital platforms to mobilize international support during military conflicts. The theoretical framework includes key factors: influencers' motivation and positioning as diplomatic actors, communication strategies, content topics and style (emotional vs. logical), audience targeting and engagement patterns, narrative construction, combining personal testimony with strategic messages, and levels of expertise. The framework maps how citizens transform into spontaneous digital diplomats during security crises. The theoretical framework was applied to the 'Israel-Hamas War' that began on October 7, 2023, when Hamas committed a massacre of more than 1,200 Israelis and abducted 251, the most brutal terrorist attack in Israel's history and the worst since the Holocaust, until a ceasefire was signed on October 10, 2025. This event constitutes a unique case study for examining how citizen influencers operate in extreme threat situations, when international legitimacy and public support become critical strategic assets. Using a mixed-methods framework, we examined the X-platform activities of twenty leading Israeli influencers during the first two months of the war. The research included quantitative content analysis of approximately 4,000 top tweets, combined with semi-structured in-depth interviews with influencers, designed to generate a deeper understanding of the framework's key factors and operational patterns.

Preliminary findings reveal that citizen influencers adopt communication strategies characterized by high urgency, intense emotional content, and use of harsh visual materials. Influencers operate as "spontaneous digital citizen diplomats," leveraging their authenticity and personal credibility to reach international audiences that are inaccessible to official channels. They create narratives combining personal stories with strategic messages, successfully evoking emotional engagement and support among global audiences. The research contributes to expanding public diplomacy theory to civilian actors in crisis situations, offers a methodological model for evaluating digital influence during conflicts, and provides practical insights for integrating citizen voices in official diplomacy efforts during high security situations.

POL08 Far-Right and Anti-Liberal Mobilization Online

PP 0348 Everyday Extremism on Parenting Forums in Bulgaria and Sweden: A Mixed-Methods Study

Jullietta Stoencheva[1]

[1] Malmö University, School of Arts and Communication- K3, Mamö, Sweden

Early internet research celebrated the empowering and emancipatory potential of online forums, including female-dominated spaces such as parenting communities. The medium of the forum allowed users to practise everyday political talk, which occasionally led to mobilising collective action, thereby strengthening democratic participation from below (Bakardjieva, 2012). Today, however, this optimistic view sits uneasily with a transformed platform environment characterised by the mainstreaming and normalisation of exclusionary and authoritarian ideas, including anti-migration, anti-gender, and anti-feminist narratives (Wodak, 2015; Miller-Idriss, 2018; Krzyżanowski, 2020; Graff & Korolczuk, 2022; Volk, 2025). Against this backdrop, a growing body of research has begun to examine how (semi-)anonymous online forums function as sites for the circulation and normalisation of exclusionary and authoritarian ideas. However, this emerging literature has focused overwhelmingly on male-dominated environments, often associated with the manosphere, the far right, and adjacent counterpublics (Massanari, 2017; Marwick & Lewis, 2017; Banet-Weiser, 2018; Ging, 2019). By contrast, women-oriented online spaces remain largely absent from contemporary research on online extremism and ideological mainstreaming.

This study addresses this gap by focusing on female-dominated forums in two European countries: BG-Mamma (Bulgaria) and Familjeliv (Sweden), covering the period 2023–2025. It aims to explore how parenting forums function today as spaces of everyday norm production, and whether, how, and under what conditions exclusionary and extremist narratives surface there. To do so, it draws on the concept of everyday extremism (Askanius & Stoencheva, 2024; Stoencheva & Boshkoska, 2024), which treats extremism not as a fixed ideological position or overt political mobilisation, but as a set of narrative logics embedded in ordinary talk and routine sense-making. Everyday extremism captures the mainstreaming and normalisation of exclusionary, hostile, and violent narratives through mundane expressions of everyday political talk. Rather than

solely promoting overt violence, it operates across a continuum ranging from symbolic and structural violence to explicit dehumanisation and hate speech.

Methodologically, the study employs a sequential mixed-methods design. First, it conducts an exploratory computational mapping of the full 2023–2025 corpus using topic modelling (applied separately to each forum) to identify dominant concerns. These topic clusters are complemented by keyword-in-context checks to locate threads where exclusionary framings become salient. Second, drawing on the computational results, the study uses purposive sampling to select a set of high-relevance threads for qualitative narrative analysis, focusing on the presence and interaction of three narrative components: (1) in-group and out-group constructions, (2) crisis or threat framings, and (3) proposed solutions, ranging from symbolic and structural exclusion to more explicit dehumanisation or hostility. This stage aims to trace how these narrative elements emerge, and whether they stabilise or are contested.

By studying parenting forums through the lens of everyday extremism, the study contributes to debates on digital participation and ideological mainstreaming by critically reassessing the democratic promises of everyday political talk under contemporary platform conditions.

POL09 Populism, Nostalgia, and Political Memory

PP 0464 Nostalgia in populist communication: Deducting moral superiority vs. empathy from the past

Manuel Menke[1]

[1] University of Copenhagen, Department of Communication, Copenhagen, Denmark

This presentation investigates the strategic use of nostalgia in populist political communication and its implications for morality, identity, and democratic cohesion. Nostalgia has become a potent rhetorical resource in times of uncertainty, enabling populist actors to frame the present as a period of decline and promise a return to an idealized past (Elçi 2024; Menke & Wulf 2021). While research has highlighted nostalgia's role in fostering in-group/out-group dynamics and nationalist identities (Taggart 2004; Norocel, Hellström & Jørgensen 2020), less attention has been paid to its moral dimension, i.e., how nostalgic rhetorics and imaginaries underpin claims of superiority or have the potential to evoke empathy.

Drawing on a qualitative comparison of two Danish populist parties, namely the right-wing Danish People's Party (DF) and the green-left Alternative (Å), during the 2022 national Danish election, this study analyzed the two parties' election manifestos using OpenQDA (Belli et al. 2025). A codebook was developed to identify all uses of the past related to collective memory, history, and policy areas, which for DF resulted in 104 and for Å in 91 passages of different length and substance. In a second step, the coding was specified further to identify how crises, nostalgia, collective identity, morality, and future visions/policies resonate in the passages.

Findings reveal contrasting strategies: DF employs restorative nostalgia to defend cultural heritage, family values, and national traditions, framing immigration and globalization as existential threats. This narrative constructs moral superiority by glorifying Western civilization and delegitimizing cultural "others," reinforcing exclusionary identity politics. In contrast, Å adopts a more reflective nostalgia, referring to past progress and pioneers of social welfare as inspiration for systemic change in the present. Rather than claiming cultural exceptionalism, Å emphasizes moral empathy, urging recognition of privilege and solidarity for both humans and animals. Consequently, the collective memories and histories that are nostalgically woven into political agendas and communication might be more versatile based on whose sense of collective identity and shared morality is targeted, and how exclusive or inclusive the communication is towards others.

While right-wing populism exploits nostalgia to polarize and legitimize regressive agendas (Smeekes, Wildschut & Sedikides 2021), this study demonstrates that populist nostalgic engagement is not inherently anti-democratic. When oriented toward shared responsibility and inclusivity, nostalgia can foster empathy and social cohesion (Wildschut et al. 2010; Zhou et al. 2012). This raises normative questions about the potential for "nostalgia for the better," which acknowledges the value of a polyphony of memory in pluralistic societies (Schwarzenegger & Lohmeier 2020).

By highlighting the moral dimension of nostalgic meaning-making, the presentation contributes to research on memory politics, populism, and affective political communication. It calls for a nuanced understanding of nostalgia in political communication beyond its currently predominant association with right-wing actors, recognizing its ambivalent capacity to either undermine or reinforce democratic norms.

POL09 Populism, Nostalgia, and Political Memory

PP 0465 Virtue and villainy: A comparative study of populist narratives in alternative and legacy media during the federal election period in Germany

Christine Wendo King'ang'i[1], Jingyuan Yu[1], Emese Domahidi[1]

[1] Technische Universität Ilmenau, Computational Communication Science, Ilmenau, Germany

News media play a central role in democratic processes, particularly during elections, as exposure to political information shapes ideological positions, political attitudes, and ultimately voting behaviour (da Silva, 2025). While online extensions of legacy media remain the most widely used sources, the growth of digital political news offers has shifted political

information consumption toward alternative online outlets located at the political fringes, which are increasingly used alongside or instead of established news media (Müller & Schulz, 2021).

Alternative Political Online Media (APOM) are digital-native outlets operating primarily via websites (McDowell-Naylor et al., 2021). They exist outside mainstream media institutions and position themselves as alternatives to established news media. They are also frequently characterized by populist narratives that construct society as divided into two homogeneous and antagonistic groups—the virtuous people and the corrupt elite—and assert that politics should express the general will of the people (Mudde, 2017). This antagonistic worldview is expressed through recurring moral characterizations: "the people" are portrayed as authentic, hardworking, and morally upright, while "the elite" are depicted as corrupt, detached, or self-serving(Erhard et al., 2023; Olivas Osuna, 2021).

These populist narratives become particularly salient during election periods, as alternative media emphasize specific topics and conflicts gaining traction in public debate. Rather than focusing on fixed issues, populist communication displays broad thematic diversity and attaches itself opportunistically to salient topics as electoral competition intensifies (Poier et al., 2020). Despite growing interest in populist communication, few studies systematically compare legacy and alternative media, particularly regarding how they differ in topic coverage and the amplification of populist narratives during election periods. Consequently, this study examines the most salient topics discussed during the election period and then analyses how APOM and legacy media in Germany differ in their amplification of populist narratives. The analysis draws on 96,137 articles published by 12 APOM outlets (10,111 articles) and 15 legacy media organizations (86,026 articles) during six weeks before and six weeks after the 2025 German federal election.

Methodologically, we apply a BERTopic model to extract topics and seed words based off a dictionary by Gründl (2022) to identify references to "the people" and "the elite". Large language models are then used to assess the moral characterizations attached to these references. Articles containing populist discourse were then further analysed to identify prevalent topics, political actors, and institutions.

Preliminary results show that 58% of APOM articles and 40% of legacy media articles contain simultaneous references to both "the people" and "the elite," often with multiple mentions, reflecting differences in the intensity and repetition of populist narratives across media types. The next steps of the analysis will focus on assessing the characterization of these references and selecting the optimal topic model from 100 parameter combinations. Ultimately, we aim to identify patterns linking topic salience and populist discourse across the two media types.

POL09 Populism, Nostalgia, and Political Memory

PP 0466 Nostalgia and populist challenges in post-industrial communities: Futurephobia and the reimagination of the past

Darren Lilleker[1], Anke Fiedler[2], Maike Dinger[1], Julian Genten[2], James Morrison[3], Andy Rader[4]

[1] Bournemouth University, Communication, Poole, United Kingdom
[2] Universität Greifswald, Institut für Politik- und Kommunikationswissenschaft, Greifswald, Germany
[3] University of Stirling, Communication, Stirling, United Kingdom
[4] Universitat Rostock, Institut fur Medienforschung, Rostock, Germany

Post-industrial communities experience some of the highest indicators of relative deprivation and evidence possessing populist and anti-democratic tendencies. The decline in status of the regions and their communities with the closure of coal, steel and related heavy industries has led to them being characterised as "left behind". The economic fragility residents experience in terms of job and income security was worsened by the global economic crisis, Covid-19 pandemic and further economic shocks relating to Brexit and the Russian invasion of Ukraine. Many of these communities thus look to populist and far-right movements which employ anti-elitist rhetoric while implicitly promising to restore the greatness and pride these communities once experienced. This paper explores how nostalgia is embedded in the everyday cognition of residents of post-industrial communities and so how this makes them open to manipulation by nostalgic populist rhetoric.

The data, from the DFG/AHRC funded project Voices from the Periphery, explores the socio-economic and political perceptions of residents of regions in the North of England and East of Germany. Utilising the methodology of storytelling cafés, we ask residents of post-industrial communities to reflect on their lifeworlds in the past, present and future. Millennials and over-50s share a sense of pride in the past, in the hard physical labour of themselves, their peers or their ancestors, and their contribution to the national economies. They equally share the sense that the regions were let down: as industries declined, there was no plan to stabilise the economies of the region. Residents display an apathy towards politics and a hopelessness towards the future following years of neglect by a range of governing parties. These reflections, founded on learned attitudes embedded in experience, provide a fertile space for anti-elitist populist thinking to flourish which can then be manipulated to reject centrist, democratic forces. In revealing the voices of the residents in deindustrialised towns and villages, we demonstrate how lifeworld experiences of high relative deprivation can act as a destabilising force on democracies.

POL09 Populism, Nostalgia, and Political Memory

PP 0467 Identifying variants of left-behind social groups in Germany – An updated research agenda on social marginalization and hostile media beliefs

Roman Winkelhahn[1], Silke Adam[1], Dorothee Arlt[2]

[1] University of Bern, Institute of Communication and Media Studies IKMB, Bern, Switzerland
[2] Ilmenau University of Technology, Institute of Media and Communication Science, Ilmenau, Germany

In times of eroding stability in societies that have long been considered archetypes of democracy, our study addresses the ongoing discussion about the causes and consequences of social marginalization. We make two novel contributions to the field: first, by describing the stratification of the German electorate into different variants of marginalized and non-marginalized social classes, and second, by exploring how class structure intertwines with media-related beliefs.

Our data were collected through an online survey conducted via Bilendi's online access panel (certified according to ISO 20252:2019). Data collection proceeded from September 5 to September 23, 2025. Using quota sampling stratified by gender, age, and education, the final sample comprised 2018 respondents from the German population. 49.8 per cent (n = 1005) of participants were male. Respondents' mean age was M = 45.64 (SD = 14.45, min = 18, max = 69). 21.9 per cent (n = 442) of respondents had a university degree.

Applying latent class analysis, we identify a total of nine distinct societal classes that differ in their responses to four indicators: perceived political efficacy, subjective economic situation, traditionalist values and affective marginalization, that is, the latent feeling of being neglected by society in general. We distinguish between five left-behind, one hybrid and three non-left-behind classes of different sizes and describe them along socio-demographic variables and voting behavior. Inter-class differences in mean age, gender, level of education, household income (by household size), region (east vs. west) and party preferences are statistically significant. Interpreting class profiles combined with a post-hoc analysis of these secondary variables, we find that our results are consistent with structures and narratives of current social and political debates in Germany, proving the validity of our approach. We were able to reproduce, for example, existing income disparities between genders and regions (east vs. west).

In a second step, we demonstrate that the assumption that attitudes towards media and towards politics are immediately interlinked is only true under *certain* structural conditions and cannot be generalized to all identified classes. We find that hostile attitudes towards politics do not explain hostile media attitudes in three left-behind classes, namely those that display the high levels of perceived political marginalization as well as large shares of conservative or right-wing voters. In the remaining left-behind classes (economically marginalized left-wing or non-voters) as well as in all non-left-behind classes, a significant share of within-class variance in the hostile media beliefs variable is explained by hostile attitudes towards politics.

Our findings contribute to an urgently needed shift in the research on social marginalization in demonstrating (1) that the phenomenon spans far beyond right-wing politics and is of considerably more complexity than suggested in much of the existing literature (e.g. Bollwerk *et al.* 2024), and (2) that the heterogeneity of social marginalization clearly reflects in media-related beliefs. These observations serve our project as a starting point for further research on the relationships between social identity and attitudes linked to media and political information.

- Bollwerk, M., Wetzel, E., Schlipphak, B., & Back, M. D. (2024). Who feels marginalized? A latent class analysis of perceived societal marginalization. *Group Processes & Intergroup Relations, 27*(3), 597–618.

POL09 Populism, Nostalgia, and Political Memory

PP 0468 The past and the future: Paradoxical political narratives about oil and climate change

Karoline Andrea Ihlebæk[1]

[1] Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway

In this paper I will explore how Norwegian political parties, from the left to the right side of the political spectrum, use references to the past in their party manifestos to legitimize political solutions. More specifically, I will scrutinize how parties frame the paradoxical position of being historically- and presently- dependent on the oil and gas industry, while at the same time presenting a viable and livable future due to climate change (Bang & Lahn, 2019; Ihlen, 2006, Borgen-Eide & Gubrium, 2025). In the paper, I ask: How are political parties constructing visions of the future by referring to the past in the context of oil dependency and climate change?

Theoretically, the study will draw on perspectives from memory studies, political communication and populism (Erll, 2022; Menke and Hagedoorn, 2023; Merrill, 2020; Sierp, 2025; Verovšek, 2016). Several studies concerned with political uses of the past, have been focused on populist far-right, and specifically how nostalgic narratives about the nation and the homeland are used to legitimize immigration-critical perspectives and policies (Karakaya, 2020; Menke & Wulf, 2021). However, there is a need for a broader approach to how the past is used also in other political arenas, and further – across the political spectrum.

Methodologically, the study rests on a qualitative content analysis of written party manifestos (N = 15) from three election periods (2015–2020, 2021–2025, 2025–2029), from five parties, representing different political ideologies and positions: The governing Labor Party, and their ally, the Socialist Left Party; the main oppositions parties the Conservative party and the Progress Party; and finally the niche Green Party that has climate as it main policy area of concern. The Party programs represent a specific form of strategic communication where political parties present themselves and their visions for the future to the public. They are written documents that inform the voters of what the political parties plan to carry out if they win, which is necessary for citizens to make informed choices on the election day. Party programs have at the same time been criticized for being unrealistic and opportunistic that potentially may mislead the voters (Eder et al. 2017; Gyampo and Debrah 2013; Kavanagh 1981).

Building on studies that have been concerned with policy developments and political rhetorics about oil, welfare and climate change in Norway (Band & Lahn, 2019; Bhopal, 202; Korsnes et al., 2023), the study illuminate how references to the petroleum past, including the construction of the Norwegian Oil fund, are framed across the political spectrum in their party manifestos. Further, the study discusses how competing narratives about the past enable specific dystopian and utopian visions for the future, including the sustainability of the welfare state and livable future, that is used to legitimize short-term and long-term policy solutions.

POL10 Navigating Disrupted Communication Environments: New Perspectives on Citizen Engagement with Disinformation In and About Eastern Europe

PN 32 "Mom, Google will help you": How older adults navigate search infrastructures during the Russian-Ukrainian war

Olga Pasitselska[1], Eadan Amit-Danhi[2]

[1] The University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands
[2] University of Groningen, Centre for Media and Journalism Research, Groningen, Netherlands

Navigating through the landscape of digital information is an important challenge, made exceedingly crucial as crises, such as pandemics or wars, unfold. As digital non-natives, older adults are more likely to experience difficulties with Internet access and use (Hunsaker & Hargittai, 2018), in part due to potentially flawed folk theories of where online content comes from (Fletcher & Nielsen, 2019). Once online, older adults also face a distinctive set of dangers, such as elderly-targeted scams (Oliveira et al., 2019). While research demonstrates that domain-specific knowledge helps older adults navigate search infrastructures (Sanchiz et al., 2017), little is known about older adults' information search practices beyond laboratory conditions and specifically within propaganda-ridden media environments. Informed by recent findings about the susceptibility of (LLM-assisted) search engines to manipulation and propaganda by Kremlin-backed actors (Williams & Carley, 2023; Kravets et al., 2024; Makhortykh et al., 2024), Ukraine emerges as a paradigmatic case for this exploration. Thus, we ask: how do Ukrainian older adults search and verify information online during war? We conducted 8 online and offline focus groups (n = 65) with older adults (60+) across Ukraine in the aftermath of the full-scale Russian invasion in summer 2024. Our analysis combined deductive thematic analysis and critical discourse analysis to explore the participants' information search strategies and the reasonings that foreground them. Through deductive thematic analysis, we identified three themes that reflected the complexity of older adults' information search and reasoning strategies. First, the path-finding theme describes older adults' navigation of digital infrastructures. The length and complexity of paths taken enroute to verified information varied by level of media literacy and topical domain, but were also dictated by participants' media use habits and access to devices, apps, and platforms. Crucially, these infrastructures (e.g., browser type and existing social media accounts and YouTube history), conditioned participants' search and verification practices along the path. Second, the three-step information flow theme describes technological and social intermediaries in information search. Elaborating on the 'two-step flow' (Katz, 1957), this theme explores the social negotiation and/or verification of meanings derived from digital infrastructures and filtered through "official" channels (steps one and two), and the emergence of a third step, the filtration of meanings through intuitive understandings. The third theme describes folk-imaginaries of technological intermediaries ("internet-girl" or "this thing") that older adults incorporate into their information-search reasoning, as obscure information providers. To further understand the recurrence of rhetorical vagueness in focus group responses noted in the third theme, we applied critical discourse analysis. We found that while participants can evaluate the trustworthiness of named sources (traditional media, Telegram media channels, YouTube experts), navigating the digital information landscape brings forth more complex evaluation challenges, which preclude establishing relationships of trust and devising clear strategies of verification. These challenges manifest in the prevalence of unnamed entities ("this thing") in participants' responses. We discuss implications for algorithmic literacy and chart further avenues for research in light of the ubiquitous introduction of LLMs into search engines.

POL10 Navigating Disrupted Communication Environments: New Perspectives on Citizen Engagement with Disinformation In and About Eastern Europe

PN 33 Who believes falsehoods about Ukraine? The impact of age, pro-Russian attitudes and social media use on susceptibility to disinformation in Eastern Europe

Vaclav Stetka[1], Fanni Toth[2]

[1] Loughborough University, Department of Communication and Media, Loughborough, United Kingdom
[2] Durham University, School of Government and International Affairs, Durham, United Kingdom

In recent years, information environments in Eastern Europe have been marked by increasing efforts to influence public opinion through pro-Russian narratives (Bokša, 2019; Krekó 2020), particularly following the full-scale Russian invasion of Ukraine in February 2022 (Takácsy, 2023). This has included systematic dissemination of disinformation aimed at shaping public attitudes towards the war and undermining support for Ukraine. Previous research points to a high prevalence of belief in false information about the war among the public in Eastern Europe (HDMO 2024; Wenzel, 2023), with citizens in the region generally demonstrating greater susceptibility to pro-Russian narratives than their counterparts in Western Europe (Hameleers et al., 2024). However, the factors that help explain this tendency remain under-studied, particularly in the context of a rapidly evolving digital information environment. This gap is especially evident in research on age and disinformation, which has traditionally assumed that older people are more susceptible to false and pro-Russian narratives (Loos and Nijenhuis, 2020; Guess et al., 2019). Yet, growing (though still mainly anecdotal) evidence suggests that younger people may be increasingly vulnerable as well – an observation often linked to the spread of deceptive content on new video platforms such as TikTok, or to the political impact of influencer-driven communication networks, as illustrated e.g. during the 2024 Romanian Presidential Election. This paper addresses these gaps by examining generational differences in susceptibility to disinformation about the Russia–Ukraine war in a comparative cross-national setting, and by assessing how these differences are shaped by patterns of social media use and attitudes towards Russia. Utilizing data from a representative population survey (N = 2,440) conducted in Poland, Romania and Serbia in summer 2025, the study addresses two key research questions: (RQ1) Which age group is most likely to believe Russian-linked disinformation about Ukraine? and (RQ2) How is this susceptibility mediated by social media use and pre-existing pro-Russian attitudes? Preliminary results reveal clear cross-national variation in the relationship between age and susceptibility to pro-Russian disinformation. In Poland and Romania – contrary to much of the existing literature, largely based on Western contexts – younger cohorts are consistently more likely to believe false claims about the war than older adults. These generational differences persist even after controlling for other socio-demographic characteristics and pro-Russian attitudes. In Serbia, by contrast, age effects are substantially weaker and become largely insignificant once pro-Russian attitudes are accounted for, suggesting that susceptibility is driven primarily by political alignment rather than generational position. Patterns of social media use only partially mediate these generational effects. Aggregate measures of social media news consumption explain relatively little of the observed age differences. However, when focusing specifically on TikTok use, the generational gap in Poland and Romania is attenuated, indicating that platform-specific exposure contributes to higher susceptibility among younger users. Overall, the findings challenge the assumption that older adults are inherently more vulnerable to disinformation, and instead highlight how susceptibility among younger cohorts is shaped by the interaction between political attitudes and selective engagement with platform-driven information environments.

POL10 Navigating Disrupted Communication Environments: New Perspectives on Citizen Engagement with Disinformation In and About Eastern Europe

PN 34 Deceit between facts and morality: Understanding audience engagement with disinformation

Sabina Mihelj[1], Stefan Janjić[1], Hanna Orsolya Vincze[2], Andreea Mogos[2]

[1] Loughborough University, Department of Communciation and Media, Loughborough, United Kingdom
[2] Babeş-Bolyai University, Faculty of Political Administrative and Communication Sciences, Cluj-Napoca, Romania

Existing literature tends to define disinformation in relation to falsehood and deceit, and contrasts it, often in a binary way, with accurate information or 'truth' (Adams et al. 2023, Kapantai et al. 2021, Wardle 2017). This narrow approach has some notable weaknesses that have been acknowledged in literature, and several conceptual alternatives have been proposed (Hameleerts, Van der Meer and Vliegenhart 2021, Hutchings et al. 2025, Tandoc et al. 2018). While valuable, even these alternative conceptualizations tend to retain an epistemic or 'infocentric' perspective (Lenoir and Anderson 2023, Peck 2023) which reduces communication processes to the transmission of information and misses their ritual, meaning-making dimensions (cf. Bastos and Tuters 2023, Cabañes 2020). To develop a more comprehensive understanding of disinformation, we draw attention to its moral dimensions. In the conceptual part of the paper, we offer a conceptualization of the morality of disinformation, distinguishing between three layers: the moral framings evident in public discourses about disinformation, the moral framings embedded in materials designated as disinformation, and the moral framings arising in citizens' responses to such materials. In the empirical part of the paper, we examine the last of these three layers by drawing on a thematic analysis of 18 focus groups conducted between April and June 2025 in three countries: Poland, Romania and Serbia. Focus groups comprised a total of 125 participants, divided by generation (18–30, 31–50, 51–75). Participants

included roughly equal proportions of men and women, with 64% of participants having completed higher education and the remaining 36% secondary education. Questions covered participants' media consumption habits, responses to specific disinformation examples, general experiences with false information, and perceptions of disinformation as a societal problem. Four examples of disinformation were selected for each country, two concerning the Russia-Ukraine war and two focusing on gendered disinformation related to LGBTQ+ rights, all identified as false or misleading by local fact-checking organizations. Our analysis shows that moral judgments play a fundamental role in citizens' direct engagement with disinformation across all three countries. Participants frequently judged claims regarding events or actors not only based on whether they are factually correct ('epistemic mode') but also based on whether they are morally right ('moral mode'). Importantly, both epistemic and moral judgments were used by participants as part of 'boundary work' – that is, as part of arguments about which issues belong to the realm of legitimate controversy and are thus acceptable as an object of news reporting and public debate, and which should remain excluded. To put it differently, encounters with disinformation prompted participants to engage in negotiating the boundaries of legitimate controversy, consensus and deviance. We conclude by reflecting on what these findings mean for scholarly research on disinformation and for counter-disinformation practices.

POL10 Navigating Disrupted Communication Environments: New Perspectives on Citizen Engagement with Disinformation In and About Eastern Europe

PN 35 Am I being manipulated? Perceptions of, blame attributions for, and reactions to coordinated digital manipulation in Hungary's 2026 Parliamentary Election

Márton Bene[1]

[1] Eötvös Loránd University, Centre for Social Sciences, Budapest, Hungary

Using original survey data, this study examines the extent to which Hungarian voters in the April 2026 Parliamentary Election perceived themselves to be exposed to digital manipulation, which specific forms of manipulation they reported, which agents they attributed these practices to, and what reactions such perceptions elicited. The digital environment can be conceptualized as an unedited (Bimber & Gil de Zúñiga, 2020) and disrupted (Bennett & Pfetsch, 2018) public arena in which coordinated manipulative strategies find ample opportunity to operate (Thiele et al., 2025). This dynamic may be particularly pronounced in hegemonic illiberal public spheres (Štětka & Mihelj, 2024), where the watchdog capacity of independent publics is constrained by limited reach and polarized discourse, while the uneven competition incentivizes the illiberal side to deploy these tools with virtually unlimited resources and minimal risk, while simultaneously tempting challengers with the motivational pull of an unfair contest and the low cost of achieving reach. Hungary represents a paradigmatic case of this configuration, where multiple actors have employed coordinated manipulative strategies, especially in the domain of social media advertising (Bene et al., 2023; Bene & Juhász, 2025). In the increasingly contentious 2026 campaign, coordinated manipulation already appears to play a central role, not least because platform restrictions on political advertising have shifted attention toward alternative tactics: investigative journalists have reported human-coordinated networks of fake accounts, large-scale foreign-based profile activity aimed at manipulating engagement metrics, AI-generated disinformation content, the political capture of well-known meme pages, centrally organized digital activists operating under explicit instructions, and astroturf-like activities by celebrities. Drawing on a representative population survey fielded in the final weeks of the campaign, this paper assesses how strongly voters perceive these manipulative practices in their digital information environment, disaggregating perceptions across specific instruments such as fake profiles, astroturf pages and actors, and disinformation activities (RQ1). Because manipulative practices typically imply concealed actors (Thiele et al., 2025), the study also investigate attribution processes: whether respondents associate perceived manipulation with domestic political actors, foreign interference, or platform-driven economic incentives (RQ2a), and whether their perceptions are selective – primarily attuned to abuses attributed to the opposing side – or generalized, extending across partisan lines (RQ2b). Finally, it examines the downstream consequences of perceived exposure to coordinated social media manipulation. Specifically, it tests whether such perceptions reduce epistemic political efficacy and foster skepticism about the possibility of knowing political reality (RQ3a), or instead encourage a stronger turn toward professional news media (RQ3b) and/or greater reliance on the guidance of preferred political actors or particular digital opinion leaders (RQ3c).

POL10 Navigating Disrupted Communication Environments: New Perspectives on Citizen Engagement with Disinformation In and About Eastern Europe

PN 36 Misinformation, incivility and the problematic boundaries of academic freedom in online discourse about Ukraine

Joanna Szostek[1]

[1] University of Glasgow, School of Social and Political Sciences, Glasgow, United Kingdom

Online misinformation and incivility have become major topics within the political communication literature over recent years (Boatright et al. 2019; Muddiman 2017; Jerit and Zhao 2020). However, there has been little if any consideration of

how academics themselves sometimes incorporate incivility and misinformation into their own discourse when participating in (and shaping) public debates. In fact, it is not uncommon for academics to 'rant' on social media about issues of public concern, using language that may be considered uncivil. This has been a visible phenomenon during Russia's war on Ukraine, with academics sometimes ranting to attract attention to atrocities, injustice, and misinformation. More rarely, misinformation about Ukraine has unfortunately appeared in publications written by established scholars (for example, Hayward and Robinson 2024), and such publications have been among the targets of academic rants. However, public uncivil rants are not without risks for academics, because universities prohibit some forms of incivility and it is not clear where the boundaries of permissible speech are located; there is room for subjective interpretation in the wording of multiple intersecting laws and policies, and there is little transparency in how universities apply and enforce policies. This paper addresses two questions that are of practical relevance to scholars working within and beyond Political Communication: (1) To what extent and in what contexts are academics bound to communicate publicly in ways that are 'civil'? (2) To what extent and in what contexts are academics bound to be factually accurate in their public statements? The questions are addressed together, both from a regulatory perspective (to what extent are academics bound in practice by their employers' rules), and from a normative perspective (to what extent should the 'civility' and accuracy of academics' public discourse be regulated?) Based on a critical review of relevant literature and academic rant examples relating to the Russia-Ukraine war, the paper argues that universities in the UK are more likely to censor academics for violating 'civility' requirements than for repeatedly violating the professional norm of factual accuracy by endorsing misinformation. The paper further argues that this is problematic, and proposes steps which might improve the regulation of academic freedom as it pertains to incivility and misinformation.

POL11 Platform Campaigns and Voter Mobilization

PP 0460 Misinformation perceptions and electoral participation: Evidence from a three-wave panel survey in the Netherlands, Germany and Poland

Marina Tulin[1], Katjana Gattermann[1], Elske van den Hoogen[1], Patrick van Erkel[1], Claes De Vreese[1]

[1] University of Amsterdam, ASCoR, Amsterdam, Netherlands

The aim of this study is to better understand whether and how perceptions of the salience of misinformation affect electoral participation. Concerns around misinformation are high, especially during key political events like elections (e.g., Farooq et al., 2025), and misinformed beliefs have a small negative impact on electoral participation (Green et al., 2022; van Kessel et al., 2021; Partheymüller et al., 2022). However, we know relatively little about the impact of misinformation as a perceptual crisis, especially in the context of elections where misinformation concerns seem to be amplified. Our overarching research question therefore asks: How do misinformation perceptions relate to electoral participation?

A focus on misinformation as a perceptual crisis matters seeing that citizens are highly worried about the prevalence of misinformation (for a review, see: Hameleers, 2025), estimate it at about 50% of all information they encounter (Hameleers et al., 2023; van der Meer & Hameleers, 2024). In an election context, citizens were additionally found to be highly worried about the (mis)use of generative AI for deliberate deception (Farooq et al., 2025). Subjective perceptions that misinformation is abundant and dangerous may have tangible consequences for voting in elections. We study this in a comparative fashion focusing on three EU countries, namely Germany, Poland and the Netherlands before, during and after the European Parliament elections 2024.

Building on theoretical arguments from studies on perceived electoral integrity (e.g., Frank & Martínez i Coma, 2017), we hypothesize that higher levels of perceived misinformation prevalence decrease the likelihood to participate in the elections (H1). We argue that perceived electoral integrity is critical, because only if citizens believe that they have access to accurate and reliable information relevant to the electoral process, will they perceive elections as meaningful. If citizens view the media landscape as failing to provide high-quality information on political candidates, parties, policies, and the electoral process itself, then this undermines electoral integrity.

Based on motivated reasoning mechanisms we hypothesize that citizens are more likely to participate in the EP24 elections if their favourite party is perceived as a more likely target of misinformation (H2). Citizens may seek to resolve the dissonance caused by a negative misinformation attack on their favored party by doubling-down on their allegiance. By casting their vote for their favored party, citizens reaffirm their commitment to the political party that is under attack by hostile outgroups. Our preliminary findings based on logistic regression analyses show mixed results for H1: higher perceived prevalence of misinformation in waves 1 and 3 are negatively related to electoral participation, which supports H1, however, the opposite pattern emerges in wave 2. In support of H2, we find that citizens who perceive their own party to be a more likely target of misinformation are more likely to participate in the elections.

These findings highlight the importance of studying misinformation as a perceptual crisis and suggest a nuanced picture where not only the amount, but also the targets of misinformation have both serious and divergent consequences for democratic participation.

POL11 Platform Campaigns and Voter Mobilization

PP 0461 Attention to political advertising on social networking platforms: Evidence from a linkage analysis using mobile in-app tracking, survey, and content analysis

Hanna Paulke[1], Simon Kruschinski[2], Marcus Maurer[1], Ruben Renz[3], Sabine Trepte[3]

[1] Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany
[2] GESIS – Leibniz-Institut für Sozialwissenschaften, Computational Social Science Data Services for the Social Sciences, Köln, Germany
[3] University of Hohenheim, Department of Communication, Hohenheim, Germany

Paid digital political advertising (DPA) on social networking platforms (SNPs) places targeted, personalized campaign messages in users' feeds (Kruschinski & Bene, 2022). Prior research has examined its persuasive and mobilizing effectiveness conditional on exposure quantity and the congruency between ad and recipients' characteristics. However, studies rely largely on experiments and self-reports, providing limited evidence on whether users *pay attention* to DPA during real-world SNP use (Guldemund et al., 2026). While attention is a crucial precondition for media effects, its empirical assessment remains methodologically challenging (Neijens et al., 2024). Consequently, it remains unclear whether drivers of DPA effectiveness attract user attention that is not forced or triggered by study design. To address this gap, we introduce a methodological combination of tracking data, survey and content analysis to empirically answer how *exposure quantity* and *congruency* relate to reception time as an indicator of attention to DPA.

Research Questions and Hypotheses

Mere exposure theory suggests that *repeated exposure* to DPA from the same party increases visibility and persuasive/mobilization effectiveness (Chu et al., 2024). However, whether repeated exposure stimulates attention or produces attentional wear-out effects remains unclear (RQ1). Beyond quantity, advertising effectiveness depends on *message-user congruency* (Hirsch et al., 2024). We examine two forms: *party congruency*, defined as recipients' positive evaluations of the advertising political party, and *issue congruency*, the personal relevance of the advertised policy issue (Noetzel et al., 2025). Party congruency should increase attention through partisan selective exposure (H1), while issue congruency should enhance attention by stimulating involvement with personally salient topics (H2).

Method

We employ a linkage design combining *mobile in-app tracking*, *survey data*, and *content analysis* with a sample representative of German Facebook and Instagram users (N = 1,509). For four weeks preceding the 2024 European Parliament election, participants' mobile devices were tracked daily, capturing all DPA exposures on Facebook and Instagram. This yielded 3,603 ad contacts with German parties for n = 445 participants. *Attention* was operationalized as reception time via the in-app tracking: the duration an ad remained on screen before scrolling or app closure (M = 11.5s; Mdn = 3.5s). *Party congruency* was measured via survey, where participants rated their evaluation of each German party. *Issue congruency* was derived by matching policy issues coded manually in a subsample of 563 unique ads (2,197 ad contacts) with participants' self-reported issue importance.

Results

GLM regressions (participant-nested with controls) show that reception time increased significantly with same-day exposures to ads from the same party (RQ1; β = 0.06, p = .007). Contrary to H1, ads from negatively evaluated parties received significantly longer reception times than those from positively evaluated congruent parties (β = 0.19, p = .008). Both effects remain robust in the coded subsample. Consistent with H2, issue congruency had a significant positive effect on attention (β = 0.18, p = .03). While our findings support mere exposure and issue-congruency arguments, they also point to unexpected party (in)congruency effects, which can be discussed in terms of motivated reasoning and counterarguing (Guldemund et al., 2025). We thus provide new empirical insights into attention dynamics in DPA and demonstrate the value of linkage designs for studying exposure and attention in personalized online environments.

POL11 Platform Campaigns and Voter Mobilization

PP 0462 Communicating conflict within parties: A content analysis of German party congresses

Sarah-Michelle Nienhaus[1]

[1] Center for Advanced Internet Studies, Transformation of Digital Democratic Discourses, Bochum, Germany

Political parties are the central actors of most democratic systems. They were traditionally described as unitary collectives, but empirical political science research shows that they are divided into ideologically diverse factions. These factions compete for power, are highly organized and demonstrate cross-issue discipline. Their strong organization facilitates party splits when intraparty conflicts escalate, a phenomenon that particularly affected the German party system in recent years, for example with the Sahra Wagenknecht Alliance splitting from the Left Party or the WerteUnion's departure from the Christian Democrats. But factional conflict is also an inherent feature of intraparty democracy, and many factions remain and manage to bridge their differences.

Intraparty conflicts can thus lead to different outcomes. But a central element in these conflicts, their communicative negotiation, has hardly been studied in political communication research. This is not only problematic because of splits Interfactional relationships have also been shown to affect programmatic directions of parties and the stability of whole party systems. Consequently, this paper addresses this gap by examining how factions within Germany's two major mainstream parties, the Social Democratic Party (SPD) and the Christian Democratic Union (CDU), communicate in the face of different intensities of disagreement and how communication relates to conflict outcomes. A quantitative content analysis of federal party congress speeches between 2015 and 2025 is conducted. Factions enter direct competition at party congresses, where they publicly discuss motions and amendments. Four policy areas are included in the analysis due to their salience in German politics over the past decade: migration, environment and climate, labor policy, and armament.

The analysis is based theoretically on the approaches of factionalism and interaction modes. Six theoretically derived interaction types between factions (cooperative, coexisting, negotiative, competitive, conflictive and degenerative factionalism) serve as the basis of the analysis, differing in the degrees that communication is (1) agreement oriented and (2) expresses ideological distance. Variables mainly include stylistic communication characteristics such as arguments, verbal attacks, or expressions of approval. A subsequent cluster analysis shows whether these ideal types are reflected in actual intraparty communication or whether alternative patterns emerge. The actual communication types are further tested regarding their relationships to outcomes, policy area, party, and time period. Given the limited existing research on interfactional communication, the study thus adopts a rather exploratory approach.

Preliminary results reveal that disagreements are discussed extensively in the SPD, while speaking time is more restricted in the CDU. Conflicts in the SPD are articulated with more offensive language such as attacks and accusations. Concerning the policy areas, the CDU experiences particularly strong conflicts over migration and labor policy, while armament proves to be the most divisive issue within the SPD. A similarity between both parties lies in the prominent role of their youth organizations as vocal critics of the party mainstream. Overall, the analysis contributes to political communication research by highlighting how communicative practices within parties and the management of internal conflicts shape the functioning of party democracy. The study also contributes to a broader understanding of meso-level polarization.

POL11 Platform Campaigns and Voter Mobilization

PP 0463 An (angry) image is worth a thousand words? A multimodal computational cross-national study on emotions in political parties Facebook posts during the 2024 EP election campaigns

Maria Teresa Valle[1], Ulrike Klinger[1], Alessandro Nai[1], Linda Bos[1]

[1] University of Amsterdam, Communication Science, Amsterdam, Netherlands

Considerable evidence exists that election campaigns across the globe have become more aggressive in recent decades, often showcasing negative and emotional content to capture the public's attention in information-rich environments. The rise of social media has accentuated this tendency, due to the algorithmic architecture of these platforms, building on politicians' need to boost engagement and visibility. Facebook, a key platform in political communication, offers a unique portrait of this dynamic due to the emotional reactions in its architecture. Existing research shows that text-based campaign communication on social media can elicit *angry* reactions, which in turn boosts visibility. Facebook is, however, a multimodal platform where the textual and visual content interact. Interestingly, our understanding regarding the usage of *visuals* (and multimodality in general) in campaign messages to elicit anger remains limited.

Given the predominance of visuals in today's digital environments, as well as their ability to quickly and efficiently communicate emotions, this paper seeks to narrow the gap in our understanding of which visual elements contribute to *angry* reactions on Facebook-based political communication.

What is the correlation between European parties' visual tools with angry reactions on Facebook? (**RQ1**)

In addition to being emotionally evocative, visuals can be used alongside textual arguments to reinforce them; inversely, visuals can introduce ambiguity to a textual argument, e.g. softening the edge of negative messages. Understanding that visuals and text seldom operate separately, we also investigate the multimodal interaction between text and images.

What is the emotional congruence between the textual and visual content of European parties' campaign communication on Facebook? (**RQ2**)

Our approach combines a quantitative content analysis of the captions text (completed) and a computational analysis of the images (ongoing, to be completed in Spring 2026) of 5855 Facebook posts by 186 political parties in ten EU countries during two/four weeks of campaigning prior to the 2024 EP election days. The article takes an inductive approach, aiming to uncover patterns in how visual tools are used across the party posts. Using LLaVa-Video-7B-Qwen2, an open-source Vision Language Model (VLM), we annotate these images ($N = 5855$) and conduct an automated content analysis to identify visual and emotional concepts in the images that correlate with more *angry* reactions.

Through semantic clustering, images are first grouped based on their connotative similarities and then correlated with patterns in user's angry reactivity. Additionally, our multimodal approach with separate coding of text and images allows for a deeper exploration of emotional congruence and incongruence between textual and visual components. Against the

background of increasing negative campaigning and populist communication, we seek to understand whether and how images are used to concentrate, or dilute, this negativity.

Our study contributes to the conference's theme, because visuals and multimodality have been shifting ground in political communication for a while now, but our understanding of how text and images interact to create emotion in political messages lags behind.

POL12 Long-Term Campaign Dynamics in Hybrid Media Systems

PP 0572 Strategic adaptation under democratic strain: Campaigning in hybrid media systems (2002–2022)

Kajsa Falasca[1]

[1] Mid Sweden University, Media and communication science, Sundsvall, Sweden

The transformation of political campaigning in hybrid media systems has intensified long-standing tensions between strategic efficiency and democratic ideals. While research on political communication has documented processes of professionalization, digitalization, and platformization, less attention has been paid to how political parties internally negotiate these tensions over time. This paper addresses this gap by examining how Swedish political parties have learned, translated, and institutionalized practices of strategic political communication across six national election campaigns between 2002 and 2022.

Drawing on theories of organizational learning and translation, the study conceptualizes campaign development as a dynamic process in which parties selectively adapt external communication ideas while seeking to preserve democratic legitimacy. Rather than treating campaign change as a linear response to technological innovation, the paper foregrounds political parties as organizational actors operating under competing logics: journalistic scrutiny, algorithmic visibility, participatory expectations, and internal democratic norms. Hybrid media systems thus function not only as a structural context but as a continuous source of organizational strain that shapes strategic decision-making.

Empirically, the paper is based on a longitudinal qualitative case study of Swedish election campaigning. The analysis draws on 45 in-depth interviews with party secretaries and senior campaign officials from all parliamentary parties, conducted after the national elections of 2002, 2006, 2010, 2014, 2018, and 2022. This rare longitudinal elite material provides insight into how parties reflect upon, evaluate, and reorganize their communication practices over time. The design allows for tracing the full trajectory of campaign innovations—from early experimentation and imitation to normalization, contestation, and decline.

The findings identify three interrelated organizational mechanisms that structure campaign adaptation in hybrid media environments: imitation of perceived best practices, contextual translation of imported communication concepts, and institutionalization into stable routines and professional roles. Practices such as news management, marketing techniques, political advertising, and social media campaigning have gradually become embedded within party organizations. At the same time, each wave of innovation has generated new democratic tensions, particularly concerning centralization of message control, data-driven targeting, algorithmic dependence, and the erosion of participatory ideals.

The paper shows that hybrid media systems intensify permanent campaigning and amplify pressures for speed, visibility, and responsiveness, often at the expense of deliberation and internal democracy. Organizational learning thus emerges as both technical and normative: parties continuously negotiate how far strategic adaptation can proceed without undermining credibility, trust, and democratic legitimacy. By integrating organizational learning theory with political communication research, this study contributes a process-oriented perspective on how democratic tensions are managed—and reproduced—within contemporary campaign organizations operating under conditions of hybrid and platformized media.

POL12 Long-Term Campaign Dynamics in Hybrid Media Systems

PP 0573 "Meet the new boss – same as the old boss" – A longitudinal study of negative campaigning and Facebook engagement

Anders Olof Larsson[1]

[1] Kristiania University College, Department of Communication, Oslo, Norway

This study presents a longitudinal analysis of the communication of parties and party leaders on Facebook, focusing on the Norwegian Progress Party and its leaders, Siv Jensen and Sylvi Listhaug, over a decade-long period. Utilizing a hybrid content analysis approach that combines Large Language Models (LLMs) with human classification, we assess the sentiment of Facebook posts—categorized as negative, positive, or neutral—and the interactions (likes, shares and comments) that arise from these posts. Our findings reveal a significant increase in negative sentiment and engagement over time, particularly under Listhaug's leadership, corroborating the claim that negative content drives online engagement.

The study contributes to understanding the evolving landscape of digital politicking, emphasizing the interplay between political actors' communication strategies and audience engagement. It addresses the call for longitudinal insights into political communication, showing that negative sentiment in political posts, characterized by criticism of opponents, has

become more prevalent over time. This trend aligns with the broader shift towards negative campaigning observed in various political contexts.

The research further examines the relationship between post sentiment and different types of Facebook engagement—shares, comments, and likes. Negative posts were found to drive higher levels of shares and comments, supporting the notion that negativity is a potent force in both politics and social media engagement. However, the relationship between negative content and likes was less straightforward, with positive content often leading to more likes. This suggests that while negativity may drive more active forms of engagement, such as sharing and commenting, positive content may still hold appeal for actors seeking what could perhaps be referred to as lighter forms of interaction. Expressed differently, different types of sentiment result in different types of Facebook interactions – a finding that assists in our understanding of the contemporary political landscape.

Methodologically, the study demonstrates the effectiveness of using LLMs for sentiment analysis in political communication research, offering a scalable approach for analyzing large datasets in a non-english language. Essentially, all 11 160 posts provided by the two subsequent party leaders and the party itself between 2013 and 2023 were classified as characterized by positive, neutral or negative sentiment. Reliability between man and machine was based on a five percent sample of all posts (N = 558) and calculcated using Krippendorff's alpha with a result of .82, indicating satisfactory levels of reliability.

In conclusion, this study provides longitudinal insights into the use of sentiment in political communication on social media, highlighting the interplay between sentiment type, audience engagement and political actor. It underscores the importance of adapting communication strategies to the evolving digital landscape, where negative sentiment can be a powerful tool for political actors seeking to amplify their messages and engage with audiences. It also points to the clear role of individual politicians in relation to the parties they lead – indeed, the apparent "Listhaug effect" is apparent in the results, as the mother party adopts more negative stylistics directly after her takeover as leader.

POL12 Long-Term Campaign Dynamics in Hybrid Media Systems

PP 0574 To trend or not to trend – That is the question. Tracing long-term patterns in German newspaper coverage of Federal and European election campaigns, 1949/1979 to today

Melanie Leidecker-Sandmann[1], Jürgen Wilke[2], Stephanie Geise[3]

[1] Karlsruhe Institute of Technology, Department of Science Communication, Karlsruhe, Germany
[2] Johannes Gutenberg-University Mainz, Department of Communication Science, Mainz, Germany
[3] University of Bremen, Center for Media- Communication- and Information Research, Bremen, Germany

Understanding how election campaign communication changes over time is a central concern in political communication research. Scholars frequently assume linear, long-term trends in campaign communication and media coverage (Krewel & Wolsing 2023; Schäfer & Schmidt 2016). A prominent framework is the Americanization or modernization thesis (e.g., Donges 2000), proposing increases in personalization, visualization, negativity, horse-race reporting, and an overall expansion of the campaign period ("permanent campaigning") in media coverage.

Testing such assumptions requires longitudinal content analyses with consistent methodology and stable operationalizations. Yet such studies are rare; most research relies on single-election case studies (Krewel & Wolsing 2023; Strömbäck & Kaid 2008).

Addressing this gap, we examine long-term patterns in German election campaign coverage across all federal (Bundestag) elections since 1949 (21 elections) and all European Parliament (EP) elections since 1979 (10 elections).

We conducted quantitative content analyses from four national quality newspapers (Frankfurter Rundschau, Süddeutsche Zeitung, Frankfurter Allgemeine Zeitung, Die Welt) during the four weeks prior to each election (Bundestag: 7,702 articles; EP: 2,130 articles). All coding was conducted manually using a consistent instrument, only minimally updated before each election (e.g., candidates, parties) without changing underlying operationalizations—an approach unique in German political communication research.

We test for long-term (linear) trends in

(RQ1) personalization (more candidate mentions),
(RQ2) visualization (more candidate images),
(RQ3) negativity (more negative candidate evaluations),
(RQ4) horse-race reporting (more poll coverage), and
(RQ5) the temporal expansion of campaign coverage.

Our findings reveal little evidence of linear long-term trends. For personalization (RQ1), Bundestag election consistently shows high levels of candidate references, while EP elections display lower levels, with brief peaks in 2014 (introduction of lead candidates) and 2024 (von der Leyen as lead candidate). For visualization (RQ2), Bundestag coverage shows a short-term increase in candidate images between 2002 and 2009, followed by decline or fluctuation; EP coverage shows a gradual increase since 2004.

Candidate evaluations (RQ3) remain consistently critical and fluctuate within similar ranges for both election types. Poll reporting (RQ4) remains at a low level between zero and four percent across all elections. Finally, no trend toward an

expanded campaign period (RQ5) is found: the share of articles published in the fourth pre-election week does not increase over time.

Overall, our findings challenge assumptions about linear, long-term trends in election coverage and underscore the need of context-sensitive analyses that consider election-specific factors such as candidate constellations or party competition.

POL12 Long-Term Campaign Dynamics in Hybrid Media Systems

PP 0575 "As time goes by" – Assessing day-by-day campaigning prioritizations across platforms and elections

Hedvig Tønnesen[1], Anders Olof Larsson[2], Melanie Magin[1]

[1] NTNU, Department of Sociology and Political Science, Trondheim, Norway
[2] Kristiania University College School of Communication- Leadership- and Marketing, Department of Communication, Oslo, Norway

Social media have become highly dynamic campaigning tools, enabling political actors to respond to events and adjust strategies almost in real time (e.g., Kreiss, 2016; Ennser-Jedenastik et al., 2021). This adaptability is crucial, as campaigns can shift rapidly due to unexpected developments, fluctuating polls, or the approaching election day. Examining campaign practices on social media on a day-by-day basis can therefore provide valuable insights into strategic priorities and their drivers. Yet, despite extensive research on social media in election campaigns, such fine-grained analyses remain rare. Most existing studies adopt cross-sectional rather than longitudinal perspectives.

Addressing this gap, this paper draws on a content analysis of posts by Norway's main political parties and their leaders on Facebook and Instagram during two recent parliamentary elections—2021 and 2025. Our paper aims to answer the following research questions: (1) How do Norwegian parties prioritize policy issues and calls to action across Facebook and Instagram during election campaigns? (2) Do audience engagement patterns influence subsequent campaign content? (3) Are these patterns consistent across platforms and elections?

Our analysis focuses on two content dimensions: (1) Policy issues (e.g., health, economy, environment, employment) raised in posts, which, to a certain degree, are likely to reflect strategic responses to recent events and shifts in polls (e.g., Pereira, 2019; Ivanusch et al., 2023); (2) Calls to action (e.g., mobilizing followers to vote), which indicate how campaigns adapt as election day nears and competition intensifies (e.g., Wurst et al., 2023). Investigating these categories across time during both election campaigns will reveal whether policy issues fade closer to election day, when mobilization messages are expected to dominate. Additionally, engagement metrics—likes, comments, shares—are included for each post. These allow us to examine whether audience reactions influence subsequent content decisions, such as amplifying topics that generate high engagement and avoiding those that do not.

Norway, which combines high voter turnout with widespread social media use among parties, politicians, and voters, is a well-suited case to investigate how parties prioritize certain content in the course of European election campaigns. Coding for the 2021 election is complete and reliability-tested; coding for 2025 is ongoing and will conclude in spring 2026. Comparing two campaigns allows us to link post content with data on the election campaigns (e.g., polls and events), shedding light on how contextual factors shape short-term strategies. Comparing two platforms enables us to assess whether these strategies are platform-specific or overarching.

Preliminary findings from the 2021 campaign suggest that policy issues declined as election day approached, while calls for mobilization—primarily urging votes—increased. The comparison with 2025 will show whether these patterns persist and how they differ across platforms and contexts. By analyzing campaign dynamics at this granular level, the study contributes to understanding how political actors prioritize content in response to evolving conditions. It also highlights the interplay between strategic messaging, audience engagement, and platform affordances in shaping modern election campaigns.

POL13 Journalism and Polarization: Fueling the Fire and How To Tame It

PN 51 (De)polarizing practices in journalism: A conceptual framework and research agenda

Michael Brueggemann[1], Agnieszka Stępińska[2], Clara Juarez Miro[3]

[1] University of Hamburg, Journalism and Media Research, Hamburg, Germany
[2] Adam Mickiewicz University Poznań, Political Science and Journalism, Poznań, Poland
[3] University of Barcelona, Political Science Constitutional Law and Philosophy of Law, Barcelona, Spain

Political communication research has argued that journalistic reporting can fuel polarization. Scholars point to practices such as conflict framing, winner-loser narratives, and the emergence of hyper-partisan outlets as particularly harmful (e.g.,

Lawrence, 2000; Levendusky & Malhotra, 2016; Price, 1989). However, content analyses that directly measure polarizing reporting remain rare (Kubin & Sikorski, 2021), and the field still lacks an integrative framework connecting polarization research and journalism studies to analyze (de)polarizing journalistic practices. Our approach starts from the assumption that journalism serves a double function in a democratic public sphere. Firstly, it makes social conflicts visible by giving voice to different perspectives, thus reproducing controversy driven by social actors. Secondly, journalism moderates debates by amplifying certain actors' voices and frames, thus providing salience, contextualization, and commentary. It is in this second function that journalism has agency in co-producing, with other public actors, more or less polarized debates. While journalistic practices shape patterns of news coverage that may fuel a spiral of polarization, they may also enable controversial but constructive public debates about solutions to pressing challenges. We identify four categories of practices that may plausibly fuel polarization: (1) overreporting polarization, (2) hyper-partisan coverage, (3) reconstructing debates as toxic two-camp fights, and (4) focusing on problems rather than solutions. Firstly, journalistic meta-discourse about polarization may over-diagnose and even deepen divergence (Lee, 2022; Levendusky & Malhotra, 2016) by exaggerating depictions of society as falling apart (i.e., "false polarization"; Fernbach & Van Boven, 2022). Such portrayals may feed a self-fulfilling cycle of polarization (Wilson et al., 2020). Secondly, media organizations may align ideologically with extreme actors, providing coverage that is not only biased on single issues but also aligned with broader party lines (i.e., ideological alignment; Fiorina & Abrams, 2008; Druckman et al., 2013). Thirdly, journalistic routines such as selecting and emphasizing aspects that provide news values such as conflict and negativity (the idea of news values dates back to Lippman, 1922, and Galtung & Ruge, 1965, elaborated e.g. in Eilders, 2006, and O'Neill & Harcup, 2009), can recast pluralistic debate as a toxic two-camp fight in which the loudest, most extreme voices stand in for each side. This can heighten cross-cutting exposure to the most antagonistic voices from the other side, helping explain why cross-cutting exposure may not only depolarize by opening up echo chambers but also polarize, as a recent literature review shows (van Eck et al., 2026). Fourthly, journalistic work often foregrounds problems over solutions, whereas constructive, solutions-oriented approaches offer alternatives for covering social challenges (Bro, 2024).This framework informs a future research agenda to systematically test both the polarizing effects of these practices and the potential of depolarizing interventions across political and media systems.

POL13 Journalism and Polarization: Fueling the Fire and How To Tame It

PN 52 When polarization becomes news: Cross-national trends in talk about polarization across five European countries, 2020–2025

Laia Castro[1], Mike Farjam[2], Hendrik Meyer[2], Louisa Pröschel[2], Anamaria Dutceac Segesten[3], Agnieszka Stępińska[4], Michael Brüggemann[2]

[1] University of Barcelona, Political Science, Barcelona, Spain
[2] University of Hamburg, Journalism and Media Research, Hamburg, Germany
[3] Lund University, Centre for Languages and Literature, Lund, Germany
[4] Adam Mickiewicz University, Political Science and Journalism, Poznan, Poland

This work maps the extent to which polarization is evoked as a narrative element across newspapers in five European countries. Polarization is not only a label for political dynamics; it is also a recurring topic in journalism and part of a wider discourse. News frequently frames events through the lens of "a polarized society," using polarization as a diagnosis, warning, or explanation (Farjam et al., 2025). This matters because research on "false polarization" shows that audiences often misperceive political opponents as more extreme and more hostile than they actually are (Fernbach & Van Boven, 2022). A polarization frame may fuel such misperceptions by foregrounding conflict as the default lens for interpreting politics. Yet we still know comparatively little about how this polarization discourse evolves across Europe: whether it is becoming more common, how it is emotionally framed, and whether it differs from outlets' average ideological stance. We analyze polarization discourse in Germany, the United Kingdom, Sweden, Spain, and Poland between 2020 and 2025. The country selection spans different media systems and historical backgrounds, allowing us to assess whether patterns travel beyond single-country contexts. We analyze a corpus of more than 100,000 newspaper articles that use polarization-related keywords. We draw from multiple outlets per country, selected to maximize ideological variety and to cover both broadsheets and tabloids. We characterize discourse on polarization along three dimensions. First, volume/salience: we compile a country-specific list of polarization terms, starting from the seed word 'polarization' in each language and expanding it with semantically similar expressions identified via word embeddings. We then track how often outlets use this vocabulary over time. Second, emotionality: using pre-trained emotion classifiers, we estimate an 'anger premium', defined as how much anger-related language increases as the use of polarization-related keywords increases within an article. Third, we introduce the concept of an 'ideology premium' that mirrors the same logic for ideological positioning: how much more ideologically extreme stances become as keyword use increases. To compute this premium, we combine computational topic modeling with stance detection: topic models (BERTopic) identify fine-grained issue contexts within polarization discourse, and stance models (large language models validated against human coders) classify directional positions toward the topic of an article. The ideology-premium analysis is ongoing; complete results will be presented at the conference. Thus far, the paper offers three core contributions. First, polarization discourse is on the rise across countries over the observation window, and this increase is not confined to any single media-system type. The discourse is more common in left-leaning than in right-leaning newspapers, and in broadsheets than in tabloids. Second, the anger premium is remarkably consistent: polarization discourse tends to be emotionally intensified relative to outlets' baseline style, even

in media environments typically described as less polarized. Third, by measuring emotional and ideological intensification as premia relative to each outlet's own baseline, the approach distinguishes stable outlet "tone" from changes that are specific to polarization discourse.

POL13 Journalism and Polarization: Fueling the Fire and How To Tame It

PN 53 From antagonistic talk to cooperative acts: An experiment on polarization cues in news and their effects on attitudes and cross-partisan behavior

Mike Farjam[1], Hendrik Meyer[1]

[1] University of Hamburg, Journalism and Media Research, Hamburg, Germany

This work tests whether polarization meta-discourse actually polarizes audiences. As demonstrated in presentation 2, references to a 'deeply polarized society' have become a routine journalistic device in many European broadsheets. Yet it remains unclear whether such polarization talk merely describes social division or actively produces it among audiences. Building on false polarization theory, i.e., misperceptions of partisan distance that can become self-fulfilling (Fernbach & Van Boven, 2022), this paper tests whether brief polarization contextualizations embedded in otherwise factual reporting shift both (a) perceived polarization and (b) behavior toward political out-groups. We report two laboratory experiments conducted in Germany (Study 1: N = 302; Study 2: N = 295). Participants read two authentic newspaper articles that either included or omitted short contextual sentences framing the reported issue as evidence of broader societal polarization. The manipulation was designed to be subtle and ecologically valid, mirroring how such clauses appear in everyday journalism. After exposure, participants completed standard measures of affective polarization (in-group vs. out-group feeling thermometers) and ideological extremity (distance from neutrality across three salient policy items: migration, climate policy, and redistribution). To capture whether attitudinal shifts translate into consequential action, participants then played incentivized economic games with real partners from the ideological out-group: Dictator, Ultimatum, and Trust Games. These games systematically vary in the mutual dependence between the two players, allowing us to test whether interdependence moderates how polarization narratives affect cross-partisan cooperation. Across both studies, exposure to polarization cues increased self-reported affective polarization and ideological extremity, consistent with the logic of false polarization. Behavioral outcomes, however, were contingent on the structure of interaction. In the Dictator Game—where one-sided allocation is possible, and the partner cannot respond—treated participants kept more of the endowment, aligning behavior with heightened out-group hostility. In the Trust Game—where gains depend on reciprocal trust and cooperation—treated participants sent more to out-group partners, and the receiving counterpart reciprocated more. This suggests that participants who perceived society as more polarized but were simultaneously made aware of their dependence on members of the opposing ideological camp, send a cooperative counter-signal rather than comply with a conflict script presented in the media. Behavior in the Ultimatum Game fell in between these patterns, mirroring the intermediate position of the game in terms of mutual dependence between the participants. These findings refine expectations about media-induced polarization by showing that polarization narratives can reliably increase perceived division while producing heterogeneous behavioral effects depending on interdependence. Substantively, the results highlight a boundary condition for when divisive rhetoric is most likely to undermine democratic life, and when it may instead activate norms of reciprocity or collaboration that sustain societal cooperation in times of increasing polarization.

POL13 Journalism and Polarization: Fueling the Fire and How To Tame It

PN 54 Mapping ideological alignment in contentious arenas: Topic modeling and stance detection in German newspapers, 2020–2024

Louisa Pröschel[1], Mike Farjam[1]

[1] University of Hamburg, Journalism and Media Research, Hamburg, Germany

Legacy journalism is often assumed to fuel discursive polarization when outlets become ideologically aligned with political camps, i.e., systematically selecting, emphasizing, and evaluating issues in ways that reinforce 'two-camp' perceptions. In the panel's framework (Presentation 1), such ideological/partisan alignment is one of the key journalistic practices that can plausibly intensify polarization dynamics (Fiorina & Abrams, 2008; Druckman et al., 2013). Yet empirical evidence that directly maps how strongly legacy outlets align ideologically, and whether such alignment is stable across issues, remains limited outside highly aligned media environments (Lane et al., 2025).This paper examines ideological alignment in German legacy news between 2020 and 2024. Germany is an informative test case because it combines a multi-party political space with comparatively institutionalized legacy journalism and lower political parallelism, where strong, stable alignment should be less pronounced than in hyperpartisan systems. We analyze a corpus of >12,000 articles from eight mainstream outlets selected for ideological diversity. Substantively, we focus on major arenas of political conflict (Mau et al., 2023)—migration, diversity/gender, climate change, and distributional conflict—and add the Israel–Gaza war as a salient foreign-policy and identity-related conflict since 2023.Methodologically, we propose a scalable way to assess ideological alignment as an issue-sensitive phenomenon rather than a fixed outlet trait. First, we identify fine-grained sub-issues within each arena via topic modeling, allowing us to measure which outlets emphasize which parts of each conflict arena. Second, we estimate topic-specific evaluative direction using large language models, calibrated and validated against two trained human coders

on a balanced validation set (ordinal Krippendorff's α around 0.8, with LLM–coder agreement comparable to coder–coder). This design separates agenda emphasis (what is covered) from directional positioning (how it is evaluated), which are often conflated when diagnosing partisan alignment in journalism. The findings qualify simple expectations about 'aligned' outlets. Some arenas show recognizable clustering into left-leaning and right-leaning blocs when aggregated across topics, consistent with the idea of ideological alignment. However, this bloc structure weakens markedly once we disaggregate by arena and especially by sub-issue: outlets that appear aligned in one arena diverge in others, and within-bloc disagreement is substantial on several contested sub-issues. Migration and Israel–Gaza-related coverage stand out in overall salience, yet engagement is not uniformly concentrated in 'extreme' outlets, and these outlets are not always the ones taking the most consistently directional stances. Overall, the paper contributes an empirically grounded, computational map of when ideological alignment holds and when it breaks down in legacy journalism, thereby linking a central mechanism in the panel's framework (ideological alignment as a potentially polarizing practice) to concrete, issue-specific patterns of coverage and evaluation.

POL13 Journalism and Polarization: Fueling the Fire and How To Tame It

PN 55 Between observation and intervention: Journalists' role perceptions in polarized public debate in four European countries

Anamaria Dutceac Segesten[1], Agnieszka Stępińska[2], Louisa Pröschel[3], Clara Juarez Miro[4], Michael Brüggemann[3], Choni Flöther[5]

[1] Lund University, Centre for Languages and Literature, Lund, Sweden
[2] Adam Mickiewicz University, Political Science and Journalism, Poznan, Poland
[3] University of Hamburg, Journalism and Media Research, Hamburg, Germany
[4] University of Barcelona, Political Science Constitutional Law and Philosophy of Law, Barcelona, Spain
[5] Netzwerk Recherche, NGO, Berlin, Germany

Building on the conceptual framework of polarizing and depolarizing journalistic practices introduced in the first paper of this panel, this paper examines how journalists themselves perceive their role in processes of political polarization. Drawing on semi-structured, in-depth interviews with 18 journalists across four countries with different political and media systems and different levels of political polarization (Poland, Sweden, Germany, and Spain), the study adopts a comparative qualitative design to explore how role perceptions vary across these contexts. The analysis is guided by research on journalistic role performance and cultures of journalism, particularly the distinction between detached (reporting reality) and interventionist (journalistic voice: opinions, interpretations, suggestions) role conceptions (Mellado, 2015; 2025), as well as by scholarship on political parallelism and external pluralism in European media systems (Mancini, 2012). Against this theoretical background, the paper examines how journalists interpret polarization, assess their professional responsibilities, and reflect on editorial routines and practices that may amplify or constrain polarized public debate. The findings show that journalists across contexts largely reject intentional polarization as a professional goal, yet differ markedly in how they evaluate the legitimacy of intervention, emotionalization, and contextualization in political reporting. These differences correspond to both nationally embedded journalistic cultures and media-system characteristics, and resonate with the polarizing practices identified in Paper 1, in particular the reproduction of conflict, the privileging of antagonistic voices, and the framing of political debate as a binary opposition. Beyond identifying cross-national differences in role conceptions, the analysis shows how journalists' high degree of reflexivity regarding polarizing practices coexists with a limited sense of professional agency, as polarization is experienced primarily as an outcome of structural pressures, platform dynamics, and the communication of political actors rather than as a product of deliberate journalistic intent. By linking journalists' self-understandings to these practices, the paper advances a comparative perspective on journalism's ambivalent role in sustaining or mitigating harmful forms of polarization in contemporary European public spheres.

POL14 Cross-Cutting Exposure and Affective Polarization

PP 0568 Polarization as a media signal: How polarized issue coverage shapes perceived issue importance and vote choice

Rens Vliegenthart[1], Annelien Van Remoortere[1]

[1] Wageningen University and Research, Strategic communication, Wageningen, Netherlands

Political polarization is widely perceived as one of the defining features of contemporary democracies. Citizens increasingly report that politics feels more divided, conflictual, and emotionally charged, and media coverage frequently presents political issues in polarized, camp-based terms (so-called affective polarization). While a growing literature documents the prevalence of polarized discourse in news and on social media, much less is known about how such polarization in media content affects citizens' political priorities and electoral decisions. This paper integrates agenda-setting and priming perspectives with polarization research to examine whether issues framed as polarized in media coverage become more important to voters and exert a stronger influence on vote choice.

We conceptualize polarization not merely as ideological distance or affective hostility, but as a communicative signal embedded in media coverage. When journalists, politicians, and online users frame issues as conflicts between opposing camps, they do more than highlight disagreement: they signal that an issue is politically consequential, identity-relevant,

and normatively charged. Building on agenda-setting theory, we argue that such polarized framing increases the perceived importance of issues beyond what can be explained by their sheer visibility. Drawing on priming theory, we further argue that polarized issue coverage increases the likelihood that these issues are used as criteria in political judgment, thereby shaping vote choice.

We test these expectations using a unique five-wave panel survey conducted in the run-up to the 2025 Dutch parliamentary elections (N = 3,000 in wave 1 and 2,461 in wave 5). The panel includes repeated measures of vote intention, vote considerations, and political attitudes, as well as both closed and open-ended most important problem (MIP) questions that capture issue salience from the citizen's perspective. These individual-level data are linked to a large-scale content analysis of the news and social media content respondents were exposed to, based on a combination of data donations (e.g., browsing and social media traces) and detailed self-reported media use. Using large language models, we automatically classify the issues present in each respondent's media diet and estimate the degree to which these issues are framed in polarized terms. Linkage analysis then connects individual exposure profiles to within-person changes in issue salience and voting considerations over time.

Preliminary analyses provide evidence for our theoretical expectations. First, issues that are more strongly framed as polarized in a respondent's media exposure are significantly more likely to be mentioned as most important problems in subsequent waves. Crucially, this effect persists when controlling for the overall volume of coverage, indicating that polarization adds to, rather than merely reflects, classic agenda-setting effects. Second, polarized issue salience translates into electoral relevance: issues that respondents encounter in more polarized form are more strongly associated with their party preferences (through issue ownership mechanisms) and voting intentions than issues covered in a less conflictual manner. This pattern remains robust in models that account for prior vote intentions and ideological predispositions.

Together, these findings suggest that polarization is not just an outcome of political competition but also a mechanism through which media structure political attention and choice.

POL14 Cross-Cutting Exposure and Affective Polarization

PP 0569 How can echo chambers emerge in curated facebook feeds? Simulating cross-cutting information sharing in a Danish context

Frederik Henriksen[1], Eva Mayerhöffer[1], Jens Ulrik Hansen[2], Jakob Bæk Kristensen[1]

[1] Roskilde University, Department of Communication and Arts, Roskilde, Denmark
[2] Roskilde University, Department of People and Technology, Roskilde, Denmark

Public and academic debates often claim that social media push citizens into ideological echo chambers that fuel polarization. Yet evidence is mixed: studies of individual exposure frequently find substantial diversity, while network-level analyses on platforms such as Facebook show strong homophily and clustering. This tension raises a methodological challenge for political communication research: how exposure in social media environments and user sharing jointly produce system-level patterns of segregation and polarization.

To address this challenge, we develop a theory-driven agent-based model (ABM) that simulates how users are exposed to and share political information on social media platforms. Agents hold a continuous political orientation and differ in key behavioral traits: their propensity to post original content, their likelihood of sharing attitude-aligned content versus cross-cutting content, their tolerance for disagreement (an attitude-distance threshold that defines when content is experienced as "aligned"), and their volatility (how strongly exposure shifts their orientation). In each time step, agents may produce original content, receive an exposure set consisting of content shared by accounts they follow (a simplified proxy for feed exposure), and selectively re-share items. Agents update their political orientation as a function of the aggregate mix of exposures, producing emergent outcomes such as clustering, segregation between communities, and changes in cross-cutting exposure over time. The model thus treats segregation between communities and polarization shifts as emergent consequences of repeated micro-level exposure, selective sharing, and updating.

We evaluate the ABM against a large-scale Danish Facebook dataset. Using ~48 million posts collected via snowball sampling of news-media URL sharing (2019–2024), we map diffusion dynamics across interaction-based page communities, which allows us to derive empirical validation targets (e.g., segregation between communities, cross-community diffusion distributions, and cross-cutting engagement patterns). In addition, the Facebook data are used to delineate empirically plausible ranges of network structures (e.g., degree heterogeneity and the strength of community structure). We then run systematic parameter sweeps across behavioral heterogeneity and network environments to identify the configurations that reproduce observed network-level patterns.

Our contribution is twofold. Substantively, the study clarifies which echo-chamber configurations are compatible with observed patterns of cross-cutting engagement in a Nordic, multi-party context. Rather than asking whether echo chambers "exist" in the abstract, we specify the conditions under which they are more or less likely to arise in curated Facebook feeds. Methodologically, we demonstrate how platform data can be used to validate ABMs of political communication by linking individual-level mechanisms to macro-level outcomes in contemporary platform-mediated publics.

POL14 Cross-Cutting Exposure and Affective Polarization

PP 0570 Cross-cutting exposure revisited: A story-level analysis of political news consumption across 6 countries

Ernesto De León[1], Sebastian Stier[2]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands
[2] GESIS, Leibniz Institute for the Social Sciences, Mannheim, Germany

Concerns about online political "echo chambers" have made the ideological diversity of news diets a central question in political communication. However, recent research has cast doubt on how much ideological self-selection actually occurs online. Using individual-level digital trace data, studies have found that people typically consume news from a diverse range of sites (Guess, 2021), and even audiences of hyperpartisan outlets still engage substantially with mainstream sources (de Leon et al., 2024). Some have concluded that social media increases, rather than reduces, exposure diversity (Stier et al., 2022; Jürgens & Stark, 2022).

Most of this work relies on domain-level ideological scoring: assigning a fixed ideological label to entire websites. This method treats every story from, say, The New York Times as uniformly left-leaning, counting any visit as left-leaning exposure. But emerging scholarship suggests this is a flawed proxy (Mangold et al 2024). Goel et al. (2024) highlight how mainstream news stories are often co-opted in disinformation campaigns. De Leon et al. (2025) describe how ideological actors amplify stories from credible (but ideologically opposed) sources to bolster their own narratives, a process they term "weaponized information." Greene et al. (2024) show that elites often share content from ideologically distant outlets not because they agree with it, but because it suits their framing.

These findings suggest domain-level measures may substantially overstate ideological diversity. In response, we introduce a story-level approach: instead of labeling entire domains, we infer the ideological valence of each individual story. We do this by calculating scores based on the partisan leanings of political elites who share them, using a method developed by Eady et al. (2024).

Our study draws on two datasets across six countries: Spain, France, Germany, Italy, the UK, and the USA. The first includes 94,613 URLs shared by political elites on Facebook and X, used to infer ideological positioning. The second is individual-level web-tracking data from over 7,000 individuals across all countries, capturing actual online news consumption and ideological exposure.

Initial analyses confirm that domain-level scoring masks substantial variation within sites. Among 12,000 stories accessed by users and shared by elites, we observe significant ideological spread. For instance, while The New York Times has an average ideological score of 4.7 (on a 0–10 left-right scale), individual stories reach up to 8.2. This suggests some stories are mobilized by right-wing elites, meaning their consumption by conservatives should not be classified as "cross-cutting" exposure.

The paper proceeds by estimating how domain-level scoring overstates exposure diversity. This helps provide a more accurate and nuanced understanding of ideological segregation in online news consumption across six Western democracies.

POL14 Cross-Cutting Exposure and Affective Polarization

PP 0571 Affective polarization and epistemological beliefs: Audiences beyond journalism

Salla Tuomola[1]

[1] Roskilde University, Communication and Arts, Roskilde, Denmark

Over the past decade, research has increasingly focused on political polarization as an alarming phenomenon that helps explain the fundamental problems that democracy is facing today. Whereas polarization was initially understood in issue-based terms that reflected ideological divide between political groups, research has since also recognized *affective polarization*, marked by growing dislike and distrust between members of opposing political parties, (Iyengar et al., 2019, 2012). The concept denotes an emotional form of division, characterized by antagonistic "us" versus "them" distinctions constructed between individuals who disagree on societal issues (Iyengar et al., 2019). Affective polarization tends to be context-dependent, in that social media use can intensify it, particularly in established democracies (Kubin & von Sikorski, 2021; Lorenz-Spreen et al., 2023). Political polarization has been analysed, for instance, through the fourfold model, which examines the phenomenon along the dimensions of ideology, affect, morality, and epistemology (Lehtonen & Ylä-Anttila, 2024). Within this framework, the interaction between affective and epistemic polarization suggests that information environments can become embedded in political identity: affective polarization intensifies (typically negative) emotions towards out-groups, while epistemic polarization heightens dispute over facts, knowledge, and information sources (ibid.). The growing academic attention to polarization has also drawn criticism. Political polarization has been associated with the global crisis of democracy, but only with little consensus about its meaning and with a range of different subtypes being introduced (Schedler, 2023). Roch et al. (2026) introduce the notion of a *mainstream polarization narrative*, arguing that polarization functions less as a neutral description of political developments and more as a constructed frame that shapes our understanding of the world. This study examines whether affective polarization plays a role when audiences engage with epistemic sources beyond mainstream journalism. By "beyond mainstream journalism" I refer to the emerging

range of other types of epistemic actors serving as news and information brokers, including content curators such as social media commentators, political figures, public discussion groups, and news influencers (Mayerhöffer et al., 2024). Drawing on semi-structured in-depth interviews (N ≈ 20) with users following such new epistemic actors in Finland, the study investigates whether affective polarization is discernible both in the perceptions and behavior of audiences. The study explores whether audiences recognize and assign value to affective experiences in their choices of consuming certain media, epistemic source, or news provider. Moreover, it examines whether these experiences align with and potentially shape their epistemological beliefs. The interviewees include audiences of both politically active and non-active podcasters, alternative media producers, bloggers, writers, and activists active in Finland.

POL15 Polarization in News Media and Public Discourse

PP 0689 The ideology of lifestyle: A large-scale analysis of cross-ideological engagement in non-political digital spaces

João Gonçalves[1]

[1] Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

Political affective polarization and a lack of cross-ideological discussion and tolerance and seen as increasingly pressing issues in Western democracies. In political communication research, online discussion spaces such as newspaper comment sections and blogs are studied because they both represent and shape how cross-ideological discussions take place. However, most research has focused on news comment sections or politician's pages where political talk is more likely to emerge. Apart from a few recent exceptions, political talk outside of political spaces has been understudied, especially from a cross-platform perspective. This is an important gap, given that cross-ideological talk may be more likely in online spaces where ideological identities are less salient. On the other hand, lifestyle enclaves make it plausible that users in non-political spaces are as or even more segregated than those who take part on discussions on the YouTube channels of news organizations or comment on a politician's Facebook page.

This study addresses this gap by asking three key, interrelated questions: 1) Is political talk more ideologically diverse in non-political spaces (e.g. Taylor Swift's Facebook page or r/gaming) than in news and politics (e.g. Facebook page of Bernie Sanders or r/Democrats)? 2) What kind of non-political topics are more likely to yield cross-ideological discussions? 3) Are there platform differences in how political discussions cluster ideologically in non-political spaces? To answer these questions, I collect and analyze 45.9 million comments from 463 Facebook Pages, 421 subreddits, and 312 YouTube channels. I then use state of the art BERT-NLP machine learning classifiers (Krippendorff's Alpha > . 67) to identify if these comments contain political talk and, if so, if they lean ideologically left, right or have a neutral or balanced perspective.

Results show that, in general, non-political spaces are not significantly more or less cross-cutting than political spaces, with the exception of non-profit and activism pages/subreddits/channels, which tend to be less ideologically diverse than news and politics. A fine-grained analysis shows that cross-ideological engagement tends to happen on left-leaning spaces, which are commented by both sides of the political spectrum, while left leaning users seldom comment on right-wing pages, channels or subreddits. Within non-political spaces, cross-ideological talk happens mostly on pages related to comedy and humor. Pages related to politically loaded lifestyle aspects, such as veganism or atheism lean left, while sports pages and certain types on entertainment (e.g. wrestling) lean right. In terms of platform variation, different platforms seem to lead to the emergence of varied political and non-political enclaves. On Reddit, left-wing enclaves emerge on non-political topics, but on YouTube the same takes place on the other end of the spectrum. While ideological enclaves exist on Facebook, they tend to happen mostly on political pages, sometimes counterintuitively. For instance, the Facebook page of Kamala Harris is a right-wing enclave, because it is mostly commented by opposition users disparaging her views.

This research is limited to English language content, making it US centric. Nonetheless, it shed light on non-political spaces as a meaningful contributor for cross-ideological talk, following platform specific dynamics.

POL15 Polarization in News Media and Public Discourse

PP 0690 Measuring ideological discursive polarization among German newspapers through a combination of topic modeling and LLM-based stance detection

Mike Farjam[1], Louisa Pröschel[1], Hendrik Meyer[1]

[1] Hamburg University, Wirtschafts- und Sozialwissenschaften, Hamburg, Germany

Public debates—and Western societies more generally—are widely perceived as drifting apart. Yet longitudinal evidence that demonstrates how media debates diverge across issues and evaluations remains limited, especially in contexts where polarization is not fully institutionalized. Building on discursive polarization theory, this paper focuses on ideological discursive polarization: the idea that debates "break apart" when news actors increasingly emphasize different issue elements and attach systematically different directional evaluations to them, reducing shared discursive ground.

We introduce and validate a computational pipeline that makes this construct measurable directly from news content. The approach combines inductive issue discovery with topic-specific stance estimation and then quantifies how far outlets separate in a multidimensional discourse space. We demonstrate the method in Germany—often characterized as a democratic-corporatist media system with comparatively high journalistic professionalism and lower political parallelism—making it an informative setting to assess whether content-based polarization measurement can detect meaningful divergence even outside strongly aligned systems.

Empirically, we analyze a corpus of roughly 12,000 newspaper articles (2020–2024) from eight mainstream outlets spanning left-leaning and right-leaning camps. The corpus targets four "arenas of conflict" central to contemporary German debates—migration, gender/diversity, climate change, and the Israel–Gaza war as a salient foreign-policy/identity conflict since 2023—identified through broad, arena-level Boolean queries expanded via distributional semantics to avoid pre-structuring the corpus along ideological lines.

Methodologically, the workflow proceeds in five steps: (1) BERTopic recovers fine-grained issues and topic probabilities per article; (2) a large language model (gpt-oss:120b) classifies topic-specific stance on an ordinal scale (-1/0/+1) from stratified samples of high-probability articles per outlet–topic; (3) salience and stance are combined into stance-weighted outlet vectors that locate outlets in a K-dimensional ideological discourse space; (4) cosine distances quantify ideological divergence within and between outlet groups; and (5) the most polarizing topics are identified as those that maximize cross-outlet distance within the learned space. The stance component is formally validated against two trained coders (ordinal Krippendorff's $\alpha \approx 0.78$ for model–human coder agreement; human coder–coder $\alpha \approx 0.78$), supporting its use as an automated coder.

Overall, the paper contributes a transferable, inductive measurement strategy for ideological discursive polarization that does not require pre-defined issue lists or a fixed one-dimensional ideology scale. By recovering issue structure and evaluative separation from the corpus, the pipeline yields comparable, scalable estimates of discursive divergence and pinpoints the concrete topics driving it—turning an otherwise abstract theoretical claim about "debates breaking apart" into a reproducible set of estimators for computational communication research.

POL15 Polarization in News Media and Public Discourse

PP 0691 Media as a catalyst for polarization? Understanding the influence of (digital) media on affective and perceived polarization

Sanne Kruikemeier[1], Svenja Schäfer[1], Annelien van Remoortere[1], Sanne Tamboer[1], Rens Vliegenthart[1], Susan Vermeer[1], Emma Turkenburg[1]

[1] Wageningen University, Strategic Communication Group, Wageningen, Netherlands

The relationship between media use and democratic processes has become increasingly important to current societal and academic debates. There has been a strong focus on the role of (social) media in shaping polarization within societies. A key focus here is on affective polarization, defined as the tendency to evaluate one's own group positively and other groups (often political opponents) negatively (Iyengar et al., 2012; Gidron et al., 2020). Additionally, perceived polarization is receiving increased attention, as citizens generally overrate the degree of polarization in their countries and have democratic consequences on its own (Enders & Armaly, 2019).

Previous work suggests that affective polarization may undermine trust in democracy and its institutions (Graham & Svolik, 2020; McCoy & Somer, 2019), though more recent studies report mixed effects on democratic support, ranging from negative associations to null findings (Broockman et al., 2023; Voelkel et al., 2023; Van Remoortere & Vliegenthart, 2024). However, in the literature, traditional and social media are often cited as catalysts of polarization (Kruikemeier & Vliegenthart, 2024).

Nevertheless, a review of the state-of-the-art reveals that important scholarly challenges in understanding these dynamics remain (Kubin & Von Sikorski, 2021). For instance, the existing literature focuses heavily on the United States, and negative narratives about media effects dominate. Research has also focused less on a diverse set of media usage by citizens, which

may differentially impact both affective and perceived polarization. This study addresses these gaps by examining how diverse forms of media use relate to affective polarization and perceptions of polarization.

In the run-up to the national elections in the Netherlands of 2025 and immediately thereafter, we surveyed the same group of respondents five times about their media use, political preferences, and attitudes (N = 3,000 in wave 1, conducted in early September, and N = 2,461 in wave 5, conducted in the week following the election in November). We used a representative sample of the Dutch population.

The findings show nuanced results that challenge dominant assumptions about the polarizing influence of social media. Interestingly, media use plays only a small role in explaining affective polarization, which is largely stable and mainly related to political interest rather than media usage. Hence, social media use shows no significant effects. Media use is, however, more strongly influencing perceived polarization, especially through online news consumption. Commercial television is, conversely, linked to lower perceptions and concerns about polarization. These results highlight the importance of making a difference between actual and perceived polarization and call for more research into how specific (social) media content features impact various forms of polarization

POL15 Polarization in News Media and Public Discourse

PP 0692 Feuding, voting, settling down? Tracing perceived online incivility across four national elections

Eliza Mitova[1], Laia Castro[2], Michael Amsler[1], Pamina Syed Ali[1], Yuan Zhang[1], Frank Esser[1]

[1] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland
[2] University of Barcelona, Department of Political Science, Barcelona, Spain

How do citizens perceive political incivility on social media, and do these perceptions shift as elections unfold? Perceptions of political incivility matter: they can normalize the erosion of democratic norms, undermine mutual trust, and discourage participation among more moderate, risk-averse citizens. Because incivility is partly "in the eye of the beholder" (Herbst, 2010, p. 3), understanding how citizens perceive norm transgressions and under what conditions these perceptions shift is essential. How citizens experience incivility, however, is further shaped by the medium on which they encounter political information (Sydnor, 2020). Social media platforms, in particular, possess distinct characteristics, such as enabling impulsive and anonymous communication and algorithmically promoting ideological homophily, that can actively foster uncivil discourse (Sude & Dvir-Gvirsman, 2023). Against this background, we examined how perceptions of political incivility on social media changed from pre- to post-election based on country contexts and individual characteristics, drawing on social identity theory and motivated reasoning. Building on and synthesizing previous conceptualizations by, e.g., Muddiman (2017), Papacharissi (2004) and Bentivegna & Rega (2022), we distinguished between *personal-level incivility directed at individuals,* violating politeness norms through, e.g., personal attacks, and *public-level incivility directed at sociopolitical entities,* transgressing against deliberative and democratic norms such as protecting democratic freedoms. Empirically, we utilized a two-wave panel survey with samples representative of age (18+) and gender across four nations (BRA, ESP, SUI, USA; *N = 2908*), reflecting different media and political systems, in the weeks leading to and following their national elections (2022–2024). At the *micro-individual level,* findings suggest that cross-cutting exposure is positively associated with incivility perceptions, whereas post-election increases in affective polarization are linked to decreased perceptions of incivility. Contrary to expectations, electoral *winners* reported higher perceived incivility than losers. Generally, incivility perceptions remained moderately stable and were not strongly predicted by dispositional traits. These results suggest a "desensitization" dynamic: persistent exposure to online incivility may diminish the perceived severity of norm transgressions. At the *macro-national level,* important cross-national variation emerged. In Brazil's highly polarized environment, perceptions of incivility increased post-election, consistent with citizens' heavy social media reliance and intense elite rhetoric surrounding the close outcome. In Spain, perceptions did not shift significantly after the parliamentary elections, possibly reflecting that coalition-building outcomes remained unresolved. In contrast, Switzerland and the United States both saw decreases in perceived incivility. Notably, in three of four countries, personal-level incivility was perceived as more prevalent than public-level incivility, with Spain as the exception. These divergent findings suggest that incivility perceptions are primarily shaped by meso- and macro-level factors, specifically the national political context and its electoral landscape. Taken together, our study advances current scholarship on political incivility perceptions and their interaction with factors at the micro, meso and macro levels. Ultimately, the findings highlight the importance of preserving deliberative spaces that safeguard democratic norms, especially in an environment where the public may become desensitized to incivility.

POL16 Navigating the Post-Truth Frontier: Quality of Political Communication and Disinformation Resilience in Central and Eastern Europe

PN 59 Quality political communication in the age of disorder: Comparing actors' perceptions in Poland, Canada, the UK, and France

Barbara Brodzińska-Mirowska[1], Damian Guzek[2], Emilia Moddelmong-Anweiler[3], Katharine Dommett[4], James Weinberg[5], Karolina Koc-Michalska[6], Elisabeth Dubois[7]

[1] Nicolaus Copernicus University, Faculty of Philosophy and Social Science, Toruń, Poland

[5] The University of Sheffield, School of Sociological Studies Politics and International Relations, Sheffield, United Kingdom
[6] Audencia Business School, Communication culture & languages, Paris, France
[7] University of Ottawa Canda, Department of Communication of the Faculty of Arts, Ottawa, Canada

The political actors directly responsible for creating public messages conceptualize the notion of "quality" within the tension of deliberation and efficacy (Coleman & Blumler 2009). While recent scholarship has extensively analyzed communication effects on audiences (Stier et al. 2018; Dimitrova et al., 2011; Pennycook & Rand, 2019), there remains a notable lack of insight into how politicians themselves define the criteria for high-quality, trustworthy interaction within a destabilized information environment. Consequently, this study aims to investigate how politicians across the examined countries perceive political communication and which specific elements of their messaging are intended to foster trust among voters. This research examines the internal standards that practitioners use to evaluate their own work and the perceived effectiveness of various communicative strategies in creating a credible public image. This study draws on an ambitious, ongoing cross-national research project, „PODTRUST," that involves 200 semi-structured in-depth interviews (IDIs) with political practitioners and members of the public in Poland, Canada, the United Kingdom, and France. The analysis identifies specific communication formats, message types, and content structures that practitioners believe are essential for fostering institutional trust and building resilience against manipulation. By comparing the perspectives of actors from a Central and Eastern European (CEE) context with those from transatlantic democracies, the paper explores whether a universal standard of communicative excellence is emerging or if professional ethics remain tied to specific political cultures. The results suggest that high-quality communication serves as a strategic defense against non-constructive processes, such as polarization and disinformation. By examining the practitioners' viewpoint, the study highlights how transparency, consistency, and professionalized content structures are perceived as vital tools for maintaining voter engagement. Methodologically, the scale of this qualitative study presents a rare opportunity to examine the internal logic and strategic choices of political creators, offering a nuanced perspective on the future of democratic deliberation and the practical mechanisms of trust-building in contemporary politics.

POL16 Navigating the Post-Truth Frontier: Quality of Political Communication and Disinformation Resilience in Central and Eastern Europe

PN 60 Journalism quality across Central and Eastern Europe: Autonomy and journalistic roles

Agnieszka Węglińska[1], Katarzyna Konarska[1], Anda Rožukalne[2]

[1] University of Wrocław, Faculty of Social Communication and Media, Wrocław, Poland
[2] Riga Stradiņš University, Faculty of Social Sciences , Riga, Lithuania

This presentation explores findings from the Worlds of Journalism Study, focusing on journalism quality in Central and Eastern Europe. This study examines key dimensions of journalistic professionalism in selected Central and Eastern European (CEE) countries, taking into account their shared historical and political legacies. It examines how professional autonomy, news verification practices, and strategies to counter fake news shape journalistic roles in polarized societies. The discussion highlights comparative insights from the third wave of research and reflects challenges and future directions for journalism in the region. Data from the Worlds of Journalism Study (WJS3) show that Latvian journalists report a high degree of perceived professional autonomy: 82.9% indicate full freedom in selecting stories and 87.9% in emphasizing particular aspects of them. At the same time, only 39.4% believe that media freedom is fully realized in Latvia. Previous research has identified the coexistence of three competing journalistic cultures in Latvia, differentiated by their approach to accountability (Dimants, 2018): a traditional Russian journalism culture in ethnic minority media; an instrumental, post-Soviet culture marked by political and economic dependence; and a professional culture oriented toward high ethical standards and editorial autonomy. While Latvian journalists overwhelmingly endorse the roles of detached observer and watchdog and emphasize the importance of professional ethics, survey data also reveal internal contradictions. More than half of journalists consider ethical decisions to be a matter of personal judgment, and around one third agree that ethical standards may be suspended under extraordinary circumstances. At the same time, Latvian journalists perceive commercial rather than political pressures as the dominant influence on their work (Rožukalne, 2020). The need to reconcile professional values with market imperatives and responsibility for organizational performance fosters self-censorship and conformism in journalistic practice (Schimpfössl et al., 2020; Rožukalne, 2020). More broadly, Latvia and the Baltic States are often

analysed within the wider CEE context, without sufficient attention to their specific historical media cultures. Research on post-socialist media systems has highlighted persistent challenges, including political influence, insufficient funding of public service media, clientelistic relations with sources, and ethical dilemmas (Balčytienė, 2012; Balčytienė, 2015; Dobek-Ostrowska, 2015; Örnebring, 2012; Bajomi-Lázár, 2015; Dimants, 2018). Jakubowicz (2004) critically questions the application of Western normative benchmarks to CEE media, arguing that processes of imitation and mimetic development have led to hybrid media systems in which elements of "old" and "new" logics coexist. As a result, attempts to replicate Western media models have often failed to overcome path-dependent, "atavistic" patterns of media development in CEE countries (Gross, 2004).

POL16 Navigating the Post-Truth Frontier: Quality of Political Communication and Disinformation Resilience in Central and Eastern Europe

PN 61 The destabilising impact of media politicisation on journalist employment security in Central and Eastern Europe

Magdalena Mateja[1]

[1] Nicolaus Copernicus University, Faculty of Philosophy and Social Sciences, Toruń, Poland

This study investigates the intersection of political influence and the professional stability of journalists in Poland, Slovakia, and Ukraine. Over the last decade, these Central and Eastern European (CEE) nations have experienced significant structural shifts marked by increased state interference in the media sector. Using a secondary data analysis of academic literature, legal documents, and detailed press reports, this research examines how political pressures actively reshape the working conditions and autonomy of media professionals. To establish a solid analytical framework, the research applies an interdisciplinary model combining insights from security studies, organizational psychology, labor economics, and law. This approach is specifically tailored to the institutional realities of CEE media systems, where the transition toward democratic standards remains an ongoing challenge. The findings indicate that political interventions have systematically undermined employment security by replacing professional merit with political loyalty as the primary criterion for career longevity. The impact of this trend goes beyond individual job precariousness. The erosion of journalistic independence fundamentally degrades the quality of political communication. As newsrooms are pressured to adopt partisan narratives, their capacity to facilitate objective public discourse is severely diminished. This research demonstrates that when job security depends on political subservience, the flow of information becomes distorted, which in turn reduces transparency and prevents citizens from making truly informed decisions. Ultimately, the politicization of media employment does not just threaten professional standards; it weakens the very foundations of the democratic order. By exploring these internal labor dynamics, this study directly addresses the themes of the panel, illustrating how professional vulnerability in journalism serves as a critical entry point for disinformation and the erosion of truth in the region.

POL16 Navigating the Post-Truth Frontier: Quality of Political Communication and Disinformation Resilience in Central and Eastern Europe

PN 62 The spiral of silence in Poland's security debate: Public opinion on military involvement in Ukraine

Tomasz Gackowski[1], Karolina Brylska[1], Adam Balcerzak[1], Marlena Sztyber-Popko[1]

[1] University of Warsaw, Faculty of Journalism Information and Book Studies, Warsaw, Poland

This presentation examines the phenomenon of the spiral of silence in Polish political discourse through the lens of one of the most pressing security questions facing Central and Eastern Europe: the potential deployment of Polish troops to Ukraine. Drawing on a representative CATI survey of 1,100 adult Poles conducted in May 2025 by the Laboratory of Media Studies at the University of Warsaw, this study reveals critical insights into how citizens navigate controversial political topics in an increasingly polarized information environment. The survey consisted of a form concerning the socio-demographic characteristics of the respondents, as well as the main part, divided into six short cafeteria questions. The research demonstrates that while 65% of Poles oppose sending troops to the Ukrainian-Russian border, and nearly 60% believe the majority shares their position, only 52% would be willing to express this opinion publicly to strangers. This gap between private conviction and public expression exemplifies Elisabeth Noelle-Neumann's (1974) spiral of silence theory, wherein individuals withhold opinions they perceive as unpopular due to fear of social isolation. The findings reveal significant demographic variations: men express stronger certainty about both their positions and perceived social consensus, while women demonstrate greater caution and ambivalence. Age and education also emerge as differentiating factors in willingness to engage in controversial political discussions. These (and other) results of the study illuminate fundamental challenges to deliberative democracy in the CEE region. The reluctance to openly discuss contentious security issues- even when respondents hold firm private opinions- suggests a communicative environment where political polarization inhibits genuine public debate. This self-censorship dynamic creates fertile ground for echo chambers and allows dominant media narratives to operate unchallenged, ultimately distorting the public sphere's representative function. The study contributes to understanding disinformation resilience by demonstrating how the quality of political communication is undermined not only by external manipulation but also by internal psychological mechanisms that discourage citizens from participating in

democratic deliberation. In the CEE context, where historical experiences with authoritarianism have created particular sensitivities around political expression, these patterns may be especially pronounced. The research – which will be discussed in the broader context of similar studies (eg. Badora 2025, Dojwa-Turczyńska 2023, also IPSOS and CBOS studies, as well as Eurobarometer reports of 2025)- suggests that strengthening democratic discourse requires not only combating false information but also addressing the social and psychological barriers that prevent citizens from engaging authentically with controversial topics. Understanding these dynamics is essential for developing communication strategies that can rebuild trust and encourage genuine political participation in the post-truth era.

POL17 Propaganda, Telegram, and Algorithmic Information Warfare

PP 0684 The laziness of the crowd: Selective attention among raters risks undermining the efficacy of X's community notes program

Morgan Wack[1], Patrick Warren[2]

[1] University of Zurich, Department of Media and Communication Research IKMZ, Zurich, Switzerland
[2] Clemson University, Economics Department, Clemson, USA

Crowdsourced moderation systems such as X's Community Notes program have emerged as promising alternatives to professional fact-checkers for combating online misinformation at scale. While prior research has examined the effectiveness of such systems in reducing engagement with false content and their vulnerability to partisan bias and coordinated manipulation, we identify a previously untested mechanism linking claim plausibility to systematic non-participation by crowdsourced raters. We hypothesize that claims requiring less cognitive effort to evaluate, specifically those that are obviously false and easy to refute, are more likely to receive public notes than claims that are more plausible and require greater cognitive effort to debunk.

Our theoretical framework draws on dual-process theories of cognition and extends Pennycook and Rand's (2019) influential "lazy, not biased" account of misinformation susceptibility to the fact-checking process itself. Just as individuals may accept plausible misinformation due to insufficient cognitive engagement, we propose that raters in crowdsourced systems may be less likely to invest the effort required to evaluate and rate notes addressing nuanced false claims. This represents an extension of the cognitive miser framework from individual news consumption to collective fact-checking behavior, revealing what we term the "laziness of the crowd."

Using two years of vaccine-related Community Notes data comprising 2,865 posts and crowdsourced believability ratings from 382 survey participants, we test whether the perceived plausibility of false claims predicts the likelihood of proposed notes achieving "helpful" status. We focus on COVID-19 vaccine misinformation as a least-likely case for effort avoidance given the topic's high salience and moral charge. These are conditions under which motivated engagement should be maximal. Our design allows us to distinguish plausibility effects from partisan bias by collecting ratings across the political spectrum and controlling for respondent characteristics.

Results confirm our hypotheses across all three measured dimensions. Posts rated as more personally believable were significantly less likely to receive notes (OR = 0.89, p = .034), with highly believable posts showing a 34% relative reduction in note probability compared to implausible posts. Effects were stronger for perceived audience believability (OR = 0.84, p = .003, representing a 48% relative reduction) and strongest for fact-checking difficulty (OR = 0.80, p < .001, representing a 56% relative reduction). Posts rated as most difficult to fact-check had only a 4% probability of receiving a note compared to 9% for those rated easiest, representing a halving of an already rare outcome.

These findings reveal a fundamental tension in crowdsourced content moderation with significant implications for moderation efforts and broader political communication strategies for managing potentially harmful online content. Our findings suggest that one of the most dangerous misinformation, plausible claims that can readily deceive audiences, may be precisely the content least likely to receive corrective annotations. As Community Notes-style systems spread to other large platforms such as YouTube, Meta, and TikTok as replacements for human moderators, understanding these cognitive constraints becomes increasingly urgent for democratic discourse. We conclude by proposing design interventions including hybrid routing systems, differential incentive structures, and automated nudges to mitigate plausibility bias in crowdsourced moderation.

POL17 Propaganda, Telegram, and Algorithmic Information Warfare

PP 0685 Algorithmic deceptions: An LLM-assisted analysis of Russian propaganda curation on search engines

Ilaria Vitulano[1], Elizaveta Kuznetsova[1], Mykola Makhortykh[2], Martha Stolze[1], Maryna Sydorova[2], Victoria Vziatysheva[2], Manuel Tonneau[3]

[1] Weizenbaum Institute, Platform Algorithms and Digital Propaganda, Berlin, Germany
[2] Bern University, Institut für Kommunikations- und Medienwissenschaft, Bern, Switzerland
[3] University of Oxford, Oxford Internet Institute, Oxford, United Kingdom

The influence of Russian propaganda on global public discourse has been a major concern for democratic societies, particularly since Russia's full-scale invasion of Ukraine. However, despite a plethora of literature on Russian digital propaganda, we

still lack a comprehensive account of how online platforms manage problematic content produced by the Kremlin and how their algorithms shape information environments where users are exposed to propaganda-related topics. To remedy this limitation, our paper uses a mixed-method approach, combining agent-based algorithmic audit and large language model (LLM)-assisted content analysis to process a large multilingual set of data of search engines' performance in the context of Russian propaganda. We compare the world's most used search engines Google, Bing, Yandex, and DuckDuckGo in six countries (USA, India, Qatar, Brazil, Poland, Germany), which are to various degrees targeted by the Russian propaganda campaigns, and use a structured corpus of propaganda statements based on dimensionality analysis translated into nine languages (English, Spanish, Portuguese, German, Hindi, Polish, Arabic, Russian, and Ukrainian). Our preliminary analysis highlights the profound impact of language, search query phrasing, and topic of search on the outputs, which has major implications for the algorithmic information curation and the selection of outputs resulting from it. Particularly, we notice a concerning drop in the quality of sources retrieved by search engines when users search for propaganda-related topics, which varies across individual search engines. This shows how the phrasing of propaganda-related queries can fundamentally change the type of information environment on search engines and result in different exposure to propaganda content. Moreover, our analysis shows that Russian propaganda has a strong influence on what political knowledge users are exposed to with some queries related to the most common Russian propaganda frames, such as anti-Western and anti-EU messaging messaging, resulting in strongly pro-Russian information environments. This finding is troubling due to search algorithms potentially facilitating the spread of Russian propaganda and doing it in a differentiated manner (thus complicating its detection) and points to the importance of a comprehensive understanding of information environments surrounding critical political topics and the role of algorithmic systems.

We further argue that there is a need for a comprehensive understanding of the information environments surrounding critical political issues and of the role algorithmic systems play in shaping them.

POL17 Propaganda, Telegram, and Algorithmic Information Warfare

PP 0686 Telegram contextualized: A comparative study of public Telegram channels in six European countries

Kostiantyn Yanchenko[1], Edda Humprecht[1], Julian Kauk[1]

[1] Friedrich-Schiller University Jena, Institute of Communication Science, Jena, Germany

In recent years, Telegram has grown rapidly and attracted the attention of political communication scholars (e.g., Buehling & Heft, 2023). While its use is particularly widespread in parts of the Global South, the platform also plays a growing role in interpersonal communication and news consumption in Europe (Newman et al., 2025).

Existing research shows that Telegram's role varies substantially across different media and political systems (e.g., Urman et al., 2021). Because the platform lacks centralized algorithmic content curation, users' experiences depend largely on which actors are dominant in a given context and on the types of content they produce. However, the lack of systematic comparisons of Telegram environments makes it difficult to contextualize the platform's role for different audience segments.

To address this gap, our study takes a comparative approach and examines the distribution of actor types and the content they produce on Telegram in six European countries with large user bases and differing information environments: Germany, Italy, Russia, Serbia, Turkey, and Ukraine. We analyze the most-followed public Telegram channels in each country (n = 6,000), identified through a snowball sampling strategy based on the Telegram API and the Telethon Python library, using country-specific seed lists from Telemetr.io. Linguistic filters and URL-based classification were applied to retain channels intended primarily for the respective national audiences.

The analysis focused on the theoretical dimension of institutional presence, defined as the extent to which a given Telegram segment was dominated by institutional actors—such as governments, public agencies, political parties, and legacy media—rather than by non-institutional actors, including influencers, anonymous individuals, and loosely organized groups. Institutional presence was measured through channel-level actor classification based on manually validated automated content analysis. In addition, we analyzed the dominant topics addressed by each channel to assess how institutional involvement varies across different issue areas. To identify dominant topics, BERTopic was applied to randomly sampled messages from each channel.

Findings show clear cross-national differences in institutional presence and dominant topics. In Ukraine, and to a lesser extent Russia, institutional actors account for a substantially larger share of prominent Telegram channels than elsewhere. In Italy, Turkey, and Serbia, institutional actors are less prominent, and highly followed channels more often focus on commercial, gambling-related, or cryptocurrency-related content. Germany also shows low institutional presence; however, political topics remain prominent and are addressed mainly by non-institutional actors, including journalists speaking in a personal capacity, and influencers. The proposed approach allows one to assess Telegram's political relevance across contexts and the extent to which it reflects the broader information environment or constitutes an alternative ecosystem.

POL17 Propaganda, Telegram, and Algorithmic Information Warfare

PP 0687 Shifting narratives: A comparative analysis of Ukrainian and Russian policymakers' Telegram communication before and after Russia's full-scale invasion of Ukraine

Mykola Makhortykh[1], Aytalina Kulichkina[2], Kateryna Maikovska[2]

[1] Universität Bern, Institut für Kommunikations- und Medienwissenschaft, Bern, Switzerland
[2] University of Vienna, Department of Communication, Vienna, Austria

This study examines elite-driven political communication on Telegram during the Russo-Ukrainian war, the first large-scale European war in the social media era. We use a unique dataset of all Telegram channels of the current policymakers in Ukraine and Russia and analyze 1,178,231 Telegram public posts from 2019 to 2024. We investigate the changes in the communication volume, thematic content, and actor engagement following Russia's 2022 full-scale invasion, combining descriptive statistics and computational text analysis. In particular, we use dynamic topic modelling based on BERTopic with manual topic validation and interpretation by the authors.

First, our findings show a sharp increase in Telegram activity after the invasion, particularly among ruling-party policymakers in both countries. This manifested in the increase in the number of active Telegram channels and the volume of posting. This increase indicates that the invasion has been perceived as a major communication challenge in both countries, prompting policymakers to respond.

Second, the dynamic topic modeling shows that Ukrainian policymakers initially focused on war-related topics together with other news and international relations, however, the emphasis on war declined over time. In contrast, Russian policymakers largely avoided war-related topics, instead emphasizing unrelated news, social and economic issues, as well as crises in the West and historical narratives, which may suggest an effort to distract public attention.

Third, we identify differences in communication strategies between representatives of large and small political parties, as well as individual policymakers. On the party level, we identified differences between large parties engaging with a broad range of topics, and smaller parties specializing in a narrower set of issues, for instance, economy or traditional values. On the individual level, we noted differences depending on the topic: Some topics were led by small groups of policymakers, whereas for other topics the engagement was more diffused across actors.

Our findings provide insights into how elite-driven wartime communication functions online. Specifically, we show that for autocracies, like Russia, it may be easier to streamline governmental communication responses in states of emergency compared to democracies, even when considering the less controlled social media environments. Besides, we demonstrate that while war-related news constitute a part of the policymakers' wartime communication, their discourse is not limited to war-related topics and even may strategically focus on other matters to divert attention. Both in Ukraine and Russia, policymakers continued posting on other topics, from economics and public policies to holiday greetings, thus making the wartime discourse kaleidoscopic, rather than exclusively war-focused or war-evading. Thus, our findings contribute to the literature on mediatization of war and political communication by presenting a unique longitudinal analysis of how policymakers adapt their messaging during wartime. Additionally, this study enhances our understanding of how varying political regimes navigate the communication challenges posed by hybrid warfare. It highlights the importance for democracies to develop comprehensive emergency communication strategies that balance efficiency with the preservation of democratic pluralism, enabling them to effectively confront the more centralized and streamlined communication approaches characteristic of autocracies.

POL17 Propaganda, Telegram, and Algorithmic Information Warfare

PP 0688 Strategic communication in times of conflict: How political violence is justified

Moritz Bürger[1]

[1] University of Passau, Chair of Science Communication, Passau, Germany

Despite its widespread use, political violence is almost universally rejected from a normative perspective (Sabucedo et al., 2002). This puts pressure on violent actors to justify their actions in order to generate public support and mobilise combatants. While many studies focus on the journalistic coverage of war (e.g. Roman et al., 2017), intrastate conflicts (e.g. Haigh & Bruce, 2017), or terrorism (e.g. Falkheimer & Olsson, 2015), violent actors' strategic communication has attracted limited attention. The existing research points towards differences in legitimation strategies between actors with differing degrees of power, but comparative studies are scarce (e.g. Hamdy & Gomaa, 2012). Thus, the study aims to answer two research questions:

RQ1. Which communication strategies do political actors use to legitimise their violence?
RQ2. To what extent do these communication strategies differ with regard to the types of actors?

The study draws on Beetham's (2013/1991) three-dimensional concept of legitimacy, encompassing observance of established rules, justification by reference to shared beliefs, and demonstrable public consent. The communication strategies derived from this concept are operationalised as legitimation statements consisting of (1) a speaker, (2) an object whose legitimacy is evaluated, (3) the evaluation (positive/negative), and (4) an argument that establishes the criteria on which the evaluation is based (cf. Kleinen-von Königslöw et al., 2019).

To answer the research questions, a quantitative manual content analysis was conducted. The material was sampled from publicly accessible PR and propaganda materials published by nine actors involved in four conflicts. These actors vary with regard to their degree of power, including two decision-makers (the presidents of Ukraine and the US), two challengers with access to formal political decision-making and their military wings (Kurdish actors in Syria and Republican actors in Northern Ireland), and two outsiders without access to formal decision-making (the Islamic State and the Red Army Faction). The two coders achieved satisfactory reliability scores (Krippendorff's Alpha: M = .89) and coded a sample of 387 texts. Here, they identified 5,691 legitimation statements on which the empirical analyses are based. The study is currently in an early stage of data analysis. Preliminary results show that most actors discuss ingroup and outgroup legitimacy to a similar extent. As expected, an overwhelming majority of statements evaluates the legitimacy of an actor's ingroup positively (99.2% of all statements about the ingroup) and their outgroup's legitimacy negatively (99.7% of all statements about the outgroup). When it comes to arguments relating to the first dimension of legitimacy, informal rules such as traditions (0.4%/0.5% of all positive/negative action-related statements) or following charismatic leaders (2.7%/0%) are rarely cited. More important are arguments based on the legality/illegality of actions (30.9%/63.8%), such as claims of acting in self-defence or accusations of terrorism. These findings are in line with previous research. More comprehensive results, also including the other dimensions of legitimacy, will be presented at the conference to fully deliver on the study's contributions: first, a comparative perspective on legitimacy as a central concept for understanding power relations, and second, an expanded application of legitimacy theory beyond state actors.

POL18 Climate, Energy, and Polarizing Political Issues

PP 0796 From average to anti-climate: Explaining radical right party position shifts through frame profiles

Jonas Baur[1]

[1] University of Fribourg, Communication and Media research, Fribourg, Switzerland

Recent developments in many Western European democracies indicate that climate change has become an increasingly contested issue. One explanation is the adoption of anti-climate policy positions from radical right parties (RRP) coupled with their electoral success. RRP have shifted their position on climate change policy from an approximately average position to a clear anti-climate position in the last two decades (Dickson and Hobolt 2024). This striking example of a policy position shift is the focus of this study. Although there is a rich literature on when and why parties shift their policy positions, only scant evidence exists on *how* parties reposition. I explain the strategic communication when shifting position with the novel concept of *frame profiles*. Frame profiles of parties reflect the mix of frames parties use in their communication about an issue analogous to issue profiles (Wagner and Meyer 2014). I argue that RRP's climate change frame profiles did not only change considerably in the last 15 years but also became aligned with their immigration frame profiles. Thus, climate change is increasingly treated as a wedge issue by radical right parties. Extending the PARTYPRESS data set (Erfort et al. 2023) with party press releases from Switzerland and France, the empirical analysis is currently based on press releases from 10 radical right parties across 9 Western European countries (2010–2025). To measure RRP's frame profiles on climate change, I use a transfer learning approach and fine-tune a pre-trained transformer model to classify generic frames as well as an inductive LLM approach (Kubli 2025) to classify issue-specific frames. The results will have important implications for research on party communication strategies and shed light on the role of parties in tackling climate change. While climate change is a global problem, national-level actors, such as political parties, remain crucial in the fight against it.

POL18 Climate, Energy, and Polarizing Political Issues

PP 0797 What fuels the fire? Identifying polarizing content in climate crisis news coverage

Lisa Merten[1], Katharina Esau[2], Patrick Zerrer[3], Cornelius Puschmann[3], Paul Pressmann[3], Samantha Vilkins[2], Carly Lubicz-Zaorski[2], Axel Bruns[2], Felix Münch[4], Ahrabhi Kathirgamalingam[5]

[1] Leibniz Institut für Media Research - Hans-Bredow-Institut Hamburg, Media Use and Media Effects, Hamburg, Germany
[2] Queensland University of Technology, Digital Media Research Centre, Brisbane, Australia
[3] University of Bremen, ZeMKI, Bremen, Germany
[4] GESIS - Leibniz Institute for Social Science, Knowledge Technologies for the Social Sciences, Köln, Germany
[5] GESIS - Leibniz Institute for Social Science, Transparent Social Analytics, Köln, Germany

There is extensive research on the relationship between polarized political attitudes and potentially polarizing media content (e.g. Kubin & von Sikorski 2021; Kreiss & McGregor 2023). Media effects on polarization are often discussed in the context of counter-attitudinal or incivil media content (e.g. Bail et al. 2018; Druckman et al. 2019), yet surprisingly little is known about which specific textual features make media content polarizing. This study addresses that gap by developing, implementing, and validating a theory-driven, multi-layered computational framework for detecting symptoms of polarization in news content.

While not all forms of polarization pose a threat to democracy, we focus on a form that has been theorized as inherently harmful: destructive polarization (Esau et al. 2025) denotes communicative practices that undermine the functioning of the democratic public sphere and marks the point at which communication dynamics erode citizens' ability to understand one another and participate meaningfully in collective decision-making. Esau et al. identify five symptoms that signal such dynamics: breakdown of communication, discrediting and dismissing of information, erasure of complexities, disproportionate attention to extreme voices, and exclusion through emotions.

Our paper operationalizes these symptoms in news texts by integrating conceptual refinement with state-of-the-art computational content analysis, including the use of Large Language Models. As a pilot domain, we focus on climate crisis news coverage, an issue that is both socially consequential and empirically linked to polarized public reactions.

We propose a modular operationalisation strategy that translates each symptom into measurable textual indicators. To capture, for example, the symptom of breakdown of communication - understood as opposing sides failing to engage or engaging only in hostile ways - we measure patterns of speaker attribution, (in)direct speech, stance diversity, and toxicity levels. Discrediting and dismissing of information is identified through a pipeline combining named-entity recognition, claim extraction, and detection of delegitimising cues. Exclusion through emotions is captured via targeted emotion detection, derogatory-term identification, and out-group-directed toxicity. All modules feed into an integrated indicator architecture in which symptoms of destructive polarization are quantified as continuous, non-binary dimensions and systematically tested across German and English news corpora. Because single articles often provide too little information to exhibit multiple symptoms, our framework supports aggregated analyses (e.g., by outlet, topic, or time period).

Before ECREA, we will not only complete and validate the automatic measurement of these indicators but also test whether exposure to indicators of destructive polarization has a measurable association with polarized attitudes. We do so using a large-scale German panel dataset combining passive web-tracking and survey data (N ≈ 2,600; 2022–2023). By matching exposure to articles containing symptom indicators to respondents' climate-related attitudes, we assess whether correlations between indicator exposure and polarization emerge in vivo. Symptom indicators that reliably predict shifts in polarized attitudes will be designated empirically consequential and applied to larger news corpora.

By presenting an empirically validated operationalisation of destructive polarization in text, our study advances methodological standards, offers a scalable toolkit for diagnosing destructive dynamics in public discourse and lays the groundwork for future comparative and longitudinal analyses.

POL18 Climate, Energy, and Polarizing Political Issues

PP 0798 Preempting, facilitating, and coping with polarization: Democratic resilience in contested energy transitions

Emilija Gagrcin[1]

[1] University of Bergen, Department of Information Science and Media Studies, BERGEN, Norway

Across Europe, accelerated energy transitions are unfolding in the context of multiple, overlapping crises, including climate change, geopolitical reordering, economic stagnation. Manifesting global issues at the local level, sustainable energy projects combine high political urgency with localized decision-making, asymmetries of power, and material interventions into everyday environments [1,2], making them a revealing context for studying *polarization* as a communicative process that actively (re)shapes citizen participation in local energy transition [3,4]. Building on Esau et al., I understand polarization as a *dynamic* produced through communicative practices that are not problematic per se but can become democratically dysfunctional (or "destructive") when they erode reciprocity, amplify antagonism, and undermine trust in democratic procedures [5].

Existing research on energy transition conflicts in Germany focuses mostly on procedural participation or media framing, often framed through acceptance vs. opposition [4,6]. In contrast, this paper conceptualizes contested energy transitions as ongoing democratic problems in which conflict is legitimate, but communicative conditions fragile [4,7]. Accordingly, this paper asks: **How is polarization anticipated and managed in contested energy transitions?**

Empirically, the study draws on an ongoing multi-sited ethnography of wind power rollout processes in the German federal state of Baden-Württemberg. I follow planning and contestation across multiple municipalities through participant observation at public meetings, stakeholder interviews, field visits to designated sites, and analysis of local media coverage.

Preliminary finds show that institutional actors deploy preemptive communication formats to establish legitimacy and avoid escalation, often explicitly seeking to prevent local referenda that are widely perceived as polarizing rupture points [7]. Second, civil society organizations both facilitate and cope with polarization. While mobilization through a certain level of polarization is intrinsic to all organisations' role, right-wing leaning NGOs strategically favor referenda (Bürgerbegehren) as emotionally charged, majoritarian events that profit from populist rhetoric [4], while nature protection organizations engage in narrative buffering, counter-framing, and emotional regulation to sustain participation under strain [10]. Third, citizens develop everyday coping strategies within families and neighborhoods, including selective reframing, early de-escalation, and strategic disengagement [11]. Across all actor groups, lateral learning plays a key role, as actors compare their situations to nearby communities where conflicts have escalated and adjust communicative strategies accordingly [9,12].

The paper advances the concept of **anticipatory democratic resilience**, understood as practices aimed at maintaining participatory conditions before destructive polarization consolidates [5,8,9]. Implications for democratic resilience as a communicative process are discussed.

POL18 Climate, Energy, and Polarizing Political Issues

PP 0799 AI-generated versus journalist-produced news. Exploring the role of news source and content accuracy in climate change communication

Andreea Stancea[1], Raluca Buturoiu[1], Nicoleta Corbu[2]

[1] National University of Political Studies and Public Administration, Digital Communication and Emerging Media Department, Bucharest, Romania
[2] National University of Political Studies and Public Administration, Department of Communication, Bucharest, Romania

Communicating about climate change and its consequences is very challenging. In contemporary digital environments, where journalistic reporting increasingly coexists with AI-generated information, concerns about credibility, misinformation, and public trust have intensified. In such a context, the present study examines how the source (AI-generated vs. journalist-generated) and accuracy (evidence-based vs. misleading) of climate change news shape citizens' attitudes and behavioral intentions across three Eastern European countries: Romania, Bulgaria, and the Republic of Moldova. By adopting a comparative perspective, the study addresses an important gap in climate communication research, particularly in contexts marked by different, but comparable levels of media trust, political polarization, and exposure to emerging digital technologies.

By means of a 2×2 between-subjects survey experiment, participants will be randomly assigned to one of four experimental conditions in which they are exposed to short, news-style articles on climate-related topics, or to a control group. The stimuli consist of news articles that are systematically manipulated in terms of the source of the message (AI-generated vs. journalist-produced) and content accuracy (evidence-based vs. ambiguous or misleading data), while being standardized in tone, length, and complexity and localized for each national context.

Data collection is scheduled for early 2026. Building on previous research that has produced surprising and sometimes contradictory findings regarding the credibility of AI-generated versus human-produced news (e.g., Altay & Giraldi, 2024; Baptista et al., 2025), this study seeks to explore whether journalist-generated, evidence-based content is indeed associated with higher levels of perceived credibility, trust, and support for climate-related policies. Importantly, existing evidence suggests that AI-generated news can, in certain contexts, be perceived as equally credible, or even more credible, than journalist-produced content, particularly when accuracy cues are ambiguous or source cues are weak. Thus, we examine whether misleading information, especially when attributed to AI-generated sources, undermines credibility, increases uncertainty, and reduces attitudinal support and behavioral intentions, or whether such effects vary depending on individual predispositions and contextual factors.

Furthermore, the study explores how individual cognitive dispositions, such as confirmation bias and ambiguity aversion, shape the processing of climate-related messages across different informational conditions. Rather than assuming uniform effects, the analysis explores whether these dispositions are associated with different responses to AI-generated versus journalist-generated content. At the contextual level, we examine potential cross-national differences in message effects across Romania, Bulgaria, and the Republic of Moldova.

Results from this study will contribute to ongoing debates on AI, misinformation, and climate communication, offering insights relevant for scholars, journalists, and policymakers interested in the study of democratic resilience and digital regulation in the climate domain.

**Funding for this study is provided by the BROD project under the Digital Europe Programme of the European Union, contract number 101226153.*

POL19 Political Communication in Authoritarian and Hybrid Regimes

PP 0786 Punished for expressing online disagreement with political leadership? Civic participation and deliberation on social media during the Covid-19 pandemic in Russia

Daniil Volkovskii[1]

[1] Université Paris 1 Panthéon-Sorbonne, Doctoral school in political science, Paris, France

This study examines the patterns of (dis)agreement between Russian citizens and state authorities concerning policy measures during the Covid-19 pandemic. It also aims to understand what communicative tools Russian leadership employed in online spaces to soften social tensions or eliminate public dissent expressed digitally.

To construct the theoretical framework, the research draws upon several relevant concepts, including theories of democratic, authoritarian, and cumulative deliberation, as well as Habermas's notion of the public sphere and the theory of the authoritarian public. These frameworks help explain how digital communication in non-democratic contexts can simultaneously simulate inclusiveness and enforce control. Compiling these approaches allows for avoiding unnecessarily dichotomic visions on data by removing the opposition between democratic and authoritarian deliberation, as well as avoiding the pre-determination of empirical results that emerges by characterizing deliberation in Russia as authoritarian a priori.

Methodologically, the study employs content analysis of online conversations between citizens and government structures. It examines key dimensions of political communication such as participation activity, inclusiveness, and the dynamics of (dis)agreement between state officials and citizens. Empirical data were collected from the official social media accounts (VK.com) of three major government structures: (1) the Russian Government's portal *Stopcoronavirus.RF*, (2) *Rospotrebnadzor* — the federal agency responsible for public health supervision, and (3) the Russian representative office of the World Health Organization. The dataset includes a total of 29,294 comments posted between March 2020 and February 2023. All comments were parsed, manually coded, and analyzed.

The study found that, across the crisis period, the overall level of agreement among citizens and with authorities remained higher than the level of disagreement. The most frequent category of disagreement observed in online discussions was citizen–citizen disagreement, whereas citizen–authority disagreement was the least frequent category.

The research identified two principal mechanisms used by Russian authorities to manage or eliminate citizens' disagreement in online environments. First, a deliberative mode of communication marked by polite, reasoned, and respectful responses from official accounts appeared to soften dissent and sustain legitimacy. Second, a non-deliberative mode including denial of access to commenting, deletion or moderation of comments, and blocking of users for violating community rules functioned as an instrument of discursive control.

The findings reveal that the deliberative approach was used selectively by Russian authorities, primarily, to eliminate disagreement among citizens regarding policy measures or to maintain consensus among those already supportive of policy. This hybrid strategy combined deliberative discourse, aimed at legitimising policy and managing public disagreement, with restrictive measures limiting digital participation. As a result, these practices undermined the deliberative quality of online communication in terms of inclusiveness, openness, equality of civic participation.

The results highlight how state-led online communication during crises such as Covid-19 can simultaneously perform democratic legitimacy and reinforce authoritarian resilience by shaping, managing, and, when necessary, silencing public discourse.

POL19 Political Communication in Authoritarian and Hybrid Regimes

PP 0787 Disabling controversy: The discursive mechanics of propaganda talking points

Christian Baden[1]

[1] The Hebrew University of Jerusalem, Department of Communication and Journalism, Jerusalem, Israel

Contemporary political discourse is quick to attack. Not only do proponents of societally controversial views (e.g., on migration, vaccination) complain about alleged cancel cultures and narrowed opinion corridors; also those invested in differentiated analysis and critical inquiry (e.g., in relation to the Middle East conflict) regularly encounter hostile responses to claims that should normally be well within the range of legitimate controversy. In this contribution, I argue that part of the aggressiveness in political discourse can be understood as an outcome of deliberately crafted propaganda narratives aimed at transforming deliberative controversy into identity conflict.

To do so, I draw upon a qualitative analysis of public social media interactions (X, Youtube) around four highly controversial issues: migration, Covid-19 vaccination, Russia's invasion in Ukraine, and the war between Hamas and Israel. Through a systematic comparative analysis, I isolate a recurring pattern of specific claims being constructed and responded-to as propaganda talking points. By means of publicly identifying certain ideas with a much wider, politically positioned narrative, propaganda invites readers to interpret the expression of these ideas not as literal statements, but as markers of much wider ideological identities. I show that this symbolic transformation of expressed ideas is systematically built-up by key propaganda actors and can be applied to a wide range of beliefs, which may be expressly subjective (e.g., feeling foreign in one's country), normative (e.g., Israel's right to self-defense), fact-based (e.g., vaccine side effects) or misleading (e.g., NATO's broken promise): Once an idea is recognized as a propaganda talking point, ensuing interactions reliably shift from debating presented claims themselves toward the conflictive performance of ideological positionings within a polarized political space, attacking (or endorsing) alters for views well in excess of what was manifestly expressed.

Discussing my findings in the context of current work on political polarization, I argue that the construction of propaganda talking points not only disables the constructive negotiation of controversial ideas; it also nurtures in speakers the experience of being unduly attacked, if not ostracized for expressing (prima facie, subjectively or objectively) legitimate positions. Bringing in recent theorizing on participatory propaganda, I further argue that the elicitation of identity-based hostility plays an important role for policing ingroup cohesion while delegitimizing outgroups as aggressive, deceitful, and disinterested in legitimate controversy, fueling polarized intergroup conflict. Finally, I draw upon a few rare examples of constructive controversy to discuss avenues for disarming weaponized talking points and re-enabling inclusive public discourse.

POL19 Political Communication in Authoritarian and Hybrid Regimes

PP 0788 Comparing Digital Activist Publics in Authoritarian Regimes

Anna Litvinenko[1], Tamer Farag[1]

[1] Freie Universitaet Berlin, Institute for Media and Communication Studies, Berlin, Germany

This paper examines digital resistance under authoritarian regimes through a comparative analysis of digital activism in China, Iran, Russia, Turkey, and Syria. While digital media have become central to contemporary political contention, existing scholarship has largely been shaped by a binary debate over whether digital technologies empower activists or reinforce authoritarian control (Pospieszna & Galus, 2019; Rød & Weidmann, 2015). This debate has most often been explored through highly visible protest moments, such as uprisings or large-scale demonstrations, which has resulted in an event-centered understanding of digital activism. Consequently, more subtle, continuous, and preparatory forms of digital resistance have remained underexplored.

To address these limitations, the paper suggests a comparative framework grounded in the concept of activist publics (Asen, 2000; Toepfl, 2020). Activist publics are conceptualized as dynamic configurations emerging from the interplay of three core elements: communicative environments, participants, and discursive practices. This framework enables a shift away from singular protest events toward a broader analytical lens capable of capturing the diversity of digital resistance across authoritarian contexts, including forms of engagement that do not necessarily aim at regime change or align with liberal-democratic ideals.

Methodologically, the paper draws on exploratory case studies using an embedded multiple-case design (Yin, 2014). The five cases were selected to reflect variation in regime type, cultural background, technological development, and levels of authoritarian control. Data collection combines academic research, document analysis of policy reports, media coverage, and NGO publications with expert interviews conducted with scholars and activists specializing in digital activism.

The analysis demonstrates how political, technological, and sociocultural conditions shape the environments of digital activism. Authoritarian regimes exhibit significant learning effects, continuously refining their repressive toolkits by combining digital surveillance, censorship, legal measures, and strategic narratives. These environments, in turn, shape activists' strategies, including the use of encrypted platforms and alternative communication spaces, as well as hybrid online–offline forms of engagement.

Across cases, activist participants and goals vary widely. Digital resistance ranges from policy-oriented critique and issue-based mobilization to explicit demands for regime change, alongside forms of participation that actors themselves may not label as political. Subtle resistance plays a crucial role in highly restrictive environments, where overt opposition is risky. Discursive practices such as humor, memes, and literary discussion function as vehicles for political expression while avoiding direct confrontation. Gender- and ecology-focused activism emerges across cases as a particularly salient and comparatively accessible form of mobilization.

The paper highlights the importance of diaspora and exile communities, which often articulate more critical and confrontational discourses under less restrictive conditions, thereby shaping transnational activist publics. In conclusion, the proposed two-dimensional analytical model offers a nuanced lens for understanding the diversity, dynamics, and evolution of activist publics under authoritarian rule, contributing to a more differentiated understanding of digital activism.

POL19 Political Communication in Authoritarian and Hybrid Regimes

PP 0789 Platformisation and digitalisation in electoral autocracies and democracies

Ana Jovanovic-Harrington[1], Alessio Cornia[1]

[1] Dublin City University, School of Communications, Dublin, Ireland

In modern electoral autocracies, independent media are rarely subject to official censorship or outright bans. Instead, they are constrained by economic strangulation (Dragomir, 2018), specifically the state capture of advertising markets and the weaponisation of regulatory frameworks. Often, the ruling party deprives independent media of crucial revenue to retain financial independence, for example, by directing state funds to loyalists (Bátorfy and Urbán, 2020) or by intimidating private advertisers into boycotting independent outlets.

Deprived of traditional revenue streams, independent media are forced to migrate online to survive and reach audiences. Nevertheless, even online, they remain constrained by more elusive supranational forces: algorithms, platformisation, Denial-of-Service-Attacks, and bot armies, to name a few. In this paper, we explore the twofold pressure the media in autocracies face: being forced to migrate online for political and economic reasons, while facing the combined pressure of the state and the opaque logic of global digital platforms (Cornia, Sehl, and Nielsen, 2020; Poell, Nieborg, and Van Dijck, 2019).

Drawing on 22 semi-structured interviews with media professionals in Hungary, Poland, and Serbia, this study investigates the intersection of state capture and platformisation. The findings suggest that digitalisation, rather than serving as a liberation technology, often exacerbates the precarity of independent journalism in backsliding democracies. Participants across all three countries reported a double bind: deprived of traditional revenue by the state, they are forced to compete for attention in a digital ecosystem dominated by algorithms that incentivise sensationalism, polarisation, and 'clickbait' over public interest reporting.

Hungary, Poland, and Serbia are among the world's most dramatic cases of democratic backsliding (Lührmann et al., 2020), but the comparative analysis highlights the varying stages of this trajectory. In Poland, which is still considered a flawed democracy, professionals view algorithmic pressure and the financial squeeze from Big Tech as vulnerabilities that create fertile ground for media capture. In Hungary, where independent print media has been effectively eradicated, outlets are confined to the digital sphere, where cybersecurity concerns are increasing. Serbia represents the 'worst-case scenario,' where digital harassment frequently escalates into physical violence.

Ultimately, this paper argues that the combined effects of digitalisation and platformisation facilitate autocratisation. By displacing independent media from the market and subjecting them to algorithmic volatility, regimes can erode the economic viability of the fourth estate without formally dismantling it.

POL19 Political Communication in Authoritarian and Hybrid Regimes

PP 0790 Victimization as a political strategy: The case of former Philippine president Rodrigo Duterte and the International Criminal Court (ICC)

Ma. Aurora Lolita Liwag-Lomibao[1], Jon Benedik Bunquin[1], Maria Jeriesa Osorio[1]

[1] University of the Philippines, Department of Communication Research, Quezon City, Philippines

On March 11, 2025, former Philippine President Rodrigo Roa Duterte was arrested in Manila through an arrest warrant issued by the International Criminal Court (ICC) Pre-Trial Chamber. Duterte was charged with crimes against humanity, including murder, torture, and rape, allegedly committed between November 1, 2011 and March 16, 2019 during his "war on drugs" that resulted in the deaths of 6,000 to 30,000 mostly poor Filipinos. He was flown to the Netherlands the next day, where he is currently detained at the ICC's facilities.

Duterte is a polarizing figure in Philippine politics. His rise to presidency is preceded by 22 years as mayor of Davao City, where he first cultivated his strongman image and was central to his political identity. Duterte consistently projected himself as a no-nonsense leader, disdainful of elites and formalities, defiant of international and social norms, and, more importantly, with a reputation for harsh crime control. His seeming fearlessness and authenticity earned him a landslide victory in the 2016 elections and great popularity among Filipinos, while critics warned of his normalization of violence and authoritarian

tendencies. Nevertheless, this Duterte "brand" was strategically wielded to mobilize public support, not just for him, but for his family and political allies, who themselves held powerful posts in government and the private sector.

Duterte's arrest and subsequent detention triggered a wave of politically charged disinformation. Among the dominant communicative strategies currently peddled online by his family and allies is the "victim narrative" which positions Duterte and his family as wronged, mistreated, and persecuted by political enemies.

This ongoing research seeks to inquire into the nature of the victimhood claims made by Duterte's family and his allies in their online political communications, and to identify the ecosystem of actors, networks, and disinformation infrastructures that spread this message. The study is anchored in Hronesova and Kreiss's (2024) concept of "hijacked victimhood"—a strategic and manipulative approach that leverages victimhood narratives during power contests—and the Filipino concept of awa (pity) leveraged to amplify emotional storytelling. Through a computational analysis of Facebook posts by the Duterte family and their political allies, we examined how Duterte's arrest was discursively constructed using victimhood narratives. Initial analysis reveals two strands of victimhood: expressive and instrumental. Expressive victimhood positions Duterte as an elderly statesman with a deteriorating health condition and a subject of emotional trauma and unjust arrest, while instrumental victimhood recasts him as a martyr and a target of political adversaries within the Philippine government and international human rights bodies. This latter strand is strategically utilized to secure political gain by shifting the focus away from the victims of the Philippine drug war. Ultimately, these findings contribute to the emotional and affective turn in media research by demonstrating how "affect" is weaponized to bypass rational political discourse. Furthermore, this study offers a critical examination of these emerging political communication strategies as a key component of the authoritarian playbook, illustrating how modern regimes exploit digital infrastructures to maintain domestic legitimacy even while under international legal scrutiny.

POL20 Incivility, Sexism, and Hostility in Online Political Talk

PP 0904 Sexism as a normative cue: How target and gender shape reactions to sexist comments in online political discussions

Sabine Reich[1], Marko Bachl[2]

[1] University of Bremen, Center for Media- Communication and Information Research, Bremen, Germany
[2] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

Women participate less visibly in politics online. At the same time, incivility and hate speech are disproportionately targeting women with a public profile (e.g., politicians or journalists) and female social media users. The gender gap in participation is often attributed to women's self-censorship to avoid such backlash. We take a social norms perspective to connect these observations. The sexist online commenting culture creates communicative norms that alienate and frighten women and differentially decrease their participation. Such norms are particularly obtrusive if they are signaled to a socially close person.

Specifically, we predicted the following: Exposure to sexist comments increases the perceived injunctive norm that women are not welcome (H1a) and the expected sanctions for participating (H2a), decreases participation measured by the intent to like and comment, and increases participation measured by the intent to report a comment (H3a). These effects are stronger for women than for men (H1–3b). For women, these effects are stronger when sexism targets a socially close female social media user (H1–3c). The reinforcement by a socially close target is stronger for women compared to men (H1–3d).

We test the hypotheses using a preregistered experiment (https://osf.io/c5reb/overview?view_only=a5d51287f0d64c0e9fed20a033d5dcde). We created eight social media posts by a news organization featuring a female politician, followed by a comment from a female social media user. The subsequent three comments were either sexist or not (factor: sexsim) and addressed either the politician or the user (factor: target). Sexist comments and target recognition were pretested in a pilot study. In a within-subject design, each participant is exposed to each news post and each comment set once and to each sexism by target combination twice. 630 participants (50% women) are currently recruited via Prolific. We estimate mixed-effect models with preregistered contrasts assigned to each hypothesis.

Preliminary analyses of 475 participants indicate that sexist attacks increased the perception of a discussion unwelcoming to women and the fear of being harassed when engaging in the discussion (supporting H1a and H2a). They also reduced the intent to like and comment on the news post, and increased the intent to report the comments (supporting H3a). These effects were stronger for women regarding the expected sanctions (supporting H2b) and the likelihood of commenting (partially supporting H3b), but not for the other outcomes (not supporting H1b and parts of H3b). There was no evidence for gender-specific reinforcement when the target was a socially close female social media user (not supporting H1–3c and d).

These results suggest that sexist attacks against female actors in political online discussions set communicative norms, marking these spaces as hostile. They decrease participation intentions for both men and women, but particularly frighten women and deter them from participating. Against our predictions, the target made no (gender-specific) difference. The results raise questions about whether norm violations should be considered differently depending on whether their target

is a public or private person. From the perspective of deteriorating effects on (female) participation, both seem similarly consequential. This has important implications for academic debates about incivility and its effects, as well as for applied interventions.

POL20 Incivility, Sexism, and Hostility in Online Political Talk

PP 0905 Anti-racist communication on social media

Jule Scheper[1], Christine E. Meltzer[1]

[1] Hanover University of Music- Drama and Media, Department of Journalism and Communication Research, Hannover, Germany

Anti-racist communication on social media has become a prominent and rapidly growing research topic. Events such as #BlackLivesMatter demonstrate how social media can foster transnational solidarity, amplify calls for justice, and stimulate widespread public debate about racial inequality (Bonilla & Rosa, 2015; Freelon et al., 2018; Jackson et al., 2020). However, the interdisciplinary nature of research on anti-racist communication has resulted in varied definitions, theoretical frameworks, and methodological approaches. A comprehensive systematization is lacking.

This scoping review on anti-racist communication on social media addresses this research gap. First, we provide a comprehensive overview of diverse research fields and perspectives, and how they intersect. Second, we examine existing definitions of anti-racist communication to clarify conceptual distinctions and similarities for more unified conceptualizations. Third, we map theoretical frameworks. Fourth, we examine how scholarship addresses communicators, forms and content of anti-racist messaging (e.g., text, videos, allyship messaging), social media platforms (e.g., TikTok), and outcomes.

Our scoping review follows recommended methodological steps (e.g., Munn et al., 2018) and adheres to the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews (Tricco et al., 2018). Our review is preregistered in the Open Science Framework (OSF). In brief, we included English-language, published empirical or theoretical studies that explicitly engage with anti-racist communication on social media, and excluded offline-only studies, non-English or unpublished sources, grey literature, and literature reviews. We identified 3,100 potentially relevant articles from journals in communication science, information science, political science, psychology, and sociology via the databases SCOPUS and EBSCO. After excluding duplicated (n = 500), one researcher of our team reviewed the titles and abstracts of the remaining 2,600 articles and re-checked our criteria. This is a standard step in scoping reviews, as automated article extraction inevitably retrieves articles that do not fully meet the criteria (e.g., due to synonyms). Ambiguous cases were discussed within the team. Four coders independently coded the remaining 345 articles using a deductive-inductive coding scheme. To enhance coding quality, all articles were coded by two individuals, and disagreements were discussed within the team.

Findings reveal heterogeneity in how anti-racist communication is defined, multiple research perspectives (e.g., digital activism), and varied theoretical lenses (e.g., critical race theory). Overall, however, it is notable that the theoretical foundation is often quite narrow, and theories and models are frequently not utilized for argumentation. Furthermore, it becomes apparent that anti-racist communication is often only one among several components—studies frequently do not primarily investigate communication against racism, but also against ableism or sexism. Research components span diverse communicators such as activists, celebrities, and ordinary citizens; message forms such as text, videos, and music, social media platforms such as X and Instagram, as well as audiences such as perpetrators, bystanders, and marginalized communities. Outcomes span affective, cognitive, and behavioral domains. This work offers a preliminary conceptual and cross-platform map of anti-racist communication and describes how the second coding round will deepen the thematic synthesis to advance an integrated framework.

POL20 Incivility, Sexism, and Hostility in Online Political Talk

PP 0906 And there are no ifs, ands, or buts about it: News media, partisan prejudice, and the justification of political violence

Florian Arendt[1]

[1] University of Vienna, Department of Communication, Vienna, Austria

In recent years, several democracies, including the United States, have witnessed a troubling rise in political violence. Notable recent examples include Melissa Hortman, Democratic Speaker of the Minnesota House of Representatives, who was assassinated in June 2025, and Charlie Kirk, a prominent conservative activist and staunch supporter of the Republican Party, who was murdered in July 2025. In response to these attacks, former U.S. President Barack Obama described the events as “horrific and a tragedy” and emphasized that “there are no ifs, ands, or buts about it (…) and we have to be clear and forthright in condemning it.” Such incidents underscore a fundamental truth: political violence has no place in a democracy.

While the vast majority of citizens reject such acts, a persistent minority regards political violence as justified under certain conditions, thereby posing a serious threat to democracy. The present study examined how news media coverage may contribute to these harmful beliefs. Building on scholarship on media stereotyping and prejudice, the study focuses on

processes such as outgroup derogation, victim blaming, and dehumanization that may be triggered by specific news narratives about political violence.

I propose that specific narrative cues in news reporting can trigger partisan prejudice, shaping audience perceptions of political violence when the target belongs to the opposing political camp. In particular, cues related to how victims of political violence are described are expected to influence beliefs about such acts. For example, when coverage portrays the victim in ways that invite blame ("victim-to-villain") or dehumanization ("heartless," "not worth mourning"), partisan prejudice may be triggered, reducing empathy and facilitating moral disengagement. As a result, citizens may become more willing to justify violence. Drawing on a historical example outlined in the talk, I refer to this phenomenon as the *lanternization effect*. The lanternization effect is defined as the impact of news media on the justification of political violence through reduced empathy for the victim and heightened moral disengagement.

The theoretical expectations were tested in a large-scale experiment (N = 3,055). Republican (Democratic) participants were randomly assigned to read a news article describing an act of political violence against a Democratic (Republican) politician. The articles systematically varied in the presence and intensity of prejudice-eliciting cues. Results revealed a dose-dependent effect: exposure to such cues tended to increase the justification of political violence. This effect was fully mediated by decreased empathy toward the victim and increased moral disengagement. Notably, a news coverage that promoted a victim-to-villain transformation or dehumanizing portrayals produced particularly strong effects. Of note, bipartisan rejection of political violence was insufficient to reduce harmful effects.

Overall, the findings demonstrate that news reporting on political violence—even when ostensibly objective and factual—can meaningfully shape moral judgments and emotional distance. By activating partisan prejudice, certain forms of coverage may decouple internal moral standards from evaluations of political violence, allowing audiences to accept unethical violent behavior without psychological distress. The talk concludes by discussing implications for journalistic practice and outlining strategies to mitigate this unintended yet consequential lanternization effect.

POL21 Wartime Communication and Strategic Narratives

PP 0894 Filtered politics: Ideological transformation of far-right content in transnational platform circulation

Xin Zhou[1], Jing Zeng[2]

[1] University of Jena, Institute of Communication Science, Jena, Germany
[2] University of Zurich, Communication and Media Research IKMZ, Zurich, Switzerland

In 2024, Alice Weidel, co-leader of Germany's far-right Alternative für Deutschland, became a trending figure on Chinese social media. Her political speeches circulated as aesthetically edited videos with Chinese subtitles, often reframing her positions within nationalist discourses. This transnational circulation raises questions about how extremist political communication transforms across cultural-linguistic boundaries: rather than ideological diffusion, content may be systematically recontextualized through local political frameworks.

This study examines how platform affordances and audience practices shape the transformation of far-right political content. We integrate three theoretical dimensions: visual politics and gendered populist performance (Moffitt, 2022), platform affordances theory (Bucher & Helmond, 2018), and digital nationalism scholarship (Zhang, 2020). We propose that Chinese audiences actively appropriate Western political figures to serve local political imaginaries, constituting nationalist instrumentalization rather than passive reception.

Employing a computational social science approach, we analyze Weidel-related content across Chinese platforms (Xiaohongshu, Bilibili, Douyin) during the 2024–2025 German electoral cycle. The research design combines sentiment analysis with quasi-experimental methods (interrupted time series, difference-in-differences), exploiting key political events—including Weidel's nomination, Musk's endorsement, and the federal election—as intervention points. Pilot content analysis (n = 200) reveals that aesthetic and appearance-focused framing predominates (31.5%), followed by leadership imagery (26.0%) and nationalist discourse (22.5%), while substantive policy discussion remains marginal (11.0%). These preliminary patterns suggest systematic privileging of visual and nationalist frames over original ideological content.

This research contributes to political communication scholarship by examining how entertainment-oriented platform architectures create conditions for political content to be recontextualized in ways serving local discursive purposes. The study advances understanding of transnational far-right circulation by documenting mechanisms of ideological transformation: far-right figures may achieve transnational visibility while their original positions become subordinated to aesthetic presentation and nationalist appropriation.

Keywords

platform affordances, far-right populism, digital nationalism, transnational political communication, visual politics

POL21 Wartime Communication and Strategic Narratives

PP 0895 The rhetoric behind rape in war: The case of Turkey's invasion of Cyprus in 1974

Dimitra Chondrokouki[1]

[1] University of Piraeus, International and European Studies, Piraeus, Greece

The human body occupies a central role in international relations, as it is both shaped by and shapes violence. Specifically, when the body experiences an injury or loss, its balance is disrupted, and it attempts to restore the imbalance by either repairing the previous balance or creating a new one (Morgenthau, 1948). In this context, rape is literally a "weapon of war" that targets the body, gender, religious identity, and psychic well-being of victims and communities identified as hostile (Diken & Laustsen, 2005).

This study examines the discursive dimension of rape as manifested in the rhetoric of actors in situations of armed conflict. Specifically, the rhetorical analysis draws on the theory of moral exclusion, which explains the dichotomy between "good" and "evil," the display of hostility, and extreme harmful behavior toward the group perceived as the enemy.

The case of Turkey's invasion of Cyprus in 1974 is used for empirical analysis. The research is guided by the following research questions: (1) What meaning is attributed to human bodies, and what is their role in the construction of violence? (2) How does rape function as a communicative practice within war? (3) How is moral exclusion expressed through the rhetoric of politicians and individuals, through which bodies are separated and defined as either worthy of protection or as legitimate targets of violent practices?

Qualitative content analysis is conducted on a corpus of texts to address the research questions. The corpus consists of the discourse of political figures and other actors, drawn from testimonies and newspaper publications.

The expected contribution of this research is to shed light on the role of rape as a political and communicative act between ethnic groups or states. It further examines the rhetorical construction of violence through which bodies are produced, and how certain bodies are deemed worthy of violence within ethnic or interstate conflicts.

POL21 Wartime Communication and Strategic Narratives

PP 0896 Discourse analysis in wartime communication: Limits and adaptations in studying energy and sanctions narratives

Maxym Gardus[1]

[1] European Humanities University, Politics and international relations, Vilnius, Lithuania

Contemporary political communication research increasingly relies on discourse analysis to study power, legitimacy, and meaning-making. However, most classical approaches to discourse analysis were developed for relatively stable public spheres. Full-scale war, platform-mediated communication, and hybrid influence operations fundamentally challenge these assumptions and raise questions about the adequacy of existing methodological tools.

This paper critically examines the limits of classical discourse analysis in the context of wartime communication, focusing on energy and sanctions narratives related to Russia's war against Ukraine. Energy debates and sanctions discourses represent a particularly revealing empirical field, as they combine security concerns, economic arguments, moral framing, and strategic ambiguity. Across European media and political communication, these narratives often oscillate between depoliticization ("market logic," "prices," "energy security") and moralization ("sacrifice," "solidarity," "burden on citizens"), producing competing interpretations of responsibility and legitimacy.

Building on a qualitative analysis of political statements, media commentaries, and expert discourses in selected European countries, the paper demonstrates how traditional text-centered discourse analysis struggles to capture three key dynamics of wartime communication: the fragmentation of discursive authority across platforms, the strategic normalization of violence and economic harm, and the blurring of boundaries between political communication, expertise, and influence operations. The study shows that meaning is increasingly produced not within isolated texts, but across interconnected discursive ecosystems involving media outlets, political actors, experts, and digital platforms.

Methodologically, the paper proposes a set of adaptations to discourse analysis that account for these transformations. These include shifting the unit of analysis from individual texts to discursive constellations, integrating platform-sensitive

approaches, and explicitly addressing the temporal compression and moral asymmetry characteristic of wartime communication.

The paper contributes to communication studies by offering an applied methodological reflection grounded in empirical material rather than abstract theory. It argues that rethinking discourse analysis is essential for studying power, normalization, and responsibility in contemporary conflicts. By situating the discussion within energy and sanctions debates, the study also demonstrates how methodological innovation can enhance our understanding of political communication under conditions of war and systemic crisis.

POL21 Wartime Communication and Strategic Narratives

PP 0897 From Battlefield to Newsroom: Narrative warfare in Zelenskyy's discourses mirrored in the Romanian media

Bogdan Podar[1]

[1] University Babeș-Bolyai, Doctoral School of Political and Communication Sciences, Cluj-Napoca, Romania

In times of war, political speeches function as instruments of persuasion , myth-making, and strategic communication (Fairclough, 1995; van Dijk, 1997; Wodak, 2009). In the same time, media, through framing, selects certain aspects of a perceived reality and make them more salient in a text, thereby promoting a particular problem definition, interpretations, moral evaluation, or treatment recommendation (Entman, 1993). This study explores how Ukrainian President Volodymyr Zelenskyy constructed his wartime addresses during the first year of Russia's full-scale invasion (February 24, 2022–February 24, 2023), and how those narratives (Propp, 1928; Booker, 2004; Vonnegut, 2008) were mediatized by Romanian mainstream media, confering the journlism a mythical role (Lule, 2001). As Ukraine fought for its sovereignty on the ground, Zelenskyy waged a parallel battle through speeches that rallied domestic and international support, stir public sentiment, and framed Ukraine's role as a moral and democratic bastion. But did this rhetorical strategy cross national borders? And if so, how did Romanian media incorporate or reshape these narratives? This study explores the role of rhetoric not only to narrate war but to shape its meaning across borders, responding to the question: *How did the main narratives and frames (such as problem definitions and moral evaluations) in Volodymyr Zelenskyy's discourse align with the logic of Romanian mainstream news media?*

The current research combines critical discourse analysis with computational linguistics in a mixed-method approach, drawing on an original corpus of *n* = 580 presidential speeches and *n* = 17.080 news articles from Romania's three most trusted news media websites: *ProTV*, *Digi24*, and *HotNews*. text-mining softwares (*KH Coder* and *Sketch Engine*) were employed to analyze Zelenskyy's speeches thematic patterns, emotional language shifts, frequency distributions, rhetorical structures, and dominant frames across the chronology of key military turning points. Central to the analysis was the identification of mythological constructions and archetypes in Zelenskyy's discourse (*Myth of Sacred Land, Myth of Eternal Return*, *The Hero*, *The Victim*, *The Evil Other*, etc). These myths were followed over time to see how they matched events on the battlefield and later appeared in Romanian news reports.

Preliminary findings reveal that Zelenskyy's communication evolved in three phases. In the early months of the invasion, his speeches were longer, emotionally charged, and myth-laden, presenting Ukraine as a heroic underdog and moral force. As the war progressed, his messages became more strategic and focused, using precise language and symbolic references tailored to global audiences. Notably, the emergence and decline of specific myths coincided with important moments such as the siege of Mariupol, the recapture of Kherson, or international summits. During certain phases, particularly the start of the war and its one-year mark, Zelenskyy's dominant narrative frames were adopted by Romanian outlets.

POL21 Wartime Communication and Strategic Narratives

PP 0898 The influence of Russian state-controlled narratives on alternative Italian news outlets: An LLM-assisted frame analysis

Ilaria Vitulano[1]

[1] Weizenbaum Institute, Platform Algorithms and Digital Propaganda, Berlin, Germany

On 24th February 2022, Russia started a full-scale invasion of Ukraine. In an attempt to justify the invasion, Russian media engaged in an information war, making use of false information and a well-thought-out language to describe events. Preferred targets of pro-Kremlin narratives are alternative media worldwide, with Italian ones being no exception. The 2022-elected Italian government features several actors with clearly documented pro-Russian views. Despite being a markedly Western country, Italy saw its citizens' support for Ukraine rapidly deteriorating, and pro-Russian communication on the invasion of Ukraine by Italian political actors may have contributed to this development.

Against this backdrop, this work presents an analysis of the war-related content of two alternative media closely linked to Italian anti-system parties. This study aims to investigate elements of the Russian full-scale invasion framing that have spilt into Italian alternative media sources. We analyzed news articles linked to the invasion of Ukraine from two Russian state-controlled news outlets, Russia Today (RT) and Vesti.ru, two Italian anti-system news outlets, ByoBlu and Il Paragone, and one Italian mainstream news outlet La Repubblica.

This study employed frame and narrative analysis to examine the content in the Russian and Italian coverage of the Russian full-scale invasion of Ukraine, using an inductive-deductive approach combining manual coding with LLM-assisted analysis to identify recurring frames and narratives. In an initial exploratory phase, around 200 articles from both Italian and Russian sources were read to inductively identify recurring narratives and group them in broader organizing frames. These findings informed the creation of the codebook used for the systematic coding. The inductive coding phase yielded 34 narratives grouped into 8 overarching frames.

For a preliminary, strategically selected sample of 100 news articles, drawn from the entire body of articles (5424), performed both manual and LLM-assisted coding using the ChatGPT-5 API to identify any narratives contained in the articles.

Our preliminary results suggest that, on average, Italian alternative media news articles are more similar to Russian state-controlled news articles than Italian mainstream news articles are. We find that alternative sources were on average closer to Russian media articles compared to the Italian mainstream news media articles. Moreover, on average, GPT-5 correctly identified 78.6% of the manually coded narratives in the Italian articles and 73.6% in the Russian articles. Lastly, our findings showed partial alignment between Italian alternative media and Russian sources: in 30% of the analysed articles, more than half of the narratives overlapped.

POL22 Strategic Communication, Diplomacy, and Institutional Voice

PP 1009 Reading power in stone: Architectural communication and democratic self-representation in the United States and Denmark

Erik Albæk[1]

[1] University of Southern Denmark, Centre for Journalism, Odense M, Denmark

This paper examines how democratic values, power relations, and political self-understandings are materially communicated through architecture. While democratic theory often treats built space as a neutral backdrop for political action, this article argues that architecture is itself a medium of political communication: it shapes how power becomes visible, how citizens encounter institutions, and how democratic legitimacy is spatially produced. By comparing two contrasting democratic trajectories—the revolutionary founding of the United States and the negotiated, evolutionary transition to democracy in Denmark—the article shows how different historical paths generate distinct architectural languages of democracy.

The analysis situates architecture within broader theories of space, symbolism, and political culture, drawing on Lefebvre's notion of socially produced space, Habermas' concept of publicness, and semiotic approaches to the built environment. Architecture is treated as a nonverbal rhetoric that conveys authority, inclusion, transparency, and hierarchy through materiality, scale, form, and urban placement. Through close readings of public buildings and urban ensembles in Washington D.C. and Copenhagen, the paper demonstrates how these spatial grammars encode divergent democratic ideals.

In the United States, the monumental classicism of Capitol Hill, the axial plan of Washington, and the republic's pantheon of memorials articulate a vision of democracy grounded in clarity, balance, and civic idealism. The city's spatial organisation performs the separation of powers, while its monumental buildings create a symbolic distance designed to inspire respect for the constitutional order. American democracy thus expresses itself architecturally through a language of heroic symbolism, rational geometry, and national myth-making.

In Denmark, by contrast, democratic architecture emerges not from rupture but from reinterpretation. Buildings such as Christiansborg, Copenhagen's City Hall, and later the functionalist town halls of the welfare state communicate a quieter ethos of proximity, negotiation, and institutional modesty. Danish public architecture integrates remnants of monarchical space into new democratic meanings, emphasising accessibility, administrative pragmatism, and everyday publicness rather than monumental spectacle. Its democratic message lies less in symbolic elevation and more in material honesty, human-scaled design, and spatial openness.

By placing these traditions side by side, the article highlights how democratic values are translated into material form: American architecture privileges symbolic coherence and narrative grandeur, whereas Danish architecture foregrounds social trust and institutional continuity. The comparison ultimately shows that democratic architecture is neither universal nor stylistically fixed, but a dynamic cultural expression shaped by each polity's historical self-understanding.

POL22 Strategic Communication, Diplomacy, and Institutional Voice

PP 1010 Strategic Communication as Public Diplomacy Practice: EU Delegations between visibility, legitimacy, and power. This paper examines how European Union Delegations use communication campaigns as instruments of political positioning and legitimacy-building

Antonia Loncar[1]

[1] University of Zadar, International Relations, Zadar, Croatia

Public diplomacy is increasingly enacted not only through high-level political discourse but through everyday strategic communication practices implemented by international institutions on the ground. This paper examines how the European

Union Delegations (EUDs) operationalise public diplomacy through campaign-based strategic communication in three contrasting political and cultural contexts: Armenia, Moldova, and Lao People's Democratic Republic (PDR).

The study adopts a qualitative, practice-based research design combining participant observation, analysis of campaign strategies and materials, and comparative reflection across three EU Delegation in contexts in which the author was directly involved in designing and delivering the communication strategy. Rather than treating the EU communication as a top-down transmission of political messages, the paper approaches it through a situational lense, almost like a negotiated process directly impacted by the adaptive practices shaped by local political constraints, media ecosystems, and audience expectations (EU and local ones).

In Armenia and Moldova, EU communication operates in politically saturated environments marked by contested reform agendas, polarisation, and competing geopolitical narratives about Europe and sovereignty. Here, communication strategies must balance visibility and value-promotion with the risks of political overexposure, instrumentalisation, or public fatigue. In contrast, the Lao PDR case represents a fundamentally different configuration of political communication: a tightly regulated media environment, low baseline awareness of the EU, and strong constraints on explicit political messaging. In this context, a large-scale strategic communication campaign was designed to prioritise indirect narrative positioning, youth-oriented storytelling, cultural localisation, and development-focused framing, effectively repositioning the EU from a perceived "donor" to a long-term development partner embedded in everyday social imaginaries.

Across the three cases, the paper identifies strategic communication as a form of everyday public diplomacy in which legitimacy is constructed less through formal political argument and more through narrative presence, emotional resonance, cultural translation, and symbolic alignment. Campaign instruments—such as storytelling formats, visual culture, participatory mechanisms, and influencer-mediated communication—function not merely as outreach tools but as infrastructures of political meaning-making.

The comparative analysis highlights three recurring tensions structuring EU public diplomacy in practice: (1) the tension between strategic visibility and political sensitivity; (2) the tension between coherent institutional identity and contextual narrative adaptation; and (3) the tension between normative ambition and communicative feasibility under sistem-specific constraints. These tensions reveal how political communication in international governance is not simply a matter of message control, but of continuous negotiation between institutional objectives, local power structures, and audience interpretive frameworks.

Research questions guiding the paper are:

1. How do EU Delegations enact public diplomacy through strategic communication practices at field level?
2. How do political and media environments shape the form and limits of institutional political communication?
3. What kinds of political legitimacy are produced through campaign-based communication rather than formal political discourse?

The paper contributes to political communication and public diplomacy scholarship by shifting analytical attention from macro-level narratives to the micro-practices of institutional communication, showing how geopolitical meaning is constructed, softened, or deferred through everyday strategic communication. More broadly, it argues for understanding public diplomacy not only as foreign policy communication, but as a form of narrative governance exercised through culturally rooted communication practices.

POL22 Strategic Communication, Diplomacy, and Institutional Voice

PP 1011 Mapping EU influence: How supranational communication shapes national media themes

Katarzyna Piwnicka[1]

[1] University of East Anglia, School of Politics- Philosophy- Language and Communication Studies, Norwich, United Kingdom

This study investigates whether the European Union (EU) has agenda-building power over national media by shaping the thematic structure of EU-related reporting across Europe, using Germany and the United Kingdom as examples. While political communication research has extensively examined how the EU is portrayed in national media, existing studies largely focus on issue salience, framing, discourse, patterns or external drivers and pay limited attention to agenda-building processes. Moreover, agenda-building research has rarely conceptualised media discourse as a relational structure in which themes are systematically connected rather than appearing in isolation. This study addresses these limitations by analysing EU agenda-building as a temporal and structural process operating through thematic networks.

Theoretically, the study builds on agenda-building and network theory, as well as research on the European public sphere. It conceptualises EU agenda-building as the capacity of supranational institutions not only to promote specific issues, but to shape the networked relationships between themes through which the EU is represented in national media. From this perspective, EU agenda-building is observed when thematic emphases and co-occurrence patterns in EU-level communication are reproduced in national media discourse. It is also argued that EU agenda-building power depends on national media systems and political contexts. Germany and the UK constitute a particularly informative comparison due to their different media system characteristics and historically different relationships with European integration.

Empirically, the study draws on a large corpus of EU-level communication, primarily European Commission press releases and speeches, and EU-related reporting from leading German (*FAZ, SZ, Handelsblatt*) and UK (*The Guardian, The Daily Telegraph, The Independent*) news outlets. Applying themes as nodes, separate thematic co-occurrence networks are constructed for EU-level communication and for national media coverage. Agenda-building dynamics are examined using a combination of methods. First, temporal analyses of thematic salience assess whether themes emphasised in EU communication at one point in time are also prominent in national media. Second, network analysis metrics are used to evaluate whether the structural organisation of themes in national media mirrors EU thematic configurations. This includes analyses of centrality measures, which examine whether themes central in EU networks later occupy central positions in national media discourse, indicating the adoption of EU-promoted thematic structures.

The findings reveal cross-national differences in the EU's agenda-building power. While both German and UK media exhibit clustered thematic network structures, the German thematic network is denser, more integrated, and more closely aligned with EU-level discourse. In contrast, the UK thematic network is more fragmented and selectively receptive to EU agenda signals. EU-driven themes are primarily adopted when they align with conflict-oriented narratives.

This study demonstrates that the EU does exercise agenda-building power to some extent, but this power is uneven and mediated by national media environments. By conceptualising agenda-building as a relational network process, the study offers a novel methodological contribution to political communication research and provides new insights into the conditions under which supranational actors can shape national public discourse.

POL23 Computational Methods for Political Discourse Analysis

PP 1001 Black box populism: Systematic context effects in LLM-based measurement of populist ideology

Felipe Barreto-Storandt[1]

[1] RPTU University Kaiserslautern-Landau, Institut für Kommunikationspsychologie und Medienpädagogik, Landau-in-der-Pfalz, Germany

While there is strong theoretical consensus defining populism as a thin-centered ideology, applying this construct in comparative research remains methodologically complex. Populism inevitably attaches to distinct host ideologies that vary systematically across contexts, ranging from exclusionary nationalism in Europe (Shehaj et al., 2021) to the authoritarian populism seen in established autocracies (Ersoy & Karakoç, 2021) or clientelistic strategies in Latin America (Olivas Osuna, 2021). CConsequently, reliable measurement requires detecting diverse signals—from the nativist rhetoric of consolidated democracies to the state-driven mobilization of autocrats. However, manual content analysis at scale incurs prohibitive costs in both funding and training for multilingual corpora.

Large language models (LLMs) offer a scalable solution (Farjam et al., 2025) but introduce risks of bias, as they are trained primarily on data from wealthy, English-speaking democracies. We hypothesized that this training would cause performance to degrade in differing political contexts, specifically in autocracies and developing economies where rhetoric centering on sovereignty or regime stability predominate (Olivas Osuna, 2021). This raises the critical question of whether classification patterns from LLMs fail to generalize to theoretically equivalent manifestations of populism in regions with differing socioeconomic realities that human coding may capture.

This study tests these assumptions using the Global Populism Database (Hawkins et al., 2019), containing 1,158 speeches from 73 countries. For our preliminary results, we constructed a stratified sample of 210 speeches from 52 countries, generating 20,635 individual classification events across 7 established open-source model families. The sample mirrors the original distribution, spanning a broad governance spectrum () on the Polity IV scale (where 0 = Autocracy, 1 = Full Democracy), while retaining the source's high-income skew () on the World Bank development index (1 = Low, 4 = High Income). Additionally, it ensures linguistic diversity, with 41.3% of observations drawn from languages outside the top-10 in Common Crawl, a dataset commonly use to train LLMs. We evaluate inter-coder reliability, validity against V-Party expert surveys, and systematic errors across multiple inference configurations.

Our preliminary analysis contradicts assumptions about training data bias. Reliability and validity are consistently highest in Anocracies (=0.52 [0.50, 0.55]; =0.37 [0.33, 0.40]) and lowest in Democracies (=0.42 [0.39, 0.45]; =0.23 [0.20, 0.27]). Ordinal logistic regression reveals that both stronger democratic governance (OR = 0.62 [0.54, 0.72]) and higher income classification (OR = 0.61 [0.59, 0.65]) significantly predict underestimation of populism.. Crucially, these biases remain robust to linguistic controls (OR = 1.01 [95% CI: 1.01, 1.01]), indicating that language availability for the LLM is not the only factor on classification error. It was also observed an emergent instability: minor prompt optimizations introduced stochasticity, highlighting high sensitivity to minor instructional phrasing on prompts.

These findings suggest LLMs do not capture the underlying theoretical construct uniformly. Drawing on similar findings from Heyde et al. (2025), we argue this underperformance in high-income democracies likely stems from model alignment: LLMs may view the rhetoric leaders from stable, wealthy nations as "normative" or "polite," masking populist signals otherwise flagged in diverse contexts. This inversion of expected performance poses challenges for comparative researchers, requiring context-specific validation protocols and documentation of prompts and technical decisions.

POL23 Computational Methods for Political Discourse Analysis

PP 1002 Metaphors for a new era: A critical metaphor analysis of political discourse in the 2021 Catalan election

Guillem Lloret I Triola[1]

[1] Universitat Pompeu Fabra, Departament de Comunicació, Barcelona, Spain

The 2021 Catalan election marked a shift from the high-tension plebiscitary logic of previous years. Contrasting with the acute 2012–2017 independence phase, including the referendum of October 1st and the resulting suspension of regional autonomy, the 2021 election represented a return to institutional normality during the COVID-19 pandemic.

This research, which constitutes a core part of an ongoing doctoral thesis, examines the strategic use of metaphors in political discourse to frame "country construction" during this period. The analysis explores how different political actors utilized this figurative language to redefine Catalonia's political horizon and manage the exhaustion resulting from earlier years.

In the Catalan context, existing studies have identified the centrality of the independence-constitutionalism axis and the prevalence of the JOURNEY domain to explain sovereignty claims. Authors such as Capdevila and Moragas-Fernández (2014, 2019 and 2023) have demonstrated that metaphors function as anchoring mechanisms that assign specific values to political issues, increasing persuasiveness.

This investigation applies Critical Metaphor Analysis (CMA) as established by Charteris-Black (2004), integrated within Critical Discourse Analysis (CDA). The corpus comprises 14 key speeches from the lead candidates of each party: their final campaign rallies, their last minute from the public broadcaster's (TV3) televised debate, and the investiture speeches of President Pere Aragonès. The procedure follows three systematic stages: the identification of metaphoric tokens based on semantic tension or rupture of isotopy; the interpretation of conceptual mappings (e.g., journey, building, conflict); and the explanation of their ideological and persuasive functions within the Catalan socio-political contemporary context.

The findings indicate a diversification of metaphorical strategies that challenge the previous centrality of the independence-constitutionalism axis. While the JOURNEY (to independence) domain remains prevalent, it is highly contested: Salvador Illa (candidate for the Socialist Party, who represented institutional restoration) employs metaphors of "returning" or "turning the page" to conceptualize Catalonia as a book to be read forward, whereas ERC (pro-independence Republican Left) frames the path as a "via àmplia" (broad path) to broaden the pro-independence majority. Notably, President Pere Aragonès explicitly utilizes the Scottish 2014 referendum as a metaphorical benchmark, urging the Spanish state "to act as the United Kingdom"

The BUILDING domain has evolved from "laying foundations" for a new state to the "reconstruction" of social welfare, with ERC highlighting "republican walls" as symbols of a new stability. In contrast, polarizing right-wing actors like VOX utilize aggressive CONFLICT metaphors, framing the previous decade as a "mafia-led coup" or an "invasion," while En Comú Podem (anti-independence Republican Left) redefines conflict through the "social shield" metaphor to prioritize economic protection over national identity.

Metaphors in this campaign functioned as essential cognitive tools to navigate the transition toward a post-process and post-pandemic political era. Strategic reification and personification allowed actors to legitimize new alliances and manage public expectations by projecting a sense of movement or reconstruction. The study demonstrates that metaphor selection was not merely an aesthetic choice, but a conscious ideological effort to redefine the collective identity of a renewed Catalonia.

Keywords

political communication, metaphor, critical discourse analysis, Catalan elections, independence

POL23 Computational Methods for Political Discourse Analysis

PP 1003 Framing conflict and peace: A Large Language Model approach to the analysis of Colombian presidential speeches (2002–2025)

Jose David Ortega Chavez[1], Jeanne Bollée[2], Frédérique Gros[3]

[1] University of Winchester, School of Creative Performance and Production, Winchester, United Kingdom
[2] École Normale Supérieure, School of Letters- Arts- Humanities and Social Sciences, París, France
[3] CNRS Sciences Humaines and Sociales, Progredo, París, France

While previous research has examined the role of the news media in the Colombian conflict (Rey & Bonilla, 2004) or in recent peace negotiations (Ortega Chávez, 2025), far less attention has been paid to how political discourse itself constructs narratives of conflict and peace. This paper addresses this gap by analysing how Colombian presidents across the last four administrations have framed civil conflict and peace in their official speeches. Spanning 23 years of presidential communication, the study examines 7,350 speeches delivered by Álvaro Uribe (2002–2010), Juan Manuel Santos (2010–2018), Iván Duque (2018–2022), and Gustavo Petro (2022–2025).

Building on recent advances in computational analysis of political discourse (Bonikowski et al., 2022; Bonikowski & Stuhler, 2022; Licht & Sczepanski, 2025), the study employs a supervised machine learning framework using Transformer-based neural language models, such as BERT (Devlin et al., 2019) and RoBERTa (Liu et al., 2019), to classify text. The methodological design consists of three stages. First, a manually annotated dataset (n = 2,000) is created to label paragraphs that explicitly or implicitly reference the Colombian armed conflict or peacebuilding initiatives. Second, this annotated data is used to fine-tune a Transformer model to perform contextualized paragraph-level classification across the entire corpus (n = 7,350), identifying all instances where presidents discuss conflict or peace. Third, the resulting sub-corpus of classified paragraphs is analysed using SBERT-based topic modeling and thematic analysis to identify recurring themes and discursive patterns related to conflict and peace.

The paper is primarily concerned with establishing a robust analytical framework for tracing longitudinal changes in presidential framing. The study enables systematic comparison across administrations, making it possible to trace shifts in how conflict and peace are discursively constructed, including changes in moral justification and strategic framing over time. The paper offers two key contributions. Methodologically, it advances the application of text-as-data approaches (see Do et al., 2024) for large-scale political text classification in Spanish, an area that remains underdeveloped. Empirically, it seeks to provide the first longitudinal, computational account of how Colombian presidents have framed conflict and peace over two decades, thereby complementing existing research on media discourse and expanding our understanding of elite political communication in the context of Colombia's long-running internal armed conflict.

POL23 Computational Methods for Political Discourse Analysis

PP 1004 Language as strategy: A semantic analysis of party competition in Germany

Andreas Reich[1], Claudia Thoms[1], Tobias Schrimpf[1]

[1] University of Hohenheim, Communication Science, Stuttgart, Germany

Democratic systems thrive on political debates between parties regarding issues and political measures. In this context, parties debate in parliament, ideally aiming to translate their positions into legislation. Therefore, it is crucial for them to identify with certain issues and demonstrate competence in these areas to be elected as worthy representatives. The perception of parties' connection to issues and their perceived competence is described by the theory of issue ownership (Walgrave et al., 2015). However, to claim an issue, parties must be seen as having distinct positions on the topic compared to their political rivals. These positions are typically declared in parliamentary debates and can be influenced by the issue's salience, e.g., by recent events or increased media coverage, or by other parties taking up similar issues or adopting more radical stances. This can lead to diversification (e.g., claiming new issues) or approximation (e.g., competing on issues). An example of the latter is the convergence of the mainstream German parties to the AfD's (Germany's right-wing party) position on migration (Atzpodien, 2022). But how do these realignments manifest in speeches and parliamentary discussions?

In our study, we examine the semantic diversification of party discourse in the German Bundestag regarding several central topics. Our analysis is guided by the following research questions:

RQ1: How does the semantic differentiation develop over time among the parties in the German Bundestag regarding central topics?

RQ2: Which words characterize periods of semantic differentiation?

To answer these questions, we use a corpus of plenary speeches from the German Bundestag (N = 49,056) ranging from October 24, 2017, to December 18, 2025. We measure semantic diversification across parliamentary party groups using automated text analysis techniques, drawing on embeddings-based distance measures and distributional language models via the conText package (Rodriguez et al., 2023) to capture similarities and differences in the language that parties use when addressing the same issue.

In our preliminary analysis of the topics of climate change, migration, and pensions, we find several moments of semantic differentiation in our dataset. As expected, the right-wing AfD deviates from the mainstream parties on almost all topics and over all time periods. When it comes to climate issues, however, we cannot identify any significant differences between

the Greens and the other parties. This is inconsistent with its image as a climate party. Furthermore, in the lead-up to federal elections, we observe a trend toward semantic divergence, whereby parties refine their thematic profiles. This makes strategic sense, as parties use their parliamentary communications to position themselves in the run-up to elections. Unlike the other topics, the pension debate shows no clear longitudinal trends. Instead, it is characterized by inconsistent and fragmented positioning. According to Politbarometer survey data (www.forschungsgruppe.de), the German population considers this issue significantly less relevant, making it less interesting for parties to develop a distinct position. For the final presentation, we plan to qualitatively investigate periods of semantic differentiation between parties using nearest neighbors and contexts (RQ2).

POL24 Citizen Engagement, Inclusion, and Platform Governance

PP 1114 The good, the bad, and the funny meme: How perceived humor, political interest, and knowledge shape engagement with political memes

Martine Paulenová[1], Alena Kluknavská[1]

[1] Masaryk University- Faculty of Social Studies, Department of Media Studies and Journalism, Brno, Czech Republic

Political memes have become a prominent form of visual political communication on social networking sites (SNS), increasingly moving beyond subcultural spaces into mainstream political discourse. A defining feature of political memes is their reliance on humor, which allows users to engage with political information in ways that are affective, playful, and socially meaningful. While prior research has demonstrated that political memes can stimulate engagement, existing studies typically focus either on mobilizing characteristics of meme content or on individual user traits in isolation. We still know relatively little about how humorous meme content translates into engagement, and how this process connects to users' political dispositions and their evaluations of specific memes.

To address this gap, our study examines how perceived meme humor drives meme-induced engagement on SNS, and how this relationship is conditioned by stance congruence and individual-level political traits. We focus on political interest and objective and subjective political knowledge as key individual-level characteristics and conceptualize meme-induced emotions as mediating mechanisms linking humorous evaluations to engagement intentions.

Empirically, we draw on an original survey conducted in the Czech Republic in autumn 2025, shortly after the general election (N = 2,064). Besides questions about individual attitudes and online behavior, respondents were presented with six political memes embedded in the questionnaire. Four memes featured leading election contenders, the populist leader Andrej Babiš and anti-populist leader Petr Fiala, while two addressed the housing crisis without referencing specific politicians. The memes also varied in communicative style, employing either benevolent or corrective humor. For each meme, respondents evaluated perceived meme humor, stance congruence, and emotional reactions, and reported the likelihood of them engaging with the meme if encountered online. Meme-specific engagement intentions included liking, commenting or reading of comments, sharing (publicly or privately), and seeking additional information.

Using multilevel models, we examine how humorous meme evaluations translate into engagement intentions, and under what conditions these effects are amplified or constrained. We expect that perceived meme humor is a key driver of meme-induced engagement across engagement modes, while stance congruence conditions whether humorous memes prompt more active forms of engagement. Emotional reactions, particularly anger, are expected to partially mediate these effects, indicating that humor operates not only as a cognitive evaluation but also through affective responses. We also anticipate that individual-level political interest and knowledge structure overall engagement propensity and moderate responsiveness to humorous meme content.

By centering humor as a core mechanism of meme-induced engagement, this study demonstrates that political memes mobilize users not simply through content or audience traits alone, but through the interaction between humorous evaluations, emotional responses, and political predispositions. Our study thus offers new insights into the role of political memes in online engagement, affective polarization and political learning on SNS.

POL24 Citizen Engagement, Inclusion, and Platform Governance

PP 1116 Rupture and renew: Transforming political communication for marginalised young people

James Dennis[1]

[1] CICANT, Universidade Lusófona do Porto, Porto, Portugal

Significant concerns exist regarding the news consumption and political participation of young adults who experience inequality. They are amongst the most likely to avoid news (Skovsgaard and Andersen, 2022) and the least likely to vote (O'Loughlin and Sloam, 2022). Existing research points to a *rupture* in institutional politics; this demographic does not feel represented by political parties and legacy news media (Arguedas et al., 2023; Tabor, Kalogeropoulos and Rossini, 2025). Many fear the long-term implications of such marginalisation on democracy. Drawing on 47 semi-structured interviews with a mixture of journalists and "newsfluencers" (Hurcombe, 2025) (n = 14), representatives from political parties—including elected representatives, campaign staff, and communication professionals (n = 15)—and young adults who experience inequality in England (n = 18), this paper explores the causes of this rupture and potential strategies to address it.

Interviewees offered a vision of how to *renew* this relationship. Journalists are keen to embrace innovations in storytelling that have flourished on social media, including empowering journalists to produce vertical video through individual accounts, adopting the tone, format, and style used on social platforms, and providing more opportunities for audience engagement with this population. Still, they are conscious of the challenging working conditions in the sector for those seeking to implement them, with economic pressures leading to intense workloads where daily publishing targets minimise time with the communities they serve and for innovation and training. Newsfluencers and peripheral journalists—including content creators, influencers, and citizen journalists—argue that they offer meaningful representation, should be perceived as legitimate political actors, and require more training, financial and structural support. Campaigners, media staff, and elected representatives want to see political parties offer more genuine opportunities for young citizens to shape policy, but fear that the current electoral reality in England—where older generations vote in greater numbers—makes this unrealistic.

The paper concludes by discussing the synergies, tensions, and systemic barriers that exist to the solutions proposed by the three key actors involved in political communication (McNair, 2018).

POL24 Citizen Engagement, Inclusion, and Platform Governance

PP 1117 Digital political participation in German municipalities: Old and new digital and algorithmic divides

Thomas Feiler[1], Christian Pentzold[1], Christian P. Hoffmann[1]

[1] Leipzig University, Institute for Communication and Media Studies, Leipzig, Germany

Digital political participation includes all actions that citizens voluntarily undertake – employing networked media – with the aim of influencing decisions at various levels of the political system (Gil de Zúñiga et al., 2010). Digital political participation is seen as a useful tool for involving citizens in political decision-making, but in many European states including Germany, there is currently neither a national inventory of municipal offerings and their characteristics nor sufficient knowledge about the scope, purposes, circumstances, opportunities, and risks of using artificial intelligence (AI) in such endeavors (Vasilakopoulos et al., 2024).

This paper presents the results of a nationwide survey on the application of digital political participation in German municipalities and on supply-side contextual conditions that determine the provision of such procedures. It provides evidence that municipalities continue to face structural digital divides and that, at the same time, a new algorithmic divide is emerging in the context of AI tools.

Methodology

A nationwide online survey of all 10,751 German municipalities was conducted using a two-part questionnaire (QN): QN1 covered general digital political participation experiences and structural characteristics of the municipalities; QN2 covered details of the last two digital political participation procedures in the municipality. At the time of submission, 2,183 municipalities had partially responded to QN1 (20.3% response rate), and 1,815 municipalities had largely completed the questionnaire (16.9%). The distribution of participants corresponds to the actual structure of German municipalities and allows for representative insights.

Key findings

Firstly, we found a digital divide that is structural: present findings indicate a correlation between municipality size and digital political participation implementation. While almost all large cities offer digital political participation, only 14.3% of rural municipalities have experience with digital political participation. This points to imbalances in access to digital forms of participation. At the same time, the question arises as to whether it is a disadvantage for smaller communities not to offer digital political participation, as negotiation processes between the municipality and residents may be better resolved through offline and informal channels.

Secondly, findings also point to the risk of an algorithmic divide (Yu, 2020). Only a minority of municipalities currently employ AI in digital political participation. The use of AI focuses on editorial tasks: In local governments that use AI for digital political participation, the dominant applications are text creation (47.8%) and translation (45.5%), followed by

results presentation (25.6%) and automated post evaluation (20.3%). In contrast, AI is used rather cautiously for purposes such as hate speech detection (13.5%) or data protection violations (8.4%). AI-supported communication is thus gradually establishing itself but is concentrated in editorial applications. The cautious use of AI in content moderation and hate speech detection points to unresolved normative and technical challenges.

POL24 Citizen Engagement, Inclusion, and Platform Governance

PP 1118 The humor-ification of politics: Deepfakes and visual distraction during election campaigns

Dren Gërguri[1], Marina Serrano-Lorenzo[2], Rocio Zamora Medina[2]

[1] University of Prishtina, Dept of Journalism, Prishtina, Albania
[2] University of Murcia, Department of Journalism, Murcia, Spain

Deepfakes have changed the landscape of political communication by transforming the traditional campaign discourse. The strategic use of this technology in political campaigns has generated new debates about misinformation, authenticity, and trust in democratic systems, and all of these aspects have already been analyzed. While previous research has focused specifically on the manipulative or informational side of deepfakes, the relation between deepfake technology and political humor still remains underexplored. The paper states that political deepfakes are not necessarily deceptive, but instead, more and more become humorous, satirical, and affect-oriented types of visual persuasion, which transform attention, engagement, and the quality of political discourse. The study, in this way, promotes a reconceptualization of deepfakes in the form of strategic instruments of politainment. Two research questions were discussed in the paper: (RQ1) What are the main strategic functions of humor and satire in political deepfakes used to engage the public? and (RQ2) What patterns of audience engagement are associated with the use of humor in political deepfakes in digital campaign contexts? To provide answers to these questions, the study uses a qualitative interpretive content analysis of a purposive sample of ten political deepfakes, published between 2023 and April 2025 on major social media platforms, including X, TikTok, YouTube, Facebook, and Instagram. The sample is diverse in geopolitical contexts: the United States, Turkey, Argentina, France, Spain, the Philippines, and India, which makes it possible to compare sensitivity to various political cultures and political campaigns. All the cases were subjected to a structured coding scheme consisting of fourteen categories of analysis that included strategic intent, humorous configuration, narrative framing, affective appeal, platform dynamics, and patterns of circulation. Despite this diversity of actors, the objectives of the deepfakes cluster around three dominant strategic purposes: delegitimizing political opponents, through ridicule or insinuation (U.S. Biden cases, Turkey, Argentina, Spain, Philippines); mobilizing or engaging supporters, through entertaining, identity-affirming content (Argentina, Vox Europa, India); and image management and agenda promotion, where humor serves a softening or humanizing function (France, India). These objectives demonstrate that humor operates both offensively (attack-oriented) and defensively or promotional, depending on campaign positioning. The comparative analysis shows that humorous political deepfakes function as strategically designed communicative artifacts, where humor operates as an affective interface between technology, narrative, and platform dynamics. Across cases, humor consistently facilitates interaction and circulation, but its broader political significance is mediated by content design, dissemination context, audience alignment, and virality. Rather than producing uniform effects, humorous deepfakes reveal a complex interplay between entertainment and political strategy, confirming that their power lies less in deception per se than in their capacity to reshape how political content is framed, consumed, and shared in digital environments. Therefore, this paper contributes to ongoing debates on synthetic media, affective politics, and post-truth culture by repositioning deepfakes as artifacts of humor-driven visual persuasion rather than purely instruments of deceit.

PP 1104 Does the dog watch? When and how the media reports on political elites' repositioning

Anna-Lena Nadler[1], Jonas Baur[1], Alexandra Feddersen[1]

[1] University of Fribourg, Department of Communication and Media Research DCM, Fribourg, Switzerland

When political elites change their minds about a policy issue, media coverage of these shifts is essential for informing the public. Despite growing attention to elite position shifts in the party competition literature (e.g., Meguid, 2005; Abou-Chadi & Krause, 2018), and emerging research on voter reactions to these shifts (e.g., Nasr & Hoes, 2024; Meijers, 2025), little research has examined the role of the media. In this paper, we present the first study on when and how the media report on position changes of political elites. To this end, we create a novel dataset using a large corpus of Swiss news articles from the past 20 years, in order to identify factors associated with the intensity and tonality of media coverage of political

elites' position changes. Through inductive, manual coding we develop a typology of position changes which we apply to the entire corpus using a transfer learning approach. In general, we expect a negative tonality in news articles about position changes, since previous literature on electoral promises (e.g., Müller 2020) suggests that broken promises are covered more frequently and more negatively than kept promises. Drawing on news value theory (Galtung and Holmboe Ruge, 1965), we hypothesize that the intensity and tonality of media coverage depend on the characteristics of the position change and of the political elite who repositions. Notably, we hypothesize that a higher degree of unexpectedness and a greater inconsistency result in more negative news coverage, particularly among radical elites and those in prominent political roles (e.g., Van Aelst et al. 2008; Vos, 2016). Our findings contribute to understanding how the media amplifies or diminishes attention to political elites' repositioning. These dynamics are crucial for understanding how political media coverage influences political competition and political behavior in Western democracies.

POL25 Influencers, Persona, and the Mediation of Political Elites

PP 1105 From policy to persona: Effects of social media political communication on evaluations of politicians

Esteban Courbet[1,2]

[1] University of Fribourg, Department of Communication and Media Research DCM, Fribourg, Switzerland
[2] Paris-Panthéon-Assas University, Centre d'analyse et de recherche interdisciplinaires sur les médias, Paris, France

On social media, two markers dominate political communication strategies: privatization (Stanyer, 2013) and a colloquial language style, both central to the populist communication repertoire (de Vreese et al., 2018; Ernst et al., 2019). Although their use is well documented on the supply side, little is known about how these choices reshape evaluations of political actors in short-form video formats (Instagram Reels, TikTok).

We test these effects in a pre-registered 2×2 between-subjects experiment conducted in France (N ≈ 1,400; representative sample). Two factors are manipulated: privatization (with vs. without) and language style (formal vs. colloquial), supplemented by a non-factorial video control condition. The stimuli, produced specifically for the study, are Instagram/TikTok-style videos (vertical 9:16, face-to-camera, locked-off single take, 40 seconds), politically neutral and strictly standardized (same actor, duration, framing, lighting; controlled setting and attire). Three successive pretests (scripts, videos, expert validation) ensure manipulation validity. Dependent variables include four traits (leadership, competence, integrity, warmth), a global evaluation (feeling thermometer), and voting intention; thematic evaluations of perceived policy program quality (economy, international relations, education, health, environment, immigration, security) and covariates complete the design. Analyses rely on OLS regressions for each dependent variable, including a Privatization × Style interaction and planned contrasts.

Our results show that privatization increases scores on warmth and integrity, as well as global evaluation (feeling thermometer), but reduces competence and leadership. By contrast, a colloquial style lowers competence, leadership, and integrity, while increasing warmth and global evaluation. An interaction also emerges: the Privatization × Colloquial condition maximizes warmth and global evaluation, whereas the Non-privatization × Colloquial condition minimizes competence and leadership. For voting intention, the colloquial style increases intention relative to the formal style; privatization has a null or slightly negative effect.

Thus, this study clarifies when and how short videos shift trait judgments, global evaluation, and voting intention. Privatization and a colloquial style shift the basis of voting—from policy programs and competence toward relational signals (proximity, warmth). This shift can bias the selection of politicians and weaken democratic accountability. It may also undermine deliberative quality and equality of access to attention. Hence the strategic stakes (format choices) and the normative requirements (civic education, online campaign norms, transparency about formats).

POL25 Influencers, Persona, and the Mediation of Political Elites

PP 1106 A necessary evil? Politicians' perspectives on their relationship with journalists

Karolin Soontjens[1], Kathleen Beckers[2], Emma van der Goot[2]

[1] University of Antwerp, Department of Political Sciences, Antwerp, Belgium
[2] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

The relationship between politicians and journalists is traditionally seen as close, sometimes described as an alliance of "bedfellows" (Rosenstiel, 1993), or even as "incestuous" (Charron, 1994). Others have described this relationship as more strained, marked by mutual cynicism and distrust (e.g., Bennett & Pfetsch, 2018; Van Aelst & Aalberg, 2011). While some healthy mistrust between the two actors is expected due to their conflicting goals and is essential to a healthy democratic debate (Berkowitz, 2019), this relationship is becoming increasingly hostile. Politicians nowadays more openly attack traditional media (e.g., Egelhofer et al., 2021; Schwörer, 2021) and bypass them in favor of direct communication through social media (Marquart, Ohme, & Möller, 2020).

This wrenched relationship is potentially problematic, as it may lead to behaviors that are detrimental to democracy and the role of the news media within it. If journalists face increasing hostility and politicians sidestep traditional accountability channels, political communication may shift in ways that reinforce polarization, hinder informed citizenship, and encourage populist rhetoric. However, we have limited insight into how politicians themselves perceive and navigate their relationship with the news media.

This study addresses that gap by exploring politicians' experiences and views regarding their interactions with journalists. We conducted in-depth face-to-face interviews with 75 members of parliament (MPs) in Belgium. We asked how they evaluate their relationship with journalists, whether they feel this relationship has changed over time, and how conflictual interactions arise, are perceived, and influence their behavior. For example, do such conflictual experiences lead them to communicate less with the media, adopt a more hostile stance, or bypass the press?

While the analysis of the interview data is still ongoing, we can already provide preliminary insights. Regarding conflict, politicians mainly complain about unfavorable framing, particularly in headlines, misrepresentation due to decontextualized quotes, and unequal access to media platforms. Although this discontent seems to exist across party lines, frustrations are especially pronounced among radical party politicians. They note that their contributions (e.g., parliamentary questions) are sometimes used in media coverage without proper attribution, and they express concerns about limited access and unfavorable framing.

However, despite these criticisms and an apparent strained relationship, very few politicians appear to want to distance themselves or sideline traditional media. While some radical parties acknowledge that they rely heavily on social media because they feel underrepresented in traditional outlets, they still frequently send press releases and actively seek media contact. In that sense, no one seems to bypass the press, acknowledging that they still need the media for political success and to reach audiences. Overall, the politicians described an ongoing dependence on traditional media, even in the age of social media, where it has become increasingly easy to communicate directly with the public (Jungherr, 2016). Even politicians who place themselves outside of the mainstream still eagerly seek the attention of traditional mainstream media. Thus, it seems the relationship between journalists and politicians may best be characterized as "uneasy" bedfellows—or, as some politicians suggest, a necessary evil.

POL25 Influencers, Persona, and the Mediation of Political Elites

PP 1107 Mapping the 'outsiders': Political communication agencies and the marketisation of politics in Italy

Giulia Coppo[1], Claudio Riva[1]

[1] University of Padua, Department of Philosophy- Sociology- Pedagogy and Applied Psychology FISPPA, Padua, Italy

In the past two decades, the increasing professionalisation of political campaigns has fostered the expansion of a diverse ecosystem of political consultants whose activities extend well beyond party organisations or institutional bodies (Medvic, 2003; Grossman, 2009). As parties have increasingly internalised professional communication functions to manage the day-to-day reputational demands of political leadership, most Western democracies have witnessed the consolidation of a parallel, market-oriented industry of political communication agencies, through which communication and marketing services are externalised to political clients on a short-term, campaign-basis (Blumler and Gurevitch, 2001; Norris, 2000, Diamanti,

2016; Sampugnaro and Montemagno, 2021). Existing literature identifies them as political communication 'outsiders': professionals operating outside the political field who mobilise specialised expertise, technical know-how and social capital to deliver services that frequently intersect with commercial and corporate sectors (Negrine et al., 2007). While studies on the broader phenomenon of the professionalisation of political communication abound, political communication industries have been empirically underinvestigated, particularly in non-Anglo-American contexts.

Italy, whose political and electoral system has favoured the growth of a market that provides political communication services on a short-term and project-based basis, represents a compelling case study to examine this phenomenon (Cacciotto, 2014). In this context, these professionals have historically acted in the background, often alongside party staff, complicating efforts to empirically assess their role and relevance. Furthermore, the lack of professional registries, formal occupational categories, or institutional classification mechanisms further obscures a sector characterised by fragmentation, complexity, and opacity. As a consequence, no comprehensive overview of the Italian political communication industry operating outside party structures currently exists.

This study aims to fill this gap by presenting the first systematic mapping of Italian political communication agencies positioned outside party organisations. It does so by adopting a digital methods approach to trace the online footprints of agencies that offer, or have previously offered, communication services to political candidates, parties, or other political organisations at the municipal, regional, national, or supra-national level. An iterative and advanced online search strategy using Google and Ecosia and complemented by manual validation resulted in the identification of 76 agencies whose involvement in political communication ranges from core to marginal. Inclusion criteria were based on explicit service description, public disclosure of political clients, or campaign-related projects within online portfolios.

Focusing on the organisational presence, service profiles, and digital visibility of political communication agencies allows us to reconceptualise political communication "outsiders" not as marginal auxiliaries, but as a loosely institutionalised industry actively involved in shaping contemporary political communication practices. This work-in-progress research introduces a reproducible dataset and offers initial descriptive insights on the Italian political communication industry, including agencies' geographical distribution, degree of specialisation, service provision, patterns of social media adoption, and the visibility of political clients. More broadly, the study aims to contribute to debates on the marketisation of politics and to advance exploratory research on political communication professionalism beyond party-centred frameworks while critically engaging with digital methods as tools for investigating opaque media industries (Rogers, 2024).

POL25 Influencers, Persona, and the Mediation of Political Elites

PP 1108 How news influencers signal credibility in the 2024 U.S. Election

Eva-Maria Vogel[1], Christian Pipal[1], Morgan Wack[1], Frank Esser[1]

[1] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

The rapid rise of news influencers has disrupted political communication by challenging gatekeeping and agenda-setting roles and taking on functions once held by journalists and campaign surrogates. While prior research has examined credibility construction in the domains of marketing and traditional political communication, we know far less about how digital news influencers establish credibility in political contexts and how such strategies resonate across partisan groups.

This study investigates the mechanisms through which news influencers construct credibility, employing a framework informed by influencer marketing and political authenticity research. By distinguishing between appeals to expertise, integrity, benevolence, and authenticity, we analyze how these strategies influence audience reception.

First, we conduct a large-scale content analysis of all posts (N = 91,133) posts made by the 50 most followed U.S. news influencers per platform (Instagram, TikTok, and X) during the eight weeks leading up to the 2024 U.S. Election. Using a computational approach validated against human coding, we examine how credibility is signaled and whether influencers' reliance on different credibility cues differs by the partisan leaning of the influencer.

Second, we complement this supply-side analysis with a survey experiment. Participants are recruited through Prolific and balanced across party lines. Stimuli are derived from the content analysis: we identify common prototypes of influencer communication to generate short, prototypical videos. As influencers, we use AI avatars to isolate rhetorical strategies without the confound of human celebrity. This design allows us to test whether certain credibility appeals are differentially persuasive for Democrats and Republicans and whether these differences help explain influencers' success in spreading political information.

By integrating cross-platform data with experimental evidence, this study advances the understanding of how credibility is constructed and leveraged in digital political communication. It contributes to debates on partisan psychology, political authenticity, and the mechanisms enabling influencers to maintain authority in polarized online environments.

RAS01 Radio, Culture and Society: Audiences, Territory and Narrative Forms

PP 0499 What perceptions of local radio by its journalists and listeners tell us about its role and future

Aleksandar Kocic[1]

[1] Edinburgh Napier, Screen and Media, Edinburgh, United Kingdom

Local news is considered vital to the functioning of local communities and the engagement of citizens in local democracies (Fenton 2011; McLeod, Scheufele and Moy 1999; Nielsen 2015). Local radio's role is to bring to the fore issues relevant to the local communities it serves. However, local radio in the UK is at a turning point, with the BBC reducing its local radio output and commercial radio, largely owned by a small number of media groups, moving away from localism while maintaining only a minimal local news output. The remaining independent commercial stations often maintain strong links with the local communities they serve but struggle to provide any substantive local news coverage.

Using the theoretical frameworks of the public sphere (Habermas 1989; 1997) and localism (Napoli 2001; Cowling 2005), the present study aims to contribute to a limited body of knowledge on the role of local radio as seen by those who make it and those who listen to it. It employs extensive one-to-one interviews with 30 local BBC and commercial radio journalists and station managers, as well as four listener focus groups with 16 participants in total, in order to answer the following research questions:

- How do local radio journalists in the UK reflect on their experience of practice in meeting the informational needs of their listeners?
- How do local radio journalists and listeners perceive the role of radio in providing news?
- What are the views of both groups regarding the future of local radio in the UK?

The study finds that both local radio journalists and listeners are aware that radio in the UK is at a turning point, with numerous challenges lying ahead. Journalists understand that resources are shrinking while the competition for consumers' attention is growing. They say that traditional roles of local radio as provider of local news and forum for debate are under threat as new, digital platforms offer an alternative. In the context of major changes in the ways radio is produced and consumed, the present study shows that commercial radio seems best placed to take the advantage of the new technologies available, while the BBC and independent stations see their strengths in providing for under-served communities. All journalists interviewed still express optimism regarding the short-to-medium future of local radio.

Listeners, however, point out they are trying to make sense of the fast-changing and "overwhelming" media ecosystem. They say they value local radio and listen to it; they express a desire to stay informed, but reluctantly admit that in the current global context, local news does not matter to them very much. Their sense of civic duty is implied but does not seem to be the major determinant of listening habits.

The present study makes a contribution to a limited body of research on contemporary local radio. It does so at the time of significant changes the medium is going through and against a great deal of uncertainty regarding its future.

RAS01 Radio, Culture and Society: Audiences, Territory and Narrative Forms

PP 0500 Radio art, documentality, archive: Transnational practices

Natalia Kowalska-Elkader[1]

[1] University of Lodz, Deparment of Journalism and Social Communication, Łódź, Poland

Contemporary research on sound media is developing within the context of an intensive cultural reorientation known as the auditory turn (Matusiak 2024; Pleszczyński 2007), which is reshaping both the humanities and communicative practices by shifting attention from visuality toward affective, relational, and embodied modes of listening. In parallel, art studies have developed the perspective of the archive turn (Callahan 2022; Eichhorn 2013), which emphasizes the crucial role of archives, inscription practices, and the materiality of traces in constructing memory, identity, and relations of power. Popular audio-documentary forms—particularly investigative and true-crime podcasts (Sherrill 2020)—increasingly rely on narrative appeal (Boling & Hull 2018) and algorithmic visibility, which leads to a "flattening" of the documentary landscape and the dominance of formats that reinforce predictable storytelling structures.

This presentation situates the analysis (structural and genological) of radio-auditory documentality precisely within these two parallel turns—the auditory and the archival. The point of departure is the notion of documentality understood as a creative strategy that does not rely solely on factuality, but on relationality, archival traces, fragmentariness, and the experience of listening. The aim is to address this gap by examining radio art as a form of documentality distinct from journalistic genres, while taking into account the aesthetic, affective, and experimental properties of the medium.

The proposed approach develops the concept of documentality not as a set of factual criteria, but as a relational strategy of truth-disclosure (Heidegger 1972; Reeves & Stoneman 2014) and as a process of producing inscriptions in the sense of Maurizio Ferraris's (2009) theory of documentality—here adapted to radio-art practices. In this perspective, the sonic document emerges from the interaction between recording, listening, and interpretation, in which affect, trace, voice, and archival fragmentariness jointly co-produce epistemological meaning.

The analysis draws on selected examples of transnational radio art—including materials from New American Radio, European radio experiments, and the Experimental Studio of Polish Radio—and examines how documentality manifests itself through archival reenactment, work with witness voices, transformed field recordings, performative uses of tape, and strategies of resistance to conventional communicative modes.

In contrast to platform-based documentary formats shaped by the logics of algorithmic visibility and narrative predictability, radio art reveals an alternative model of sonic knowledge production—one that brings together affect, archive, and aesthetic excess as modes of understanding. In this sense, the sonic document creates space for marginalized perspectives, polyvocality, and for affect as a form of knowledge. The study demonstrates how radio-art practices engage notions of truth, testimony, and the archive in sound media in an era marked by the crisis of facts.

RAS01 Radio, Culture and Society: Audiences, Territory and Narrative Forms

PP 0501 Territorial zeitgeist in native podcasts on regional public radio platforms in Spain (2024–2025)

Raúl Terol-Bolinches[1], Paloma López-Villafranca[2], Toni Sellas Güell[3], Teresa Piñeiro-Otero[4], Asier Leoz-Aizpuru[5]

[1] Universitat Politècnica de València, Departamento Comunicación Audiovisual- Documentación e Historia del Arte, València, Spain
[2] Universidad de Málaga, Comunicación, Málaga, Spain
[3] Universitat de Vic, Comunicació, Vic, Spain
[4] Universidade de Coruña, Comunicación, A Coruña, Spain
[5] Universidad de Deusto, Comunicación, San Sebastián, Spain

Regional public radio broadcasters in Spain have traditionally been regarded as key institutions for the dissemination of regional culture and for the promotion and development of co-official languages, as established in their founding statutes (García González, 2007; Sierra Sánchez, 2010; Sobrino et al., 2018). In the context of the digital transformation of radio and the reconfiguration of media consumption habits (Pedrero-Esteban & García Lastra, 2019; Terol Bolinches et al., 2021), these broadcasters face the challenge of redefining and expanding their public service mission beyond linear broadcasting. Within this process, native podcasting has become established as a differentiated strategy, distinct from the mere redistribution of radio content on digital platforms (Pérez Alaejos et al., 2018; Nieborg & Poell, 2018; Bonet & Sellas, 2019; Müller et al., 2020).

Hyperlocal content, programming focused on culture and heritage, and the production of audio content in co-official languages and with distinctive regional identities (McHugh, 2016) have become a priority for these broadcasters and their platforms. Conceptual and technological adaptation aims to reach younger audiences, following precedents such as Radio Nacional de España (RNE) (Onieva, 2024) and the BBC in the United Kingdom through their audio platforms (Berry, 2020).

This paper presents a comparative study conducted during 2024 and 2025 of the native podcast offerings of five regional public broadcasting corporations: 3Cat (Catalonia), À Punt Mèdia (Valencian Community), EITB (Basque Country), CRTVG (Galicia), and Canal Sur (Andalusia). The aim is to examine the cultural and linguistic orientation of their podcasting platforms. The study is based on the hypothesis that these contents reinforce the public service mission, constituting a distinctive proposal within the digital audio ecosystem. Podcasts are understood not only as a distribution format but also as an expression of the territorial zeitgeist, defined as the set of sensitivities, imaginaries, social concerns, and cultural practices characteristic of each territory.

The research adopts a qualitative methodology based on descriptive analysis of the podcasts hosted on the official platforms and in-depth interviews with platform managers. The sample selection responds to shared legislative and historical criteria, as these corporations formed the first generation of entities integrated into the Federation of Radio and Television Organizations (FORTA), a non-profit association that brings together regional public radio and television broadcasters, and were pioneers in the development of their own digital platforms.

The analysis considers variables such as content typologies, use of co-official languages, degree of hyperlocality, and the target audiences addressed by the podcasts. The study raises questions about how native podcasts extend the public service function of regional broadcasters through exclusive content, contributing to cultural dissemination and the promotion of co-official languages. It also explores how these audio productions reflect contemporary territorial cultures and strengthen cultural identity and heritage. Finally, it examines how such content connects with younger audiences, migrant communities, and other groups that maintain a symbolic bond with their place of origin.

RAS01 Radio, Culture and Society: Audiences, Territory and Narrative Forms

PP 0502 How affective can news get? Radio reporting on the Slovenian parliamentary election

Tina Lengar Verovnik[1,2], Tanja Oblak Črnič[1], Peter Čakš[3]

[1] University of Ljubljana - Faculty of Social Sciences, Department of Communication, Ljubljana, Slovenia
[2] Research Centre of the Slovenian Academy of Sciences and Arts, Fran Ramovš Institute of the Slovenian Language, Ljubljana, Slovenia
[3] University of Maribor - Faculty of Electrical Engineering and Computer Science, Institute of Media Communications, Maribor, Slovenia

In recent decades, societal and media changes have contributed to increasingly personal and emotional engagement with news. As a result, emotion and affect have become central to research on media production and audience engagement,

leading to the so-called "affective turn" (Papacharissi 2015; Kotišová 2019) or "emotional turn" (Wahl-Jorgensen 2019) in communication, media, and journalism studies.

This perspective challenges the notion of objectivity as a widely accepted ideal in hard news reporting (Stenvall 2014). An increasing number of authors question traditional dichotomies such as objective vs. subjective, detached vs. involved, or rational vs. emotional. As Peters (2011) argues, news has always been affective: even the most prototypical "cool" broadcast posture is not unemotional. Contemporary journalism therefore builds not only on accuracy, truthfulness, and expertise, but increasingly also on emotional authenticity (Beckett & Deuze 2016). Consequently, tone and style have become central to generating trust and credibility, allowing for a diversity of emotional styles and more explicit forms of journalistic involvement (Peters 2011; Glück 2021).

Certain journalistic genres, such as commentary or feature stories, have traditionally been considered more suitable for emotional expression, whereas hard news has been framed as incompatible with affectivity. However, recent research highlights the limitations of dispassionate "just the facts" reporting, particularly in contexts of human suffering (Kotišová 2019). At the same time, emotionality in news has shown the potential to raise awareness of social problems (Pajnik 2023) and to intensify public engagement during crises and unfolding events (Papacharissi 2015).

Radio continues to play a significant role in informing audiences and maintaining credible news sources (Wu 2017; Starkey 2017). As an auditory medium, it relies on voice, tone, rhythm, and immediacy, making affect not only a discursive but also a sonic phenomenon. It is precisely these fundamental characteristics of radio style and content that have enabled radio to remain a resilient and trusted news medium despite technological and social changes (Starkey 2017).

In Slovenia, radio remains the most trusted medium, with public service radio ranking as the most trusted news source (EBU 2025). A recent survey (Pajnik 2023) shows that emotional involvement by journalists working in the Slovenian national broadcaster and other legacy media is increasingly accepted, regardless of the medium. Since affect in journalism is relationally generated (Peters 2011), and radio connects with audiences indirectly and in real time, we assume that contemporary radio news reporting also employs affective elements. Drawing on Koivunen et al. (2021) and Stenvall (2008), we conduct a linguistic analysis of radio news reporting on the Slovenian parliamentary election held in March 2026 to address the following research question: to what extent, and through which linguistic devices, are affect and emotion present in radio news bulletins. By doing so, the study extends research on affectivity to radio news journalism, a field that has so far received little systematic attention, and contributes to understanding affective journalism in the context of election reporting.

RAS01 Radio, Culture and Society: Audiences, Territory and Narrative Forms

PP 0503 Knowing your audience: The reshaping of Czech on-demand audio fiction

Filip Faja[1]

[1] Palacký University Olomouc, Department of Theatre and Film Studies, Olomouc, Czech Republic

Given the oversaturation of content in today's audio industry, producers and institutions face new challenges: they must devise effective strategies to not only engage audiences in a fragmented environment but also to sustain their own relevance. In response to this paradigm shift in the Czech context, both public and private sector actors are differentiating their products by production values for their own on-demand portals. For example, Czech Radio, as the public service broadcaster, emphasises more experimental and online-first productions for its můjRozhlas portal, while the Czech branch of the private audiobook publisher Audiotéka is focusing on high-budget audio series. Together, they offer alternatives to the content from traditional linear stations while operating in a less regulated online environment. To achieve this, institutions must create favourable conditions to ensure that production remains sustainable and relevant. According to Petr Szczepanik and Dorota Vašíčková (2023), this process requires not only transforming internal structures but also forming specialised teams that employ diverse production practices.

This paper aims to explore how on-demand production is transforming institutional commissioning processes and production practices at Czech Radio and Audiotéka, particularly in the area of original audio drama. By engaging with digital environments, institutions can access valuable user data which subsequently inform future production decisions (Napoli 2013; Johnson 2019; van Es & Poell 2020). The decision-making process within production cultures reflects the traditional tension between individual and institutional requirements. However, this dynamic is increasingly conditioned by data outputs, which are interpreted and applied in various ways (Caldwell 2008, 2023). Public metrics serve as production tools for negotiating risks associated with formats and genres, maintaining brand identity, and determining what institutions define as "successful" on-demand audio fiction.

This qualitative analysis draws on semi-structured interviews with the primary decision-makers at můjRozhlas and Audiotéka. It examines how executive strategies shape the production of original audio fiction. Building on theoretical approaches to platformisation and production cultures, the paper uses selected examples to illustrate the commissioning processes and how they contribute to redefining audio on-demand production as a mainstream commodity (Bonini 2015). A comparative analysis of these two institutions reveals that, in the Czech context, on-demand content is shaped by divergent modes of knowing the audience, leading to choices that legitimise the market value of both the products and the institutions. To

grasp the dynamics of the current media landscape, it is essential to monitor not only what audiences listen to but also how producers interpret feedback. These strategies define the shape of current Czech on-demand original audio fiction.

RAS02 Digital Transformations, Podcast Production and the Rise of Synthetic Voices

PP 0825 Deep dive news podcast production: An ethnographic approach

Jakob Dybro Johansen[1]

[1] Aarhus University, Department of Media and Journalism Studies, Aarhus N, Denmark

For almost a decade, newsrooms across the world have been experimenting with news podcasting to engage and strengthen relationships with audiences. As users gravitate increasingly towards on-demand and mobile media consumption, audio journalism in the form of podcasts has become a key component in the innovation processes of established media organisations who seek to adapt to the digital era. Specifically, the deep dive format, pioneered by 'The Daily' by The New York Times and replicated by newspapers, broadcasters, and digitally born publishers in many other countries, has been seen by media scholars and industry professionals as an antidote to news avoidance and as a particularly effective and innovative way of doing podcast journalism (Dowling, 2024; Perdomo & Lindgren, 2025).

However, research on news podcasting remains scarce with most production-oriented studies relying either on content analysis or semi-structured interviews with journalists (see, for example, de Torres et al., 2025; Miller et al., 2022; Nee & Santana, 2022). While these have provided important insights into the characteristics of the podcasts themselves and the strategies of publishers, I argue that more site-intensive approaches are needed to show what it means to work creatively with sound in the specific context of established news organisations. Taking an ethnographic approach, I ask: How do newsroom resources affect the production of deep dive news podcasts (RQ1), and what are the key elements and challenges of successful deep dive news podcast production as experienced by different staff members (RQ2)?

In this paper, I present preliminary results. They are based on a multi-sited fieldwork amongst Danish news podcast producers. First, I conducted newsroom observation across five different deep dive news podcasts. Then, I interviewed journalists, editors, and sound designers using news podcast manuscripts and audio clips as material probes. By grounding the reflections of practitioners in the experiences of producing specific podcast episodes, I show how news podcast production can be understood as the collaboration and convergence of a multitude of different skills. As news publishers struggle for relevance, my paper goes behind-the-scenes of news podcasting – one of the potential pathways for future journalism. Through fieldwork, I offer an understanding of deep dive news podcast production closely anchored in actual newsroom practices.

RAS02 Digital Transformations, Podcast Production and the Rise of Synthetic Voices

PP 0826 Radio 3 Extra and the digital transformation of public radio in Spain: A decade of innovation (2013–2023)

José M. Legorburu[1], Sara Ruiz-Gómez[1]

[1] Universidad CEU San Pablo, Audiovisual Communication and Advertising, Madrid, Spain

Innovation is considered a hallmark of public radio broadcasters (Kung, 2007; Fernández-Quijada et al., 2015; Martínez-Costa et al., 2020). This characteristic has remained unchanged throughout the transformation process of Public Service Broadcasting (PSB) into Public Service Media (PSM) over recent decades (Direito-Rebollar & Donders, 2021; Nikolaus, 2021; Fieiras-Ceide et al., 2024). In fact, this responsibility has become even more pronounced due to the digitalization of audio, which initially led to the podcasting boom (Spinelli & Dann, 2019) and, subsequently, to the phenomenon of platformization (Sullivan, 2004).

Following the example of the British BBC (Berry, 2020; Charles-Hatt & Sayers, 2021) and the U.S. NPR (Clark & McLean, 2020), in Spain, Radio 3 Extra is the first digital platform based on podcasts and developed from the alternative station Radio 3 (Vivanco-Sánchez, 2021) by Radio Nacional de España (National Radio of Spain), within the framework of

RTVE's public corporation innovation strategies. Its goal is to attract new listeners among digitally native generations (Galán-Arribas et al., 2022; Robert-Agell et al., 2022). A pioneer in creating and distributing digital audio (and video) content, during its first decade, Radio 3 Extra has become a testing ground for this public corporation, developing numerous innovative experiences with 5G and 4K technologies, Dolby Atmos immersive sound, and Artificial Intelligence.

Using a mixed qualitative-quantitative methodology, this study analyzes the production and publishing strategies of Radio 3 Extra. To this end, its entire output during this period (110 exclusive pieces of content) was reviewed using a specific analysis sheet comprising 24 variables. Additionally, semi-structured interviews were conducted with the main project stakeholders at the station and the corporation: the director, executive producer, editor of the flagship podcast, and Radiotelevisión Española (RTVE) innovation managers between 2013 and 2023.

The findings demonstrate the usefulness of this digital platform for implementing Spanish Radio and Television Corporation's innovation strategy, which not only seeks to adapt to changes in media consumption habits—particularly among younger generations—but also aims to position itself as a significant player in the digital media ecosystem by collaborating with leading private-sector technology companies and producing not only audio content but also transmedia formats. In doing so, it fulfills its legal obligations as a PSM, which include digital innovation.

RAS02 Digital Transformations, Podcast Production and the Rise of Synthetic Voices

PP 0827 Synthetic voices, moral anxieties: How journalism frames AI-generated audio

Kim Fox[1]

[1] The American University in Cairo, Department of Journalism and Mass Communication, New Cairo, Egypt

NOTE: ChatGPT was used to generate this abstract. The abstract was edited for this submission.

As AI-generated voices and synthetic audio increasingly circulate across journalism, entertainment and everyday communication, concerns about authenticity, trust and surveillance have intensified. While research on artificial intelligence in journalism has largely focused on automation, algorithms and text-based production (Carlson, 2014), comparatively little attention has been paid to how sound- and voice-based AI technologies are discursively constructed in news media. This paper addresses that gap by examining how journalism frames synthetic audio as a site of innovation, threat and moral concern, with particular attention to the cultural politics of voice.

This qualitative interpretive study employs a critical discourse-informed textual analysis, drawing primarily on Critical Discourse Analysis (CDA) (Fairclough, 1995; van Dijk, 1993) and informed by Andre Brock's Critical Technocultural Discourse Analysis (CTDA), which emphasizes the inseparability of technology, culture and power in mediated discourse (Brock, 2018). While CTDA has been most often applied to digital platforms and online communities, its attention to how dominant technological narratives encode cultural values and normative assumptions provides a useful extension for analyzing journalistic discourse about emerging audio technologies.

The corpus comprises a purposive sample of news articles published between 2024 and 2025 from a global news outlet, an international wire service and a technology-focused online publication. Articles were selected based on explicit engagement with AI-generated voices, voice cloning or synthetic audio. The corpus is designed to capture dominant discursive patterns within agenda-setting journalism. The analysis attends to lexical choices, metaphors, headline framing and the distribution of agency between human and nonhuman actors, treating news discourse as a social practice through which technological meaning is produced and contested.

Guided by two research questions, the paper examines how news media construct synthetic audio technologies as sites of innovation, threat and ethical concern, and how these constructions reflect broader cultural anxieties about authenticity, voice and technological authority. Preliminary findings suggest that coverage of AI-generated voices oscillates between narratives of progress and unease, often reproducing assumptions of technological inevitability while mobilizing affective language associated with deception and loss of trust. Drawing on CTDA, the analysis highlights how these framings are not culturally neutral but embedded within dominant technocultural logics that privilege corporate expertise and marginalize alternative understandings of voice and agency.

By foregrounding voice as a culturally and politically consequential site of discourse, this paper contributes to radio and sound scholarship by extending critical approaches to AI beyond text and visuals. It demonstrates the value of combining CDA and CTDA to interrogate how journalism mediates and reshapes public understandings of AI and audio.

RAS02 Digital Transformations, Podcast Production and the Rise of Synthetic Voices

PP 0828 Integration of journalistic podcasts in Spanish digital media: Organization, financing, and partnerships

Avelino Amoedo[1], Pilar Martínez-Costa[1], Elsa Moreno-Moreno[1]

[1] University of Navarra, Journalism Department, Pamplona, Spain

After two decades of podcasting, the journalistic podcast stands out as a key format in the current media landscape. Nevertheless, its presence still has a high potential for professional development while representing a novel research area (Martínez-Costa, Amoedo-Casais, Moreno-Moreno, 2022; Whittle, 2024). This work analyzes how Spanish digital media are integrating podcasting into the newsroom, the collaborations and partnerships they establish for production and distribution, and their financing strategies.

This study combines quantitative and qualitative methodologies through three tools. First, we will show data about the presence of podcasts in the Spanish digital media map, updated within the framework of the previous research project *Digital native media in Spain: typologies, audiences, trust construction and keys to journalistic sustainability*-DIGINATIVEMEDIA II 2022–2025, funded by the Government of Spain. Secondly, we have made progress in the content analysis of the production, financing, and distribution of podcasts from a selection of ten digital media outlets with the highest weekly reach among Spanish internet users, according to *Digital News Report Spain 2025*. Finally, the content of a dozen in-depth interviews with executives of digital-native media is coded and analyzed to understand the role they assign to audio content and to assess whether it forms part of their editorial, commercial, and distribution strategies.

This work in progress identifies the incorporation of new professional profiles, the integration of AI tools and the restructuring of newsrooms for the production of podcasts. This study is an extension of previous research carried out by this team and it is also supported by Ministry of Science and Innovation of the Government of Spain (*Artificial intelligence in digital media in Spain: models and scenarios*-Nextdigimedia 2025–2029).

Likewise, funding remains a challenge. Although advertising is the main way of getting an income, there is a growing interest in branded podcasts, whereas paid subscriptions have not achieved the expected success.

Partnerships and cooperation between media outlets, production companies and platforms are becoming more common. These collaborations seek to enhance the production, distribution, and funding. However, the relationship with major distribution platforms poses challenges in terms of monetization and visibility.

In conclusion, the integration of journalistic podcasts into the strategies of digital media in Spain is a dynamic process that presents challenges and opportunities. Adapting to new audience demands, seeking sustainable funding models, and engaging with distribution platforms are some of the key aspects of the scenario studied in this research.

RAS02 Digital Transformations, Podcast Production and the Rise of Synthetic Voices

PP 0829 Voice and persuasion: From human vocality to artificial speech

Laura Caroleo[1]

[1] Catholic University of the Sacred Heart, Faculty of Political and Social Science, Milan, Italy

The human voice has always been a persuasive instrument (In the beginning was the Word, John I: I), an embodied medium capable of conveying trust, emotion, and authority. Across history, vocal expression has functioned as a privileged channel for social bonding, leadership, and collective sense-making, precisely because is an element of bodily physicality and it carries traces of the body behiind: breath, hesitation, rhythm, and vulnerability. Yet, in the age of generative artificial intelligence, vocality itself is being reprogrammed. This paper examines the transition from human to AI-generated voices as a paradigm shift in the ecology of persuasion, where speech becomes a computational interface rather than a primarily human faculty. The study situates this transformation within the theoretical framework of *post-orality* (Caroleo, 2025), a stage in which algorithmic systems simulate human affect, rhythm, and prosody to influence perception decision-making, and behaviour at scale.

Drawing on insights from *persuasive technology* (Fogg, 2003), *computers as social actors* (Reeves & Nass, 1996), and the emerging field of *affective computing* (Picard, 1997), the research explores how synthetic voices are intentionally designed to evoke credibility, empathy, and compliance. This systems do not merely transmit onformation, they perform sociality. Through a mixed-method approach that integrates a questionnaire, a total of 20 in depth semi-structured interviews and critical algorithm studies, the paper compares persuasive affordances in human and AI-mediated vocal interactions across digital assistants, conversational agents, Ai Podcast and voice-based social media.

Findings indicate a profound shift from relational persuasion, rooted in authenticity and shared embodiment (Sundar & Nass, 2000), to data-driven modulation, where persuasion operates through predictive analytics and emotional mimicry (Bryson, 2019; Gunkel, 2020). This transformation raising ethical questions around authorship, manipulation, and the moral status of synthetic speech.

Ultimately, the paper argues that the migration of persuasion from human to artificial voices marks a decisive turn in human–AI communication—one where the voice ceases to be merely human, becoming a programmable medium of influence.

RCC01 Challenges in Warning Communication: Gaps, Barriers, and Ways Forward

PN 05 Between analog radios and AI assistants: Rethinking multi-channel warning after the Czech 2024 floods

Jaroslav Valuch[1]

[1] Ministry of Interior, Crisis Information Team, Prague, Czech Republic

The September 2024 Czech floods offered a case in which timely meteorological warnings were matched by a decisive government response, translating early forecasts into a sustained risk communication effort at the national level. Subsequent conversations with municipal leaders, however, revealed counterintuitive insights worth examining. Intensive media coverage sometimes led local authorities to reduce their own communication efforts, assuming citizens "already know." Traditional channels such as local radio, personal outreach, and neighbor-to-neighbor networks retain significant potential that remains underutilized alongside dominant digital approaches. Perhaps most notably, the very concept of "communication" lacks shared understanding: local leaders tend to perceive it as infrastructure and information exchange within the crisis management system, rather than as effective dialogue with all segments of the public. Drawing on direct operational experience and supplementary qualitative conversations with mayors in affected regions, this contribution examines the multi-channel imperative from a practitioner's perspective. The core argument is straightforward: adequate early warning cannot rely on any single channel, however sophisticated. Warnings must reach citizens through multiple, redundant pathways, across diverse population groups, narrative frameworks, and varying levels of institutional trust. Crucially, this requires moving beyond message-centric thinking toward human-centered design that places individual information needs, uncertainties, and decision-making contexts at the center of warning system architecture. Yet the full potential of existing multi-channel approaches remains unrealized. Traditional tools and communication pathways are underutilized; the infrastructure for truly redundant, inclusive reach is incomplete; the conceptual shift toward public dialogue is far from complete. And already, before these foundations are solid, new information practices are emerging. AI-powered assistants are rapidly becoming embedded in everyday information-seeking practices. While not yet significant actors in crisis communication specifically, their trajectory suggests they will increasingly mediate how citizens seek and interpret emergency information. New use cases and roles are to be expected, ones we cannot yet precisely name or define. This presents both challenge and opportunity. The challenge lies not only in alignment, ensuring that AI-generated guidance supports rather than contradicts official warning protocols, but also in coherently integrating these new actors into multi-channel redundancy frameworks. Preparedness campaigns recommend battery-powered analog radios; simultaneously, we anticipate AI assistants serving as trusted guides before, during, and after crisis situations. Both belong in the same ecosystem. The opportunity is anticipatory: we can begin now to shape how these technologies integrate with, rather than fragment, warning systems. Practitioner insights from real crisis situations, gathered through qualitative fieldwork and public opinion research, offer empirically grounded knowledge that could inform the ongoing development of language models, strengthening their capacity to serve crisis communication.

RCC01 Challenges in Warning Communication: Gaps, Barriers, and Ways Forward

PN 06 Challenges and pathways to effective warning systems for extreme weather events: Global insights for the European context

Yijing Wang[1]

[1] Erasmus University Rotterdam, Strategic Communication, Rotterdam, Netherlands

Disaster risk communication represents a critical but insufficiently examined domain that seeks to bridge the persistent gap between predictive science regarding weather forecasting as well as behavioral and societal response. This systematic literature review seeks to address this gap by offering an integrated synthesis of research on disaster warning communication. Following the PRISMA 2020 guidelines, the study employs a transparent and replicable review process that combines automated search-term identification with thematic analysis grounded in qualitative rigor. Through consolidating fragmented insights across disciplines, we aim to identify recurring challenges in effective warning communication, as well as to understand the underlying factors and innovative solutions. Leveraging the expertise of a network of European scholars and practitioners, this review (N = 173) aims to highlight the relevance of these findings for the European context, contributing actionable knowledge for policymakers and practitioners seeking to develop effective warning systems. Furthermore, the analysis directly supports ongoing efforts to enhance multi-hazard early warning systems by translating scientific precision into human-centered understanding. To guide this synthesis, the review is organized around the following research questions: RQ1: What key challenges are identified in the literature regarding disaster risk and early warning communication? RQ2: What underlying factors contribute to these challenges, including technological, institutional, and social dimensions? RQ3: What solutions, innovations, or best practices have been proposed or tested to improve impact-based communication and enhance societal resilience? The findings show that while extreme weather events like floods, droughts, and heatwaves dominated the empirical focus, the review identified cross-cutting challenges including fragmented governance, underdeveloped institutional coordination, and insufficient attention to vulnerable populations such as the elderly, low-income groups, and non-native speakers. Although the advances in impact-based forecasting are frequently addressed in prior research, the communication and use of warnings remain constrained by for example, political reluctance and digital

exclusion, as well as a lack of trust in institutions among citizens. The findings thus highlight that the effectiveness of early warning systems depends not only on technological capacity and interorganizational cooperation, but also on their social embedding and communicative legitimacy. It points to the importance of translating scientific information into human-centered understanding, in order to enhance multi-hazard early warning systems.

RCC01 Challenges in Warning Communication: Gaps, Barriers, and Ways Forward

PN 07 When warnings must work: Designing official weather warnings at the Deutscher Wetterdienst (German Meteorological Service)

Dinah Kristin Rode[1], Andreas Lambert[2], Bodo Erhardt[3], Maria Zwicker[2]

[1] Deutscher Wetterdienst, Business Area Weather Forecasting Services, Offenbach, Germany
[2] Deutscher Wetterdienst, Weather Forecasting Services, Offenbach, Germany
[3] Deutscher Wetterdienst, Weather Forecasting Services, Munich, Germany

Warnings are a specific form of public communication: they are time-critical, normatively charged, and explicitly aimed at triggering action. Yet, in many warning systems, communication design has traditionally received less attention than technical and scientific accuracy. This presentation examines how warning messages can be conceptualized and empirically evaluated as communicative acts, drawing on recent empirical studies conducted at the Deutscher Wetterdienst (DWD) between 2024 and 2026, in the context of ongoing explorations of impact-oriented warning communication. Using a series of empirical studies, the presentation investigates how different elements of weather warnings are perceived, processed, and assessed by recipients, including warning levels and labels, textual structure, impact descriptions, and recommended actions. The empirical basis combines population-representative surveys, experimental designs, and co-design approaches, drawing on research associated with the RainBoW program (Risk-based, Application-oriented and INdividualizaBle Provision of Optimized Warning Information; Leschzyk et al., 2025) and the WEXICOM research framework. The empirical results reveal several recurring patterns in how warning messages are received and evaluated. First, labels, colors, and categorical elements alone are not consistently sufficient to convey urgency. Second, variations in the internal structure of warning texts are associated with differences in comprehension and recall. In particular, the ordering of information, the number of listed impacts or recommended actions, and the relative prominence of hazard descriptions and guidance are reflected in what respondents report remembering. Third, stated preferences for specific warning elements often diverge from results of recall and comprehension tasks, indicating that different evaluation approaches capture distinct aspects of message reception. Building on these findings, the presentation reflects on implications for the design and assessment of public weather warnings, with a focus on the interplay of language, structure, content, and visual elements. Rather than relying solely on preference-based feedback, it highlights the importance of considering warning messages as coherent communicative arrangements under conditions of uncertainty. Warnings are approached as communicative interventions whose effectiveness depends on the alignment of linguistic clarity, impact-related contextualization, and actionable guidance. Particular attention is paid to impact-related information—such as return periods of events of comparable intensity or references to everyday consequences—as a communicative resource that links meteorological data to socially meaningful contexts (Schulze & Voss, 2023).In Germany, the Deutscher Wetterdienst is the sole institution authorized to issue official weather warnings. This mandate places particular emphasis on the quality of warning communication, as these messages serve as the authoritative reference for the public, media, and emergency management. The presentation situates empirical communication research as an integral part of this role and as a basis for the ongoing development and harmonization of official warning communication at the DWD (Erhardt et al., 2025).

PN 08 Unveiling local barriers to effective warning communication: Evidence from the AlertHub network

Corina Buzoianu[1], Camelia Cmeciu[2], Sylvia Bach[3], Florian Meissner[4], Andreas Schwarz[5], Henrik Olinder[6], Monica Bira[7], Roberta Raducu[7]

[1] National University of Political Studies and Public Administration, Communication, Bucharest, Romania
[2] University of Bucharest, Journalism, Bucharest, Romania
[3] University of Wuppertal, Schoof of Mechanical Engineering and Safety Engineering, Wuppertal, Germany
[4] Hochschule Darmstadt – University of Applied Sciences, Media Department, Darmstadt, Germany
[5] Technische Universität Ilmenau, Department of Economic Sciences and Media, Ilmenau, Germany
[6] Swedish Civil Defence and Resilience Agency, Crisis communication, Stockholm, Sweden
[7] SNSPA, Communication, Bucharest, Romania

This presentation discusses preliminary findings from a multi-country qualitative research project conducted within the COST Action AlertHub, involving scholars and practitioners from more than ten European countries. The research aims to uncover the challenges that local authorities and experts face in ensuring effective warning communication. While national disaster response and communication policies provide overarching frameworks, it is local-level institutions that must interpret these directives, adapt them to specific community contexts, and maintain direct communication with the population. Through semi-structured interviews with practitioners working in local disaster management, risk prevention, and emergency communication, the study examines how national policies are translated into practice and where significant barriers arise—representing one of the first coordinated efforts to analyse local-level warning communication across such a broad

range of European contexts. The analysis is anchored in warning communication research and complemented by theories of multi-level governance and policy translation. Together, these perspectives highlight how local authorities operate as frontline communicators who must interpret national directives, contextualize risk information, tailor messages for diverse populations, and sustain public trust under varying institutional and resource constraints. To examine these communicative processes in depth, the IDEA model (Internalization–Distribution–Explanation–Action) is employed as an analytical lens for assessing how local actors construct, deliver, and justify warning messages. Preliminary findings reveal recurrent challenges across more than ten participating countries, including tensions between national requirements and local realities, difficulties in tailoring warnings to heterogeneous communities, limited resources, unclear governance responsibilities, and the growing complexity introduced by digital and social media environments. Participants emphasized that effective warning communication depends not only on technological systems but also on local knowledge, coordination capacities, and meaningful engagement with communities. By highlighting these ground-level challenges across multiple European contexts, the study offers empirically grounded insights into the gaps and barriers that shape warning effectiveness.

RCC02 Leading Through Uncertainty: Crisis Communication in Communities, Organisations, and Digital Spaces

PP 0190 Authentic vulnerability and leadership communication in crises: A matrix for understanding emotion and credibility

Yijing Wang[1], Anca Anton[2], Silvia Ravazzani[3]

[1] Erasmus University Rotterdam, Department of Media and Communication, Rotterdam, Netherlands
[2] University of Bucharest, Faculty of Journalism and Communication Sciences- Department of Journalism, Bucharest, Romania
[3] Università IULM, Department of Business- Law- Economics and Consumer Behaviour "Carlo A. Ricciardi", Milan, Italy

Crises place organizational leaders under heightened public scrutiny, requiring them to communicate not only decisions and actions but also emotion under conditions of uncertainty and responsibility attribution. Research in risk and crisis communication has shown that leaders' emotional expressions can shape stakeholder reactions, particularly perceptions of empathy, sincerity, and trust (e.g. Claeys et al., 2022; Stephens et al., 2019). At the same time, findings remain inconsistent: similar emotional displays may enhance credibility in some crises while appearing exaggerated, self-centred, or manipulative in others. Existing frameworks, including responsibility-based approaches such as Situational Crisis Communication Theory (Coombs, 2007), offer limited explanation for these divergent outcomes when emotion and leadership identity are foregrounded.

This paper advances the concept of *authentic vulnerability* to address this gap. Authentic vulnerability refers to leadership communication that combines emotional openness with consistency in identity and visible acceptance of responsibility. To conceptualise how vulnerability and authenticity intersect, the paper proposes an *authenticity-vulnerability matrix* structured along two dimensions: the degree of emotional exposure and the degree of perceived authenticity. The framework distinguishes four leadership communication styles in crises: controlled messaging, performative vulnerability, grounded transparency, and authentic vulnerability. Rather than treating emotion as inherently beneficial or harmful, the matrix conceptualises vulnerability as communicative exposure to accountability and risk, and authenticity as a relational judgment inferred by publics rather than an intrinsic leadership trait.

The framework is illustrated through a set of ten leader-centred crisis cases spanning different organisational scales and cultural contexts, including multinational corporations, scale-ups, and owner-led organisations. The cases focus on situations in which senior leaders were directly implicated in both the crisis and the response, such as industrial accidents, technological failures, cultural backlash, workplace controversies, and aviation disasters. Comparative analysis shows that emotional expression alone does not constitute vulnerability, nor does it guarantee perceptions of credibility. Leaders were perceived as vulnerable when they publicly accepted responsibility, acknowledged limits to control, or incurred consequences extending beyond symbolic apology. Credibility emerged when such exposure aligned with prior leadership identity and was sustained over time, although evaluations often diverged across competing publics.

By distinguishing emotional expression from vulnerability and treating credibility as an audience-based judgment, the authenticity-vulnerability matrix extends emotion-centred crisis communication research and complements responsibility-focused models. The paper contributes a diagnostic lens for analysing leadership communication in fragmented and polarised public environments, where crisis effectiveness cannot be assessed solely through reputational repair, but must account for uneven trust and contested evaluations.

PP 0191 To conduct crisis communication during rumors

Henrik Olinder[1]

[1] Swedish Civil Contingencies Agency MSB, Crisis Communications, Solna, Sweden

Henrik Olinder, Swedish Civil Defence and Resilience Agency

To conduct crisis communication during rumors

Rumors have the ability to establish and become a topic of conversation that reaches far and wide and causes responsible politicians and authorities to change their focus. The phenomenon is nothing new, it has existed as long as people have talked to eath others. When dangers and uncertainties exist, rumors pop up in several different places at the same time. They arise from our conversations and interactions online. In the event of emergencies and crises, they also attract attention, which sometimes makes the intended crisis communication more difficult to handle. In a number of different crisis situations, politicians and authorities have commented on rumors and urged citizens not to spread them, which has had the opposite effect. Rumors also circulate in digital media platforms and have received competition from the news outlet. Rumors are still faster and take the attention as the media searches for reliable sources to break the news. In this presentation, some examples from different crises situations will be exposed how decision makers and agencies handle rumors.

Waiting for action creates prime conditions for rumors to arise, a lesson that all organizations must learn. The most crucial factor for crisis communication is to convey information rapidly. Moreover, the information that is provided must be correct. These two important perspectives are not opposed to each other. Speed is about conveying that the emergency or crisis is being taken seriously and that all available resources have been deployed to help those affected.

In this presentation, some practical examples will be presented and described. It will also explain how rumors can be perceived by politicians and authorities.

RCC02 Leading Through Uncertainty: Crisis Communication in Communities, Organisations, and Digital Spaces

PP 0192 Rumour narratives as collective sensemaking during the first two years of Russia's full-scale invasion of Ukraine

Olga Iurkova[1]

[1] National Technical University of Ukraine "Igor Sikorsky Kyiv Polytechnic Institute", Department of Publishing and Editing- Publishing and Printing Institute, Kyiv, Ukraine

This paper explores salient rumour narratives circulating in Ukraine during 2022–2023 and examines how these narratives function as mechanisms of collective sensemaking under conditions of extreme uncertainty. The paper conceptualises rumours as recurring narrative storylines through which social actors collectively interpret threat, responsibility, and possible futures in a prolonged wartime context.

The paper is theoretically grounded in sensemaking theory (Weick et al., 2005) and classical and contemporary theories of rumours (Allport & Postman, 1947; Shibutani, 1966; DiFonzo & Bordia, 2007), which conceptualise rumours as socially embedded communicative practices emerging in situations of high ambiguity and significance. It is additionally informed by research on crisis communication emphasising processual and prolonged dynamics (Coombs, 2007), which provides a framework for understanding how communicative patterns evolve when such conditions persist over time rather than unfold as singular events.

Empirically, the paper draws on two complementary qualitative datasets. The first consists of a time-bound corpus of rumours documented during 2022 and 2023 through monitoring of Ukrainian and Russian Telegram channels, Ukrainian online media, and materials collected by media literacy and fact-checking organisations. These materials enable a qualitative comparison between different phases of the war. The second dataset comprises retrospective rumour accounts collected through a large-scale survey (n>2,000), in which respondents described rumours they encountered. These accounts are treated as memory-based narratives reflecting mediated salience and emotional persistence rather than real-time circulation (Hoskins, 2009; 2018).

Methodologically, the paper adopts a narrative-oriented approach to thematic analysis (Daiute, 2013; Neuendorf, 2018). The analysis focuses on identifying recurring narrative patterns and examining their internal structure, including key actors,

causal logic, attribution of responsibility, moral framing, and temporal expectations. A qualitative comparison between 2022 and 2023 is used to explore how dominant rumour narratives shift as the war moves from a dynamic phase to an attrition phase (Horbyk, 2025). Survey-based data are analysed to consider which narratives remain salient in collective memory and how they are retrospectively framed.

By focusing on rumour narratives as communicative practices, the paper contributes to discussions on rumours, crisis communication, and collective sensemaking in contexts of sustained uncertainty.

RCC02 Leading Through Uncertainty: Crisis Communication in Communities, Organisations, and Digital Spaces

PP 0193 Polarized discourse: The role of agents in the polarization of public opinion on social media in times of moral crisis.

Karolina Hess[1]

[1] University of Warsaw, The Faculty of Journalism- Information and Book Studies, Warsaw, Poland

Abortion law constitutes a moral issue that has long polarized public opinion and offers limited potential for compromise between opposing positions. As a moral question, it is associated with strong emotions, identity-based attachments, and social conflict. In recent decades, social media have become one of the most visible and influential communication environments in which such moral conflicts are articulated, intensified, and contested, particularly in situations perceived as crises.

This project examines how agents — understood, following Bruno Latour, as actors with the capacity to influence the formation, stabilization, and change of public opinion — use social media in situations of moral crisis and if (how) their communication influences the polarization of public discourse. It focuses on cases in which changes in abortion law trigger public anxiety, social unrest, and heightened media attention.

The doctoral project addresses three interrelated research problems. First, it examines how agents with the potential to influence public opinion communicate on social media in debates related to situations of moral crisis. Second, it seeks to identify and characterize patterns of communication that are associated with polarized public discourse and to examine whether these patterns display features identified in communication in other crisis situations. Third, it explores how users respond to the communication of agents in social media environments.

The empirical focus of the project will initially be on three widely discussed cases of abortion law change: the tightening of abortion regulations in Poland (2016–2021), the decriminalization of abortion in Mexico (2021), and the repeal of the Eighth Amendment in Ireland (2018). These cases are treated as situations of moral crisis in which abortion becomes a focal point of moral disagreement, social conflict, and identity-based polarization. The comparative perspective makes it possible to examine both similarities and differences in how agents communicate across different social and cultural contexts.

This initial selection of cases serves as a starting point for a broader comparative analysis, allowing the project to remain open to further empirical expansion as the research develops. By focusing on moral crisis rather than on political competition, the project seeks to contribute to research on risk and crisis communication by examining how social media function as arenas in which moral risks, social anxieties, and polarized identities are publicly negotiated.

RCC03 Strategic Communication Across Wartime Fronts: Media, Technology, Security, and Society

PP 0310 Too much support for Ukraine, or dissatisfaction with anti-Russia policies? Explaining Euroscepticism in Romania in the context of Russia's war against Ukraine

Eugen Potra[1], Mihnea Simion Stoica[1], Ioan Hosu[1]

[1] Babeș-Bolyai University- Faculty of Political- Administrative and Communication Sciences, Department of Communication- Public Relations and Advertising, Cluj-Napoca, Romania

Russia's invasion of Ukraine has reshaped public debate across Europe, generating heightened uncertainty, perceived risk, and prolonged societal disruption. While existing research shows that overall support for the European Union has increased since the outbreak of the war, far less is known about how crisis policies influence Euroscepticism in Member States that are highly pro-European. The current article addresses this gap by examining Romania, a country on the Union's eastern border, characterized by strong support for the EU and NATO, in a context of chronic distrust in domestic institutions, and amid the

rise of a heightened Eurosceptic discourse by part of the political elite. From a risk and crisis communication perspective, the study investigates how public evaluations of the EU's crisis responses, both against Russia and in support of Ukraine, reshape trust, legitimacy, and solidarity under conditions of geopolitical threat. We focus on four highly salient policy domains: EU sanctions against Russia, efforts to reduce energy dependence on Russia, support for Ukrainian refugees, and EU involvement in Ukraine's post-war reconstruction. The article relies on original public opinion data collected in Romania between October and December 2022 (N = 5,709). Logistic regression models are then used to assess how attitudes towards EU crisis policies can predict Euroscepticism. Results show that dissatisfaction with EU assistance to Ukrainian refugees and EU's intention of involvement in Ukrainian reconstruction are the strongest predictors of Euroscepticism. The effects also remain robust when all dimensions are included simultaneously, indicating that Euroscepticism is shaped by the cumulative perception of economic, humanitarian, and security-related burdens associated with EU crisis governance. The findings suggest that Euroscepticism in Romania is best understood as crisis-driven and instrumental. While overall support for the EU remains remarkably high, it becomes conditional when EU actions are communicated and perceived as imposing disproportionate costs during a prolonged crisis. Rather than reflecting ideological rejection of European integration, Euroscepticism in Romania emerges from evaluations of crisis management, fairness, and responsibility. By focusing on a highly Euro-enthusiastic society exposed to acute geopolitical risk, this study contributes to risk and crisis communication research by showing how prolonged crises can reconfigure public trust and legitimacy toward supranational governance. The article underscores the importance of crisis communication strategies that address perceptions of risk, burden-sharing, and solidarity in order to sustain public support during extended geopolitical emergencies.

RCC03 Strategic Communication Across Wartime Fronts: Media, Technology, Security, and Society

PP 0311 When crisis communication meets forensics: Managing narratives in ransomware, third party, and nation state attacks

Wouter Jong[1]

[1] Institute of Security and Global Affairs, Crisis Governance, The Hague, Netherlands

Within crisis communication, research has traditionally examined how organizations explain, justify, and frame crises once responsibility has been established and operational control has been restored. In the context of cyber incidents, this focus has translated primarily into studies of post incident communication with customers and clients following data breaches. While this is an important dimension of crisis communication, the presentation proposed here is based on a study that shows, according to practitioners, that much more is taking place behind the scenes in which the communication function plays a critical role.

In cyber related crises, communication often takes place while investigations, negotiations, and attribution processes are still ongoing. This study argues that such conditions fundamentally challenge dominant crisis communication frameworks, which largely assume that communication follows rather than shapes crisis response. Drawing on semi structured interviews with eleven cyber crisis practitioners, this presentation reports on an ongoing study and provides an in depth analysis of how communication operates during active cyber incidents.

The findings show that crisis communication in cyber incidents frequently becomes operational. Following principles of digital forensics (Casey, 2019), communication must not compromise evidence preservation or investigative integrity. Communication choices can influence ransomware negotiations, alter pressure dynamics in third party compromises, and shape diplomatic or commercial relations in cases involving suspected nation state espionage. As a result, communication is not merely a reputational activity but is tightly intertwined with forensic investigations, operational security, and strategic decision making.

In ransomware cases, organizations must carefully balance transparency with the risk of disrupting negotiations, as threat actors actively monitor both internal and external communication. In third party incidents, public statements by partners can unintentionally escalate the crisis by increasing external pressure, requiring intensive coordination to manage communicative spillover. In espionage related incidents, the immediate consequences may be less visible to stakeholders, yet communication can become embedded in broader geopolitical narratives with implications extending beyond the affected organization.

These findings challenge the assumptions underlying dominant crisis communication models such as Situational Crisis Communication Theory (SCCT; Coombs, 2007) and Image Repair Theory (Benoit, 1997), which were not developed for contexts characterized by prolonged uncertainty, contested attribution, and ongoing operational response. By demonstrating how communication can actively shape developments within a crisis, this study contributes to crisis communication scholarship by broadening its analytical focus from post crisis messaging about data breaches to internal and external communication while being under investigation and negotiation.

RCC03 Strategic Communication Across Wartime Fronts: Media, Technology, Security, and Society

PP 0312 Framing war at the border: Finnish newspapers on the Russo-Ukrainian war

Andreas Fagerholm[1]

[1] Åbo Akademi University, Depratment of Social Sciences, Vaasa, Finland

Russia's invasion of Ukraine in February 2022 constituted a watershed moment in European security politics and profoundly reshaped political, media, and public discourses across the West. In Finland – a small state with a 1,300-kilometre border with Russia and a long tradition of military non-alignment – the war was widely interpreted as a direct signal of heightened Russian assertiveness and a fundamental challenge to national security. The invasion coincided with a rapid transformation of elite and public opinion, culminating in Finland's historic decision to join NATO. Against this, this article examines how Finnish mainstream news media framed the Russo-Ukrainian War in their editorial coverage.

The study builds on the war/peace journalism framework originally developed by Johan Galtung and later operationalized by Maslog and colleagues. Rather than adopting the framework normatively, the article employs it as an analytical tool to examine how different framing orientations manifest empirically in media texts. Using a quantitative content analysis, the study analyzes editorial texts published between February 2022 and July 2025 in six Finnish newspapers. The sample includes national tabloid newspapers, national quality newspapers, and regional quality newspapers published in both Finnish and Swedish, enabling systematic comparisons across media type, organizational level, language, and time.

The analysis assesses the relative prevalence of war journalism and peace journalism indicators in editorial framing and tests a set of hypotheses concerning overall dominance, temporal dynamics, and variation across different segments of the Finnish press. Particular attention is paid to whether war-oriented framing declines over time as the conflict becomes protracted, and to whether tabloid, national, and regional outlets differ in their reliance on elite-driven, victory-oriented, and emotive frames. By focusing on editorials – texts that explicitly articulate normative and interpretative positions – the study offers insights into how media in a bordering small state construct meaning around war, responsibility, and security under conditions of geopolitical crisis. More broadly, the article contributes to research on media performance in wartime, the dynamics of elite consensus in small-state media systems, and the empirical applicability of the war/peace journalism framework in the context of a prolonged interstate war in Europe.

RCC04 Disaster Risk Communication: Capacity, Accessibility, Trust, and Resilience

PP 0639 Reducing communication-related vulnerability to disasters: A framework for capacity development

Sten Hansson[1], Kati Orru[1]

[1] University of Tartu, Institute of Social Studies, Tartu, Estonia

Social vulnerability to disasters is often exacerbated by failures or shortcomings in risk and crisis communication. The framework of 'communication-related vulnerability to disasters' (Hansson et al., 2020) suggests that people may become more vulnerable if they encounter problems with accessing, understanding, or acting upon information about hazards. Communication researchers, policy makers, and emergency responders need to devise concrete plans for reducing these obstacles and for building communication capacity as a part of broader systemic disaster preparedness capacity development.

Efforts to strengthen disaster risk communication capacities tend to rely on generalized principles, operational standards, or compilations of 'best practices', typically derived from scholarly analyses of practitioners' reflections on previous disaster responses (Seeger & Schwarz, 2024). This approach is known in disaster studies as the 'all-hazards' approach as it is based on an assumption that different disasters share common features and can thus be addressed by uniform preparedness strategies. However, recent research suggests that this approach to disaster planning does not support the consideration of the unique features of each hazard scenario (Bodas et al., 2020; Peleg et al., 2021).

In this paper, we address this shortcoming by outlining a scenario-based framework for the development of communication capacity of disaster management institutions. Drawing on recent theorisations of the dynamics of disaster vulnerability (Orru et al., 2023), the framework combines audience research and engagement and scenario-based vulnerability analysis exercises to provide input to evidence-based changes in organisational practices that reinforce preparedness and communication capabilities. The identified development tasks help to address the needs of people in vulnerable situations, take into account situational complications that may emerge in a particular disaster scenario, and guide the filling of capacity gaps in disaster management, communication, and social support structures.

RCC04 Disaster Risk Communication: Capacity, Accessibility, Trust, and Resilience

PP 0640 How data accessibility amplifies knowledge gap in civil protection: Mapping warning communication documentation across 27 countries

Sten Torpan[1], Bengt Johansson[2]

[1] University of Tartu, Institute of Social Studies, Tartu, Estonia
[2] University of Gothenburg, Department of Journalism- Media and Communication, Gothenburg, Sweden

In cross-national research a persistent challenge emerges: the uneven accessibility and availability of official documentation. While research consortiums might use unified research protocols across countries, the outputs stumble upon the strict barriers of research validity and reliability: in some cases, relevant documents are easily accessible and publicly available, in others they are restricted, fragmented, or scattered across institutions, and in some contexts they may not exist at all. This creates both practical barriers for researchers and deeper questions about social science research replication and transparency. This discrepancy doesn't just complicate comparative research; it exposes a deeper knowledge accessibility problem in civil protection, where documentation also indicates how institutions mitigate people's vulnerabilities – scarce documentation refers to a stronger reliance on individual experience and memory but more flexibility for *ad hoc* solutions, whereas extensive regulating reflects a stronger dependence on institutional memory and collective experience, often at the cost of reduced flexibility in countering unforeseen threats in risk and crisis communication.

We built an agent-based search algorithm to map documents related to warning communication in 27 countries. To that end we created a research protocol in English and translated the questions into local languages. For the agentic search we used local VPN servers to mirror possible local accessibility issues and restrictions in each country separately. We then compared our agent-based search results with results from an international consortium of researchers (AlertHub) who carried out the same search manually and independently. By examining 27 countries, our study highlights how uneven access to warning communication documents reflects broader gaps in institutional transparency, knowledge production, and preparedness. We argue that these disparities are not just methodological obstacles but valuable signals pointing to where civil protection systems need to develop, harmonize, or strengthen documentation practices.

RCC04 Disaster Risk Communication: Capacity, Accessibility, Trust, and Resilience

PP 0641 Communicating risk on the margins: Disaster experience, citizens' trust, and public communication paths in insular territories

Alessandro Lovari[1], Alessio Piscedda[1], Mariano Porcu[1]

[1] University of Cagliari, Department of Political and Social Sciences, Cagliari, Italy

The increasing frequency of natural disasters, amplified by climate change, have made risk communication a crucial dimension of contemporary society for understanding persistent and emerging global challenges (Schwarz et al. 2025). The impacts of climate change are increasingly visible and are significantly shaping how institutions communicate with citizens and media (Eurobarometer 2025).

Citizens' responses to natural hazards are closely linked to how risk and crisis communication are managed by public organizations, such as regions and municipalities, whose legitimacy largely depends on institutional trust. Public communication (OECD 2021) plays a key role in transparently informing and engaging citizens during uncertain and critical events. In an era characterized by mega-crises (Sellnow-Richmond & Lukakovic 2025) and the proliferation of digital platforms, the challenge extends beyond information delivery to nurture intangible assets like trust (Canel & Luoma-aho 2019). When risks escalate into disasters, communicative effectiveness depends on institutions' capacity to maintain a dialogue with media and citizens to foster engagement and resilience (Lovari & Pisu 2025).

This abstract presents the activities of a research project funded by the Italian Ministry of University, aimed at supporting more participatory and inclusive risk communication policies through a survey on citizens' risk perception and

communication practices (Ivčević et al. 2021). The study focuses on Italy's major islands, Sicily and Sardinia, where insularity represents a key factor shaping vulnerability and communicative resilience. It adopted a probabilistic, multi-stage stratified sampling design based on territorial distribution, degree of urbanization, age, and gender. Data were collected in 2025 using a mixed-mode approach combining CAWI and CATI. Overall, 3,022 interviews were completed: 1,356 in Sicily, 443 in Sardinia, and 1,223 in a national comparison sample.

The findings show that direct experience of natural disasters is strongly shaped by territorial context. At national level, respondents mainly report experience with events like thunderstorms, lightning and hail (80.8%), heat and cold waves (74.4%). In insular contexts, direct experience highlights more specific risk patterns. Sardinians report high experience with drought (66.8%) and wildfires (57.8%). Sicilians highlight direct experience with earthquakes (55.6%) and volcanic eruptions (43.6%).

In terms of trust, family and friends emerge as the primary reference points for coping with disasters, especially in Sardinia (86.5%). This reliance on informal networks is consistent with a stronger sense of cohesion in insular contexts: respondents in Sardinia (27.1%) and Sicily (28.8%) believe that citizens must largely cope on their own, compared to 14.6% at the national level. Institutional trust is highest for emergency actors (Fire Brigades, Civil Protection), while trust in regional, national, and European institutions is comparatively lower.

Regarding information sources, emergency services are considered the most reliable channels across all phases of emergencies (58% nationally), followed by traditional media like television, radio, and newspapers (38–42%). Local and regional media play a more prominent role in Sardinia (42%), while trust in social media remains limited (10–13%).

Findings identify specific paths to integrate citizens' voices in the management of public risk communication strategies by improving its clarity, timeliness, and territorial reach, particularly in insular settings marginally investigated in risk communication (Diers-Lawson & Meißner 2021).

RCC04 Disaster Risk Communication: Capacity, Accessibility, Trust, and Resilience

PP 0642 Crisis, social media and citizen publics: The case of the Kahramanmaraş earthquakes in Türkiye

Taner Sezer[1], Bengü Sezer[2], Zafer Kıyan[3]

[1] Mersin University, Technology Transfer Office, Mersin, Turkey
[2] Mersin University, Foreign School of Languages, Mersin, Turkey
[3] Ankara University, Department of Journalism, Ankara, Turkey

Natural disasters trigger both physical and communicative responses in individuals. During crises, like earthquakes, these responses become publicly visible through mass media and social media platforms, paving the way for the formation of active publics (Grunig & Hunt, 1984). Disaster communication research shows that information seeking, help requests, and emotional expression intensify, while media plays a key role in shaping these dynamics (Major, 1998; Goltz & Bourque, 2017).

This study, supported by the Turkish Scientific and Technological Research Council, examines citizens' communicative practices on social media during earthquakes. While prior research focused on the use of social media by institutional actors, the communicative approaches adopted by citizens during crises have been addressed to a limited extent. Existing studies nevertheless indicate that communication differs between directly and indirectly affected individuals and that user-generated content mainly centers on help, information, and solidarity (Miyabe et al., 2012; Malasig & Quinto, 2016; Ağralı et al., 2022).

This study employs a mixed-method approach combining corpus-based and quantitative content analysis to examine citizens' communicative practices on X (formerly Twitter) during the earthquakes. The dataset includes 186,439 tweets posted between 6–13 February 2023, limited to tweets with at least 50 retweets, generating over 500M interactions. Twitter was monitored at 30-minute intervals, during which all hashtags appearing in the top ten trending topics were recorded. In total, 4,586 distinct hashtags and 6,578 distinct mentions were collected, capturing the breadth and dynamics of earthquake-related discourse. The corpus was tokenized using TSTokenizer, a social media–aware tool that preserves hashtags, mentions, emojis, and URLs as independent tokens; then an annotated corpus was built.

The findings show that X operated as both a news source and a distributed platform for crisis communication and coordination. Network and hashtag analyses indicate that civil society actors and celebrities often generated more interaction than official institutions, while citizens framed the crisis around urgency, help, and responsibility. Comparisons between verified and unverified accounts further reveal that institutional actors use more limited, framing language, whereas ordinary citizens adopt a more pluralistic, demanding, and normative repertoire.

The study shows that the citizen discourse that emerges on social media reveals an active public in which public sensitivity appears during crises, while also fulfilling functions of accountability and coordination.

RCC04 Disaster Risk Communication: Capacity, Accessibility, Trust, and Resilience

PP 0643 Lessons learned from a communications blackout in the United States of America: The critical role of radio broadcasters and amateur (ham) radio operators during Hurricane Helene

Donald Connelly[1], Betty Farmer[1], Katerina Spasovska[1]

[1] Western Carolina University, Communication, Cullowhee, USA

The second-deadliest storm in the United States of America's history, Hurricane Helene wreaked havoc on communities across the Southeast in September 2024. In addition to the massive physical devastation, crisis responders faced a daunting communication challenge: No power, no phones, no internet, no cell service, and no reverse 911 emergency messaging. It was a communications blackout. Such severe damage to the communications infrastructure had not occurred in the U.S.A. More than 1,700 miles of fiber-optic cable was destroyed, including all three fiber-optic communication trunk lines in Western North Carolina. There were 1,034 cell sites down, 1,100 land and rockslides, and more than 1,500 roads and bridges damaged or destroyed. Communities were suddenly isolated, both physically and technologically. Crisis communication plans built on websites, social media, reverse 911 phone calls, and mobile messaging were rendered insufficient. In the absence of these channels, radio and amateur (ham) radio filled the information void. This presentation will highlight how radio broadcasters and amateur (ham) radio operators helped people navigate washed out roads and bridges, find gasoline, food, water, shelter, etc. and connect people in need with emergency responders. Utilizing the case study method and interviews, this presentation will showcase the response of three entities: 1) a university radio station serving a rural mountainous area that continued broadcasting even though the university was closed, 2) an assemblage of eight, iHeartRadio stations serving the metropolitan area most devastated by the storm that were connected via a Starlink satellite the day after the storm, and 3) an amateur (ham) radio society that provided critical connectivity for emergency responders and radio broadcasters. Drawing on insights from the case studies, as well as interviews from state and county emergency managers and crisis communicators, we will share lessons learned and recommendations for how organizations can prepare for crises when terrestrial-based channels fail in the future. Twelve recommendations across three categories will be offered: 1) The need for robust contingency planning, e.g., utilizing the U.S. Army's PACE communication planning approach; 2) Enhancing pre-crisis infrastructure, e.g., procuring satellite uplinks and phones; 3) Developing pre-crisis relationships, e.g., identifying and connecting with American Radio Relay League or International Amateur Radio Union groups. Finally, we will discuss the emotional toll broadcasters and crisis communicators experienced as they tried to save people's lives and re-connect them with their loved ones. Some broadcasters shared they still have those calls "ringing in their heads." For example, one broadcaster received a call from a man on the roof of his home with his family and wondered what they should do. The broadcaster later learned the family was swept away in the flood waters and didn't survive. An emergency manager in one of the hardest hit areas said the communications blackout was "terrifying," and that the mental health providers who took the time to talk to him in the weeks following the storm were "a Godsend." We conclude that providing mental health support to responders and communicators during crises should be prioritized and is a ripe area for future research.

RCC05 Trust Under Pressure: Crisis Communication, Misinformation, and Moral Credibility

PP 0743 Logical persuasion or social belonging? A survey experiment on the effectiveness of social nudges versus classical pre-bunking on belief in misinformation

Bengt Johansson[1], Sofia Johansson[1]

[1] University of Gothenburg, Journalism- Media and Communication, Göteborg, Sweden

Recent crises have highlighted the rapid spread of misinformation, prompting the development of interventions aimed at strengthening citizens' resilience, among which pre-bunking has become a prominent approach (Loomba et al., 2021; Erlich & Garner, 2023). Rooted in inoculation theory, pre-bunking assumes that prior exposure to weakened forms of misinformation can reduce later susceptibility (Traberg et al., 2022). While classical pre-bunking relies on warnings or corrections before exposure (Lewandowsky & van der Linden, 2021), more recent approaches have emphasized nudges, which operate through psychological reminders rather than logical persuasion (Andi & Åkesson, 2021).

Social norm nudges, in particular, highlight what is socially desirable or commonly practiced and may be especially effective because they leverage existing group identities (Andi & Åkesson, 2021; Tajfel & Turner, 2004). Specifically, they may

strengthen adherence to group norms by highlighting the alignment between individual behavior and group values (Tajfel & Turner, 2004). When specific group identities are made salient, it may be the case that social norm nudges outperform classical pre-bunking, particularly among individuals who strongly identify with that group (ibid). Conversely, they may be less effective than classical pre-bunking when appeals target broader, majority-based, descriptive norms.

Despite novel research showing the potential of social norm nudges, no study has systematically compared them with classical pre-bunking. Consequently, we do not know whether the above reasoning holds true, how effective social norm nudges are compared to classical pre-bunking, or under which conditions social norm nudging has the strongest impact.

This study addresses this gap by systematically comparing social norm nudges and classical pre-bunking strategies on belief in misinformation within a randomized between-subjects survey experiment with three treatment groups (warning, classical pre-bunking, and social norm nudge) and one control group (N = 2 000).

The study also examines potential moderators, such as how strongly individuals identify with the social group made salient in the social norm nudge. As such, the results contribute to understanding the effectiveness of social norm nudges compared to classical pre-bunking strategies.

Consequences of the results for risk communication strategies aimed at strengthening citizens' resilience are discussed.

RCC05 Trust Under Pressure: Crisis Communication, Misinformation, and Moral Credibility

PP 0744 From silence to apology: Papal crisis communication on sexual abuse of minors in the Catholic Church

Veronika Müllerova[1], Renáta Sedláková[1]

[1] Palacký University Olomouc, Department of Communication, Olomouc, Czech Republic

Sexual abuse of minors in the Catholic Church is a topic that has been appearing more or less constantly in the world media since the 1980s, posing burning questions to the leaders of the Catholic Church. Although cases of sexual abuse began to leak into the public domain as early as the 1960s, it was not until 2008 that the victims received their first official apology from the Pope. The news media almost always wrote about the topic as a crisis or scandal, and these labels resonated in public discourse. However, with one notable exception (Benedict, 2010), popes do not use the term "crisis" in their official communications.

The research focuses on how popes refer to the sexual abuse of minors in their official texts and how their communication on this topic has changed over time. The scope of this study covers the years 1997 through 2025, analyzing the official communications issued by Popes John Paul II, Benedict XVI, Francis, and Leo XIV. The sample examined contains over 4,000 official texts signed by the head of the Catholic Church, ranging from extensive encyclicals to texts intended for internal communication within the Catholic Church to short greetings delivered in St. Peter's Square in Rome.

The analysis used a triangulation of quantitative and qualitative research methods. Relevant texts were searched for using keywords. The construction of individual texts and the narration of the topic, specific formulations, rhetoric, and argumentation were examined inductively using a qualitative approach based on critical discourse analysis (CDA). The focus was placed on the linguistic choices and rhetorical devices embedded within the discursive strategies of individual popes. This research illuminates how the issue of sexual abuse was framed and what meanings were solidified within the official discourse of the Holy See. The communication elements used by the popes to restore the Church's reputation, which are based on the basic principles of crisis communication (Benoit, 1995), were analyzed. The specific use of pronouns and the corresponding indication of the speaker's acceptance of responsibility were identified (Coombs, 2020). Furthermore, communication practices expressing an adequate degree of empathy and a commitment to reputation restoration through papal moral values were monitored.

The findings suggest that each of the popes adopted a different crisis communication strategy in their texts and speeches, ranging from silence and denial of responsibility (John Paul II) to the leadership responsibility, apology, and deep empathy (Francis).

RCC05 Trust Under Pressure: Crisis Communication, Misinformation, and Moral Credibility

PP 0745 Moral credibility in influencer-led communication in the digital public sphere: A comparison of commercial crisis (Chiara Ferragni) and humanitarian advocacy (Didi Stone, UNICEF Democratic Republic of Congo)

Cristian-Catalin Florea[1]

[1] SNSPA, Communication Sciences, Bucharest, Romania

In contemporary digital culture, social media influencers increasingly act as moral voices, blending commercial branding and public visibility with ethical advocacy. Their ability to engage audiences in this role hinges on perceived moral credibility – meaning the degree to which followers view an influencer's actions as authentic, transparent, and aligned with proclaimed values, thereby fostering trust in their public persona. This study examines how moral credibility is constructed and contested in the digital public sphere through a comparative analysis of two high-profile cases: the reputational crisis surrounding Chiara Ferragni's charity-linked commercial campaign and Didi Stone's humanitarian advocacy in partnership with UNICEF in the Democratic Republic of Congo (DRC).

Chiara Ferragni, one of Europe's most prominent influencers, has built a personal brand interweaving fashion entrepreneurship, lifestyle content, and cause-related marketing. Her moral authority was challenged in 2022 when a charity-branded Christmas campaign prompted accusations from Italian authorities that consumers were misled regarding the charitable destination of proceeds. Amid legal scrutiny and public outcry, Italian authorities imposed a fine of over one million euros for misleading commercial communication, reinforcing public attribution of responsibility and accelerating the collapse of Ferragni's moral credibility. The episode illustrates how quickly influencer legitimacy can erode when altruistic messaging is perceived as misaligned with commercial intent.

By contrast, Didi Stone, a Franco-Congolese model and UNICEF National Ambassador for the DRC, represents a different resolution of the same structural tension between influencer philanthropy and personal branding. Like Ferragni, Stone operates as a highly visible digital figure whose advocacy is mediated through her personal platform. However, in 2025, amid overlapping humanitarian crises in the DRC, Stone leveraged her digital presence in coordination with UNICEF-supported field campaigns in ways that reinforced her moral credibility. Grounded in institutional affiliation, field presence, and personal identification with affected communities, her communication emphasized transparency regarding roles and outcomes, as well as responsibility toward beneficiaries, limiting perceptions of performative self-promotion. In contrast to the Ferragni case, where commercial intent overshadowed ethical claims, Stone's advocacy aligned personal branding with humanitarian responsibility, contributing to sustained perceptions of authenticity and public trust.

The paper adopts a theory-driven and exploratory approach, drawing on Situational Crisis Communication Theory, the Social-Mediated Crisis Communication model, and scholarship on influencer authenticity and parasocial relationships. Rather than advancing causal claims, the analysis develops a comparative framework to examine how influencer-led communication operates within the digital public sphere, where moral credibility is negotiated through interactions among influencers, institutions, and networked publics. Moral emotions such as outrage and empathy are treated as mediating mechanisms rather than the primary analytical focus. The paper advances three provisional contributions: it extends crisis communication theory to influencer–institution collaborations in morally charged contexts; it clarifies how moral credibility is stabilized or destabilized through public contestation in digital public spheres; and it theorizes moral credibility as an emergent outcome of alignment between public persona, institutional support, and audience interaction. The paper concludes by outlining implications for research on influencer ethics, digital trust, and the governance of moral discourse in digitally mediated public life.

RCC06 Framing Crisis: Journalism, Public Engagement, and Institutional Responses

PP 0847 Green innovation or environmental risk? Media framing of data centers in Italian news discourse

Mario Monopoli[1]

[1] Sapienza University of Rome, Communication and Social Research, Rome, Italy

Despite the apparent immateriality of the internet evoked by the cloud metaphor (Mosco, 2014), digitalization- accelerated by artificial intelligence systems (Lehuédé, 2024; Crawford, 2021)- relies on a material supply chain that demands increasing amounts of energy and natural resources (Siddik et al., 2021; UNCTAD, 2024). While data centers are frequently promoted as drivers of innovation, competitiveness, and economic growth, they have also become contested infrastructures where environmental risks and political interests intersect (Biancalana, 2025).

Although recent research in critical data center studies has emphasized the political, spatial, and ecological implications of these infrastructures (Edwards et al., 2024), less attention has been paid to how news media shape public understandings of their risks and benefits (e.g., Rone, 2024). Italy represents a particularly relevant case in this regard, as it has recently emerged as a strategic hub for data center expansion in Southern Europe, while remaining underexplored in terms of how data centers are represented. Drawing on the social amplification of risk framework (Kasperson et al., 1988), this study conceptualizes media discourse as a key arena in which technological development, environmental concern, and political

values are negotiated. In line with research on ideological cultures in news discourse (Carvalho, 2007), the analysis explores how political orientations structure divergent interpretative repertoires surrounding data center expansion.

Methodologically, the research combines textual network analysis (Segev, 2020) with qualitative frame analysis (Entman, 1993). The corpus consists of news articles published between January 2024 and December 2025 and collected from mainstream, left-wing, and right-wing Italian newspapers. Headlines and meta-descriptions from online newspaper articles are analysed to identify co-occurring concepts and thematic clusters, which are subsequently interpreted as broader frames. Based on preliminary analysis, particular attention is paid to clusters related to national economic innovation, energy resources and green technologies, Big Tech power, and geopolitical dynamics. This mixed-method approach enables a comparative examination of how different media domains articulate the material and symbolic dimensions of digital sustainability.

The study assesses whether data centers are predominantly framed as "green" and smart infrastructures supporting innovation, or alternatively as emerging sources of environmental risk. In doing so, it examines how news discourse on the "green cloud" contributes to the naturalization- or problematization- of the material impacts of digitalization.

RCC06 Framing Crisis: Journalism, Public Engagement, and Institutional Responses

PP 0848 Frames and sources in institutional risk communication: An experimental survey in Italy

Francesca Comunello[1], Alessandra Massa[1], Andrea Cerase[1], Alessandro Lovari[2]

[1] Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy
[2] University of Cagliari, Department of Political and Social Sciences, Cagliari, Italy

Today, risk communication must negotiate its relevance in contexts characterized by communicative overload, uncertainty, and skepticism toward science and institutional sources. The availability of clear and technically accurate information does not guarantee the effectiveness of messages; what becomes central is how information is presented and who conveys it—elements that are decisive for message acceptability, credibility, and recipients' willingness to adopt proactive behaviors. In fast-paced, information-saturated environments, such as digital contexts, information presentation can significantly affect attention and message evaluation, while also shaping and being shaped by perceptions of the sources disseminating those messages.

Framing and source are, indeed, "classic" topics in risk communication research. Nevertheless, the interaction between these two dimensions (especially in specific territorial contexts) warrants further investigation. It is necessary to examine how their interplay shapes perceptions of risk messages, particularly when disseminated by institutional actors.

Therefore, this paper proposes an experimental survey administered to a representative sample of the Italian online population (18+), designed to test, in a controlled manner, the roles of source, framing, and broader communication habits in the evaluation of messages related to hydrogeological risk. Concerning the source, the study investigates differences in perceived credibility and appropriateness between a political actor, such as the mayor, and a specialist and civic actor, such as the Civil Protection Department—two actors that, in the Italian regulatory framework, occupy distinct positions within the national risk communication system.

With respect to framing, the contribution draws on the tradition of gain frames (emphasizing the benefits of complying with recommendations) and loss frames (emphasizing the costs of non-compliance), examining their effectiveness and acceptability, as well as their association with the sources that convey them. The overarching objective of this study is to explore how different combinations of sources and frames affect perceptions of credibility, message clarity, and behavioral intentions. Moreover, the survey maps media habits and risk perceptions.

Thus, a survey was conducted among a representative sample of the Italian online population aged 18+ (N = 1,618). The questionnaire includes items designed to capture sociodemographic characteristics, risk perception, familiarity with early warning systems, information pathways, trust, and the perceived role of risk communication sources. This data collection is followed by a 2×2 between-subjects experimental design. Participants were randomly assigned to four groups and asked to respond to questions based on a visual stimulus. The graphics vary according to the combination of source (Mayor vs.

Civil Protection) and frame (gain vs. loss). This design allows for investigating credibility, trust, and risk perception, using the survey's descriptive sections as control variables.

The survey was administered in December 2025; therefore, the results are currently under analysis. The analytical strategy focuses on identifying potential dimensions of heterogeneity, hypothesizing that gain and loss frames may function differently at distinctive levels of institutional trust; that the figure of the mayor may be evaluated differently across age groups; and that emotional and rational elements may emerge in distinct ways across different publics. Overall, the contribution outlines an evidence-based approach to producing effective risk communication messages.

RCC06 Framing Crisis: Journalism, Public Engagement, and Institutional Responses

PP 0849 Small drones making big headlines at European airports: Hybrid threats as a challenge for journalism ethics

Ville Manninen[1], Turo Uskali[1]

[1] University of Jyväskylä, Dept. of Language and Communication Studies, Jyväskylä, Finland

How to report ethically on news events that have been deliberately manufactured by hostile actors? It is the main question for this paper that focuses on analyzing the news coverage of the 2025 Europe-wide string of drone incidents and its implications for journalism ethics.

Our study is based on the concept of 'hybrid threats': actions intended to undermine or indirectly control a target by creatively combining various means, both overt and covert, military and –especially– non-military (Giannopoulos, Smith & Theocharidou 2021).

News media is important for detecting and reporting (potential) hybrid threats. However, a key characteristic of hybrid threats is their plausible deniability (Giannopoulos et al. 2021, 19–20). This puts pressure on journalists, for whom timely reporting is central. While investigations by authorities may take weeks or months, news cannot wait that long. Reporting based on limited information may lead to false interpretations, but not reporting would yield the communicative space to other actors. A dearth of high-quality information creates an ideal environment for the spread of untrue claims (e.g. Vraga et al. 2023, 91). The subsequent confusion is often the goal of hybrid threat operations (e.g. Splidsboel Hansen 2021). News organizations are faced with a dilemma: How much can they report without abetting the hybrid threat actor? Due to hybrid threats' deliberate ambiguity, full transparency with regards to missing information and suspected perpetrators may be just as counterproductive as strategic omission.

Drone-related disturbances quadrupled at European airports between January 2024 and November 2025 (Paternoster & Schumann 2025). For this paper, we gathered news media content from ProQuest Central and focused on newspapers. The search terms used were "drones" and "airports". Altogether 3,573 news stories were collected from over 2,000 newspapers from 1.1.2025 to 31.12.2025.

We will first conduct a quantitative content analysis and then form a representative sample of news stories to qualitatively analyze the reporting of drone incidents from a journalism ethics perspective. We will focus on transparency as a tenet of journalistic ethics and its application in the coverage, particularly in terms of attribution. We conclude with practical recommendations for journalists covering suspected hybrid threats.

RCC06 Framing Crisis: Journalism, Public Engagement, and Institutional Responses

PP 0850 The role of journalists in face of military threats: Autonomy, crisis communication and making of mediated realities

Lina Rimšaitė[1]

[1] Kaunas University of Technology, Faculty of Social Sciences- Arts and Humanities, Kaunas, Lithuania

European societies more and more faces with various crisis, as well as military threats and hybrid crises, which leads to threats to national security. In these time of crisis, journalism becomes one of the most important mediator between

government institutions responsible for crisis response, management and society. The significantly increaced urge for the news and speed of sharing, news platforms competitions for audience attention and heightened political – national security pressures can affect information verification processes, clarity and ethical judgement, which could affect trust in media, state institutions and in such way intensify social polarisation. The analysis examines journalists role under military threat conditions by linking crisis communication imperatives with professional autonomy, ethical dilemmas and the contemporary risks of "simulated" mediated realities.

The analysis develops framework that combines 1. Normative ethics accounts of journalism as a profession grounded in autonomy, factuality, transparency and service to the public; 2. Crisis and war reporting as a high-stake environment where published information can reduce harm, but also can trigger panic, propaganda or strategic vulnerability; 3. A Jean Baudrillard perspective of simulation and hyperreality, which helps to explain how news of crisis can shift from representing events to producing emotionally compelling content which affects factual grounding. With this background, analysis raises questions: 1. How journalist autonomy and external restrictions (censorship, institutional control, marketing strategies) shapes crisis/war reporting? 2. How do journalism ethical principles (telling the truth, credibility, harm minimization and autonomy, enters news agencies decisions when war-related information can impact security risks? 3. When crisis communication in the media contributes to increasing public awareness, and when it increases uncertainty due to sensational content?

In the analysis there is a proposition for a comparison of two historical case analysis to illustrate how different "information control regimes" reconfigure journalistic responsibility towards journalists' profession and public. The comparison is grounded by two empirical examples: Vietnam War reporting as a case associated with a high journalistic freedom and strong public impact to politics decisions, and Israel's conflict environment as an example where journalism faces a high military and government censorship and culturally embedded self-censorship structure reporting choices. The analysis combines academic accounts of these contexts along with readings of representative journalistic content (broadcast narratives, photojournalism, editorial decisions) to reveal recurring tensions between public's right to know, democratic accountability and security restraint.

RCC06 Framing Crisis: Journalism, Public Engagement, and Institutional Responses

PP 0851 Engaging spontaneous volunteers in disaster management and risk communication in the Italian context

Antonio Opromolla[1], Sonia Matera[2], Cristina Casareale[3]

[1] University of L'Aquila, Human Sciences Department, L'Aquila, Italy
[2] Dblue, Dblue, Rome, Italy
[3] Save the Children Italy, Save the Children Italy, Rome, Italy

In recent years, Europe has faced overlapping crises, including the COVID-19 pandemic, large-scale flooding, and mass displacement following Russia's invasion of Ukraine. These events have further highlighted the growing role of spontaneous volunteers (citizens who offer help outside formal emergency management structures) in disaster risk management (DRM). While the Sendai Framework for Disaster Risk Reduction 2015–2030 promotes inclusive and participatory approaches, the extent to which spontaneous volunteers can contribute effectively depends largely on national institutional arrangements, regulatory frameworks, and risk communication practices. Empirical, comparative research on this topic remains limited and largely relies on pre-2020 data.

This contribution is part of a broader study which aims to examine how spontaneous volunteers are engaged in DRM in five European contexts: Estonia, the Netherlands, Italy, Malta, and La Réunion. Building on desk research and semi-structured expert interviews, the study explores three research questions: (1) what regulations and institutional arrangements exist for engaging spontaneous volunteers; (2) which methods, tools, and risk communication practices are used across the phases of prevention, preparedness, response, and recovery; and (3) what lessons have been learned from recent crises regarding collaboration between authorities and spontaneous volunteers. The analysis reveals significant cross-national variation. In countries with strong traditions of organised volunteering and formalised civil protection systems, spontaneous volunteering remains weakly institutionalised and is often managed ad hoc, particularly during response and recovery phases, with risk communication frequently fragmented or informal.

The contribution especially focuses on the Italian context. Despite extensive organised volunteer networks, spontaneous volunteers played a crucial role during the 2023–2024 Emilia-Romagna floods, while operated largely outside formal regulations. Digital platforms, social media, and messaging apps emerged as central risk communication and coordination infrastructures, enabling rapid mobilisation, peer-to-peer information exchange, and situational awareness. At the same time, these communication practices generated challenges related to safety, misinformation, responsibility, and trust between spontaneous volunteers and formal responders. Barriers to effective engagement include restrictive legal frameworks, liability and insurance concerns, limited training and mentoring capacity, and scepticism among professional responders. Enabling factors include flexible local coordination, recognition of community-based knowledge, short-form training, and clear, timely, and dialogic risk communication.

Overall, the study demonstrates how institutional structures, risk communication practices, and digital coordination tools jointly shape the possibilities for democratic participation in disaster response. It concludes with policy-relevant

recommendations for integrating spontaneous volunteers into DRM without undermining their autonomy, emphasising adaptive governance, continuous risk communication in "peacetime," and co-produced guidelines that bridge formal and informal response capacities while supporting safer and more resilient community action.

RCC07 Risk, Meaning, and Governance: From Everyday Finance to Prolonged Crisis

PP 0852 Take a risk – or risk it all: The role of alternative risks in the financialization of everyday life

Axel Vikström[1], Liza Jakobsson[2]

[1] Lund University, Department of Communication, MALMÖ, Sweden
[2] Södertörn University, Historical and Contemporary Studies, Stockholm, Sweden

In recent decades, financial markets and practices have become more embedded in the everyday lives of broader segments of the population – a development often described as the financialization of everyday life. A key aspect of this process, driven by market-oriented actors such as banks and brokerage firms, is a reconfigured understanding of risk-taking. Risk is no longer depicted merely as something the individual must accept; it is framed as morally and practically desirable, and as the most rational strategy for securing one's economic future. Embracing this logic may involve, for instance, learning to identify one's "risk profile" when investing in stocks and mutual funds, or taking on a substantial mortgage to enter the housing market.

This paper introduces the concept of "alternative risks" to address a critical yet under-theorized aspect of the financialization of everyday life: the risks associated with *avoiding* financial risk-taking. Building on Luhmann's (2017) notion of "prevention risks", we conceptualize alternative risks as a specific form of "fictional expectation" (Beckert 2016), centered upon the construction of undesirable future scenarios that are projected to happen should individuals and/or society fail to embrace financial risk-taking. Unlike the concept of alternative costs, which is primarily confined to economic calculations, alternative risks encompass broader imaginaries that are strategically crafted and communicated by market-oriented actors, e.g., to counteract loss aversive behavior among individuals or promote pro-market political policies.

We develop this concept through an analysis of how Swedish real estate brokers, investment firms, and journalists have constructed threatening visions of the future to advocate specific individual/societal solutions from the 1990s onwards – a period marked by pension reforms, growing mutual fund investments, and increasingly large mortgages. Drawing on advertisement campaigns, news articles, and editorials, we demonstrate how alternative risks – manifested in the use of future scenarios involving credit debt, social exclusion, and broken social contracts – have been mobilized to argue against the promotion of rental apartments and taxes on fund savings. By showing how alternative risks are used to enhance uncertainty in contrast to "calculable", "safe", and "predictable" forms of financial risk-taking, the study opens new avenues for examining the role of media and communication not only in the financialization of everyday life in a time of volatile financial markets and rising private debt, but also in shaping the relationship between risk and uncertainty more broadly.

RCC07 Risk, Meaning, and Governance: From Everyday Finance to Prolonged Crisis

PP 0853 Translating "risk": The global travels of a modern concept in the early modern Chinese press

Zhiyue Jin[1,2]

[1] University of Vienna, Department of Sociology, Vienna, Austria
[2] University of Chinese Academy of Social Sciences, School of Journalism and Communication, Beijing, China

During early modern China's "Sattelzeit" (Saddle Period, 1840–1949), the social cognitive schema underwent a profound reshaping, in which the introduction and evolution of the "risk" concept served as a core manifestation of modernity's implantation. Building on the theories of Ulrich Beck and Niklas Luhmann, who emphasize that "risk"—unlike "danger" attributed to external nature or divine forces—refers to calculable uncertainty arising from human decision-making, this study explores how "risk (fengxian)" as a modern concept matured in China. It investigates what it meant for "risk" to transition into its modern sense and how it was locally constructed through the medium of modern newspapers.

This research is grounded in the Social Construction of Communication and the Sociology of Knowledge Approach to Discourse (SKAD). It treats modern newspapers as objectivation of knowledge, analyzing the relationship between sign usage as social practice and the production and transformation of social orders of knowledge. Therefore, the study employs a corpus-assisted approach, integrating the Discourse-Historical Approach (DHA) from Critical Discourse Analysis. A comprehensive corpus spanning early modern Chinese history was established, primarily utilizing Shenbao, supplemented by Ta Kung Pao and other modern periodical databases. The analysis includes a quantitative investigation using word co-occurrence analysis and network centrality measurements to identify key semantic turning points. This is followed by a qualitative in-depth analysis of discourse across four dimensions, building modern concept of "risk" : intra-textual linguistic features,

intertextual and interdiscursive relationships, extra-linguistic social institutional variables, and the broader macro-historical context.

The findings reveal that "risk" in early modern China evolved from describing external natural threats like "maritime wind disasters" (danger) to a modern concept associated with rational decision-making and economic calculation (risk). This process unfolded across five stages: incubation, problematic, expansion, critical, and stabilization. Specifically, the consequences of risk shifted from "shipwreck and loss of life" to "damaged cargo and loss of profit"; the risk environment moved from "perilous journeys" to "market fluctuations"; and risk-related agency shifted from "divine fate" to "human decision." These changes collectively pushed "risk" toward a counter-factual orientation, establishing a temporalized relationship between the present and the future as a modernized "conceptual dispositif". Through the discursive practices of meteorological forecasting, insurance services, and financial markets, the agency over the future was relocated from "heavenly/natural fate" to "rational human action," extending economic logic into everyday life.

This shift profoundly reflects the modern social transformation described by Karl Polanyi: social relations became re-embedded within an economic system centered on efficiency, credit, and profit-and-loss calculation. While this cognitive transition marks the maturation of modern governance, it also manifests the "Epistemicide" feared by Boaventura de Sousa Santos—the replacement of traditional knowledge systems regarding contingency, fate, and community reciprocity by Western rational-calculative logic. Ultimately, the maturation of the "risk" concept represents not merely a linguistic shift but a deep-seated construction and identification with the essence of modernity within the communicative practices of modern Chinese society.

PP 0854 One framework, many practices: Comparing risk communication and community engagement in prolonged crisis governance

Audra Diers-Lawson[1], A. Elisabeth Hasselström[1], Pauline Gidget Estrella[2]

[1] Kristiania University of Applied Sciences, Institute for Communication, Oslo, Norway
[2] Technical University of Ilmenau, Economic Sciences and Media, Ilmenau, Germany

Risk Communication and Community Engagement (RCCE) is widely promoted by WHO/Europe as their foundational framework for effective public health emergency response, emphasizing trust-building, transparency, listening, and meaningful engagement with communities. Despite its prominence in global guidance, there remains limited empirical insight into how RCCE principles are enacted within government decision-making during prolonged, high-uncertainty crises. This study examines how government leaders interpreted, operationalized, and constrained RCCE principles during the COVID-19 pandemic, with a particular focus on cross-national variation in implementation across governance systems.

The study addresses three research questions: (1) How were RCCE principles understood and enacted by government leaders during COVID-19? (2) To what extent were RCCE principles integrated into decision-making processes rather than confined to outward-facing communication? and (3) How did political, institutional, and cultural contexts shape the enactment of RCCE across countries? Empirically, the study draws on qualitative interviews with government officials and advisors in Italy, Spain, the United States, the United Kingdom, Sweden, and the Netherlands. The analysis examines concrete RCCE-related practices, including public listening mechanisms, culturally and linguistically adapted communication, transparency practices, and the use of community feedback in policy and communication decisions.

Theoretically, the study integrates RCCE scholarship with implementation theory and crisis governance, conceptualizing RCCE as a set of practices that are translated and negotiated within institutional and political contexts rather than uniformly applied. This approach enables examination of how global RCCE principles are reinterpreted as they move into national decision-making environments.

Findings reveal marked variation in the enactment of RCCE principles across countries. In Italy, RCCE was operationalized through large-scale listening infrastructures, particularly toll-free public information lines that facilitated sustained two-way communication and informed adaptive communication decisions. In Spain, RCCE was enacted through culturally and linguistically tailored communication strategies, where language proficiency and contextual adaptation were central to engaging diverse communities and maintaining trust. In Sweden and the Netherlands, RCCE principles were more strongly embedded within institutional governance structures, with high levels of institutional trust enabling transparent communication, consistent messaging, and the integration of public health expertise into decision-making, though with less emphasis on direct community dialogue mechanisms. By contrast, in the United States and the United Kingdom, RCCE implementation was more fragmented. While transparency and information dissemination were emphasized, systematic listening and community feedback were less consistently integrated into decision-making, with communication strategies shaped more heavily by political negotiation, media dynamics, and centralized messaging.

Overall, the findings demonstrate that RCCE principles were most substantively enacted where leaders adopted communicative and adaptive orientations and where institutional conditions supported engagement as an input to decision-making rather than a downstream communication activity. The study contributes to risk communication and crisis governance scholarship by clarifying how RCCE moves from normative guidance to situated practice, highlighting the leadership and

contextual conditions under which community engagement becomes a meaningful component of government crisis response.

RCC07 Risk, Meaning, and Governance: From Everyday Finance to Prolonged Crisis

PP 0855 Nedsläckt Land/Blackout Country: Reality TV, crisis preparedness capabilities and public value

Pavel Rodin[1], Georgia Aitaki[2]

[1] University of Gothenburg, Journalism- Media and Communication JMG, Gothenburg, Sweden
[2] Karlstad University, Institute for Geography- Media and Communication, Karlstad, Sweden

Survivalist reality television, like *Robinson*, *Survivor*, *Alone*, *Outlast*, *Surviving Paradise* and *Siren: Survive the Island*, typically centers on individual resilience, wilderness survival, and competitive elimination formats. *Nedsläckt Land* (transl. *Blackout Country*) is a reality TV series broadcast by the Swedish public service broadcaster SVT in 2019 (with a rerun in 2025 and currently accessible on its streaming service SVT Play) that takes a different approach. It departs from by dramatizing a large-scale societal disruption: a severe solar storm triggers a prolonged national power outage, leading to the breakdown of critical infrastructure and essential services. Framed by the producers as a public-service 'experiment', the program situates participants in a rural environment where they must navigate resource scarcity (water, food, heating, communications) and collective coping, complemented by commentary from subject-matter experts (researchers and civil-contingency authorities).

Existing scholarship has examined the rise of "prepper culture" (Mellander, 2023) and foregrounded the potential of cultural approaches to crisis (Arvidson et al, 2013). However, the (ambiguous) role of popular media in fostering societal crisis preparedness – including risk awareness, adaptive/coping capacities, and understandings of systemic and individual vulnerability – remains comparatively underexplored.

The study draws from the Citizen Crisis Communication (CCC) model (Odén et al., 2016). The model utilizes the concept of capability, inspired by Martha Nussbaum's work (1997). In contrast to organization-centered approaches, the CCC model focuses on the key functions that citizens need as members of a society in crisis situations, and how crisis communication can help strengthen these capabilities. The model outlines three capabilities: survival (appropriate action), democratic (accountability and responsibility), and social (communicating hope, enhancing crisis preparedness, and strengthening interpersonal and societal trust).

Against the backdrop of ongoing public debates about civil preparedness, resilience, and the responsibilities of public service media in Sweden and beyond, this paper combines theories of mediatization, post-documentary, and disaster and crisis communication to ask:

i) How does reality-based television mediate systemic and individual vulnerabilities in societal crisis?
ii) *Nedsläckt Land* contribute to enhancing survival, democratic and social capabilities of citizens in crisis?
iii) How do such representations intersect with debates about reality TV's societal function and public value?

By bringing (reality) TV studies into dialogue with crisis preparedness research, this paper discusses the potential of popular media to shape and strengthen citizens' capabilities before and during a societal crisis.

RCC09 Trust, Visibility, and Vulnerability in Contemporary Risk Communication

PP 1061 Framing vulnerability in climate emergencies: Institutional social media strategies and public counter-narratives after the mortegliano hailstorm

Manuela Farinosi[1], Alessandro Meneghini[1], Chiara Piccolo[1]

[1] University of Udine, Department of Mathematics- Computer Science and Physics, Udine, Italy

In an era characterized by "shifting grounds" and intensifying climate-related disruptions, public institutional communication serves as a fundamental infrastructure for emergency management. Beyond mere information dissemination, it functions as a mechanism for operational coordination and the discursive construction of public legitimacy (Lovari & Ducci, 2022), directly impacting the resilience of vulnerable populations.

This paper investigates the communicative response to the severe hailstorm that struck Mortegliano (Udine, Italy) in July 2023. This extreme meteorological phenomenon, which set new European records for hail size, resulted in a localized humanitarian and economic crisis, overwhelming the community's immediate coping capacities and pulverizing

infrastructure. Adopting a theoretical framework that integrates the Crisis and Emergency Risk Communication (CERC) model with the social construction of vulnerability, the study analyzes the digital strategies of two pivotal actors: the Friuli Venezia Giulia Region and the Regional Civil Protection. Specifically, it examines their content production on their official accounts on Facebook and Instagram during the thirty days following the event, focusing on the representations of vulnerability, alongside the resulting interactions and reactions from their publics.

Methodologically, the research employs a mixed-methods approach. It utilizes topic modeling on a dataset of posts (N = 195) and user comments (N = 1499), complemented by a qualitative thematic analysis of key entries to unpack linguistic strategies and representations of vulnerability.

Findings reveal a significant communicative asymmetry. While the institutional social media output effectively managed technical updates, it predominantly framed vulnerable subjects as passive recipients of top-down assistance. Vulnerability was discursively reduced to physical and economic dimensions, focusing on material damage, while neglecting relational, psychological, and informational disparities. Conversely, the analysis of user comments unveils a complex counter-narrative structured around three axes: grassroots solidarity, the contextualization of the event within the climate change crisis, and critiques of institutional efficacy.

The study highlights an unresolved tension between the institutional framing of emergencies as isolated technical disruptions and the public perception of systemic crises requiring transformative policy shifts. Ultimately, the paper argues that despite the interactive potential of social media, institutional practices remain anchored in reactive, top-down logics. The lack of a communicative strategy oriented toward genuine dialogue transforms social media into arenas of discursive friction between institutional mandates and civic expectations, rather than spaces where collective agency and shared resilience can be co-constructed.

RCC09 Trust, Visibility, and Vulnerability in Contemporary Risk Communication

PP 1062 "It's a kind of patina you immediately recognise": Generative artificial intelligence in the changing landscape of risk communication

Alessandra Massa[1], Francesca Comunello[1], Mario Monopoli[1], Andrea Scorsino[1], Andrea Cerase[1]

[1] Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

Generative artificial intelligence (AI) is increasingly being considered a tool for public and institutional communication, including risk communication. Its adoption may contribute to the production of clearer and more targeted messages, yet it raises unresolved ethical and operational questions. Communicating risks goes beyond information transmission (*what* is conveyed); it involves a relational dimension concerning *who* communicates and with what authority. For this reason, technological innovations such as AI require contextualisation and focused reflection.

Existing literature has primarily investigated the content and format of risk communication, as well as their combined effects. Trust, framing, empathy, and institutionalisation are among the most frequently examined dimensions. By contrast, the role of AI remains underexplored: it is necessary to understand how citizens perceive and interpret AI-generated content in institutional contexts, and how this may affect central dimensions of risk communication, such as transparency and trust. This contribution then focuses on the authorial role of AI, assessing its viability in producing risk communication messages.

This study investigates how institutional legitimacy is affected when AI enters the communication chain, particularly among audiences with specific sensitivities toward environmental issues and technologies, such as Generation Z. The aim is to explore how AI-generated content (and its disclosure) reshapes credibility and responsibility in the production of risk communication.

To this end, we adopted a qualitative research design combining prompt-based AI content generation with semi-structured interviews. Drawing on institutional materials from Italy's Civil Protection on seismic and hydrogeological hazards, we generated simulated social media posts using a generative AI system. Each message varied along two dimensions: (1) *framing* (gain vs. loss) and (2) *source* (mayor vs. local Civil Protection authority). The posts were presented as visual stimuli to 32 university students enrolled in communication courses. Participants were initially invited to discuss preferred formats, tone, and credibility without knowing the origin of the messages. Only after this evaluation was the AI-generated authorship disclosed, allowing us to examine how awareness of technological mediation affects perceptions of credibility, ethical acceptability, and the expected role of institutions in risk communication.

The findings show that the adoption of AI elicits contrasting reactions. On the one hand, there is clear curiosity about the tool and its potential applications in institutional contexts; on the other, participants express concerns regarding agency and responsibility in the curation and validation of content. For the interviewees, the use of AI highlights that trust does not reside solely in the content of messages but primarily in the recognisable human supervisor, such as the Civil Protection authority or the mayor. Attention to framing amplifies this dynamic: the extreme and polarised tones shaped by AI are noted by almost all participants. While they acknowledge the functional utility of such messages (gain: construction of a sense of community; loss: emphasis on the consequences of actions), the lack of nuance makes them difficult to accept outside a simulated context. Overall, the analysis confirms that AI is not a neutral actor in risk communication, but contributes to reshaping actors, credibility, and expectations.

RCC09 Trust, Visibility, and Vulnerability in Contemporary Risk Communication

PP 1063 Understanding information-seeking intentions and risk perceptions in the context of sustainable mobility: Insights from a rural real-world laboratory in Germany

Elisabeth Ulrike Wagner-Olfermann[1], Andreas Schwarz[2]

[1] TU Ilmenau, Institut for Media and Communication Science, Ilmenau, Germany
[2] Ilmenau University of Technology, Institute of Media and Communication Science, Ilmenau, Germany

Transport-related greenhouse gas emissions remain one of the most persistent barriers to achieving climate targets. In the EU, transport is the only major sector where emissions have risen recently; road transport accounts for about three quarters, with private cars responsible for over 60%. Germany reflects this trend: from 1990 to 2023, the transport sector's share of national emissions increased significantly, and households now emit more from mobility than housing. These developments demonstrate how mobility has become a critical environmental risk area- shaped not only by technology but equally by communication, public awareness, and behavioral factors.

Despite its societal importance, risk communication about everyday mobility, especially regarding long-term climate risks, has received limited scholarly attention. Our research helps fill this gap by integrating environmental communication, mobility studies, and risk and crisis communication. As part of an interdisciplinary project on rural mobility transition, we conducted a standardized survey with 633 participants in summer 2025 in a rural federal state in central Germany. The study explored mobility behavior, risk perceptions, attitudes toward the transition, and (risk) information-seeking behavior – fundamental communicative mechanisms during environmental uncertainty and socio-technical change.

The study draws on the Risk Information Seeking and Processing (RISP) model and the Planned Risk Information Seeking (PRISM) model. Both frameworks assume that subjective information insufficiency and informational social norms shape intentions to seek information, moderated by risk perception, affective responses, and prior information-seeking experiences. While originally developed for personal risks, these frameworks have increasingly been applied to impersonal risks such as environmental and societal challenges. This study extends that work by examining risks associated with mobility behavior, where threats are perceived as societal rather than personally relevant.

Findings show a moderate overall perception of mobility-related climate risks. Respondents acknowledge societal risks more strongly than personal risks and primarily assign responsibility for the mobility transition to political, economic, and scientific institutions. The personal willingness to change mobility behavior remains limited, and mobility routines are strongly car-centered. Information-seeking behavior is characterized by moderate perceived knowledge, heightened information needs, but relatively low active search efforts and weak informational social norms.

A multiple linear regression (adj. R^2 = .54) identifies attitudes toward seeking, informational norms, affective response, and risk perception as positive predictors of information-seeking intention. Strikingly, information insufficiency emerges as a negative predictor, suggesting potential defensive avoidance – a phenomenon rarely examined in environmental risk contexts and relevant for crisis communication research.

By highlighting how communication shapes responses to emerging environmental risks in everyday life, this study contributes to the Risk and Crisis Communication Section's focus on uncertainty, societal transformation, and interdisciplinary integration. It underscores the need for communication strategies that emphasize personal relevance, strengthen social norms around staying informed, and address motivational avoidance as a barrier to public engagement in the mobility transition.

RCC10 Risk Communication and Institutional Trust in the Age of Disinformation

PP 1159 Blaming the government: The impact of misinformation on governmental trust during natural disasters

Ellen Droog[1], Ivar Vermeulen[1], Dian van Huijstee[1]

[1] Vrije Universiteit Amsterdam, Department of Communication Science, Amsterdam, Netherlands

Introduction

In crisis situations such as natural disasters, people often try to make sense of what has happened by assigning blame. According to Attribution Theory (Weiner, 1985), this process helps individuals restore a sense of predictability and control when faced with uncontrollable events. By attributing responsibility to a powerful external actor, such as the government, people create narratives that makes the disaster seem less random or threatening. However, this sense-making process can also backfire, as blaming institutions may foster public distrust in said institutions. While prior research has linked misinformation to declining institutional trust in other crises (e.g., COVID-19), its role during natural disasters remains

underexplored. The present study examined how exposure to government-blaming misinformation after a natural disaster influences belief in the misinformation and governmental trust.

Method

In a *between-subjects* experiment, 687 Dutch participants were exposed to an adapted NOS news article focusing on the 2021 floods in Limburg, the Netherlands. Half of the participants were exposed to misinformation, consisting of a false Facebook post claiming the government was responsible for the disaster, asserting to a popular conspiracy theory that the deliberate removal of dams by the government was the cause of the flooding. The dependent variables were belief in misinformation (i.e., the government *deliberately* caused the floods; α = .90) and governmental trust (α = .95). Conspiracy thinking was measured as a potential moderator (α = .86).

Results

Focusing specifically on the mechanisms underlying governmental trust, a moderated mediation analysis revealed that exposure to misinformation indirectly reduced trust in the government through increased belief in the misinformation (b = –0.043, SE = 0.017, p = .009, 95% CI [–0.079, –0.014]), at mean levels of conspiracy thinking (M = 3.12). Exposure to government-blaming misinformation significantly increased belief in the idea that the government deliberately caused the floods (b = 0.26, SE = 0.09, p = .003). In turn, stronger belief in this misinformation predicted lower trust in the government (b = –0.17, SE = 0.03, p < .001). This indirect effect was even stronger at higher levels of conspiracy thinking (b = –0.100, SE = 0.028, p < .001, 95% CI [–0.157, –0.050]). The direct effect of misinformation exposure on trust was not significant (b = 0.06, p = .30). All effects were controlled for baseline trust in the government measured prior to the manipulation.

Conclusion

The results show that even single exposure to a relatively extreme conspiracy claim (suggesting that the government deliberately caused the floods) was enough to increase belief in the misinformation. Higher belief in the misinformation was associated with lower trust in the government. This indirect effect was particularly strong among individuals with higher levels of conspiracy thinking, suggesting that individuals with a higher predisposition to conspiratorial beliefs seem more vulnerable to accepting blame-attributing misinformation. Overall, the results indicate that even brief exposure to such claims may distort the public's perceptions of responsibility, making it harder for governments to manage natural disasters effectively and maintain public trust, at a time when it is needed most.

RCC10 Risk Communication and Institutional Trust in the Age of Disinformation

PP 1160 Co-creation and care in risk and emergency communication with older adults in Portugal

Bianca Persici Toniolo[1], Elizângela Carvalho[2]

[1] University of Beira Interior, LabCom - Laboratory of Communication, Covilhã, Portugal
[2] Catholic University of Portugal, Centre for Communication and Culture Studies, Lisbon, Portugal

In March 2025, the European Union urged citizens to prepare "72-hour survival kits" for crises such as wildfires, pandemics, or cyberattacks. A month later, a major blackout across the Iberian Peninsula revealed the vulnerability of digital infrastructures and the rapid spread of misinformation. This event highlighted the urgent need for communication strategies that are effective, clear, and inclusive, particularly for socially and technologically disadvantaged groups.

This study presents the results of an exploratory research on the perceptions, preferences, and challenges faced by older adults in receiving messages about risks and emergencies. Two one-hour think tank sessions were held with groups of 5 to 6 participants (men and women over 65), all attendees of senior academies in the municipality of Leiria, Portugal. The sessions were previously authorized and audio-recorded. The activity helped to identify how this population has been informed about risks and crises in Portugal, the main obstacles to accessing guidance, and their assessment of strategies adopted by the EU and the Portuguese government. Good communication practice recommendations were also collected.

Inspired by the principles of communication of care (Florczak, 2024) and inclusive co-creation (Aliska et al., 2025), this proposal recognizes that older adults are not merely passive receivers but social actors whose knowledge can enrich the design of communication strategies. The empirical results reveal that older adults trust traditional media, value clarity and empathy in messages, and wish to participate actively in emergency preparedness strategies. These findings reinforce, in practice, the theoretical propositions of Florczak (2024) and Aliska et al. (2025).

When participants state that "we lack care, not just information," they express what Florczak (2024) calls the communicative dimension of care, a relational approach based on attentiveness and the recognition of the other's humanity. This ethical listening goes beyond instrumental efficiency, seeking to create communicative environments in which people feel valued and capable of acting. At the same time, the participants' suggestions for using local channels, practical training, and community engagement reflect the logic of inclusive co-creation described by Aliska et al. (2025). If communication is built with citizens, and not merely directed to them, trust and collective autonomy are likely to be strengthened, key components of social resilience. This co-creative practice breaks with the deficit model of communication – where the public is viewed as lacking information – and promotes mutual learning between authorities and the community.

These findings echo Rubert and Scroferneker's (2024) argument that public communication can be a driver of the culture of care when it assumes a dialogical and participatory stance. In their view, grounded in Wolton's (2023) notion of alterity and negotiation of coexistence, care is inseparable from communication that recognizes difference and vulnerability. In moments of crisis and disaster, such as those discussed in this study, public communication becomes a moral and civic duty, centered on the right to information, transparency, and social participation. By placing care at the center of the process, it advocates for public communication that is more empathetic, understandable, and safe.

RCC10 Risk Communication and Institutional Trust in the Age of Disinformation

PP 1161 Countering disinformation in a digital society: Media/institutional responses to the LVU crisis in Sweden

Mahitab Ezz El Din[1], Emma Ricknell[2], Andreas Önnerfors[3]

[1] Linnaeus University, Media and Journalism, Kalmar, Sweden
[2] Linnaeus University, Political Science, Växjö, Sweden
[3] Linnaeus University, Fojo Media Institute, Kalmar, Sweden

In recent years, disinformation campaigns have increasingly targeted democratic institutions, exploiting digital platforms to spread false narratives and undermine public trust. Campaigns have been known to exploit already existing cleavages and tensions in society, in some cases adding to already existing challenges of distrust in institutions and undermining cohesion.

In late 2021, Sweden became the target of a large-scale social media disinformation campaign directed at its social services, centring on the application of the Care of Young Persons (Special Provisions) Act (LVU). The campaign falsely alleged systematic abuses by Swedish authorities, particularly the unjust removal of children from their families, and rapidly gained traction across digital platforms. According to the Swedish Psychological Defence Agency, the LVU campaign constituted the most serious disinformation attack Sweden had faced to date, exposing vulnerabilities in institutional communication and societal trust.

This paper examines how the LVU disinformation crisis was understood, managed, and countered by key professional actors within Swedish media organizations and social services authorities. Drawing on qualitative, semi-structured interviews with representatives from social services and journalists working in newsrooms in Sweden, the study explores how different professional communities navigated the challenges of responding to coordinated disinformation in a highly polarized and digitally mediated information environment.

The results reveal six common themes: 1) Disinformation disrupts: the consequences of the campaign for the professional praxis of social workers and journalists. 2) Social Media Effect: the experience of particularity of the campaign as a phenomenon predominantly in the online information environment. (3) Emotions and affect: how the campaign triggered and exploited emotional engagement. (4) Reconfiguring communication approaches: linguistic and cultural adaptability fast forward. (5) Root causes of societal exclusion: how the campaign was perceived in terms of its cultural context. (6) Societal Trust: how the campaign laid bare gaps in trust and promoted attempts to bridge them. The paper contributes to the debates on digital disinformation, institutional resilience, and the mediation of trust in contemporary democracies.

disinformation; societal trust; journalism; social services; Sweden; LVU campaign; digital media; qualitative interviews

RCC10 Risk Communication and Institutional Trust in the Age of Disinformation

PP 1162 Countering the invisible threat: The impact of fake news and deepfakes on trust in central banks and the evolution of strategic communication

Raluca Iacob[1]

[1] National University of Political Studies and Public Administration SNSPA, Post-Doctoral Studies visiting researcher at Sciences Po, Bucharest, Romania

Central banks are currently in a paradoxical position: they must engage more with their stakeholders, but every word risks being distorted. Their legitimacy rests not on popularity, but on trust- and trust today is under threat also from the rise of artificial intelligence (AI).

In a period when a once marginal risk – misinformation and disinformation amplified by synthetic media - is becoming increasingly prominent, the growing challenges of communication do not bypass these institutions. From fake news articles to deepfake videos impersonating central bank officials, deliberately spread to spark confusion or even panic, disinformation adds to eroding public trust in these institutions, undermining their integrity. Moreover, recent incidents demonstrate that no central bank is immune to disinformation- scale, reputation, or geography make little difference.

This research focuses on the impact of AI-driven misinformation and disinformation on public trust in central banks, as well as on how these institutions manage their strategic communication in response. Based on a comparative study between the European Central Bank (ECB), the Banque de France (BdF), and the National Bank of Romania (NBR), the postdoctoral study pursues two main directions: (1) How disinformation affects trust in central banks and public perception, and (2) How central banks adapt their communication strategies in response to reputational threats.

The paper presents the results of both quantitative and qualitative methods. Through an online survey conducted in France (N = 500) and Romania (N = 500), the research collects data that facilitates understanding of how people's exposure to AI-generated disinformation, particularly synthetic audio and video, can affect their perception and trust in the central bank, as well as how people perceive the central bank's communication and responses to disinformation. Preliminary results of the quantitative component of the paper reveal whether there are any differences in terms of perceived exposure to disinformation effects on trust and public image (and the moderator effects of media literacy, AI literacy, and financial literacy) between Romania and France.

The qualitative component is based on a series of interviews with representatives of the ECB, BdF, and NBR (4 to 6 respondents for each central bank) across departments directly or indirectly engaged with external communication or information risk. The aim is to capture their views on whether disinformation impacts and poses risks to their institutions, and if so, to what extent, as well as to understand how these challenges are currently managed within the institutions, particularly through strategic communication.

Despite the growing digital complexity, the effects of disinformation on the trust, legitimacy, authority, and operational clarity of central banks remain an under-explored topic. This project aims to fill this critical gap in the literature and stress the urgent need to respond effectively to the subtle but growing threat of disinformation.

SCI01 AI & Environmental Communication

PP 0006 Between progress and risk: Framing communicative AI in German newspapers

Moritz Schäfer[1], Matthias Kast[1], Martin Bürger[1], Helena Bilandzic[1]

[1] University of Augsburg, Department of Media- Knowledge and Communication, Augsburg, Germany

The emergence of generative artificial intelligence (AI) has garnered considerable public attention with extensive debate on benefits and risks. News media play a central role in shaping the public understanding of emerging technologies by structuring them through specific frames. Prior research shows that AI coverage oscillates between frames of progress and risk, with portrayals becoming more critical over time (Ittefaq et al., 2025). Existing research has largely examined artificial intelligence in general (Brause et al., 2023). Only few studies have explicitly addressed communicative artificial intelligence (ComAI) specifically. Previous studies have established that risks and benefits of ComAI are present in public discourse (e.g., Tandoc et al., 2025). However, empirical research remains limited regarding large-scale analyses of news coverage published after the release of ChatGPT. Existing studies rely on small samples or focus on isolated dimensions of framing.

Drawing on a substantially larger dataset and applying automated content analysis, the present study enables a systematic assessment of the prevalence of specific risk and progress frames, their associations with actors and topics, and their development over time. The sample consisted of n = 3,838 articles published between November 2022 and July 2024 in German print news outlets. A codebook was developed based on previous research. A subsample of n = 464 articles was coded by four trained coders and used to validate the automated analysis. Reliabilities between the AI and manual coding were excellent (Gwet's AC > .70).

Results show that 68.92% of all articles contain at least one risk-related frame, while 68.45% include at least one progress-related frame. Nearly half of the articles (49.06%) combine both risk- and progress-oriented framings.

Among progress-oriented frames, coverage is dominated by portrayals of ComAI as a technological advancement (31.50%), followed by general progress narratives (27.46%) and references to societal benefits (16.81%). Risk-oriented framing most frequently emphasizes general risks (25.22%), information-related risks (23.81%), and economic risks (19.80%).

Media attention to ComAI increased after the introduction of ChatGPT and subsequently leveled off over time, reaching a plateau. This saturation effect suggests a phase of normalization in which ComAI became an established topic in news reporting.

We also identified ten key events related to the development and regulation surrounding ComAI. Time-series analyses show no consistent event-specific effects on either article volume or framing patterns. Instead, coverage dynamics align with the observed saturation effect.

PP 0007 AI-mediated futures: Algorithmic imaginaries in the communication of ecological issues

Mehtap Tunç Zengin[1]

[1] Istanbul Bilgi University, Communication Science-PhDc, Istanbul, Turkey

AI-Mediated Futures: Algorithmic Imaginaries in the Communication of Ecological Issues

This theoretical paper examines how artificial intelligence (AI) reshapes the communication of ecological issues and future environmental scenarios in digital media. It argues that AI should be understood not only as a set of tools that assists content creation, but also as a socio-technical arrangement that structures what becomes visible, credible, and actionable in public discourse about ecological futures. By integrating scholarship from sustainability communication, futures studies, and algorithmic mediation, the paper develops a conceptual framework to explain how "algorithmic imaginaries" of ecological futures are produced, circulated, and interpreted across platformed environments. Rather than offering empirical results, the paper synthesizes recent research to clarify mechanisms, risks, and opportunities, and to provide a structured agenda for future empirical work.

The proposed framework specifies three analytically distinct yet interdependent levels. **First, Production** concerns how AI participates in the construction of ecological future narratives through prompt-based generation, synthetic imagery, automated summarization, and AI-assisted forecasting and scenario writing. At this level, the paper highlights how AI can expand communicative capacity (e.g., rapid visualization of scenarios, translation and localization of sustainability messages), while simultaneously introducing representational risks such as homogenized "template" narratives, uncertainty laundering (where speculative outputs appear authoritative), and the reproduction of dominant cultural frames that marginalize alternative ecological imaginaries.

Second, Distribution addresses how platform recommender systems and ranking logics condition the reach and salience of ecological content. The paper foregrounds the role of algorithmic amplification, engagement optimization, and moderation regimes in shaping what ecological futures are encountered by audiences, under what emotional registers (e.g., doom, hope, solutionism), and with what degrees of contestation. Particular emphasis is placed on how platform logics may privilege simplified or sensational future projections, reward polarizing framings, and create attention bottlenecks that disadvantage slow, contextual, and uncertainty-aware sustainability communication.

Third, Reception examines how audiences interpret and negotiate AI-mediated future projections depending on their critical media literacy, algorithmic literacy, and epistemic trust. The paper conceptualizes reception as an interpretive process influenced by perceptions of AI credibility, perceived institutional authority, and users' awareness of personalization and ranking dynamics. It also considers how algorithmic curation can normalize certain future imaginaries through repeated exposure, potentially generating resignation, fatalism, or misplaced confidence—while, under different conditions, it can support learning, participation, and collective sense-making.

Across these levels, the framework treats ecological futures as contested imaginaries shaped by interactions between human communicators, AI systems, platform infrastructures, and institutional actors. It identifies key tensions that sustainability communication must address in AI-dense environments: speed versus reflexivity, accessibility versus oversimplification, personalization versus pluralism, and visibility versus epistemic reliability. The paper concludes by translating the framework into a research agenda, proposing testable propositions and methodological directions (e.g., comparative platform analysis, discourse and visual analysis of AI-assisted content, audit studies of recommender exposure, and audience research on perceived AI authority). Overall, the model offers a clear foundation for examining how AI can both enrich public understanding of ecological futures and distort it through new forms of mediation, selection, and credibility signaling.

SCI01 AI & Environmental Communication

PP 0008 Human vs. virtual greenfluencers: An empirical study on the influence of humanness on pro-environmental behavioral intentions

Julia Plattner[1], Fabian Mayer[1], Holger Schramm[1]

[1] Julius-Maximilians-University Würzburg - Institute of Human-Computer-Media, Department of Media and Business Communication, Würzburg, Germany

Greenfluencers, human and virtual influencers (VI) promoting sustainability through environmental communication on social media, are gaining relevance due to climate change (Groth & Qin, 2025; Lan et al. 2025). Human greenfluencers can positively impact commercial (Breves & Liebers, 2022) and non-commercial contexts (Boerman et al., 2022), while virtual greenfluencers particularly can positively impact commercial contexts (Kim et al., 2023). However, it remains unclear how the effects of human and virtual greenfluencers on pro-environmental behavioral intentions differ in non-commercial contexts.

Whereas social media influencers (SMI), as real humans, clearly exhibit a maximal degree of human likeness, human-like VI (HVI) possess more anthropomorphic characteristics (Arsenyan & Mirowska, 2021) and a higher degree of realism (Mouritzen et al., 2023) than anime-like VI (AVI), and should therefore be perceived as more human. Increasing influencer humanness is expected to lead to socially richer media experiences (Ahn et al., 2022). This perception should be further enhanced by direct eye contact from the influencer (Shahid et al., 2012). Perceived social richness is assumed to positively influence perceived influencer credibility (Ahn et al., 2022; Go & Sundar, 2019; Munnukka et al., 2022), which, through its persuasive impact, is expected to elicit an increase in recipients' pro-environmental behavioral intentions (Yang et al., 2023). An online experiment was conducted using a 3 (influencer human likeness: SMI vs. HVI vs. AVI) × 2 (influencer eye contact: direct vs. averted) between-subjects design (N = 210). The stimulus was a non-commercial Instagram post whose caption encourages environmentally friendly practices in the fashion context and whose image showed one of the three influencer types with either averted or direct gaze. The manipulation of human likeness (SMI vs. HVI: $p < .001$; HVI vs. AVI: $p = .023$) and eye contact ($p < .001$) was successful. All measures had a reliability of *Cronbach's* $\alpha > .70$. Results of a moderated serial mediation analysis (Hayes, 2022) revealed negative interaction effects between influencer human likeness and influencer eye contact (SMI vs. HVI: $b = -1.086$, $p = .024$; HVI vs. AVI: $b = -1.439$, $p = .004$). When influencer eye contact was not considered, influencer human likeness significantly predicted perceived social richness (SMI vs. HVI: $b = 2.535$, $p < .001$; HVI vs. AVI: $b = 1.889$, $p = .016$). Perceived social richness significantly predicted perceived influencer credibility ($b = 0.492$, $p < .001$), which, in turn, did not have a significant effect on pro-environmental behavioral intentions ($b = 0.037$, $p = .635$).

In an additional moderation analysis (Hayes, 2022), no significant interaction effects were found between influencer human likeness and prior experience with virtual humans (SMI vs. HVI: $b = 0.053$, $p = .754$; HVI vs. AVI: $b = 0.038$, $p = .832$).

Overall, the findings demonstrate that it is not the different degrees of influencer human likeness, but rather the perceived social richness of the influencers, that is central to non-commercial greenfluencer marketing. Persuasive effects observed in commercial greenfluencer marketing cannot be readily transferred to non-commercial content and call for further research on relevant underlying mechanisms.

PP 0009 De-anthropomorphizing generative AI: How negated and mechanical language affect public perceptions of ChatGPT

Gudrun Reijnierse[1], Ellen Droog[2], Aletta G. Dorst[3]

[1] Vrije Universiteit Amsterdam, Language- Literature and Communication, Amsterdam, Netherlands
[2] Vrije Universiteit Amsterdam, Communication Science, Amsterdam, Netherlands
[3] Leiden University, Leiden University Centre for Linguistics, Leiden, Netherlands

Since the public launch of ChatGPT in November 2022, academic and societal attention for generative AI (GenAI) has increased significantly (Ryazanov et al., 2024). Although generative AI models merely predict text based on statistical probabilities, media and public discourse frequently describe them using anthropomorphic language: the models 'think', 'feel', 'reason', and so on (Cheng et al., 2024). Research in science communication suggests that such framing may enhance comprehensibility (McGellin et al., 2021), but it also risks causing the public to wrongly perceive these models as autonomous, trustworthy, or even moral agents (Placani, 2024). This, in turn, may not only affect acceptance of GenAI but also how people trust, use, or hold these systems accountable (Salles et al., 2020; Singh, 2024).

In response to these concerns, scholars and science communication practitioners have called for avoiding anthropomorphic language in communication about (Gen)AI (e.g., Barrow, 2024; Shanahan, 2024) and instead use mechanical terminology (e.g., 'process', 'generate'; Inie et al., 2024) or stress that GenAI does *not* have human-like characteristics ('Language models do not have personal experiences'; Abercombie et al., 2023, p. 4776). However, previous research has shown that mechanical language and explicit negations may not always have the intended effect (e.g., Bullock et al., 2019; Maciuszek & Polczyk, 2017).

Despite calls to avoid anthropomorphic language in descriptions of GenAI, little is known about how alternative strategies, such as mechanical descriptions or explicit negations, affect public perceptions of it. This study addresses this gap by investigating the effects of these two de-anthropomorphization strategies on public perceptions of GenAI. In an online between-subjects experiment (N = 475), participants read a fictitious newspaper article about ChatGPT containing either anthropomorphic language, negated anthropomorphic language, or non-anthropomorphic mechanical language. They then reported their perceptions and attitudes toward AI systems such as ChatGPT.

Results show that negated anthropomorphic language, but not mechanical language, reduced perceived humanlikeness and trust in GenAI compared to anthropomorphic descriptions. No differences were found between the conditions for other variables including perceived ease of use, general attitudes, behavioral intention, and AI anxiety. Participants generally expressed positive attitudes towards GenAI, yet they also indicated to be afraid that AI will take over jobs or get out of control, despite not perceiving the systems themselves as intimidating. These findings suggest that public perceptions of GenAI are largely resilient to linguistic de-anthropomorphization strategies, highlighting the limits of current recommendations for responsible AI communication.

SCI01 AI & Environmental Communication

PP 0010 Implicit and explicit anthropomorphism of generative AI models in news coverage: A qualitative analysis

Matthias Kast[1], Helena Bilandzic[1]

[1] University of Augsburg, Department of Media- Knowledge and Communication, Augsburg, Germany

Communicative or generative artificial intelligence (ComAI) refers to systems designed to simulate human communication and interaction. Since the release of ChatGPT and comparable chatbots, public engagement with such tools has increased dramatically, driven in part by their strikingly human-like quality. Users frequently attribute human characteristics, emotions, or intentions to these nonhuman entities; this 'anthropomorphization' can serve as a heuristic that both provides and produces orientation in ambiguous or complex environments (Epley et al., 2007).

In public discourse, journalists tend to anthropomorphize ComAI when reporting on the technology, using human-like descriptions to make complex systems more accessible (Tandoc et al., 2025). Such representations shape public debates and contribute to specific societal imaginaries. Quantitative framing analyses demonstrate that AI-anthropomorphism is a wide-spread phenomenon (Ryazanov et al., 2024; Tandoc et al., 2025). However, anthropomorphic portrayals have many variations, ranging from simple agency attributions (e.g., "When asked, the AI admits its own mistakes") to complex depictions of overarching masterplans ("AI could wipe out humanity, much like pandemics or nuclear weapons"). We argue that these nuances, alongside evaluations and contexts, play a crucial role for shaping public discourse about ComAI and

provide audiences with symbolic resources for meaning-making. While Brokensha and Conradie (2021) offer a qualitative content analysis of AI technology more broadly, a systematic examination of ComAI anthropomorphism is still lacking.

Our study addresses this gap by offering an in-depth qualitative thematic analysis (Braun & Clarke, 2021) of ComAI anthropomorphism in German news media. We use a starting sample of *n* = 100 articles from 13 German print news outlets published between November 2022 (the launch of ChatGPT) and July 2024, and continue sampling until theoretical saturation is reached. Initial coding is guided by a heuristic definition of anthropomorphism, which is iteratively refined as the analysis progresses, and categories are developed.

Analysis is still ongoing, but preliminary results show that ComAI is partly constructed through established AI frames as well as frames that appear unique to ComAI. The analysis also reveals that explicit anthropomorphism (linguistically or visually recognizable depictions of AI as human) is frequently accompanied by more implicit forms, which are not stated directly but emerge through semantic cues with the reporting.

SCI02 Polarisation, Partisanship, Evidence Politics, and Contested Credibility in Climate Science Communication

PN 09 Mapping obstruction through coalitions: A relational, contextual, and scalable way to explore polarisation, partisanship, and evidence practices in energy debates

Carly Lubicz-Zaorski[1]

[1] Queensland University of Technology, Digital Media Research Centre, Brisbane, Australia

Just as climate change is entrenched as a deeply politicised and polarising topic, so too is Australia's renewable energy transition. Once-bipartisan energy policy is divided along party lines, with conservative politicians and aligned actors advocating for nuclear energy while the incumbent Labor government continues rolling out renewables, despite pushback from some quarters. Some concerns are legitimate, particularly from regional communities hosting infrastructure, while others – though plausible at face value – can be traced to actors with histories of obstructing climate action. Compounding this confusion is evidence politics. Technical reports and energy system modelling are selectively deployed to support particular positions, while the inherent complexity of both the topic and the evidence makes science communication by experts and information verification by audiences challenging. It is this complexity that calls for an approach beyond assessing individual claims alone, and instead expanding the focus to understand who is saying what, in collaboration with whom, and how. Discourse coalition research has examined how diverse actors align around shared policy positions. Yet two challenges remain: scaling discourse analysis to large corpora, and understanding how shared evidence practices – beyond shared storylines – contribute to coalition formation. This study extends discourse coalition analysis by introducing LLM-Assisted Discourse Analysis: a human-in-the-loop approach that enables systematic large-scale analysis while examining evidence sources as a coordination mechanism in contested energy policy debates. Analysing 858 public submissions to Australia's 2024–25 Parliamentary Inquiry into Nuclear Energy Generation, I work with Anthropic's Claude to identify actors, actor types, policy stances, claims, evidence cited, and how that evidence is framed. Coalition structure is then mapped using social network analysis: actors cluster when sharing stances, claims, or citing similar authorities. Preliminary analysis reveals polarised coalition structures reflecting Australia's energy partisanship, with pro-nuclear actors distinct from pro-renewables actors, and these positions relate to fossil fuel and climate change stances (pro-nuclear is aligned with mixed and anti-climate stances, while pro-renewables is aligned with pro-climate). The pro-nuclear coalition includes a conservative fossil fuel-supporting politician, partisan think tank, and pro-mining business actors that have previously been associated with Australian climate policy obstruction. Distinct evidence practices are emerging: The same scientific government report is simultaneously treated as authoritative by one coalition (pro-renewables) and dismissed as unreliable by another (pro-nuclear): a pattern of selective credibility that points to group membership and political alignment. Furthermore, actors with oppositional or mixed attitudes to climate change and/or renewables, or mixed or supportive attitudes to fossil fuels and/or nuclear are more than twice as likely to use the claim "Energy policy needs to be based on appropriate evidence", understood as a delegitimisation of the current evidence base. Shifting the analytical lens to examining with whom actors align (stances and shared storylines) and how they mobilise evidence is useful for understanding complex

policy discussions where climate obstruction may be more nuanced. By mapping discursive alignments and evidence use, we can explore where division occurs, which discourse coalitions are relevant to further investigate, and consider the implications of evidence partisanship in context-dependent debates.

SCI02 Polarisation, Partisanship, Evidence Politics, and Contested Credibility in Climate Science Communication

PN 10 How the news makes the case: Evidence use in polarised climate reporting

Katharina Esau[1], Samantha Vilkins[1], Michelle Riedlinger[1], Alice Fleerackers[2]

[1] Queensland University of Technology, Digital Media Research Centre, Brisbane, Australia
[2] University of Amsterdam, Faculty of Humanities, Amsterdam, Netherlands

Journalism plays a crucial role in the climate crisis not only in informing audiences, but also in shaping how knowledge claims are justified, contested, and rendered credible. Yet climate journalism operates within highly polarised environments, where disagreements about action, science, and social movements are amplified by partisan politics and divergent editorial stances. This paper examines news polarisation at the level of justification for claims in climate change reporting. While prior research has documented ideological bias, framing, and issue polarisation in climate news (e.g., Feldman et al., 2017; Hase et al., 2021), little is known about how different forms of evidence and argumentation are mobilised. This is an important dimension of polarisation not only over political position, but epistemology: what counts fundamentally as authoritative evidence within different communities. In practice, justification choices are guided by competing considerations of pragmatics, norms and expectations. Certain evidence may carry unwanted associations—like countering emotional stories with legal reasoning—while opposing sources may be selected to fulfil objectivity norms. We take a non-discriminatory approach to studying justification, drawing on Toulmin's framework for argumentation drawing on rhetoric studies as well as literature on expertise and evidence from sociology (e.g., Porter & Espeland, 2023). We analyse climate reporting across 22 Australian media outlets with national reach, covering November 2023 to August 2024. The sample includes mainstream and public service outlets such as The Guardian Australia, Australian Broadcasting Corporation (ABC), and Sky News Australia, alongside fringe and alternative outlets including Green Left and Quadrant. We draw on manually-coded data (K-α >.70) from a larger coding project, where coders first identified relevant articles then coded all mentioned actors and all climate-relevant political positions and claims. Each claim had accompanying expressions of emotions, value statements and justifications coded. Coders sorted justifications into one of seven types: (1) research/scientific evidence, such as reports from research organisations; (2) law and regulation, such as direct citation; (3) expert opinion, such as comment from individual experts or representative bodies; (4) statistics without attribution; (5) analogy, such as comparison to precedent cases or examples; (6) morality and ethics; and (7) personal experience. Results reveal significant differences in justificatory repertoires across outlets. Public service and progressive outlets such as The Guardian, ABC, and Special Broadcasting Service (SBS) predominantly rely on research-based evidence and expert authority to support climate-related positions and claims. These choices represent low-risk alignments for their audiences, as these sources are frequently widely-trusted public service organisations themselves. In contrast, conservative and populist outlets—most notably the Herald Sun—rely more heavily on personal experience and anecdotal justification. Alternative right-wing outlet Quadrant uses analogies comparatively often, more than others and also most compared to other types, potentially drawing together disparate discourses more frequently than other reporting. These patterns suggest that epistemic polarisation in climate communication operates not only through competing frames or narratives, but through systematically different standards of credibility which are motivated by fundamentally different aims. Such divergences have important implications for public trust, epistemic polarisation and democratic deliberation.

SCI02 Polarisation, Partisanship, Evidence Politics, and Contested Credibility in Climate Science Communication

PN 11 Polarised public trust in climate scientists: Predictors and correlates in 68 countries

Niels G Mede[1], TISP Consortium[2]

[1] Wageningen University & Research, Strategic Communication Group, Wageningen, Netherlands
[2] TISP Consortium, TISP Many Labs, https://www.tisp-manylabs.com/people, Switzerland

In many countries, different parts of the public have conflicting opinions on climate change. These conflicts have been conceptualised against the backdrop of affective, ideological, and factual polarisation, where different social groups oppose each other as they do not share the same beliefs and values, and reject those of others. These groups typically differ across sociodemographic characteristics, political views, and media use. Societies worldwide were also found to be polarised on whether scientists are trustworthy sources of knowledge about climate change. However, the evidence on polarised trust in climate scientists is limited: There is little research on demographic and attitudinal "cleavages" between trustful and distrustful segments of the population. In addition, few studies have analysed non-Western contexts. This study is one of the first to provide worldwide, comparative evidence on the drivers of polarised perceptions of climate scientists' trustworthiness. It draws on the publicly available TISP dataset (Mede et al., 2025), a preregistered, quota-sampled, post-hoc weighted online survey (2022–2023) with 71,922 respondents in 68 countries. We analysed 13 potential predictors and

correlates of climate change-related polarisation, including demographic characteristics, sociopolitical views, and information sources. Overall, we find that the majority of respondents trust climate scientists (55%). People in several East-Asian nations (e.g., India) report particularly strong trust, whereas many Latin American (e.g., Bolivia) and some African countries (e.g., Botswana) show less trust. Our results suggest that the most important driver of polarised trust in climate scientists is populism: Trustworthiness perceptions are relatively sharply split between those who support and those who reject science-related populist attitudes (b = -0.17***). We also identify slight religious vs. secular (b = -0.09***), left-leaning vs. right-leaning (b = -0.07***), and liberal vs conservative cleavages (b = -0.07***). News media use (b = 0.09***) and personal conversations about science (b = 0.09***) also tend to polarise societies into more and less trustful segments. However, contrary to common concerns, use of social media and messaging apps has little capacity to explain polarisation. Demographic characteristics are also less informative predictors of polarisation, with the exception of formal education (b = 0.07***).Multilevel models show noteworthy patterns and variations across countries. For example, we find substantial polarisation between age groups in some countries, such as the United States, Australia, Nicaragua, and Peru, where young people—often described as the "climate generation"—have clearly more trust than older cohorts. Notably, religious polarisation is stronger in Muslim-majority countries and also in Israel. Political cleavages are especially pronounced in many European countries. Social media, messaging apps, and personal conversations with peers outside the Internet do not seem to cause much polarisation, but there are a few exceptions (e.g., United States, Turkey, Australia).Future scholarship will need to investigate the predictive value of further sociocultural cleavages (e.g., GAL-TAN), interrogate further origins (e.g., with news media analyses), and explore further components of climate-related polarisation (e.g., attitudes toward environmental policies). Research and practice will also need to work towards effective strategies to depolarise public perceptions of climate scientists.

SCI02 Polarisation, Partisanship, Evidence Politics, and Contested Credibility in Climate Science Communication

PN 12 The impact of argument exposure and perceived argument strength on affective polarisation between climate action supporters and opponents

Thomas Zerback[1], Quirin Ryffel[2]

[1] Heinrich Heine University Düsseldorf , Institute of Social Sciences, Düsseldorf , Germany
[2] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Research problem

Effects of political cross-cuttingness—i.e., exposure to political views that differ from one's own—are a central topic in the field of political communication. At the core of this line of research lies the question of whether exposure to political disagreement positively or negatively affects democratically desirable outcomes, such as political participation, knowledge, or tolerance towards others (Mutz, 2006). Our study is situated within this tradition. We focus on supporters and opponents of stricter climate action, who are regularly publicly portrayed as divided into antagonistic camps, and examine the potential of argumentative cross-cuttingness, i.e., exposure to counter-attitudinal justifications, to reduce affective polarisation. Affective polarisation refers to the (increasing) rejection of members of an out-group alongside a (more) positive evaluation of one's own in-group, which can be driven, e.g., by an increasing aversion, negative feelings, and resentment towards an out-group. The literature offers competing expectations: cross-cutting exposure has the potential to increase mutual understanding and out-group favorability, but can also reinforce group identities and rejection of the opposing group, especially among individuals with strong or extreme attitudes. This can be explained by the perceived threat that cross-cutting exposure poses to one's in-group and is especially likely when cross-cuttingness occurs in the form of attacks against an in-group (Mason, 2016). Our study, however, focuses on political cross-cutting in terms of exposure to counter-arguments and therefore expects a reduction in affective polarisation. Additionally, the possibility of a reverse causal relationship has not yet been examined—that is, that affective polarisation may also affect the frequency of exposure to counter-attitudinal arguments. Strong rejection of an out-group may, for example, lead to avoidance of corresponding arguments (Slater, 2007).

Method

We analyse data from three-wave online panel surveys fielded by YouGov in the United States, Spain, and Germany in 2024, with approximately six-week intervals (overall NW1 = 4,706; NW2 = 3,622; NW3 = 2,654). In each wave, respondents reported exposure to five pro and five contra arguments about stricter climate change mitigation measures and evaluated their perceived strength. Affective polarisation was operationalised as the absolute difference between favorability ratings of the climate-policy in-group and out-group. We estimated fixed-effects regression models with time-varying controls and complemented them with random-intercept cross-lagged panel models.

Findings

Across all three countries, counter-attitudinal argument exposure is associated with lower affective polarisation, whereas pro-attitudinal exposure is associated with higher affective polarisation. However and importantly, changes in polarisation are driven more by perceived argument strength than by exposure frequency alone. Cross-lagged models furthermore suggest reciprocal processes: exposure can reduce polarisation, and polarisation can affect later exposure patterns. Our

findings imply that reducing affective polarisation in climate change mitigation debates may depend less on increasing cross-cutting exposure but rather on fostering engagement with substantively convincing arguments.

SCI02 Polarisation, Partisanship, Evidence Politics, and Contested Credibility in Climate Science Communication

PP 0338 The permeance of objectivity? Mapping audience evaluations of the advocacy role in climate journalism

Floriane Van Alphen[1], Christel van Eck[1], Hannes Cools[1], Anke Wonneberger[1], Christian Burgers[1]

[1] Amsterdam School of Communication Research, University of Amsterdam, Amsterdam, Netherlands

Climate journalists play an important role in the climate crisis; they are the primary source of climate information for most audiences, and they impact how people perceive and act on the climate crisis. At the same time, traditional journalistic roles and norms, such as objectivity, are being revisited, and the advocacy role in climate journalism is being debated by practitioners and academics alike. Given that the general public consumes most of their climate information through news media, it is remarkable how unexplored the audience perspective is within these debates. Hence, we set out to understand how Dutch citizens evaluate the advocacy role in climate journalism.

We address this, firstly, by offering a stronger conceptualization for the advocacy role, specifically when reporting on climate solutions. Secondly, we address this through six focus groups with Dutch citizens (N = 24). These focus groups were segmented by climate concern, and participants partook in a card sorting exercise with fragments from a fictional newspaper article. Each fragment contained one message characteristic, which we stipulated from the aforementioned conceptualization, to identify whether a journalistic product may have been, implicitly or explicitly, written out of the advocacy role.

The data was collected in October 2025, and the data analysis will be completed by early 2026. However, we already observe some preliminary results. Firstly, we observe that participants across different levels of climate concern expected objective, value-free, and independent reporting. Balance and nuance were hoped-for by many; climate skeptical participants, for example, expected journalists to also include scientists that do not represent the scientific consensus. Opinions were tolerated in columns, but most agreed that opinions did not have a place in mainstream news reporting. Moreover, and in terms of climate solutions, several participants wanted journalists to present course(s) of action, but some recognized the persisting need of, first and foremost, communicating the problem of climate change. Lastly, several participants discussed the pluri-crises (including mis/disinformation) that characterize the current geopolitical landscape, the difficulty for journalists to balance urgency and avoid fearmongering, and whether phrases such as 'climate crisis' are losing their weight.

Based on these preliminary results, it is notable that audiences still uphold traditional views on journalism, largely expecting journalists to provide objective, balanced, and nuanced accounts. Despite struggling to define what this might look like in practice, it seems that the desirability of objectivity permeates audience as well as journalistic discourses. Moreover, it is worth considering whether this emphasis on objectivity and independence may be heightened by the audiences' worries around pluri-crises, and whether these are seen as proxies to safeguard the epistemic authority of, and trust in, journalists.

Ultimately, this paper offers a threefold contribution. We present a (1) conceptual contribution by better demarcating the advocacy role when reporting on climate solutions, and an (2) empirical contribution by exploring how audiences evaluate news coverage that is written out of this advocacy role. Understanding audiences' receptivity towards this role, also offers a (3) practical contribution for newsrooms that may be reconsidering their position in this era of climate action.

SCI03 Energy & The Green Transition

PP 0222 How interactivity and immersion of visualizations affect the acceptance of and the participation in wind energy projects

Matthias Mack[1], Dominique Heinbach[2], Nino Bohn[3], Christian Schemer[1]

[1] University of Mainz, Department of Communication, Mainz, Germany
[2] University of Mannheim, Department of Communication, Mannheim, Germany
[3] University of Siegen, Human-centered Cyber-Physical Systems, Siegen, Germany

The global imperative for sustainable energy solutions has significantly propelled the development and deployment of wind energy projects. However, local acceptance and citizen participation remain critical determinants of their successful implementation (Liebe et al., 2017). Visualizations of planned wind energy projects are increasingly recognized as vital tools in addressing citizens' concerns about visual, acoustic, and ecological impacts, thus promoting acceptance. Interactive techniques and immersive tools are expected to enhance participatory planning by presenting detailed site information

and enabling feedback mechanisms (Berry & Higgs, 2012; Cranmer et al., 2020; Teisl et al., 2018). This effect is mainly due to interactive and immersive presentation of objects and services, which creates positive experiences that translate into more favorable opinions and behaviors toward them (Grigorovici, 2003). Prior research has often conflated interactivity and immersion without exploring their individual effects, treating interactivity as a feature of immersion (Berry & Higgs, 2012). The present study addresses this gap by experimentally separating the individual effects of interactivity and immersion on acceptance of and participation in a wind energy project. Our research questions are as follows:

RQ1: How does the degree of a) interactivity and b) immersion affect participants' acceptance of a wind energy project?
RQ2: How does the degree of a) interactivity and b) immersion affect participants' willingness to participate in a wind energy project?

Method

We conducted an online experiment with 1,235 participants representative of the German population in terms of gender (49% female), age (M = 49.1, SD = 15.2), and federal states, with 57% living in rural areas.

Participants first completed an online questionnaire assessing attitudes toward different forms of energy production. They were then randomly assigned to one of the online informational materials about a local wind energy project. They were instructed to imagine themselves as citizens of a neighboring community and to explore the wind park information freely. The websites were manipulated in a 2 x 2 between-subjects design: interactivity (interactive-non-interactive) and immersion (immersive-non-immersive). Interactive versions allowed participants to engage with features such as revealing noise and shadow impacts. Immersive versions presented realistic 3D visualizations of the local landscape and 3D models of the wind turbines, compared to abstract maps in the non-immersive condition. All environments presented the same information related to the project. After navigating the information environments, participants completed another questionnaire measuring acceptance, and willingness to participate in the wind energy project.

Results

- Two ANCOVAs were conducted, each controlling for attitudes toward onshore wind energy. Participants showed higher acceptance in interactive compared to non-interactive environments, while immersion did not significantly affect acceptance (F(1, 1231) = 14.75, p < .001).
- Furtermore, interactivity yielded a significant positive effect on willingness to participate (F(1, 1231) = 15.48, p < .001), whereas immersion showed no significant impact. No interaction effects emerged in any of the analyses.
- The findings suggest that, in contrast to immersive presentation, interactivity in informational materials increases acceptance (RQ1) and willingness to participate (RQ2) in local wind energy projects. Hence, participatory planning processes should prioritize interactive information materials as an effective measure to promote public acceptance and citizen participation.

SCI03 Energy & The Green Transition

PP 0223 The rising support for nuclear energy in Norway: Media framing, public opinion, and political debate

Silje Kristiansen[1], Finn Corus[1], Waider Verena[1]

[1] University of Bergen, CET - Centre for Climate &- Energy Transformation- Department of Information Science and Media Studies, Bergen, Norway

Despite concerns over nuclear accidents, costs, and waste disposal issues, support for nuclear energy is rising in Norway and is covered in the media.

Several factors may help explain this public climate. Norway's push for renewable energy faces conflicts over wind farm locations is leading to greater interest in alternatives. Public debate mentions that municipalities are rejecting industry proposing opening new business out of fear of future electricity shortages. The perceived risks of nuclear energy have faded since Fukushima, while the EU's classification of nuclear as a sustainable energy source has bolstered its legitimacy. Growing climate concerns and the framing of nuclear as a "green" alternative have further increased acceptance. Meanwhile, the nuclear lobby in Norway, especially the company Norsk Kjernekraft (NK) is working persistently to promote a positive perception of the technology. Both public opinion and media coverage reflect this shift.

We ask: What clues can media coverage provide about the rising public support for nuclear energy and its potential resurgence in Norway?

We conducted a quantitative media content analysis of three media: NRK (public service broadcaster), Aftenposten (national legacy media), and Klassekampen (left-leaning national newspaper), January 2021-September 2025. We manually sampled articles with strong focus on nuclear energy (>50%), resulting in n = 211, NRK n = 38, Aftenposten n = 82, Klassekampen n = 91. We used ChatGPT v5 for coding gain and loss frames. We developed and tested a ChatGPT-prompt and reached sufficient intercoder reliability (above 80% for most variables, above 70% for a few, averaging 86% agreement) compared to a human coder across 19 articles.

We observe differences between the media. NRK uses the societal gain frame (74%) as well as other countries investing in nuclear energy (74%) the most, and more than Aftenposten and Klassekampen. Aftenposten uses the international frame (57%) and the benefits for the environment frame (55%) frequently. Klassekampen often frames the issue through a safety

frame (58%) and has a strong focus on other countries investing (52%). When it comes to possible loss to the environment, an important aspect of nuclear energy, this frame is overall the least used frame, however, NRK does give this frame quite substantial attention (47%).

The company NK is directly quoted in ~30% of Aftenposten and NRK articles, which reach a large audience (NRK ranks #1, Aftenposten #7). In Klassekampen, NK receives less airtime (11%). Generally, the gain frames are more prevalent when the profit-driven company NK is quoted.

Findings suggest that the media frames to some degree are influenced by NK's work. We conclude that the publicly funded NRK and high standing Aftenposten are influenced by economic interests when they cover nuclear energy. Whether this has led to the positive opinion climate in Norway is impossible to conclude here, however, we do see that the positive tone found in representative surveys is present in the media coverage as well. Not surprisingly, the left-leaning Klassekampen shows a different picture, which likely helps strengthen the opinion of those against nuclear energy.

SCI03 Energy & The Green Transition

PP 0224 From green growth to degrowth – from progress to loss: How news media relate environmental crises and economic growth

Anke Wonneberger[1], Sarah Marschlich[1]

[1] University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

A main cause for global environmental crises, such as climate change or the loss of biodiversity, is that contemporary societies overexploit natural resources. This directly links environmental crises to our economic system which is built on the principle of continuous growth. While some have argued that to preserve habitable environments, economic growth should be limited (e.g., Hickel & Kallis, 2020), others argue that with different choices and future scientific developments economic growth and environmental preservation could very well be compatible (see Smulders et al., 2014). Although this may be very much a scientific debate, the societal debate is not the be neglected. Public debates as reflected in the news media are a key source of information for citizens and political decision making. Moreover, especially for issues that lack a scientific consensus, journalists play a vital role as gatekeepers in granting visibility to an issue and selecting issue positions (Rosen et al., 2016). While ample research has explored public opinion on this topic (e.g., Drews et al., 2018; Kenny, 2021), thus far, research that aims to understand how the compatibility of economic growth and environmental protection is represented in the news media is scarce: limited to US news media (Stecula & Merkley, 2019) or focusing on more narrowly defined topics such as degrowth (Sagvosdkin, 2025).

The interrelationship between environmental and economic developments can be considered as an example topic to study how loss is anticipated, avoided, neglected, and negotiated in public discourses (Reckwitz, 2024). While progress narratives dominate modern thought, casting change as inherent improvement, this framework tends to negate the experience of loss. At the same time, environmental (and other) crises generate loss. And while the dominance of the growth paradigm emphasizes progress, it further intensifies environmental loss. This duality gives rise to questions about social practices around loss—ranging from denial to fixation, and from denial to cultural rituals around processing loss. The current study examines this duality in the context of the interlinkage between the environment and the economy with the following research questions:

RQ1 To what extent and how do the news media frame news about the relationship between the economy and the environment along the continuum of loss and progress?
RQ2 Which actors and topics are related to these frames?
RQ3 Which losses and progresses are framed as legitimate?
RQ4 To what extent and how does this differ between news media across countries and across the political spectrum of news outlets?

To answer these research questions a qualitative and quantitative content analysis of national media coverage linking environmental and economic topics is conducted comparing across three countries (Australia, Germany, the Netherlands). First, a qualitative analysis based on a corpus of 60 news articles per country, spread over three newspapers per country, deductively identifies key loss and progress frames and linked actors. Based on these findings, a codebook is developed for a manual, quantitative content analysis of relevant news articles published in 2025 to compare the frames across countries and news outlets.

SCI03 Energy & The Green Transition

PP 0225 Smokescreen or climate solution? Negotiating carbon capture in the press

Mikkel Fugl Eskjær[1], Anders Horsbøl[2]

[1] AAU Copenhagen, Communication and Psychology, Copenhagen, Denmark
[2] Aalborg University, Communication & Psychology, Aalborg, Denmark

Aim & scope

Carbon capture is increasingly presented by IGOs, such as the IPCC (Shukla et al., 2022), and national governments as necessary to meet the goals of the Paris Agreement. In Denmark, the technology is a crucial element in achieving net-zero emissions by 2050 (Danish Climate Act, 2020). By promising not only to capture CO2 emissions but also convert CO2 into green energy (through Power-to-X technologies), it has become the "holy grail" of climate mitigation. At the same time, CCUS remains controversial. NGOs such as Friends of the Earth view CCUS as a technofix with significant environmental and local community risks.

The media serves as a key platform for public understanding of climate-mitigating technologies. This study explores how Danish news media inform and discuss capture, storage, and utilisation of carbon dioxide (CCUS).

Theoretical background

While the literature on public negotiations of CCUS is expanding (Nielsen et al., 2022), it mostly aligns with the "public acceptance of technology" perspective (Arning et al., 2019). Experimental survey designs, for instance, have shown that public knowledge of CCUS is limited (Zuch & Ladenburg, 2023).

We situate our study within the public acceptance approach. However, we step back and examine public *negotiations* of CCUS *prior to* any public acceptance (Batel & Devine-Wright, 2015). Thus, we contend that public attitudes are preceded by a period of public negotiation in which different technologies, actors, and issues are presented and debated.

Research design

To investigate how CCUS is negotiated in Danish news media, we ask:

RQ1: How, when, and where did CCUS emerge on the news agenda?
RQ2: What are the dominant themes and issues associated with CCUS?
RQ3: How are support and criticism of CCUS articulated in the press?

The analysis combines quantitative and qualitative approaches. First, we use text mining to trace the emergence and development of the CCUS agenda from 1997–2025 (n = 15101). We then focus on recent developments (2019–2025). Based on a purpose sample (n = 102), we investigate four media platforms (national dailies, public service corporations, regional news, and trade news). Timeline analysis, word clouds, and open coding constitute our main analytical tools.

We aim to update "ethnographic content analysis" (Altheide, 1987, 1996) by integrating it with digital tools (NVivo) to ensure an inductive approach grounded in systematic coding protocols.

Findings

Our coding process has resulted in a significant number of codes (n = 22) and sub-codes (n = 96), which are relatively evenly distributed across time and media platforms. We present the major patterns emerging from the coding.

Timeline analyses show that media coverage of CCUS is driven by Nationally Determined Contribution (NDC) targets, which have become a key instrument in climate policy. It indicates that the media adopt official narratives about CCUS as inevitable, although some reports criticise it for sustaining fossil-fuel technologies rather than systemic decarbonisation.

Discussion

Based on our findings, we discuss whether media language is hyperbolic regarding CCUS, thereby contributing to a "promotional discourse" (Nerlich et al., 2024), and whether the media disregards historical lessons from previous immature techno-solutions to the climate crisis.

SCI03 Energy & The Green Transition

PP 0226 Museums in the age of the ecological crisis: How petrostates construct the future

Yaroslava Oleksandrivna Kutsai[1]

[1] Charles University, Media and Communication Studies, Prague, Czech Republic

Museums, as well-established institutions, are uniquely positioned to connect historical trajectories with the climate emergency and to help the public make more informed choices as consumers, citizens, and activists (Cameron et al., 2013; Janes, 2024). They can interrogate deeply entrenched and often problematic assumptions about economic growth and prosperity and facilitate transitions towards more sustainable energy sources. Despite this potential, however, many museums remain reluctant to address the systems underpinning the ecological crisis (Isager et al., 2021; Baker, 2023). This reluctance is

evident in exhibitions envisioning the planet's future in countries with significant petroleum reserves, which form the focus of this study.

This paper adopts a social constructionist paradigm and draws on discourse theory (Laclau & Mouffe, 1985; Carpentier & De Cleen, 2007). Using qualitative discourse-theoretical analysis, it examines how the Climate House, part of the Natural History Museum at the University of Oslo, and the Museum of the Future in Dubai recreate, reconfigure, or omit particular environmental discourses in their forecasting practices, and how they construct notions of accountability and change.

Despite markedly different political and welfare regimes, both Norway and the United Arab Emirates have accumulated substantial national wealth through oil and gas extraction. This shared material foundation is approached in divergent ways within their exhibition spaces. The Norwegian case explicitly acknowledges the country's reliance on hydrocarbons and foregrounds community-oriented responses through chains of equivalence linking individual and collective actions, articulated through a discourse of stewardship and hopeful narratives of humanity's capacity to unite and adapt. By contrast, the Emirati exhibition leaves its reliance on hydrocarbons largely unexplored, instead advancing a narrative of expansionism through extraterrestrial endeavours, set against a backdrop of mass extinction ultimately framed as solvable through innovation. Both institutions' nodal points stabilise anthropocentric, optimistic future imaginaries while marginalising structural critiques of capitalism and fossil-fuel dependence.

These findings point to a broader tendency in contemporary museum practice to avoid reflexive confrontation with business-as-usual logics and instead opt for neutrality and spectacle. Drawing on scholarship advocating the long-term and equitable management of natural resources, this paper argues that museums could enrich their discursive fields by introducing counter-hegemonic imaginaries and ecocentric perspectives, and by more directly engaging with the transformations required to render net-zero emissions scenarios thinkable.

SCI04 Framing & Reporting The Environment

PP 0329 Comparing constructive news on the environment from across languages and cultures: An MCDA-based case study of Positive News (UK) and EnPositivo (Spain)

Ashley Riggs[1]

[1] Ca' Foscari University of Venice, Department of Linguistics and Comparative Cultural Studies, Venice, Italy

This study of constructive environmental news from different linguacultures combines (constructive) journalism studies and multilingual, multimodal critical discourse analysis (MCDA) to continue and extend an existing preliminary study (Riggs 2025) that explored only the coverage of *sustainability* in constructive news from *Positive News* (UK) and *En Positivo* (Spain).

The pressing environmental issues of our time transcend borders and are therefore a major focus of (constructive) news globally. The presence, types and impact of constructive environmental news in different countries have often been explored (e.g., Lough 2025; Lough & McIntyre 2021), and constructive environmental news has been shown to motivate readers to take action (e.g., Maduneme & Cohen 2024; Said & Wölfl 2025), reflecting alternative "norms, values…ethics" (CFP) to those of predominant "if-it-bleeds-it-leads news". These are worthy of further consideration given the need for news to not only "contribute to meaningful societal progress" (CFP), but also draw and maintain audiences.

What is rarely taken into account, however, is that (constructive environmental) news is re-presented, mediated, across different linguacultures (exceptions are Riggs 2024, 2025; Riggs & Davier 2025). Few studies of constructive news investigate the nuts and bolts of the *language* used to describe environmental issues and solutions to them, the interplay of language and image in such coverage, and how these may *vary* according to linguaculture (the micro-/meso-level).

Furthermore, on a macro-level, depending on where such news comes from, it may emphasise mitigation over adaptation or vice-versa; individuals' power to help preserve the environment or the responsibility of large and powerful economic and political actors in degrading the environment; it may or may not engage with the larger question of whether capitalism and environmental protection/preservation are in fact mutually exclusive (Baer 2012; Thier & Wu 2024).

This study will combine thematic content analysis with examination of information (de)selection, use of sources, congruence/dissonance/personalization/depersonalisation between topic and image, the presence, absence or transformation of

stylistic features such as metaphor (including visual/multimodal metaphor; e.g., El Refaie 2003; Forceville 2016), alliteration, modality, and register (including presence/absence of interpellation [e.g., Althusser]), to confirm, refute, or nuance findings from the preliminary study, for instance:

On the micro-/meso-level, *EnPositivo* added content to make texts more explicitly about sustainability; used less verbal metaphor but more visual metaphor than *Positive News*, and a much more formal register, creating distance and didacticism, whereas *Positive News* combined wordplay, alliteration and interpellation to lower the register and establish proximity with readers, and lightheartedness;

On the macro-level, *EnPositivo* defined andproblematized environmental issues more and was more critical of the capitalist model and the "big players" who hinder sustainability, while *Positive News* focused more on economic development and consumption; both emphasised the role of technology in sustainability. Sources in *Positive News* were more often founders of companies, marketing representatives; in *EnPositivo*, institutional/scientific documentation, community representatives and organisers. *Positive News* was more UK-focused with *EnPositivo* instead reporting on Spain, the EU, Latin-America and beyond.

SCI04 Framing & Reporting The Environment

PP 0330 Framing planetary health: A systematic analysis of framing concepts in environmental and health communication research

Julia Serong[1], Anna Gaul[1]

[1] LMU Munich, Department of Media and Communication, Munich, Germany

The accelerating degradation of planetary systems and the global rise of health challenges have led to the development of a new interdisciplinary and transdisciplinary research field, planetary health. This emerging field of research, seeking to understand interconnections between environment and health, shows an increasing interest in communicative practices addressing these intertwined crises of human health and ecological sustainability. Within this growing body of literature, framing has emerged as a dominant theoretical approach, serving as a lens through which researchers analyze and interpret complex relationships and processes. Yet, despite its prevalence, significant conceptual ambiguity persists regarding how environmental and health-related frames are defined, categorized, and applied, particularly in topic-specific contexts. This lack of standardization hinders comparability and cumulative knowledge development.

This study presents findings from a content analysis of 57 scholarly publications selected from a larger preregistered scoping review (N = 213, 2009–2023) on planetary health communication. Focusing on studies that explicitly use framing as a primary theoretical framework, the research examines how environmental and health-related frames are employed, defined, and operationalized. The study addresses three research questions: (RQ1) What types of frames – generic or issue-specific – are most commonly used? (RQ2) How are frames related to environment and health defined? (RQ3) How are these planetary health-related frames distributed across research domains and methods?

A mixed-methods content analysis was conducted using a codebook adapted from climate change communication research. Variables included theoretical tradition, frame development, frame types, focus of analysis, framing effects, frame materials, and frame names, particularly those linking environment and health. Open coding enabled inductive identification of new frame concepts.

Two trained coders tested the codebook on a 30% pretest sample (n = 17), achieving substantial agreement (ICR ≥ 0.75) for five variables and excellent agreement (ICR ≥ 0.83) for the remaining two after a third training, confirming high reliability. The full coding of the 57 studies has been completed and the data analysis is now underway.

Preliminary results show that 67% of studies draw on a sociological tradition, with 51% analyzing media content frames and 45% focusing on audience frames. Notably, 74% use issue-specific frames, and 44% explicitly identify planetary health-related frames, commonly labeled as "public health" or "health" frames, but also more specifically as, e.g., "air pollution", "water quality", or "heat-related" frames. Furthermore, it appears that environmental and health frames are often analyzed as unrelated or even contradictory (environment vs. public health).

The findings are expected to reveal a fragmented use of framing theory, with varying definitions and applications of planetary health-related frames. This fragmentation limits the field's ability to build cumulative knowledge and effectively communicate the interconnected nature of environmental and health crises.

The study makes two key contributions: first, it offers a systematic overview of framing's application in planetary health communication; second, by clarifying definitions and improving coding instruments, the study supports the development of more robust frameworks for future interdisciplinary research. Ultimately, the study advances the theoretical foundations of planetary health communication, thereby enhancing public understanding and engagement with planetary health.

SCI04 Framing & Reporting The Environment

PP 0331 Who gets to speak for the forest? Discursive power in media framing of the Church of Sweden's Forestry inquiry Kristina Riegert and Ida Wallin

Kristina Riegert[1], Ida Wallin[2]

[1] Södertörn University, Journalism/School of Social Sciences, Huddinge, Sweden
[2] Swedish University of Agricultural Sciences, Forest Policy and Governance- Southern Swedish Research Center, Lund, Sweden

Forests are increasingly central to climate change mitigation, intensifying political and public interest in Sweden's forest governance and sparking polarized debates about sustainability and societal values. This study examines media coverage of the Church of Sweden's forestry inquiry—a landmark initiative by one of Sweden's largest private forest owners to align management with ecological, economic, social, and spiritual sustainability. Published in 2024, the inquiry proposed halving clear-cutting, introducing close-to-nature forestry on one-third of holdings, and expanding protected areas to 20%. These recommendations challenged Sweden's dominant forestry model, triggering extensive debate during the public consultation (Oct 2024–Feb 2025) and influencing church elections in Sept 2025, where green coalitions gained ground.

We ask: (1) What dominant frames emerged from the media debates about the Church of Sweden's forestry inquiry? (2) Which actors gained discursive power, and how were they represented?

The study draws on Hjarvard, Mortensen, and Eskjær' study (2015) of the dynamics of mediatized conflicts—amplification, framing and performative agency, and co-structuring—we analyze how media act as conduits, shape conflict environments, and influence outcomes. We also use Jungherr et al.'s (2019) concept of discursive power in hybrid media systems referring to the ability to "introduce, amplify and maintain topics…and dominate attention in ongoing political discourse."

Using framing analysis (Benford & Snow 2000), we examined diagnostic frames and prognostic frames and actor standing (frequency, placement, direct quotes) in 82 articles across local, regional, specialist, and national press and public service media during the consultation period. Three major agenda-setting frames emerged, each dominant at different times:

Moral-Ecological-Climate Frame (Oct–Dec): Led by some church leaders, environmental NGOs, Sámi actors, and activists, emphasizing biodiversity, FPIC, and spiritual sustainability. This coalition supported the inquiry's recommendations and initially dominated coverage.

Economic-Operational-Scientific Risk Frame (Jan-Feb): The Church Joint Property Board (ENSO) and diocesan representatives commissioned analyses predicting severe revenue losses, questioning the science, and opposing centralization. Industry-oriented outlets (e.g., ATL), regional/local and some religious press amplified this frame.

Procedural-Legitimacy Frame (Late Jan–Feb): Bishops and the author of the inquiry criticized "remiss sabotage," and climate urgency, reframing the debate around governance and legitimacy.

In February, the moral-ecology-climate and the economic-operational-risk frames existed side by side, leading to news pegs discussing ethics and intra-church maneuvering. These shifts underscore how the media co-constitute and are instrumentalized in conflicts through amplification and performative interventions (commissioning alternative analyses, redefining the stakes, leaked email exchanges). The shifts in discursive power reveal how the media enable particular interests to shape what the conflict is about - a polarization that continued after this period and played a major role in the Church election. Understanding these dynamics is vital for fostering deliberative spaces in sustainability discussions and mitigating polarizing effects of mediatized conflicts.

SCI04 Framing & Reporting The Environment

PP 0332 The discursive constructions of nature and culture in Swedish environmental journalistic assemblages

Elisabeth Wennerstrom[1]

[1] Institute of Communication Studies and Journalism, Faculty of Social Sciences- Charles University, Prague, Czech Republic

Research on environmental journalism predominantly follows a critical or scientific perspective, examining Swedish environmental journalism as part of a Western, liberal media system characterized by institutional autonomy and media power. In contrast, this paper focuses on the examination of the discursive construction of nature and culture, highlighting their entanglement in Swedish environmental journalistic assemblages. Drawing on the analysis of articulations, the research gauges entanglement as a constitutive form of situatedness, corroborating the call to examine environmental journalism "as a complex, interactive societal process" (Corbett, 2015, p. 288) – also explained as a necessary first step, for "its capacity to respond" (Haraway, 2016, p. 78).

Supporting this research, the role and relevance of relations between the particular and the universal is argued from the poststructuralist and post-Marxist discourse theory on identity and the political (Laclau & Mouffe, 1985). New materialist writings, including DeLanda's (2016) conceptualization of assemblage theory and a particular interest in 'natureculture' – conceptualized by Donna Haraway (2003) – complement the theoretical framework. The study employs qualitative methods to investigate the discursive construction of nature and culture by their hegemonic and counterhegemonic articulations, or the lack thereof, as seen by the collection of 180 textual and audiovisual media materials in Swedish public service, private media, and independent collaborative networks, published 2020–2025, and selected the diversity criteria (Van Cuilenburg, 2000), alongside 20 +/- interviews with environmental journalists and editors. The application of discourse theoretical analysis (Carpentier & De Cleen, 2007) through the explanatory discursive-material knot (Carpentier, 2017) approach highlights how the entangled articulations are not only (re)constructed but also resisted.

The main research question is: How are nature and culture articulated in the Swedish environmental journalistic assemblage of public service, private media, and independent collaborative networks? Specifically, the study examines 1) how hegemony and counter-hegemony are articulated in the material; 2) how the materials articulate gaps/limitations; 3) subgroup differences; and 4) what the examination of secondary research questions explains about the discursive construction of nature and culture. In the paper, which focuses on hegemonic and counterhegemonic articulations, gaps, and differences in the media material, the analysis demonstrates how hegemonic tactics to categorize and prioritize nature and culture include "resources," "needs," and "progress." The media material also demonstrates the presence of resistance in the material, further highlighting the environmental journalistic assemblages' capacity to respond to both nature and culture. Counterhegemonic articulations highlight, on the one hand, identification and self-realization, as tactics of "being nature"; and on the other hand, extend space and self-awareness into tactics of "becoming nature", revealing their limits. Meanwhile, counterhegemonic articulations in the material include entanglements of articulations that are also "ignoring nature and culture", arguing for the continued address of relations in Swedish environmental journalistic assemblages.

SCI04 Framing & Reporting The Environment

PP 0333 TV broadcasting of the 2024 floods in Valencia, Spain: How the regional Public Media Service reported the relation between science and politics in a polarized system

Miguel Vicente[1], Enric Sendra Duro[2], Pablo López Rabadán[2]

[1] Universidad de Valladolid, Sociología y Trabajo Social, Segovia, Spain
[2] Universitat Jaume I, Ciències de la Comunicació, Castelló de la Plana, Spain

On 29 October 2024, torrential rain caused by an isolated low-pressure area at high levels brought over a year's worth of precipitation to several areas in eastern Spain, with Valencia as the most damaged territory. The resulting floodwaters caused the deaths of about 237 people and substantial property damage, turning them into one of the deadliest natural disasters in European history.

The crisis management has been the subject of harsh criticism ever since, while the ongoing judicial investigation advances aiming to determine criminal and civil liability. The contentious relationship between the right-wing political parties that hold regional power and the left-wing parties governing at the national level has made this crisis a constant topic of news coverage and political confrontation.

This heated debate has also brought scientific actors into the public discussion. Extreme rainfall events are becoming more frequent in the Mediterranean region due to climate change, where sea temperatures are steadily rising, affecting weather patterns. While "cold drop" episodes are common along the Mediterranean coast, the scale of this event exceeded all expectations and had tragic consequences.

Given the impactful outcomes of the floods, media attention was huge within the Spanish news landscape. This paper is exclusively focused on the coverage of À Punt, the regional TV channel of the Autonomous Community of Valencia, given its pivotal role in the media system closer to the most damaged area. On this occasion, the corporation was recognized by various professional associations for its prompt response and leadership during the catastrophe.

A quantitative content analysis of 984 news stories aired by À Punt between 29 October and 31 December was conducted, devoting special attention to the thematic agenda and to the framing strategy presented in this long-term approach to the natural disaster and its subsequent crisis management. Concurrently, the study reviews the management of information sources, placing special emphasis on the contribution of scientific experts.

The initial findings point towards a prevalence of human-interest frames where individual protagonists were leading the news pieces during the first weeks. This humanitarian approach was slowly replaced by a growing presence of the political confrontation: once the harder impacts were digested, the evaluation of the crisis management turned into the main topic, trying to find out the causes lying behind the severe consequences.

The role played by scientists in the coverage was carefully analysed, placing a special focus on how their presence and contributions interacted with the political leaders' discourse. The intimate connection between climate change, global warming and some extreme weather events counts with a solid ground within the scientific community, but it is easy to turn into a subject for political confrontation, mainly when parties with a sceptic discourse emerge in the institutional arena.

The divergent positions of political parties in the current Spanish field of play led to significant clashes between scientific and political arguments.

SCI05 Climate Journalism

PP 0334 Constructing constructive climate coverage Audience views on current climate journalism and paths forward

Peter Busch Nicolaisen[1], Morten Skovsgaard Hansen[1]

[1] University of Southern Denmark, Centre for Journalism- Department of Political Science, Odense, Denmark

The grim outlook of climate change makes it difficult for journalists to retain the attention of readers, viewers and listeners when covering the subject. Among those who "often" or "always" actively try to avoid climate change news frequently mentioned reasons are that this news coverage affects their mood negatively, that they feel powerless to do something with the information, and that they are overloaded with climate change news.

It has been suggested that shifting the reporting on climate change in a more constructive direction could be an effective way of engaging media users and enhance their sense of efficacy, and the constructive reporting style has gained traction among climate journalists worldwide. So far, however, the evidence of the proposed beneficial effects is inconclusive when they are studied through controlled experiments. This calls for studies that more granularly explore how audiences negotiate the potential of constructive climate coverage founded on discussions about how the media currently handle climate change. Gaining such an understanding will help researchers in carefully designing studies that explore the potential effects of constructive climate coverage more in line with the actual audience expectations and practices, and it will inform climate journalists on how they can balance their reporting to these audience expectations and practices.

Drawing on 13 focus groups with a diverse sample of Danish members of the public (N = 68) in terms of age, educational level and climate attitude, this study takes an audience perspective to examine the prospect of emphasizing solutions in the framing of climate stories.

The focus group participants generally agreed that contemporary climate journalism is excessively negative and wedded to doomsday narratives. Accordingly, there was a widespread wish for a more constructive approach in climate reporting. Unpacking the specifics of this demand, the discussions revealed that the participants particularly wanted climate journalism to center more on what individuals can do to mitigate the climate crisis, rather than on responses at the systemic or technological level. It speaks to the substantial proportion of climate news avoiders that indicate that they feel that there is not much they can do with the information that they get from climate change news.

Additionally, the finding that readers, viewers, and listeners prefer constructive climate journalism to revolve around micro-level actions contrasts with scholarly views of constructive journalism as exclusively concerned with structural matters. Our bottom-up design can spark debate on whether definitions of constructive climate journalism are sufficiently attuned to audience inclinations. Lastly, our observations can help inform journalistic work by pointing out the shortcomings of contemporary climate journalism and outlining future trajectories.

PP 0335 Decoupling net zero from climate change: A new form of policy obstructionism in the UK media

James Painter[1]

[1] Reuters Institute- Oxford University, Politics and International Relations, Oxford, United Kingdom

Context

Recent academic research strongly suggests that many of those groups opposed to taking action to reduce greenhouse gas emissions are shifting the emphasis from questioning climate science ('trend', 'attribution' or 'impact' scepticism) to questioning climate policy ('response scepticism'). In the UK, for several years sections of the media strongly challenged the scientific consensus on climate change. However, more recently these same outlets regularly question the UK's net zero target and the policies aimed at achieving it.

In October 2024 the leader of the Conservative party, Kemi Badenoch, declared herself to be a 'net zero sceptic' but not a climate change sceptic, thus cementing a difference between a belief in the reality of climate change and a belief in the advisability of net zero policies, or in other words 'decoupling' climate change from net zero. Such a position is problematic in that climate change cannot be stopped without reaching net zero, a fact established by the IPCC.

This study was designed to assess whether a similar process of decoupling net zero from climate change is taking place in parts of the UK media.

Method

We used the Factiva search engine to examine coverage of Net Zero in the nine main UK legacy print media with an online presence from 2018 to 2024. First, we identified the number of articles mentioning net zero at least once (73,000 articles), then those having Net Zero once in the headline and at least twice in the article, and finally, those with Net Zero in the

headline and at least four other mentions. We used a complex array of Boolean search terms such as [atleast3 “net zero”] AND [hd=“net zero”], then [atleast3 “net zero”] AND [hd=“net zero”] AND [“climate” OR “climate change” OR “climate crisis” OR “climate emergency” OR “global warming” OR “global heating”], then [atleast3 “net zero”] AND [hd=“net zero”] NOT [“climate” OR “climate change” OR “climate crisis” OR “climate emergency” OR “global warming” OR “global heating”]. We also selected a limited number of articles for qualitative assessment.

Results

Amongst our findings are:

- In 2018, 90% of articles mentioning net zero also included the phrase ‘climate change’ or similar. By 2024, this figure had fallen to just 42%.
- Over the same period, 100% of all the article with three mentions of net zero also mentioned climate change. That dropped to 75% in 2022 and to 59% in 2024.
- The downward trend is particularly noticeable in the right-leaning media (Telegraph, Express, Sun).

Societal importance

Polling evidence in the UK and elsewhere suggests strong public support for tackling climate change, but confusion and lack of understanding over Net Zero policies. We discuss if certain papers or editors are driving an agenda to divide climate change (an issue that the public greatly care about) from net zero (its solution, which is less understood). And we make recommendations for how journalists can improve their coverage of the net zero target.

SCI05 Climate Journalism

PP 0336 Mediating climate knowledge: How Finnish climate experts assess their relationship with the media and policy-making

Marko Ampuja[1], Mervi Pantti[1], Risto Kunelius[2]

[1] University of Helsinki, Department of Social Research- Media and Communication Studies, Helsinki, Finland
[2] University of Helsinki, Institute for Social Sciences and Humanities, Helsinki, Finland

While public trust in science and expertise remains relatively strong in Europe, epistemic institutions—such as universities, research institutes and journalism—are increasingly challenged in their capacity to support the epistemic infrastructure of democratic decision-making. This paper focuses on a fundamental systemic challenge of climate change, examining the relationship between climate experts, political decision-making and the media. We provide an empirical case that addresses the crisis tendencies affecting the epistemic capacities in European societies.

Previous studies on the mediation of climate science have focused on the production routines and practices of climate journalism, its discursive or visual content, and audience interpretations of and reactions to climate change communication (e.g. Schäfer & Painter 2021; Holmes & Richardson 2020). However, there is detailed research on what climate experts think about their relationships with the hybrid mediated public sphere and the political decision-making networks they aim to inform (Kunelius et al. 2017). Contributing to this topic, we offer a theoretically informed and contextually anchored analysis of how Finnish climate experts understand, evaluate, and manage their relationships with the media and mediated politics in the current context of major transformations in media ecosystems and political conditions (Wetts et al. 2025).

The paper draws on 35 semi-structured interviews conducted in 2025 with a diverse range of climate researchers (from geophysicists to social scientists and economists) as well as climate experts working in the private sector, government, and non-governmental organizations. We asked questions regarding a) their perceptions of the news media and their communication activities and strategies, b) their practices as experts in communicating with different policy stakeholders and the public, and c) their approaches to negotiating the role of an expert within the current epistemic ecology.

The paper offers evidence on:

1) how climate experts’ relationships with the media and social media have changed,
2) what kind of strategies and criteria they use to navigate the new technopolitical media landscape, and
3) how they assess the changing political environment, where public debates are increasingly polarized and framed by national interests.

By discussing these findings, the paper provides fresh insights into the experiences of climate experts in an era where pressing environmental crises intersect with a changing political and media landscape.

SCI05 Climate Journalism

PP 0337 Meta coverage in news reporting on UN-Climate Change Conferences

Julia Lück-Benz[1], Solveig Schroth[1]

[1] Institute for Media and Communication Studies, Freie Universität Berlin, Berlin, Germany

Climate change constitutes one of the most consequential and conflict-laden issues of contemporary societies. Public understandings of climate governance rely heavily on mediated communication, which makes journalism a central arena in which meanings, responsibilities, and possible responses to climate change are negotiated. Communication scholarship has long emphasized that critically observing public discourse—and media coverage in particular—can contribute to shaping democratic debate on environmental issues. This paper focuses on a specific, yet understudied phenomenon within climate journalism: meta coverage.

Meta coverage refers to news reporting that does not only address events, actors, or policies, but explicitly makes communication itself visible, observable, or evaluable. This includes references to media coverage and journalistic practices, to the communicative strategies of political and societal actors, and to communication as part of political processes. While meta coverage has been extensively studied in contexts such as election campaigns and war reporting, its role in climate journalism—and particularly in the reporting on international climate negotiations—has received little systematic attention.

The paper examines meta coverage in news reporting on the United Nations Climate Change Conferences (COPs), which represent highly mediatized global political events. During the COPs, national delegations, civil society organizations, business actors, scientists, and journalists converge in an intense communicative environment. Negotiations are accompanied by strategic public communication, symbolic acts, media performances, and contestation over visibility, legitimacy, and influence. As a result, COPs provide a particularly suitable case for studying how journalism reflects on communication itself as part of global climate governance.

Building on this framework, the study addresses two guiding research questions: *(RQ1)* To what extent and in which forms does meta coverage occur in news reporting on the UN Climate Change Conferences?*(RQ2)* How do news media, in their meta coverage, refer to and evaluate (a) media and social media communication, (b) the communicative practices of relevant actors, and (c) communication as part of the COP process itself?

Empirically, the study develops and applies a quantitative content-analytic instrument to capture meta coverage in COP reporting. Meta coverage is defined strictly as explicit references to communication, distinguishing three dimensions: (1) references to media and social media communication, including journalism, platforms, and public debate; (2) references to communicative efforts of political, economic, civil society, and expert actors related to the COPs; and (3) references to communication at the COP itself, encompassing the communicative structure of the summit, negotiation processes, outcomes, symbolic and ritualized aspects, organizational performance, and disruptions.

The instrument further differentiates evaluative patterns, capturing whether communication is framed as neutral information transmission, as strategic or tactical action, or as normatively accountable communication. COP-specific categories assess how negotiation processes, outcomes, conflict dynamics, inclusion and exclusion, ritual symbolism, organizational communication, and interference events are framed. The analysis is applied to the reporting on the 30th UN Climate Change Conference in Belém (Brazil) 2025 in leading national quality newspapers with agenda-setting functions in their respective media systems in the Germany (Süddeutsche Zeitung, Frankfurter Allgemeine Zeitung), Italy (Corriere della Sera, La Repubblica), the Netherlands (de Volkskrant, NRC) and the United States (The New York Times, The Washington Post).

SCI06 AI & Science Communication

PP 0451 Designing SciComAI: Applying value-sensitive design to an AI chatbot for science communication

Irene Broer[1], Monika Taddicken[1]

[1] TU Braunschweig, Institute for Communication Science, Braunschweig, Germany

Artificial intelligence (AI) opens up new avenues for science communication but also privileges particular practices, representations and “ways of knowing” over others, with the values guiding these AI-mediated interactions often remaining opaque (Klein-Avraham et al., 2024). Although attention to AI’s impact on the content, practices, and outcomes of science communication is growing (Kessler et al., 2025), less is known about how AI design itself shapes the conditions of science communication.

This contribution approaches science communication with AI as a design challenge (Kalmár & Stenfert, 2020) and examines how AI reflects – and can be made to reflect – normative orientations in science communication. It presents the design process of a science communication chatbot using Value Sensitive Design (VSD), a methodological framework meant to ensure that technologies reflect stakeholder priorities (Friedman & Hendry 2019; Sadek et al. 2024). The process was guided by four questions: (1) Who is directly or indirectly affected by AI in science communication? (2) Which values do these technologies support, contest, or transform? (3) How do practices evolve as AI becomes embedded in science communication? and (4) What systemic effects may emerge?

Following VSD's tripartite logic, the process started with a conceptual phase that consolidated quality principles for science communication with AI, followed by an empirical phase that combined a representative survey of audience expectations of AI-mediated science communication (*N* = 1,500) with qualitative interviews and observations of chatbot users (*N* = 50); and analyses of interaction protocols from an early prototype. The ongoing technological phase translates these findings into design requirements for the chatbot's interface, dialogue structure, and quality safeguards. The resulting prototype integrates two functions: a dialogue mode supporting interactive engagement with scientific topics, and a generation mode that produces outputs while enabling reflection on communicative choices such as tone, framing, certainty, or complexity. In this way, the interactions become an opportunity for reflective practice, making value trade-offs in science communication visible and open to deliberation.

The VSD lens has revealed how AI-mediated science communication involves a multiplicity of stakeholders and further blurs the boundaries between producers and audiences (Taddicken & Krämer, 2021). Scientists, press officers, journalists, policymakers, and citizens alike become potential users of a technology that itself takes on the role of a communicative agent in science communication (Hepp et al., 2023; Guzman & Lewis, 2020), while distinct value tensions emerge, for instance, between accuracy and accessibility, or personalization and objectivity (Silva Luna et al., 2025). Treating these tensions as design challenges allows their negotiation within AI applications for science communication, showing how communication research can not only analyse but also shape technological change.

SCI06 AI & Science Communication

PP 0452 Stop pushing junk science! User corrections of misinformation in science are common and advanced

Tuomas Heikkilä[1]

[1] University of Helsinki, Communication and Media Studies / Faculty of Social Sciences, Helsingin yliopisto, Finland

Previous research on misinformation has largely concentrated on obvious falsehoods from dubious sources, paying little attention to a potentially more significant mechanism of misleading the public: the accidental publication of inaccurate information by trusted and popular epistemic authorities (see van der Linden & Kyrychenko, 2024). Consequently, we still lack a solid understanding of how science – frequently presented as the opposite of misinformation – can sometimes contribute to damaging public misperceptions (Motta & Stecula, 2021; Swire-Thompson & Lazer, 2022; West & Bergstrom, 2021). To address this gap, the present paper examines how social media users engage with and contest what we call *misinformation in science*: unreliable research rejected by relevant experts for violating scientific integrity. Using an observational research design, the study provides much-needed evidence of user corrections 'in the wild' (Bode et al., 2024), showing that real-world correction practices closely mirror established experimental recommendations.

As an empirical case, we revisit the controversy surrounding the off-label use of ivermectin and hydroxychloroquine as COVID-19 treatments, selecting 12 retracted articles touting these drugs that have been widely circulated despite their serious flaws. We introduce a novel mixed-methods procedure through which we collected approximately 33,730 posts and 13,743 replies on Twitter referencing these unreliable research papers (early 2020 through late 2022) and analysed them using a combination of quantitative, qualitative and computational text analysis techniques to quantify the acceptance of misinformation in science as well as explore the strategies to combat it.

Our findings show that, while most posters uncritically accepted retracted findings, corrections to these posts were also common, accounting for almost half of all replies. These corrections were also overwhelmingly detailed, neutrally expressed, and nuanced with most users employing at least one widely recommended debunking strategy. In contrast, we found little evidence of polarising or needlessly convoluted language which are discouraged in experimental literature. While these insights are limited to a single platform and a context specific to the pandemic, the findings highlight the significant role that ordinary users play in countering unreliable science, and point to the need for researchers and policymakers to provide stronger support for bottom-up corrective practices.

SCI06 AI & Science Communication

PP 0453 Different AI realities? Segmenting science communicators, intermediaries and audiences across the Swiss science communication ecosystem

Damiano Lombardi[1], Gerta Lokaj[1], Xiran Liu[1], Mike S. Schäfer[1], Daniela Mahl[1], Sophia C. Volk[2]

[1] University of Zurich, Department of Communication and Media Research, Zürich, Switzerland
[2] LMU Munich, Department of Media and Communication, Munich, Germany

Rationale

Artificial intelligence (AI) will be transformative for science communication, influencing both the production of science-related content (Guenther et al., 2025) and its accessibility (Greussing et al., 2025). While prior research documents AI-related attitudes, literacy, and use among individual groups, such as citizens (Bao et al., 2022) or professionals (Henke, 2025), empirical work remains fragmented. Consequently, we lack a systematic understanding of how AI-related attitudes align or diverge across the science communication ecosystem and what such patterns imply for the production, intermediation, and reception of scientific information.

Addressing this gap, we apply a segmentation approach (AUTHORS, 2021) to the science communication ecosystem as a whole. Drawing on the tripartite model of attitudes (Ajzen, 1989), we examine AI-related **cognitive, affective, and behavioral** dimensions across six actor groups in Switzerland: (1) professional science communicators, (2) scientists, (3) Wikipedians, (4) science content creators, (5) science journalists, and (6) citizens.

RQ1: Which segments emerge across the Swiss science communication ecosystem based on AI-related cognitive, affective, and behavioral dimensions?

RQ2: How are these actor groups distributed across the identified segments?

Data

We draw on large-scale, multilingual, national surveys conducted between November 2025 and March 2026. Participants are recruited via institutional and professional networks, mailing lists, social media snowball sampling, and third-party survey providers. At the time of submission, the study is undergoing preregistration, and the authors have not accessed the data. The study includes 2000 respondents from the general population and at least 250 participants in most additional actor groups, with smaller samples anticipated for science journalists and science content creators, resulting in an expected total sample size of approximately 3000.

Measures and analytical approach

AI-related attitudes are operationalized as follows:

- **cognitive** dimension is measured through *AI literacy*, including subjective self-assessments and objective knowledge-based items drawing on validated instruments (e.g., Henestrosa & Kimmerle, 2024; Klein-Avraham et al., 2025; Wissenschaftsbarometer, 2025).
- **affective** dimension captures *AI-related perceptions, evaluations and perceived impacts* using established multi-item scales adapted from prior research (e.g., Greussing et al., 2025; Sohn & Kwon, 2020; Gillespie et al., 2023).
- **behavioral** dimension is measured through *AI use frequency* and *AI use experience*.

Overall, the segmentation analysis is based on 31 indicators, measured consistently across all groups. To answer **RQ1**, latent class analysis is used to identify homogeneous subgroups characterized by shared patterns of AI-related attitudes.

Actor group membership (e.g., scientists, journalists) is not included in the segmentation itself, but examined in a subsequent step to assess how different groups are distributed across the segments thus answering **RQ2**. Segment profiles are further characterized by sociodemographic and contextual characteristics, including job experience or organization type and size.

Contribution

By moving beyond actor-specific analyses, this study provides an ecosystem-wide map of AI-related attitudes in science communication. It is expected to highlight potential divides between actors (e.g. regarding literacy) that may shape how scientific information is produced, mediated, and received. These insights offer a basis for targeted interventions and provide a conceptual heuristic for comparative and qualitative follow-up research.

SCI06 AI & Science Communication

PP 0454 The role of science media influencers in addressing scientific topics and shaping youth understanding of science journalism in Arab countries

Yassmeen Hanafy[1], Eman Essam[2]

[1] Canadian International college, Masscommunication, Cairo, Egypt
[2] Arab acafemy for Science & Maritime Smart Village Branch, Media, Giza, Egypt

Since the late 20th century, science journalism has grown in significance on a global scale as a unique area that is vital to the public's understanding of complicated scientific concepts. In many Arab nations, scientific journalism is still rare ,underscoring a significant vacuum in available, trustworthyscience communication. According to research from 2025, there is an increasing number of science media influencers in Egypt, many of whom have tens to hundreds of thousands of followers on social media sites like YouTube and Instagram. These personalities have a significant impact on young audiences, influencing how they view and comprehend scientific subjects. Nevertheless, no analysis has been done on the impact of this content, including its correctness, presentation forms, topic focus, and perceived scientific value.

Subsequently , this study aim to assess the role of science media influencers in the Arab world in addressing scientific topics and their impact on youth's understanding of science journalism. This study also aims to fulfil certain objectives as to analyze the content presented by scientific influencers in the Arab world, Secondly, identify how this content affects Arab youth's understanding, and perception of scientific subjects , thirdly, assess the opinions of scholars and specialists of content disseminated by science media influencers , and fourthly, offer suggestions and for improving influence of science media communication in the Arab world.

This study employs a comprehensive theoretical framework integrating both Framing Theory and the Contextual Model of science communication. Framing Theory contributes by analyzing how science media influencers selectively highlight aspects of scientific topics, where the Contextual Model emphasize the role of audience background, and knowledge in interpreting the framed messages. Influencers in science media who work in scientific journalism make up the analytical universe. thoroughly examined using qualitative content analysis, which provide contextual insights, where five influencer instagram pages are purposefully chosen based on their significance to scientific journalism, follower count that indicates impact, and regular posting frequency. This study focuses on youth aged 18 to 24, a group recognized as significant consumers of scientific journalism. The purposive sample includes both male and female youths who actively follow science media influencers and have a keen interest in scientific topics . Additionally, in-depth interviews will be conducted with academics and experts specializing in science journalism to gather authoritative views on influencers' content quality and impact.

The study covers a three-month period from November 1, 2025, to January 1, 2026, chosen to capture consistent content trends while reflecting the latest developments in science media influence in the Arab world.

SCI07 AI & Climate Change

PP 0563 AI and climate change communication: A systematic literature review

Marc Esteve Del Valle[1], Brenda Mcnally[2], Julia Cope[3], Tristan Cann[4], Sylvia Hayes[4], Loredana Loy[5], Yasmin Koop-Monteiro[6], Ned Westwood[7], Mahima Anand[1]

[1] University of Groningen, Media Studies and Journalism, Groningen, Netherlands
[2] Dublin City University, School of Communications, Galway, Ireland
[3] University of Pennsylvania, Annenberg School for Communication, Philadelphia, USA
[4] University of Exeter, Centre for Climate Change Communications and Data Science, Exeter, United Kingdom
[5] University of Miami, Department of Environmental Science and Policy- The Rosenstiel School of Marine- Atmospheric- & Earth Science, Miami, USA
[6] University of Prince Edward Island, Sociology and Anthropology, Charlottetown, Canada
[7] University of Miami, Rosenstiel School- Schools & Colleges, Miami, USA

Artificial intelligence (AI) is reshaping how climate change is produced, communicated and consumed (Schaefer and Hase, 2023). While generative and language-based tools offer scalable communication opportunities, they also raise concerns around misinformation, methodological limits, and the environmental costs of digital infrastructures. As AI increasingly mediates public understanding of climate change, it is vital to understand how it intersects with climate communication research and practice.

Recent scholarship highlights that AI represents a dual influence on climate communication (Schaefer, 2024). On the one hand, studies indicate that it represents an opportunity to amplify and target climate communication at scale (Bulian et al. 2023; Chen et al., 2024). On the other, research shows that AI presents significant challenges for climate communication in the context of rising mis- and dis-information (King et al., 2023). Despite this, to date studies have not focused specifically on how AI, particularly generative and language-based tools, is conceptualised and debated within climate communication. This PRISMA-guided systematic literature review (Page et al. 2020) addresses that need by investigating how AI has been operationalised in climate communication research and practice.

This paper presents the first systematic and critical review of empirical research at the nexus of AI and climate communication. We examined English-language, peer-reviewed research published from 2020 to 2025, drawn from Scopus, Web of

Science, and ACM. The initial search returned a total of 827 papers which were exported to the Covidence platform. Article titles and abstracts were then double-screened using working definitions of AI, climate change, and climate communication. Research group discussions of conflicting cases produced a corpus of 156 publications. Full text articles were then manually coded via Covidence to guide categorisation and thematic extraction.

Our preliminary findings illuminate several emerging themes in the intersection of AI and climate communication. We identify the dominant AI methodologies currently employed within this multi-disciplinary field and assess the value they contribute to advancing climate-related discourse and engagement. Moreover, we examine the extent to which studies address climate obstruction, particularly through the lenses of misinformation and disinformation, and highlight the geographic distribution of research activity. Our analysis also sheds light on the regions that actively shape the scholarship alongside those that remain underrepresented, whether in terms of authorship or as areas of empirical focus.

Beyond mapping disciplinary and geographic trends, the review examines methodological and theoretical assumptions about climate communication and evaluates whether ethical questions are considered. This is particularly important given the increasing calls for just transitions to post carbon futures as well as growing concern about the environmental impacts of AI. Relatedly, we explore how environmental costs are addressed (or overlooked) and argue for more sustainable and inclusive approaches to AI-facilitated climate communication and engagement.

SCI07 AI & Climate Change

PP 0564 How human-in-the-loop disclosure and lateral reading support shape the effectiveness of LLM-based fact-checking chatbots in climate change misinformation correction

Shirley Ho[1], Junru Huang[2], Chang He[1]

[1] Nanyang Technological University, Wee Kim Wee School of Communication and Information, Singapore, Singapore
[2] Campus for Research Excellence and Technological Enterprise, CNRS@CREATE, Singapore, Singapore

Climate change misinformation, which is often associated with narratives that question or reject established climate science, poses a critical threat that undermines public understanding and support for climate policies and actions. As Artificial Intelligence (AI) advances, AI systems are increasingly used to detect, evaluate, and correct misinformation. Large language models (LLMs) have further expanded these possibilities by enabling scalable, automated fact-checking through conversational chatbots, which can provide timely corrections and engage users interactively. However, challenges remain regarding public trust in AI-delivered corrections and how to leverage these tools to cultivate users' literacy and verification skills so that correction efforts become more robust. To address these challenges, our study examines how two key design features of fact-checking chatbots—specifically human-in-the-loop (HITL) disclosure and lateral reading support—shape users' perceptions and behaviors during climate change misinformation correction.

LLMs, despite their strong generative and evaluative capabilities, remain prone to factual errors and hallucinations. Human-in-the-loop (HITL) approaches, where humans are actively involved in supervising, validating, or correcting AI system outputs, offer one solution for mitigating these limitations. Yet, while such oversight is often implemented behind the scenes, little is known about whether explicitly disclosing HITL involvement affects user trust and credibility judgements. This gap motivates our examination of the effect of HITL disclosure during fact-checking practices using LLM-based chatbots.

Meanwhile, research has consistently shown that lateral reading, a media literacy strategy that trains individuals to verify information using multiple external sources, can enhance resilience to misinformation by promoting active verification rather than passive acceptance. Embedding features that support lateral reading—such as providing external links or nudges to cross-check information—into chatbot interfaces may guide users toward more deliberate verification, thereby enhancing correcting effectiveness. Importantly, the combination of these two design features may produce interactive effects: while HITL disclosure may increase trust in the system, lateral reading support may prevent over-reliance by keeping users engaged in verification, which will enhance the ultimate correction effectiveness.

This study proposes a 2 (HITL disclosure: present vs. absent) × 2 (lateral reading support: present vs. absent) between-subjects online experiment. Approximately 400 participants will be recruited to evaluate multiple climate-related statements, receive chatbot-guided correction, and complete a questionnaire measuring their trust, perceived credibility, continued use intention, sharing intention, and further verification intention. Theoretically, this study contributes to misinformation research, media literacy, and human-machine communication literature to explain how oversight cues and verification scaffolds jointly shape user responses to machine fact-checking. Practically, the findings provide design insights for developing trustworthy, literacy-enhancing AI tools that strengthen public resilience against climate misinformation.

SCI07 AI & Climate Change

PP 0565 Identifying social norms of (non)compliance with climate measures in alternative and legacy media – An LLM approach

Janine N. Blessing[1], Sarah Geber[2], Yingqiang Gao[3], Gerold Schneider[3]

[1] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland
[2] University of Mannheim, Institute for Media and Communication, Mannheim, Germany
[3] University of Zurich, Department of Computational Linguistics, Zurich, Switzerland

The climate crisis demands collective action to mitigate its consequences. Social norms, indicating what others do *(descriptive)* and approve of *(injunctive)*, play a key role in coordinating such action (Cialdini et al., 1991; Lapinski & Rimal, 2005; C. R. Schneider & van der Linden, 2023). Yet, recent developments show that counter-movements opposing such mitigation norms have gained visibility in climate discourse (Fairmedia, 2023). As arenas where competing interpretations and values circulate, media and especially alternative outlets play a central role in these norm contests. Alternative media can amplify oppositional voices, challenge mainstream interpretations, and provide visibility to actors and frames that remain marginal in legacy media (Holt et al., 2019). Thus, the present study investigates how alternative and legacy media depict descriptive and injunctive climate-action norms.

This analysis is part of a broader research project examining the role of news media in the formation and dissemination of social norms regarding climate change. Within this project, the current study focuses on a large-scale, AI-assisted content analysis of German-language news coverage, which will later be linked to complementary survey data. Following Li and Klinger (2024), we developed and iteratively refined an in-context learning approach by prompting mainstream large language models (LLMs), specifically GPT models (gpt-4o, gpt-4o-mini, and gpt-5.1), to identify descriptive and injunctive climate norms and related key attributes. The prompt instructed the model to recognize (a) the type of norm (descriptive vs. injunctive), (b) whether the norm addressed mitigation or adaptation to climate change (e.g., emissions reduction vs. preparedness and resilience measures), (c) whether the norm promoted or opposed climate mitigation or adaptation, and (d) the social group to which the norm referred (e.g., political actors). The prompt was optimized following the human-in-the-loop principles and adjusted to improve accuracy and recall including explicit clarifications.

To evaluate model performance, one researcher manually coded 30 articles, and we calculated agreement between human and machine coding at the article-level (i.e., agreement in identifying whether an article contained any norms) and the instance-level (i.e., agreement in identifying specific norms within jointly recognized articles). The highest-performing configuration achieved Cohen's κ above 0.74 for norm type, direction, and topic and customized agreement scores above 0.73 for behavior, social group, and source variables. For automatic assessment, we applied a Hungarian algorithm-based approach that maximizes the overall alignment between machine and human coding (Kuhn et al., 1955).

In the presentation, we will report further details on prompt development and discuss key practical challenges, including identifying the best-performing model. We present an effective LLM prompting protocol for identifying norms in news content using LLMs, which can be adapted to other (crisis-related) topics. This study advances methodological understanding of LLM-assisted content analysis by offering structural guidance for designing, refining, and evaluating prompts for norm detection. The findings will also enhance understanding of how media shape norm formation, highlighting differences between alternative and legacy outlets and offering an important perspective as societies face multiple, overlapping crises requiring collective action.

SCI07 AI & Climate Change

PP 0566 Public perceptions of generative AI and climate change: Media trust, platforms, and coverage evaluations across eight countries

Waqas Ejaz[1], Richard Fletcher[1]

[1] University of Oxford, Reuters Institute for the Study of Journalism, Oxford, United Kingdom

The rapid expansion of artificial intelligence (AI) is reshaping how societies approach complex global challenges, including climate change. Critics warn that growth in AI may place new pressures on energy systems through rising electricity demand from data centres, but it is also possible that AI could support mitigation and adaptation efforts, for example by optimising renewable energy systems or improving climate modelling and forecasting. These competing narratives position generative AI simultaneously as a potential climate solution and an emerging environmental risk. News media are therefore likely to play a central role in shaping how the public interprets the relationship between AI and climate change. This paper examines how public perceptions of generative AI's impact on tackling climate change are associated with platform-specific news exposure, trust in news media, and evaluations of AI-related news coverage. The analysis draws on original survey data from the UK, US, France, Germany, India, Pakistan, Japan, and Brazil, spanning diverse media systems and political contexts across the Global North and South. The findings show that platform effects are differentiated rather than uniform: exposure to television news and social media are each independently associated with more positive perceptions of generative AI's climate potential. Results also point to significant demographic differences, i.e., men, older respondents, and those with higher levels of education expressing more optimistic views of generative AI's role in addressing climate change, while

political orientation shows weaker and less consistent associations. Notably, once media-related factors and demographics are considered, cross-national differences in public perceptions are relatively limited, with only a small number of countries deviating significantly from the overall pattern. This finding suggests that media evaluations and information environments may play a more central role than national context alone in shaping how the public understands generative AI in the climate domain. The findings also show that public views of generative AI's climate impact are related to views about media performance, with respondents who believe that AI will make climate change worse more likely to evaluate news coverage of the issue negatively. This suggests that people worried about the impact of AI on climate do not think the news media is doing enough to communicate the risks to the public. Overall, this study provides evidence on the crucial issue of public perceptions of generative AI and climate change, highlighting the importance of media in shaping attitudes towards emerging technologies across diverse national contexts.

SCI07 AI & Climate Change

PP 0567 When climate change comes home: Local vs. global framing in AI-assisted disaster simulations

Vered Elishar-Malka[1], Hen Friman[2]

[1] The Max Stern Yezreel Valley College, Communication, Yezreel Valley, Israel
[2] Holon Institute of Technology, Electrical Engineering, Holon, Israel

Climate change is increasingly framed in Western media as a major global threat, yet many audiences still experience it as distant, abstract, and not personally consequential. Construal Level Theory (CLT) predicts that when a threat is perceived as psychologically distant (e.g., spatially or socially), it is processed more abstractly, evokes weaker emotion, and yields lower motivation for action. Building on this perspective, the present study examines whether AI-assisted audiovisual simulations of climate-related disasters can reduce psychological distance, and whether anchoring identical threats in a local (vs. foreign) geographic context intensifies affect, perceived personal relevance, and willingness to act.

We conducted an online experiment with a representative sample of Israelis (N = 402; excluding ultra-Orthodox and Arab populations). Each participant viewed four short (90–130 s) videos depicting climate disasters: (1) a large-scale wildfire in Israel affecting forests, homes, people, and animals; (2) a closely matched wildfire abroad; (3) a tsunami striking Tel Aviv's coastline and urban space, damaging people, property, and infrastructure; and (4) a matched tsunami abroad. Videos were produced with an AI-supported workflow (ChatGPT scripting, Midjourney visuals, Adobe Premiere Pro editing, and Hebrew voiceover via ElevenLabs), while keeping length, editing pace, and narration tone constant to limit confounds. After each video, participants rated fear/anxiety, worry about the future, personal relevance of climate change, and willingness to act on a 1–4 scale (1 = most impactful; 4 = least).

Results show a strong and consistent proximity effect across all outcomes. Scenarios set in Israel were experienced as more impactful than identical scenarios located abroad. Local videos elicited higher fear (wildfire: M = 1.98; tsunami: M = 2.00) than their abroad counterparts (M = 3.02 and M = 3.00, respectively), higher worry (wildfire: M = 1.83; tsunami: M = 1.95) than abroad scenarios (≈ 3.1), and greater willingness to act (local M ≈ 1.61–2.01 vs. abroad M ≈ 3.06–3.32). Demographic patterns indicated women reported higher fear, worry, and action readiness than men; younger adults (18–34) tended to respond more strongly than older participants; and higher education was associated with greater worry and motivation to act. Regionally, participants' responses tracked local risk salience (e.g., stronger reactions to wildfires in fire-prone areas, and to tsunamis among coastal/central residents).

Overall, the findings reinforce CLT's psychological distance mechanism and suggest that vivid, AI-assisted disaster simulations can amplify engagement most effectively when anchored in a local context—translating climate change from an abstract global problem into a personally relevant, action-eliciting threat. Methodologically, the study demonstrates the feasibility of using generative AI to create high-production-value, audience-tailored climate-risk communication stimuli at reasonable cost and speed.

SCI08 Framing Climate Change

PP 0675 Between healing and tampering: how metaphorical framing shapes public attitudes toward emerging climate solutions

Femke Van Bruggen[1], Hedwig te Molder[1], Gudrun Reijnierse[1], Tim Groot Kormelink[1], Elliott Hoey[1]

[1] Vrije Universiteit Amsterdam, Department of Language- Literature and Communication, Amsterdam, Netherlands

The urgency of global warming and limited progress in reducing greenhouse gas emissions have increased interest in potential solutions such as large scale carbon dioxide removal (CDR) approaches (Boettcher et al., 2021). One emerging approach is ocean alkalinity enhancement (OAE), which involves adding large quantities of alkaline substances to seawater to increase pH and, in principle, enhance the ocean's capacity to absorb CO_2 from the atmosphere (Cooley et al., 2023). Despite growing research, investment, and pilot testing by both researchers and commercial parties, substantial uncertainties remain regarding OAE's effectiveness and ecological risks.

Public familiarity with OAE is currently low (Cox et al., 2020), yet available evidence suggests it is often perceived as risky (Nawaz et al., 2023; Satterfield et al., 2023). Recent public opposition to a proposed UK field trial that was ultimately cancelled illustrates these concerns (Waller et al., 2025).

For complex and unfamiliar technologies such as OAE, early attitudes are especially susceptible to influence by media and scientific communication, as prior knowledge is limited and opinions are not yet well formed (Raimi, 2021). Climate technology discourse frequently relies on metaphors and analogies that map unfamiliar technological processes onto more familiar domains (Bellamy & Raimi, 2020; Castree, 2020). Such frames function as cognitive shortcuts (Sopory & Dillard, 2002) that activate semantic associations and affective states that influence reasoning and judgement (Ottati et al., 2014).

A prominent example is the anthropomorphic 'planet-as-patient' frame, which portrays the earth as sick and climate interventions as a form of medicine (Nerlich & Jaspal, 2012; Luokkanen et al., 2013). Analogies to 'natural' processes are also common and have been shown to increase support for emerging climate technologies (Corner & Pidgeon, 2015). Such analogies might feed into a larger 'natural is better' bias, suggesting that a thing is good because it is presented as 'natural'. Such frames can divert attention from uncertainty and potential risks, increasing the likelihood of delayed public backlash.

Beyond framing, message source credibility plays a key role in shaping responses to contested technologies (Siegrist, 2000; Druckman, 2001). Research on CDR suggests that messages attributed to scientists are received more favorably than those from commercial actors (Cummings et al., 2017). We therefore examine how metaphorical frames interact with source attribution and with individual differences in aversion to tampering with nature (Raimi et al., 2020), a moral value orientation known to predict opposition to emerging technologies.

Using a 3 (conventional medicine vs. 'natural' medicine vs. literal frame) × 2 (scientist vs. for-profit source) between-subjects design, a nationally representative sample of United Kingdom residents (N = 890) was randomly assigned to read one of six versions of a realistic online news article about OAE. Attitudes, affective responses, perceived risks and benefits, and overall support were analyzed using regression models testing main effects and interactions, including a three-way interaction with aversion to tampering with nature. Findings will be presented at the ECREA conference. Overall, results of this study add to the current literature on responsible and transparent science communication strategies for the early stages of contested technology development.

SCI08 Framing Climate Change

PP 0676 Framing climate migration across borders: A comparative analysis of news coverage in seven countries

Djamila Heß[1], Lukas Benedikt Hoffmann[2], Irina Lock[1]

[1] Friedrich Schiller University Jena, Communication Science, Jena, Germany
[2] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

Climate change increasingly reshapes patterns of human mobility. While the direct causal relationship between climate change and migration remains debated (Ghosh & Orchiston, 2022), climate-related migration is discussed and experienced within broader patterns of climate injustice, disproportionately affecting marginalized communities and poorer countries (Shivanna, 2022; Roosvall & Tegelberg, 2018; Mukhongo, 2024).

Public understandings of climate migration are mediated through news coverage, which has increasingly taken up the issue in recent years (Bonneux & van Praag, 2024; Demata, 2017; Munoz, 2024). How news media frame climate migration is central, particularly for an emerging issue where public attitudes and policy positions are still fluid (Druckman & Leeper, 2012). Despite its growing relevance, research on climate migration framing remains limited. Existing studies are mostly qualitative, focus on single countries or outlets, and rarely examine framing dynamics over longer periods or across global contexts (e.g. Bonneux & van Praag, 2024; Farbotko, 2005). This paper addresses these gaps through a comparative, longitudinal analysis of climate migration framing in news media, combining qualitative frame identification with large-scale automated content analysis.

Drawing on Entman's (1993) framing concept and issue linkage (Liu et al., 2016), we examine how climate migration is framed in relation to established discourses of climate change and migration. We analyze 4,811 news articles published between 1988 and 2025 in seven countries: Mexico, India, Bangladesh, South Africa, Australia, Germany, United States. We analyze (RQ1) how climate migration is framed over time, (RQ2) how it is discursively linked to climate change and migration, and (RQ3) how these framings differ between Global North and Global South contexts.

The study identifies climate migration frames using a deductive-inductive approach. Building on existing literature on migration, and climate change framing, a deductive set of frames was refined through qualitative analysis of a stratified sample of articles. This resulted in the identification of ten climate migration frames consistently present across countries and over time. These include frames adapted from refugee and climate change coverage, as well as hybrid frames specific to climate migration. We apply a large-scale quantitative content analysis to trace the prevalence and evolution of these frames over time and across countries. Using large language models, articles are automatically coded for frames and key contextual variables, with validation against manual coding.

Preliminary results based on a stratified 10% subsample (n = 480) show that frames emphasizing legal status, human suffering, and climate justice dominate climate migration coverage and have increased in prominence over time, whereas

benefit frames remain rare. In terms of issue linkage, climate migration is more frequently connected to climate change (56.3%), than to migration discourse (23.2%). Initial cross-national comparisons indicate systematic differences between Global North and Global South media in frame emphasis and responsibility attribution.

By combining qualitative frame reconstruction with scalable LLM-based analysis, this study demonstrates how automated methods can be used to analyze long-term, cross-national framing dynamics, while better explaining our understanding of climate migration.

SCI08 Framing Climate Change

PP 0677 Framing ecological crisis and health: Media discourses on climate change and biodiversity loss in Spanish newspapers

Ivan Vazquez Tarrio[1]

[1] Universidad Miguel Hernadez de Elche, Departamento de Salud Pública- Historia de la Ciencia y Ginecología, Elche, Spain

The current global socio-economic model, based on continuous growth, extractivism, and overproduction, has generated a multidimensional ecological crisis, manifested in climate change, biodiversity loss, and widespread environmental degradation. Research increasingly highlights that these processes have direct and indirect consequences for human health, ranging from heat-related morbidity and extreme weather events to food insecurity, zoonotic diseases, and mental health impacts. Despite the growing relevance of this eco-social health nexus, previous studies suggest that media coverage often addresses environmental and health issues in fragmented ways, limiting public understanding of their structural interconnections.

This paper examines how Spanish newspapers construct and communicate the health impacts of the ecological crisis, with a specific focus on climate change and biodiversity loss, and how these issues are framed in relation to the dominant socio-economic model. Drawing on perspectives from critical political ecology and environmental communication, the study explores the presence of ideological biases, dominant frames, and discursive silences in media representations of ecological determinants of health.

Methodologically, the study adopts a mixed qualitative approach combining quantitative content analysis, framing analysis, and elements of critical discourse analysis. The empirical material comprises news articles published between April 1, 2024, and January 26, 2025, in general-interest newspapers with different ideological orientations (El País, elDiario.es, El Mundo, and El Confidencial) as well as in newspapers specialized in health journalism (Redacción Médica and Diario Médico). Using a constructed-week sampling strategy through the MyNews database, the analysis identified 64 news articles explicitly focused on climate change in headlines or subheadings, alongside a smaller number addressing biodiversity loss, reflecting its lower media visibility. Articles were coded using an analytical framework assessing references to health impacts, anthropogenic causes, socio-economic drivers, and proposed solutions.

The results reveal significant asymmetries in media coverage. Climate change is relatively visible in progressive newspapers but largely absent from specialized health outlets. Biodiversity loss is even more marginalized, appearing almost exclusively in progressive newspapers and rarely framed as a structural environmental determinant of health. Moreover, the predominant media frame is focused on problem definition and environmental consequences or political conflict (almost 50% of the news analyzed). Across the climate change related articles, only 32% explicitly refers to health impacts, and just 34% acknowledge the anthropogenic origins of climate change. Across all media types, explicit critiques of the dominant socio-economic model are scarce, with coverage predominantly emphasizing technical or adaptive solutions while avoiding discussions of growth, extractivism, or structural transformation.

These findings suggest that prevailing media framings contribute to the depoliticization of the relationship between ecological crisis and health, limiting the visibility of eco social justice perspectives and alternative socio-economic approaches to the actual economic model. This study serves as an initial exploration of how the ecological and health crises are publicly constructed in Spanish media and can provide a foundation for future research on the public framing of ecological health issues, supporting more integrative and critical media approaches to environmental health challenges.

SCI08 Framing Climate Change

PP 0678 Transformational climate adaptation: A dialogical sense-making study

Victoria Wibeck[1], Björn-Ola Linner[1], Juliana Porsani[1], Alva Linnér[1]

[1] Linköping University, Department of Thematic Studies - Environmental Change, Linköping, Sweden

As climate change impacts intensify, international negotiations increasingly emphasise how to enable and support societal adaptation. In recent years, the concept of transformational adaptation has gained prominence in climate diplomacy (UNFCCC, 2024). Transformative change goes beyond technical and other practical solutions for adapting societies to a changing climate, also calling attention to changes in structures and views (IPBES, 2024; Linnér and Wibeck, 2019). Yet, interpretations of transformational adaptation remain contested with no clear consensus among policymakers and researchers.

This paper examines how different actors make sense of the concept of transformational adaptation and the opportunities and challenges it actualises. We explore whether this concept can provide a new constructive avenue in the climate change negotiations, asking: Does transformational adaptation offer the potential to build common ground that advances climate action, or will it become a buzzword that reinforces existing divides? The paper explores how diverse actors interpret the rationale, scope, and implementation of transformational adaptation, and its potential role in shaping future climate diplomacy.

Our analysis draws on in-depth interviews with delegates and observers at the international climate negotiations, and analysis of relevant policy documents, including UNFCCC negotiation texts and countries' national adaptation plans. These data are complemented by free-text responses from the International Negotiations Survey (n = 575) (https://liu.se/en/research/international-negotiations-survey) collected at COP30 in Belém, November 2025, and its preceding intercessional meeting in Bonn, June 2025.

Starting from dialogical communication theory and its focus on contextuality, interaction, and other-orientation (e.g., Bakhtin, 1986; Linell, 2009; Marková et al., 2007), we employ dialogical sense-making analysis (Wibeck and Linnér, 2021) to explore the various meanings key actors ascribe to the 'transformational adaptation' concept. We pay attention to the content as well as the processes of sense-making, specifically scrutinising how the use of metaphors, categorisation, prototypical examples, stories, and frames contribute to constructing and maintaining meanings.

This research contributes to studies of science and environment communication by advancing the analysis of sense-making processes. Specifically, we pay attention to aspects of power and communicative asymmetries in how different actors privilege certain interpretations of transformational adaptation while overlooking or downplaying others. By tracing how meaning is negotiated, stabilised, and contested, the study sheds light on the political dynamics that shape the uptake of emerging concepts in climate diplomacy.

Transformational adaptation could potentially be a game-changer for climate diplomacy. However, the concept might also add to existing conflict lines. In mapping differences and commonalities in sense-making, this paper contributes to identifying conflicts and ways forward for climate adaptation.

SCI08 Framing Climate Change

PP 0679 Playful participation on climate-related citizen processes: A qualitative analysis of the Citizen's Assembly for Climate of Catalonia

Antoni Roig[1], Gemma San Cornelio[1], Lluc Massaguer[1]

[1] Universitat Oberta de Catalunya, Faculty of Information and Communication Sciences, Barcelona, Spain

The aim of this presentation is to reflect on the design and implementation of participatory processes related to climate sensitization from the lenses of playfulness (Hautopp and Norgaard, 2017), through the notion of 'playful participation'.

Despite the relevant presence of participation in deliberation processes around key societal topics, such as climate change, a series of potential problems can limit their impact. Some of them have their origins in a superficial understanding and limited implementation of participation. Similarly, the playful dimension of a collective initiative can be easily underestimated as merely instrumental, confined to specific phases of the process, to 'not so serious' matters or just suitable for children or young people.

Our hypothesis is that designing citizen initiatives as participatory interventions (Agcal, Yin, Miller and Ray, 2025) can be very useful to address issues such as climate change. Thus, they would allow for a greater engagement in discussion, fostering mutual understanding and sense of belonging. Furthermore, in such processes, the introduction of playful elements might be key not only as motivational tools, but also to build citizen agency, cooperation, creation of communicative spaces, and citizen interaction based on accountability (Woolsey, 2020). We contemplate the following research questions:

- Which are the key elements for a qualitative evaluation of climate assemblies from the perspective of playful participation?
- How could a playful participatory form of inquiry be evaluated through a qualitative and propositive framework of analysis?

First, we will summarize our methodological proposal, structured in three key dimensions: (1) *Playful action*; (2) *Playful sociality*; (3) *Participatory action inquiry*. Then, we will apply this proposal to the case of the Citizens' Assembly for Climate of Catalonia (ACxCC), a participatory process organized by the Catalan Government (Department of Climate Action, Food and Rural Agenda) which took place between place between October 2023 and February 2024. The aim of the ACxCC was to sensitize about climate change and to hand a series of citizen proposals to the Catalan Parliament. It was co-funded by the European Regional Development Fund and through Horizon Europe program (project Horizon-CLIMAS) with the support of Deliberativa, a company specialized in large-scale participatory processes, and which took charge of the facilitation process.

With the support of qualitative visualizations, we will show how our results point towards the effects of how the promoters shape climate citizen process through key elements such as expected outcomes, sense of agency, skills, social interaction, power relations among participants, reciprocity and the definition of a communicative space, as well as self-reflection, intergenerational exchange or experimentation, more connected to playfulness.

SCI09 Science Communication

PP 0773 Setting agendas, conveying expertise? The influence of science media centers on science journalism in the United Kingdom and Germany

Tabea Lüders[1], Melanie Leidecker-Sandmann[1], Markus Lehmkuhl[1]

[1] Karlsruhe Institute of Technology, Department of Science Communication, Karlsruhe, Germany

As newsroom resources continue to decline, journalists have become increasingly dependent on external expertise to navigate and verify complex scientific information. Science Media Centers (SMCs) aim to support quality science journalism by facilitating access to scientific experts at the interface between science and the media (Rödder 2015). However, SMCs operate differently across national contexts: the British SMC positions itself as an NGO promoting public engagement with scientific evidence, whereas the German SMC operates more as a journalism-oriented observation unit specializing in science (Buschow et al. 2022).

Despite growing scholarly interest in SMCs, their influence on journalism has not yet been investigated comparatively across countries. Addressing this gap, we examine (RQ1a) whether SMCs shape journalistic agenda-setting, (RQ1b) how often their materials are used by news outlets, and (RQ2) whether they affect the structure of experts cited in news articles.

Our study draws on 480 SMC releases (UK: 149; DE: 331 releases) published between 2022 and 2023. We identified all news articles on the same SMC event appearing from one day before to two days after each release within predefined media samples (UK: 36; DE: 40 outlets). This yielded 2,480 articles for the UK and 4,463 for Germany.

To determine SMC influence, we compared the experts referenced in SMC releases with those cited in news articles. We additionally used named entity recognition to identify other societal actors mentioned (DE: 6,333; UK: 5,110 entities). For comparability, analyses focus on events for which both SMC-influenced and SMC-uninfluenced articles existed (UK: 80 events; DE: 42 events).

RQ1a: In Germany, 32% of SMC releases were not covered by the media, compared to 18% in the UK. British SMC events (60%) were significantly more likely to receive medium-level coverage (10–50% of outlets) than German events (32%).

RQ1b: When coverage occurred, UK SMC materials were used significantly less frequently in articles (33%) than German materials (8%). This difference was particularly pronounced for low-attention events. In Germany, the corresponding articles are influenced by SMC materials in the median in 100% of cases, whereas in the UK, at least 50% of events feature only uninfluenced articles. When at least one influenced article existed, the difference between countries diminished.

RQ2: In SMC-influenced articles, an additional scientist is cited in the median both in Germany and in the UK compared to uninfluenced articles. An increased presence of *independent* experts was only observed in Germany.

Although we cannot draw causal conclusions, our findings suggest that both SMCs strengthen the integration of scientific expertise in news coverage. However, their agenda-setting functions differ substantially: the journalism-oriented German SMC appears to exert a stronger thematic influence than the NGO-like British SMC.

SCI09 Science Communication

PP 0774 Motivation of science communication organisations for engaging in international networks

Arko Olesk[1], Esta Kaal[1], Aoife Taylor[2]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia
[2] Trinity College Dublin, Science & Society Research Group, Dublin, Ireland

The European science communication landscape is described as fragmented (Davies et al., 2021), with countries displaying different science cultures (Bauer, 2012) and science communication ecosystems (Fischer et al., 2025). Past decades have seen intensifying expansion of global and regional science communication networks (e.g., PCST, EUSEA, science journalists' unions) and transnational collaborations. These networks facilitate cross-border knowledge exchange through conferences and partnerships and expand professional communities (Bucchi et al., 2014).

However, the role that participation in these networks plays for science communicators has been little explored. This study investigates why institutions engage with international networks despite resource constraints and operational challenges, through qualitative interviews with nine European organizations engaged in science communication.

The study is based on organisations that enrolled as national hubs in the EU-funded COALESCE project, which is currently building the European Science Communication Competence Centre. The organisations range from academic institutions to NGOs and come from nine European countries (Portugal, France, Germany, Sweden, Latvia, Lithuania, Czech Republic, Slovenia, Bulgaria). We conducted in-depth interviews about their current science communication practices, expectations for international networks, and perceptions of their national context.

The findings reveal multiple interconnected motivations for international networking. Most frequently, organizations express the perception that other countries are more advanced in science communication; therefore, international networking offers opportunities to learn best practices from other organisations and avoid "reinventing the wheel."

Beyond organisational development, interviewed organisations also felt able to support the development of their entire national community. Having an international network was perceived to increase their status within the national community and could be leveraged for advancing the adoption of better science communication practices and reducing fragmentation.

These findings indicate that international networks serve not merely as platforms for resource exchange, but as essential infrastructure for professionalizing and advancing science communication practice across Europe's fragmented landscape. The study contributes to understanding how transnational collaboration can address structural challenges in emerging professional fields.

SCI09 Science Communication

PP 0775 Who avoids science? Investigating patterns of science-related information avoidance

Julia Metag[1], Niels G. Mede[2], Mike S. Schäfer[3]

[1] University of Muenster, Department of Communication, Münster, Germany
[2] Wageningen University & Research, Strategic Communication Group, Wageningen, Netherlands
[3] University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Understanding information avoidance is crucial for science communication, as engagement with information about science is a key prerequisite for informed decision-making. Selective news avoidance refers to the deliberate avoidance of specific types of news content rather than refraining from news consumption in general (Skovsgaard & Andersen, 2022). Although existing research has examined selective avoidance of specific science-related topics—such as climate change (Yang & Kahlor, 2013), COVID-19 (Wiedicke et al., 2023), and health topics (Link et al., 2025)—systematic knowledge about the drivers of avoidance of information about *science in general* is lacking. We follow the information utility approach (Atkin, 1973) and hypothesize, based on prior research on selective news avoidance beyond science (e.g., Andersen et al, 2024), that selective avoidance of information about science is negatively associated with (H1a) higher interest in science, higher trust in media coverage on science, higher perceived benefits of science, higher science-related media use, more frequent interpersonal communication about science, stronger norm perceptions, higher satisfaction with media coverage on science, and greater proximity to science. We also hypothesize that political ideology, education, age, and gender are associated with selective avoidance of information about science (H1b).

Method

The study draws on preregistered nationally representative survey data from the Science Barometer Switzerland 2025 (N = 1,548, preregistration: https://osf.io/ek7ju/overview?view_only=b50812bdb3364db191ddde9d533a6d7e). Using a partial split-ballot design, a random subsample (N = 744) received questions measuring selective avoidance. To test the hypotheses, linear regression models were estimated with selective avoidance of science information (composite index $\alpha = .65$) as the dependent variable and science-related media use (composite index $\alpha = .82$), perceived benefits of science (composite index $\alpha = .72$), trust in media coverage on science, norm perceptions, satisfaction with science media coverage, proximity to science, political ideology, education, gender, and age as dependent variables. All variables were operationalized using established measures.

Results

Selective avoidance of information about science in general is negatively associated with interest in science (β = −.151, p = .015). In addition, science-related media use is positively associated with avoidance (β = .125, p = .042). More frequent conversations about science with peers are associated with lower selective avoidance (β = −.195, p = .002). Among socio-demographic variables, women are more likely to avoid science-related information (β = −.109, p = .040). No other variable included in the model had significant effects on science information avoidance.

Overall, the findings partially support the proposed hypotheses. Avoidance of science-related information appears to be stronger related to individual engagement with science rather than broader evaluative or normative factors. Given the counterintuitive positive association between overall media use and avoidance, additional channel-level analyses were conducted. They show that general internet use for science information (r = −.20***) and Wikipedia use (r = −.14**) are negatively associated with avoidance, whereas social media use (r = .08*) and instant messaging (r = .17**) are positively associated. This pattern suggests that science information avoiders rely more strongly on social media and instant messengers for – presumably – non-mainstream science-related information.

PP 0776 The role of moral convictions in understanding compromise and tolerance

Lisa Maria Gaffney[1], Doris Teutsch[2], Senja Post[1]

[1] KIT Karlsruhe Institute of Technology, Department of Science Communication, Karlsruhe, Germany
[2] KIT Karlsruhe Institute of Technology, Studium Generale. FORUM Wissenschaft und Gesellschaft, Karlsruhe, Germany

Contemporary societies are confronted with a range of complex national and global challenges, which often involve so-called socio-scientific issues (SSIs): Issues that are informed by scientific evidence and expertise, yet simultaneously debated within the broader public sphere, in the media, and in politics[1]. Such issues cannot be resolved solely through scientific knowledge or expert advice. Rather, they require societal deliberation and the negotiation of solutions and compromises.

In such debates, questions of values and morality sometimes take precedence over factual or technical considerations, resulting in public contestations that are morally charged. When scientific evidence or policy positions are underpinned with undeniable moral values such as freedom, security or credibility, the discussion can shift away from the search for effective and balanced solutions for society as a whole[2].

This moralization of debates can lead to the psychological process of attitude moralization, through which preferences become values, non-moral attitudes turn into moral convictions[3]. Individuals who hold a moral conviction regarding an issue perceive it as a matter of fundamental right and wrong, an issue grounded in moral principles rather than personal preference[4]. Prior research shows that moral conviction can act as a significant barrier to political compromise[5]. Understanding how moral conviction shapes the willingness of citizens to compromise and be tolerant of opposing views is crucial for developing strategies to facilitate constructive public engagement with science-related policy debates.

Drawing on a survey conducted in February of 2025 in Germany (N = 2,340), this study examined how moral conviction relates to willingness to compromise, openness to opposing views, and opposition to censorship regarding the German energy transition. A series of hierarchical multiple regression analyses was conducted separately for proponents and opponents of the energy transition, controlling for sociodemographic variables and party preference.

Results indicate that party preference is a strong predictor of all three outcome variables, revealing partisan divides, particularly between voters of the far-right AfD and the Green Party. Among proponents of the energy transition, stronger moral conviction is associated with lower willingness to compromise and reduced opposition to censorship. Among opponents, by contrast, moral conviction is positively associated with openness to opposing views. These findings suggests that moral conviction can but does not exclusively give rise to barriers of dialogue and deliberation. Rather, under certain conditions, it may also function as a bridging mechanism that enables individuals to engage more openly with opposing perspectives in highly contested public debates.

Overall, the findings suggest that moral conviction exerts complex effects rather than uniformly undermining tolerance and compromise, underscoring the importance of a more fine-grained analysis of these relationships.

PP 0777 Wild and wonderful, but not climate change: How extreme weather is framed in Irish local, farming, and fishing media

Cormac Cleary[1], David Robbins[1]

[1] Dublin City University, School of Communications, Dublin, Ireland

Extreme weather events are increasing in frequency and intensity globally as a result of climate change. As most people get their information on climate change via the news media, it is important to understand how different aspects of extreme weather events are constructed and debated in the media. Furthermore, most media research focused on climate change, and on weather events, has examined national print media. This research aims to add to our understanding of how the media in Ireland represent extreme weather events, but also to expand that understanding to include regional, local, and specialist media, thereby filling the gap created by the existing literature's focus on national broadsheets. The paper takes the case of Storm Éowyn, which made landfall off the west coast of Ireland in January 2025 and broke wind speed records on the island. To investigate the coverage of the event, we assembled a corpus of 450 articles from fishing, farming and local media outlets. The local sector was represented by six regional case study areas. We then carried out a framing analysis on the corpus and identified the most common ways in which the event was understood. This paper provides an in-depth analysis of the category of weather frames- that is, frames that engaged specifically with the physical qualities of the storm. In analysing these frames we assess the extent to which journalists took the opportunity to reference climate change. The core finding is that these understudied media sectors framed the storm in terms of spectacle and intensity, and contextualised it in terms of storms remembered from the past, rather than placing it in the context of climate change. These findings highlight a key missed opportunity in climate change communication. Specialist and local presses can be a powerful ally in raising awareness of climate change by relating it to everyday events of interest to their respective audience. Our research demonstrates that this potential is not being leveraged effectively.

PP 0883 Eco-anxiety, social media use, and young people in the Netherlands

Marc Esteve Del Valle[1]

[1] University of Groningen, Media Studies and Journalism, Groningen, Netherlands

The impacts of climate change on mental health are increasingly recognised as significant (Pihkala, 2020), as it appears that a growing number of people experience worrying and a variety of negative emotions about the climate crisis and its consequences (Ojala et al., 2021). This, emerging studies argue, may be linked to eco-anxiety, or "the distress caused by climate change where people are becoming anxious about their future" (Coffey et al., 2021). Although the term's definition is still disputed, the phenomenon involves, among others, feelings of fear, sadness, guilt, anger, despair, grief, and hopelessness (Léger-Goodes et al., 2022). Eco-anxiety appears to affect young people the most (Whitmarsh et al., 2022) – which, Wu et al. (2020, p. 435) argue, might be due to them being at "a crucial point in their physical and psychological development", making them more vulnerable to stress and anxiety. Individuals' wider social systems, including their relationships with family and friends, have also been studied in relation to eco-anxiety (Crandon et al., 2022). Such relationships can act as sources of information and are often mediated through media (Rosenthal, 2022). However, while existing studies hint at the fact that media may be linked to eco-anxiety (Ogunbode et al., 2022), the relation has not been widely studied (Whitmarsh et al., 2022). Given the growing amount of time young people spend online, this connection calls for further research. Therefore, the present study aims at understanding the potential relation between young people's (aged 16–24 years) use of social media and their eco-anxiety experiences.

The data draws on a representative survey (N = 1,000) of young people (16–24 years) in the Netherlands, conducted by YouGov. The survey explored several dimensions, including general use of social media, social media use and climate information exposure, mental health and wellbeing, climate action and climate-friendly behaviour, climate anxiety, social norms and perceived efficacy, personality, and demographics. Participants reported being exposed several times per week to information about climate change on social media, particularly on platforms such as TikTok and YouTube. Importantly, the findings seem to indicate that homophilious exposure (receiving climate change information aligned with one's own viewpoints) on social media is associated with their eco-anxiety experiences. In addition, participants' efficacy beliefs, both collective (e.g. trusting that young people can motivate others to solve the climate crisis) and personal (e.g. trusting that one can do its part to solve the climate crisis), also appear to be positively related to climate anxiety.

Together, these results advance the understanding of the relationship between social media use and eco-anxiety (Maran & Begotti, 2021) among young people, highlighting previously unexplored contributing factors.

PP 0884 Green message, dark intent: Conceptualizing far-right greenwashing as dark participation

Bruna Távora[1], Sofie Beisemann[1], Jana Johanna Klapproth[1], Svenja Boberg[1], Luíz Henrique de Andrade Ranzani[1], Thorsten Quandt[1]

[1] University of Münster, Communication Institute, Münster, Germany

As far-right governments increasingly assume administrative positions worldwide, public concern about environmental protection and legal frameworks has intensified. Research on far-right political communication has extensively documented the centrality of climate skepticism and the outright denial of environmental issues within their discourses. However, less attention has been paid to a more recent right-wing populist strategy: greenwashing.

Greenwashing is understood as a set of communicative strategies in which actors construct an image of environmental responsibility that does not correspond to their actual performance. It involves discrepancies between discourse and practices aimed at producing a positive public perception without substantive environmental change.

Although It has been extensively discussed in Public Relations research, less attention has been given in relation to right-wing populism. Nevertheless, recent empirical studies (Vicenová, & Mišík, 2025) point to an emerging greenwashing far-right pattern: rather than abandoning environmental rhetoric, they selectively capture it to advance conservative, neo-extractivist, or authoritarian agendas while appearing environmentally concerned. Consequences are related to undermining the capacity of public opinion to critically assess environmental policies, and weakens an informed debate on sustainability.

Our conceptual contribution adopts dark participation as an overarching analytical lens (Quandt, 2018) to systematize greenwashing as a form of political disinformation across the five dimensions of dark participation: actors, reasons, objects/targets, audiences, and processes. Focusing on far-right actors as the primary agents, we argue that reasons involve electoral and legal goals and the delegitimization of opponents; targets encompass activists, Green parties, and/or local communities affected by resource exploitation; and audiences include voters, media, institutional partners, and world-trade organizations.

Regarding processes, we conceptualize two main ways in which far-right greenwashing operates. First, greenwashing is used to "greenify" political and contentious issues, capturing sustainability to attack political opponents and/or social minorities - blaming them for environmental degradation, thus justifying conservative and exclusionary agendas. Second, greenwashing is used to advance economic activities related to resource extraction embedded in confusing or misleading information, thus blurring the risks and impacts of such activities.

Greenwashing is "dark" not because it relies on outright falsehoods, but because it distorts environmental risks within policy and legislative debates. By partially legitimate environmental concerns to shift accountability and justify specific regulatory outcomes, far-right greenwashing operates along a spectrum of dark participation that blurs the boundaries of democratic environmental policymaking.

This proposed framework offers an analytical entry point for comparative research by conceptualizing greenwashing as a form of dark participation within far-right communication. As far-right actors consolidate institutional power, examining these communication strategies becomes theoretically and politically relevant, given their capacity to distort democratic deliberation and environmental governance. In the context of polarized environmental issues, the framework enables the systematic examination of these dynamics and advances critical theoretical debate.

PP 0885 Nested publics in youth climate activism across global and local contexts

Yuzhe Zhu[1], Cardoso Gustavo[1]

[1] CIES-Iscte, Centro de Investigação e Estudos de Sociologia, Lisbon, Portugal

Content circulating on social media generates emotional resonance, fosters affective engagement and amplifies emotionally charged expressions, thereby enabling networked publics to gather or dissolve around shared emotional bonds. Hashtags function as metadata labels that organize content systematically and facilitate interaction around specific topics, making collective discussion possible. Beyond enabling retrieval, hashtags also perform a form of contextualization, allowing users to situate their own expressions within ongoing conversations by tracing what others articulate through hashtags. This study approaches these dynamics primarily through the theoretical lenses of hashtag publics and connective action.

This paper examines youth-led digital climate activism and investigates how climate issues circulate, reorganize, and localize within social media hashtag networks. The analysis focuses on two groups: prominent young climate activists, and ordinary young activists in Portugal. All public posts published between January 1, 2022 and December 31, 2024 were collected.

This study applies link community analysis at three analytical levels. First, it identifies distinct link communities across the dataset. Second, it examines nested communities within topic clusters. Finally, it calculates the community centrality of each hashtag, enabling the identification of how different dimensions of climate change discourse intertwine through youth activists' hashtag practices on social media.

The findings indicate, first, that publics do not coalesce around a single hashtags or isolated thematic cluster; rather, they take shape through shared link edges that connect multiple topic areas. Second, climate action communication follows divergent logics across activist scales. Prominent youth climate activists tend to prioritize actor connectivity, using specific hashtags to delineate boundaries while emphasizing issue depth and professional consensus. By contrast, ordinary youth climate activists in Portugal foreground issue embedding, rely more on general-purpose hashtags, and integrate climate concerns into everyday communicative streams to maximize breadth and visibility. Third, global climate hashtags become re-embedded within local public arenas through their linkage to Portuguese political hashtags, effectively relocating global issues within national political contexts.

Taken together, these findings illuminate distinct communication strategies among young climate activists operating in different contexts, as well as the varying structural roles that climate labels assume within hashtag networks. While much existing research concentrates on semantic meanings or communicative effects, this study directs analytical attention toward the networked architecture of climate communication. It further demonstrates that digital activism does not merely facilitate collective action; the ongoing formation, fragmentation, and recombination of publics constitutes a political process in its own right. Drawing on theories of hashtag publics and connective action, the study offers a structural-level perspective on how climate issues become embedded, sustained, and reorganized within digital publics.

SCI11 More-Than-Human Communication

PP 0989 Engineering control: Media discourses on biotechnological solutions in Invasion Biology and de-extinction

Sara Vidal-Ramón[1], Núria Almiron[1]

[1] Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain

So-called animal 'invasive species' are increasingly portrayed by European and international bodies as one of the major threats to biodiversity loss. This places the control and management of 'invasive species' at the heart of environmental communication debates. In particular, this study explores how news media construct biotechnology as a scientific and ethical solution for 'invasive species' management. As biotechnology gains prominence in public debates on conservation, media representations play a key role in shaping public understanding of science, ethics, and policy. Combining insights from Science and Technology Studies (STS) and Critical Animal Studies (CAS), the research employs qualitative frame and critical discourse analysis on a corpus of international English-language news articles obtained from the Factiva database with coverage of the association between biotechnology and its framing as a solution within the field of invasion science. The research examines how narratives of biotechnological innovation and control of non-desirable non-human animals circulate across media discourses. It extends STS analyses by applying the co-production framework to the underexplored field of biotechnological control of 'invasive species', thereby connecting sociotechnical inquiry with questions of multispecies justice. These co-production lenses are essential and necessary to explore how science, technology, and social order are mutually constitutive, and serve to move beyond the merely descriptive accounts of media coverage. At the same time, it advances CAS by bringing the ethics of biotechnology into the context of free-roaming and so-called invasive animals, broadening the scope of interspecies ethics to include technologies of ecological management. Preliminary findings suggest that journalistic framings often reinforce technoscientific optimism while downplaying ethical reflection and the structural, anthropocentric roots of ecological problems. By connecting science communication with ethical and political critique, this study contributes to understanding how scientific authority and moral legitimacy are negotiated in the media within a context of high perceived environmental urgency.

SCI11 More-Than-Human Communication

PP 0990 Eco-design promoting inclusion and connections with living organisms?

Céline Pascual Espuny[1]

[1] Aix Marseille University, Ecole de Journalisme et de Communication d'Aix-Marseille Université, Aix-en-Provence, France

In France, design sciences lie at the intersection of information and communication sciences and engineering sciences (Darras et al., 2017, 2018; Gantier, 2018). In its primary sense, design is a form of artistic creation, whose purpose is to work with forms and renew their aesthetics. This approach can apply to spatial forms (spatial design, architectural and urban design, interior architecture), volumetric forms (product design, industrial design, object design), textiles (fashion design, styling), graphics (graphic design, image design, graphic design), audiovisual and cinematographic forms (visual and sound design, creation of animated images or sounds and new media) or interactive forms (interaction design, interface design, digital design, game design) (Leleu-Merviel et al., 2013, Mitropoulou et al., 2018)…

Designing is above all about communicating, in the sense that co-design is understood as an integrative, inclusive, short-loop activity, where co-constructed and shared interaction is an integral part of the design to come. In this sense, eco-design is seen as design methodologies applied to the environmental approach to products or processes that take into account all positive or negative externalities in product design (Varžinskas et al., 2020, Singh et al., 2019). This involves considering environmental constraints and issues, methods and tools for improving carbon footprints, adopting an eco-design approach, and working within a circular economy loop (Brezet et al., 1997; Vallet et al., 2013; Royo et al., 2023). The extensive literature on eco-design of products and packaging clearly shows the extent to which these new engineering approaches are developing, within the overall framework of so-called responsible consumption (Karlsson et al., 2006, Borchardt et al., 2011, MacDonald et al., 2015, Rio & Tyl, 2025, Tyl et al., 2015).

The research question we propose today stems from a general sense of surprise: why limit eco-design to a single operational and engineering approach? Why not consider eco-design in its vibrant social dimension, as a way of mediating and reconsidering today's complex environmental problems through an integrative and interactive approach enabled by eco-design techniques?

In this paper, we propose an initial theoretical approach that revisits participatory approaches and stakeholder theory in relation to eco-design. In the second part, we apply this analytical framework to a specific case study: the Parliaments of the Living, an experimental space aimed at integrating the voice of living beings—both human and non-human—into local decision-making. This innovative project seeks to create an alliance between different forms of life and rethink our relationship with the world. The Parliament of the Living was tested in Dracénie, France, in 2025. Its objective is to include biodiversity in public decisions: The Parliament of the Living aims to redefine local policies so that they take into account the needs of ecosystems and the species that live there, and to mobilize young people: Young people aged 16 to 25 will be at the heart of the project, participating in interactive workshops, educational debates, and concrete actions. This civic initiative aims to raise their awareness of the major issues of our time and to actively engage them.

SCI11 More-Than-Human Communication

PP 0991 Transcending anthropocentrism: A discourse-theoretical analysis of Moulding Nature's communicative-artistic tactics

Nico Carpentier[1], Vaia Doudaki[1]

[1] Charles University, Culture and Communication Research Centre, Prague, Czech Republic

The paper analyses the artworks on display at the *Moulding Nature* exhibition, to study how they related to the anthropocentric hegemonic and the ecocentric counter-hegemonic discursive assemblages. Theoretically, the study combines a discourse-theoretical framework (Laclau and Mouffe, 1985; Carpentier, 2017) and assemblage theory (DeLanda, 2006; 2016) with critical environmental theory, in particular its discursive strand (Hajer, 1995; Dryzek 1997) to analyse the discursive construction of human-nature relations, and the role of political struggles for hegemony in these relations.

The object of our study, the *Moulding Nature* exhibition, took place at the Stockholm-based arts centre Färgfabriken, in Sweden, from 26 August until 26 November 2023. During this period, it had 5800 visitors. Curated by Nico Carpentier, Daniel Urey and Emilia Rosenqvist, the exhibition was a communicative-artistic intervention aimed—according to the exhibition website—at raising "questions about how we perceive our environment [… and] how different discourses affect the way we give meaning to nature and the role of mankind in it." (Färgfabriken exhibition website)

While the exhibition itself used arts-based research (Leavy, 2015) as a core methodology to respectfully combine artistic and academic approaches, the analysis of the articulation of environmental discourses through the materiality of the exhibition, and the discourses it invoked (and critiqued), deployed a combination of discourse-theoretical analysis (DTA) (Carpentier and De Cleen, 2007; Carpentier, 2017) and auto-ethnography (Ellis et al., 2010; Adams et al., 2022). The material analyzed with DTA consisted of (in particular) the artworks, their labels, their online descriptions at the Färgfabriken website and the exhibition's press release.

As the relationship between the artworks and the diversity of environmental discourses is not mimetic, but highly complex and multidimensional—sometimes even on the verge of being contradictory—this analysis focusses on the mechanisms (or tactics, see de Certeau, 1984) that the artworks (and their artists) use to relate to the anthropocentric hegemonic and the ecocentric counterhegemonic discursive assemblages. As the analysis will show, these mechanisms include critical resignification, parody, transdichotomisation, and demonstrations of nature's strength and diversity.

The paper will thus demonstrate the political struggles over the environment, with its contingencies, but will also argue that there are no clearly demarcated trench lines between these two main discursive assemblages, that there is no simple morality to guide choices and preferences, and that there is not even discursive stability when it comes to the multitude of discourses that feature—sometimes wholly, sometimes partially—in these discursive assemblages. Instead, *Moulding Nature* shows discourses with vague contours, floating signifiers, changing alliances, endless rearticulations in practice or as opportunities, and diverse invitations with even more interpretations, witnessing the importance and complexities of artistic interventions in these political struggles over the environment.

SCI12 Migration & obstructionism in climate reporting

PP 0997 Structured absences: Climate change as a blind spot in African and European migration coverage

Merle Van Berkum[1], Susanne Fengler[2], Ana Pinto-Martinho[3]

[1] TU Dortmund, Erich Brost Institute for International Journalism, Dortmund, Germany
[2] Institute for International Journalism, Department of Journalism- TU Dortmund, Dortmund, Germany
[3] Iscte - University Institute of Lisbon Iscte-IUL, Center for Research and Studies in Sociology CIES-Iscte, Lisbon, Portugal

Climate change is increasingly discussed as an important factor shaping migration, particularly in regions exposed to environmental stress. In journalistic coverage of migration, however, climate-related causes remain largely marginal. This paper examines the absence of climate change in migration reporting and asks how this blind spot can be understood in relation to dominant patterns of migration coverage. Rather than treating the lack of climate references as a failure of reporting, the study approaches absence as an empirical finding that reveals how environmental issues are positioned within migration reporting, an area that remains largely shaped by political and crisis-oriented frames (Lecheler et al., 2019).

The analysis builds on earlier comparative research on climate change reporting in African, European, and US news media, which showed that climate change, despite its global character, is often reported through national and political lenses (reference anonymized). Drawing on these insights and responding to calls for more comparative and less Eurocentric perspectives in migration and journalism research (Hafez & Grüne, 2022), the paper turns to migration coverage and examines whether and how environmental factors are integrated into reporting on mobility.

Empirically, the study is based on a quantitative content analysis of 1,871 online news articles published between May 2023 and April 2024 in 30 opinion-leading news outlets across 15 African and European countries. Using a most-different systems design (Przeworski & Teune, 1970), the analysis focuses on explicitly coded main topics and subtopics of migration coverage, alongside formal characteristics, and actor constellations. Across both regions, references to climate change are rare, even in contexts where environmental stress is widely discussed as relevant to migration dynamics.

The findings suggest that this absence aligns with patterns of domestication and political framing in migration coverage. Migration is predominantly covered as a national political issue, centred on policy debates, and governmental actors. Within this framework, structural and long-term factors such as climate change tend to be sidelined. As a result, connections between climate change and migration are rarely made explicit in migration journalism.

The paper contributes to research in science and environment communication by showing how climate change is systematically marginalised within migration coverage. The comparative perspective across African and European media highlights that this blind spot persists across different journalistic contexts, despite different exposure to environmental stress and migration dynamics. The findings reveal that migration is largely framed through political and national lenses, leaving structural links between climate change and mobility largely invisible in mainstream reporting.

SCI12 Migration & obstructionism in climate reporting

PP 0998 Polish online media coverage of climate refugees

Bartlomiej Lodzki[1]

[1] University of Wroclaw, Faculty of Social Communication and Media, Wroclaw, Poland

Climate change has increasingly dangerous consequences, including massive displacement, an increasingly pressing issue affecting people globally. According to IDMC (2025), at the end of 2024, 83.4 million people worldwide were internally displaced, of whom 9.8 million were resettled due to natural disasters. The need to relocate primarily affects those living in the least developed countries in climate-vulnerable areas, such as deserts, small islands at risk of submersion, and territories particularly vulnerable to weather-related disasters, including hurricanes, floods, and tornadoes. It also affects EU countries, with Poland among those facing significant challenges due to its climate-exposed agricultural regions.

The research examines the representation of climate-induced displacement in Polish online media from 2019 to 2023, a period marked by escalating global climate catastrophes and record-breaking internal displacement. The study aims to analysis the complexity of the climate refugee issue in Polish media across domestic, European, and international contexts.

Most research on media coverage of climate refugees focuses on specific regions like Australia, New Zealand, and Pacific Island States (Hoeg and Tulloch, 2019). The climate justice narrative is rarely used in this context (Dreher and Voyer, 2015). European media emphasize catastrophe and crisis, framing climate migrants as security threats (Bonneux and Van Praag, 2024). Western media often speak about climate refugees rather than giving them a voice (Hoeg and Tulloch, 2019; Keller

et al., 2020). Ribot, Faye, and Turner (2020) argue that climate migrants are used to spread climate issues, not to address their needs, leading to politicization and negative perceptions. Conversely, Global South media like Al Jazeera highlight crisis narratives and personal stories (Boas et al., 2019). Polish researchers mostly focus on illegal migration during the 2015–2018 crisis, border issues, Ukraine war refugees, and legal solutions (Troszyński and El-Ghamari, 2022; Jupowicz-Ginalska and Gober, 2024). The coverage of climate refugees in Polish media is underexplored, and the presented study aims to address this gap.

A quantitative and qualitative content analysis was used. Based on the BuzzSumo platform, a database of articles was retrieved from Polish news and thematic websites using the keywords "climate refugees" and "climate migrations". Data processing was conducted in MAXQDA 2024 to identify thematic clusters and linguistic landscapes. The qualitative research was grounded in framing and thematic analysis.

The findings indicate that media coverage is structured around four narrative frames: a legal - addressing international protection gaps, an economic frame on disaster costs, a social frame focusing on human rights and personal tragedies, and an environmental frame concentrating on natural system drivers. The thematic analysis reveals three distinct clusters: diagnostic threads explaining the concept, causal analysis of environmental and anthropogenic drivers, and solution-oriented proposals ranging from legal reforms to adaptation technologies. The research further identifies a temporal dimension in the discourse, in which migration is presented through a present-day lens of immediate urgency, a future-oriented perspective on looming security threats, and a historical perspective linking past societal collapses to climate fluctuations.

SCI12 Migration & obstructionism in climate reporting

PP 0999 How is the uncertainty in drought prognoses portrayed in newspaper coverage?

Signe Filler[1]

[1] University of Kaiserslautern-Landau, Institute for Communication Psychology and Media Education, Landau, Germany

Climate change-induced shifts in precipitation patterns are increasing the frequency of droughts in various parts of the world. Prognoses assess the risk of future drought crises but always carry some degree of scientific uncertainty. Their findings are publicly discussed in the media. Journalists might be tempted to downplay uncertainties to avoid ambiguity, but studies show that the usefulness of prognoses for the recipient also depends on how uncertainty is presented: Prognoses that include specific numerical probabilistic uncertainties (e.g., 'a 30% chance of drought') positively influence understanding and trust, compared to verbal descriptions (e.g., 'drought is unlikely') or deterministic prognoses. Regarding non-quantifiable epistemic uncertainties (e.g., assessments of the quality or reliability of a prognosis), there are similarly positive effects when experts express high confidence in the prognosis compared to expressing low confidence. Studies on whether media use forms of uncertainty that promote or hinder trust and understanding are limited and often do not clearly differentiate these forms. There are indications that how uncertainty is depicted varies depending on the professional background of the cited sources. Additionally, in some thematic contexts, prognosis uncertainty is presented in a more detailed and probabilistic numerical manner, possibly because they have a higher news value due to their closeness. This study examines whether media representations of drought prognoses use forms of uncertainty representation that foster trust and understanding, and whether the influence of cited sources and closeness on how uncertainty is portrayed can be confirmed.

To do this, news articles from newspapers and online portals were analyzed through a quantitative content analysis, using the German context as an example. A total of 325 articles published between 2018 and 2023 were coded to identify the communicated uncertainties, the cited sources, and the geographical closeness of the predicted drought.

Results show that 56% of the articles mention prognosis uncertainties, with probabilistic uncertainties being discussed significantly more often than epistemic uncertainties ($\chi2(1) = 12.29$, $p < .001$). When probabilistic uncertainty was presented, specific numerical data were rarely used, and verbal paraphrases were more common ($\chi2(1)=56.64$, $p < .001$). When assessments of the prognosis's epistemic uncertainty were provided, deficiencies were mentioned significantly more often than positive aspects ($\chi2(1)=14.16$, $p < .001$). The geographical closeness of the predicted drought did not significantly influence how uncertainty was depicted ($\chi2(2)=1.18$, $p = .554$). However, a connection was found with the sources cited in the article ($\chi2(12)= 54.84$, Fisher's Exact Test: $p < .001$). According to a post hoc analysis of standardized residuals, uncertainty was discussed more frequently in connection with scientific sources than with non-scientific sources.

The results show that uncertainty in prognoses is often either not reported at all or representations that tend to cause confusion. As a practical recommendation, communicators should present probabilities using concrete numbers. Even if discussing epistemic uncertainty cannot be avoided for transparency reasons, more focus should also be given to the positive aspects related to the quality of the prognosis.

SCI12 Migration & obstructionism in climate reporting

PP 1000 From global cooling to sanctions as climate injustice: Obstructing adaptation to climate change in Russian media, 2019–2025

Mika Perkiömäki[1]

[1] Tampere University, Tampere Institute for Advanced Study, Tampere, Finland

Academic interest in climate obstruction—the actions and efforts that slow or block the implementation of climate policy—in authoritarian and non-democratic societies is growing, partly driven by the success of authoritarian parties in many democratic countries during the 2020s. Examining climate obstruction in non-democratic contexts helps anticipate practices authoritarian actors may adopt elsewhere. Russia offers a crucial case: climate denialism there is rooted in political and economic systems reliant on fossil fuel extraction and export, with the energy transition perceived as an existential threat to the regime. Cultural drivers also play a role, as public demand for climate information has been minimal.

This paper investigates climate obstruction in Russian online pro-state news media (2019–2025), focusing on how adaptation to climate change is framed, and how Russia's ratification of the Paris Agreement in 2019 and its full-scale invasion of Ukraine in 2022 shaped understandings of adaptation. The emphasis on adaptation reflects two factors: its rising prominence in global climate debates—particularly regarding the adaptation finance gap in the Global South—and the lack of prior scholarship on adaptation in Russian media.

The material consists of climate-related stories from Russian online news outlets that are either state-owned or pro-state. As shown in prior studies, mainstream media in Russia closely follows state climate policy, making these sources central to political discourse. They are also more influential on public opinion than opposition media that now mostly operates in exile. In the first phase, a content analysis categorizes climate obstruction in two ways: primary, secondary, and tertiary obstruction following Ekberg et al. (2023, 8–13), and phenomenon, action, and source obstruction as outlined by Fortin et al. (2025, 4–8). The second phase applies thematic analysis to identify obstructionist features within these categories.

The results demonstrate how understandings of adaptation and related obstructionist features have evolved in Russian pro-state media. A pilot study of one commercial outlet, *Kommersant*, suggests adaptation is often framed as adjusting to other countries' climate politics rather than to material environmental changes. Western sanctions are depicted as obstructing Russia's ability to adapt to its changing climate. The material also includes classic forms of climate denialism that call for an abrupt halt to adaptation efforts for a warming climate, instead advocating rapid adaptation measures for a radically cooler climate and claiming scientific evidence as justification.

The conclusions discuss the cultural and material drivers of climate obstruction in Russia and highlight how evidence from Russian media can inform understandings of obstructionist discourses likely to be employed by authoritarian parties in democratic contexts.

SCI13 Climate Change and Social Media

PP 1090 Cool conversations or heated arguments? A content analysis of climate change framing and comment discourse on TikTok

Lotte Tiebosch[1], Pytrik Schafraad[1], Ruud Koolen[1]

[1] Tilburg University, Department of Communication and Cognition, Tilburg, Netherlands

Public engagement with climate change increasingly occurs on social media platforms, where algorithmic curation, multimedia formats, and interactive engagement shape how environmental issues are perceived and discussed. TikTok, in particular, has emerged as a central site of climate discourse among its primarily young audience, offering a blend of authentic, personal expression, political commentary, and trend-driven communication. Consequently, this platform offers valuable insight into this young generation's perspective on climate change and their dynamic co-construction. While previous research (e.g., Basch et al., 2021; Hautea et al., 2021) has examined climate-related content on social media, limited work has investigated direct relations between specific frames in TikTok videos and corresponding responses expressed in user comments. Understanding this relationship is essential to grasp how young users engage in the climate change issue and navigate this misinformation-laden environment.

This study explores climate discourse through both the content and comments of popular TikTok videos with the hashtag #climatechange, focusing on how different frames trigger certain audience responses. A corpus of 264 popular TikTok

videos (each with over 10.000 likes) was analyzed through an inductive thematic framing approach (Van Gorp, 2010). For each video, the top twenty comments were scraped and processed, resulting in a dataset of 5480 comments. These were examined using sentiment analysis (VADER) and topic modeling (LDA) (Qiao & Williams, 2021. This exploratory mixed-methods design enabled an analysis of visual-narrative framing and discursive audience reactions, accounting for the emotional, argumentative, and layered nature of TikTok. Together, these analyses provide a comprehensive overview of recurring thematic frames in climate change messages, and their correlation to common audience reactions in their natural environment.

Eleven frames [PS1] were identified in the videos, amongst which 'Effects of climate change', 'Education and information', 'Emotional fatalism', and 'Activism' were the most frequent. Responses to videos were mostly personal and emotional, often expressing positive affect and personal relevance (34%), climate anxiety (15%), or political criticism (13%). Notably, activist and fatalist frames both elicited an increased likelihood of activist comments, suggesting that fatalism does not solely suppress engagement. Instead, moderate levels of fatalist framing appeared to increase urgency and motivate calls for action. Moreover, the analysis revealed a strong relationship between misinformation and the prevalence of misinformation or counter-argumentation in comments. Often times, videos attempting to debunk climate skepticism contained comments presenting ecological proof of the importance (e.g. "there's flowers in Antarctica") or insignificance of the issue (e.g., "Plymouth rock still not below water"). Consequently, misinforming videos echoed more misinforming comments. These findings highlight TikTok as a playground where users negotiate truthful information, rather than passively consume content. Political discussions were also common in both comments and video frames, debating systemic versus individual responsibility. These discussions were often associated with negative sentiment.

Collectively, these findings go hand-in-hand with TikTok's affordances as a platform, with personalized algorithmic feeds, audiovisual storytelling, ironic and trend-centered expression, and interactive discussions. We see that these affordances shape climate change discourse and increase emotional engagement, creating a dynamic communicative environment where climate activism, anxiety, and misinformation constantly alternate.

PP 1091 Scrolling through the climate crisis: Longitudinal evidence on climate science information diets on TikTok

Paul Pressmann[1], Patrick Zerrer[1], Cornelius Puschmann[1], Niklas Berger[1]

[1] University Bremen, Centre for Media- Communication and Information Research ZeMKI, Bremen, Germany

Social media platforms have become significant arenas for public engagement with scientific topics, including climate change (Pearce et al., 2018; Sultana et al., 2024). As a consequence, TikTok has emerged as a key site for science communication, reaching younger audiences through short-form video content blending entertainment with information (Radin & Light, 2022; Zeng et al., 2020). However, scholarly understanding of how individuals encounter and engage with climate-related scientific content on TikTok remains limited (Hautea et al., 2021; Nguyen, 2023). Few studies have investigated individual-level information behaviour over time, including how users' exposure to climate communication evolves as they navigate the platform.

Effective public engagement with climate change depends both on exposure to scientific information and on encountering diverse perspectives, sources, and framings (Moser, 2010; Corner et al., 2014). TikTok's For You Page plays a central role in shaping content visibility, raising questions about whether platform affordances support meaningful engagement with climate science or constrain users to narrow, potentially polarizing information environments (Baumann et al., 2025; Scalvini, 2023).

Drawing on a four-month longitudinal study (n = 1,035) that combines mobile in-app tracking across multiple social media platforms with 12 survey waves, we investigate:

RQ1: How diverse is individuals' exposure to climate change-related content on TikTok in terms of topics, sources, and scientific perspectives?

RQ2: How do individual engagement patterns with climate change-related content evolve over time?

RQ3: What user characteristics and behaviours are associated with more diverse versus more constrained climate science engagement?

Theoretically, we integrate public engagement with science (PES) frameworks with research on algorithmic information exposure. While PES scholarship provides normative grounding for why diverse science engagement matters (Bubela et al., 2009), we operationalize diversity through "information diet" measures, entropy-based indices capturing the range and balance of climate content in individual viewing histories (De Vreese & Neijens, 2016; Loecherbach et al., 2020). This integration allows us to connect structural patterns of content exposure to their implications for climate science engagement.

Our methodology employs behavioural in-app tracking of TikTok usage over the four-month study period. Climate-relevant content is classified along three dimensions aligned with our research questions: (1) topic (thematic categories including physical climate science, impacts, mitigation, and adaptation), (2) source type (e.g., scientists, science communicators, news, or influencers), and (3) scientific perspective (e.g., consensus-affirming, solution-oriented, skeptical). For each participant, we calculate normalized Shannon entropy indices for each dimension, where higher values indicate more diverse

information diets. Latent growth curve modeling will characterize temporal trajectories of engagement (RQ2), while multilevel regression will identify user characteristics (measured through survey data) associated with diverse versus constrained exposure patterns (RQ3).

Our research provides behavioural evidence, rather than relying purely on self-reports, on how audiences encounter climate science through algorithmic platforms. We address concerns about algorithmically constrained information exposure with empirical specificity, identifying predictors of narrow versus diverse engagement patterns. Our findings will inform climate communicators and platform researchers seeking to understand how TikTok's affordances shape public engagement with climate science.

SCI13 Climate Change and Social Media

PP 1092 Seeing climate change from distant to close? Multimodal representations of construal level and audience engagement with climate change videos on YouTube

Xiaoyue Yan[1], Mike S. Schäfer[1]

[1] University of Zurich, Department of Communication and Media research, Zurich, Switzerland

Despite scientific consensus and escalating impacts, public engagement with climate change remains limited (Hügel & Davies, 2020). A key explanation is that climate change is often perceived as abstract and psychologically distant rather than concrete and proximate (O'Neill, 2013) - after all, it unfolds across long temporal horizons, large spatial scales, uncertain futures, and abstract social relations (Carvalho, 2010), and is frequently communicated in these terms (Rebich-Hespanha et al., 2015). Research shows, however, that such abstract representations reduce perceived urgency and efficacy, whereas emphasizing local, present, and personal impacts can increase engagement and policy support (Spence & Pidgeon, 2010; Chu, 2022). These dynamics are captured by construal level theory (CLT) and psychological distance (Trope & Liberman, 2010).

According to CLT, individuals mentally represent events along a continuum from abstract to concrete, with greater abstraction corresponding to greater psychological distance (Liberman et al., 2007). Psychological distance is conceptualized across four dimensions: temporal, spatial, social, and hypothetical (Trope & Liberman, 2010). While CLT originally emphasized egocentric perception, individuals can also adopt nonegocentric construals that incorporate others' experiences or broader global contexts (Liberman & Förster, 2009). For global issues such as climate change, people often combine egocentric and nonegocentric perspectives, particularly in digital media where construals extend beyond individual cognition to shared social experiences (Schattman et al., 2021; Dubey et al., 2025).

Most existing research on CLT and psychological distance in climate communication focuses on text, despite the central role of visuals (Metag, 2020) that can shape perceived distance and related responses (Duan & Bombara, 2022). Yet climate imagery frequently relies on abstract and distant icons, like polar bears, reinforcing detachment (O'Neill, 2013). Furthermore, alignment between visuals and text enhances meaning-making and credibility, whereas dissonance may undermine engagement (Feldman & Hart, 2018).

YouTube is a major platform for climate communication (Yang et al., 2022). While its algorithmic dynamics often reinforce abstract, global framings, particularly in dominant languages like English (Segerberg & Magnani, 2025), its participatory affordances also enable localized and personalized storytelling (Duan et al., 2024). However, research rarely examines how construals is communicated multimodally on YouTube or considers all four dimensions of distance (Maiella et al., 2020). Hence, we ask:

RQ1 *How are temporal, spatial, social, and hypothetical distance represented visually and textually in climate-related YouTube videos?*

RQ2 *How are these dimensions distributed across visual and textual topics?*

RQ3 *How are psychological distance and topics related to audience engagement (likes, shares, comments)?*

We analyze 825 YouTube videos collected in November 2025, segmented into 69,064 visual-text pairs based on major scene changes. A subset is manually coded for construals based on established codebooks (Duan et al., 2017; Snefjella & Kuperman, 2015; Guenther et al., 2023) to validate the automated approach. A multimodal large language model is used to classify construals across the full dataset. Visual and textual topics are identified using BERTopic. Differences between visual and textual construals, associations with topics, and relationships with engagement metrics are examined using inferential statistics and negative binomial regression models.

We are currently annotating the validation dataset; all analyses will be completed before ECC26.

SCI13 Climate Change and Social Media

PP 1093 Young adults' perceptions of climate change on social media: A focus group study

Veerle Cannemeijer[1], Femke Hilverda[1], Jane Murray Cramm[1]

[1] Erasmus University Rotterdam, Erasmus School of Health Policy & Management, Rotterdam, Netherlands

Young adults aged 18–25 are a critical target population for climate communication. With increasing independence, responsibility, and awareness, this group has a large potential influence on climate change – both positively and negatively – through their behaviour, networks, and civil and political action. Simultaneously, this age group reports high levels of worry, powerlessness, and other negative emotions around the topic of climate change. In this study, we investigated how young adults perceive climate communication on social media. Specifically, we studied the climate emotions that social media content about climate change evokes and investigated which type of content is likely to inspire climate action in young adults.

To this end, we conducted three focus groups with 20 Dutch young adults in total. The starting point for the discussions were social media posts (mostly from Instagram and Tiktok) collected by the participants themselves, ensuring the data reflected the participants' own algorithms. For each piece of content, participants were asked to comment in a virtual comment section using Mentimeter and write down on post-its which emotions they felt after engaging with the content. The Climate Emotions Wheel from Climate Mental Health Network was used as inspiration and guidance for the participants. Subsequently, participants were asked to place their post-its on a grid with two axes, one ranging from negative to positive and the other indicating to what extent the content inspired climate action. Transcripts of the focus groups, combined with the Mentimeter results and grids with post-its, were analysed both inductively and deductively.

Preliminary results show that most of the discussed climate change-related content evoked negative emotions, such as frustration, concern, and disappointment. Some content evoked positive emotions such as hope and inspiration, while others were deemed neutral or uninteresting. Participants found that positive messages were more likely to inspire action than negative ones, especially when they included small, doable calls to action, relevant to their lifestyles. In many posts, however, the call to action was vague, absent, or impractical for young adults, leaving the audience passive and uninspired. Content which illustrated the concrete impacts and solutions of climate change as well as new perspectives on the climate crisis drew the participants' attention. Posts that leveraged social media trends and used messengers who were considered both popular and trustworthy resonated strongly. Important to note is that most participants encountered very little climate change-related content on their social media feeds, even if the topic was of interest to them.

The preliminary results imply that there are opportunities for climate communication on social media, but that in order to reach young adults, content must be tailored to their lived experiences and range of influence. A stronger focus on content that evokes positive emotions with clear and relevant calls to action could be beneficial to inspire climate action in young adults. Popular, trusted messengers and current trends that resonate with this group could help draw engagement and encourage behaviour change. More engaging climate content could also increase the quantity and frequency of climate content in young adults' feeds.

PP 1099 Imagining a sustainable internet of things: A comparative study of IoT imaginaries in Europe, China, and the United States

Yang Yang[1], Klaus Bruhn Jensen[1], Kiran Kappeler[1], Ece Elbeyi[1], Dechun Zhang[1]

[1] University of Copenhagen, Communication, Copenhagen, Denmark

The Internet of Things (IoT) (ITU, 2005) enables comprehensive monitoring of the effects of human activities on Earth's ecosystems (IPCC, 2023), potentially facilitating the green transition that the 195 parties to the Paris Agreement signed up to (United_Nations, 2015). Human intelligence may thus tap into the intelligence of nature (Abram, 1996) to ensure the survival and continued coexistence of human and other species. But the scope and the scale of the necessary monitoring of natural and built environments simultaneously entails surveillance of persons, communities, and cultures in what might become a "green but inhumane" future (Creutzig et al., 2022). The paper identifies, contextualizes, and assesses the resulting ethical dilemmas and controversies that are emerging in the window of opportunity between 2025 and 2050, identified by the Paris Agreement as the deadline for a net-zero world. The first section introduces the massive planetary monitoring systems currently being implemented in the European Union (https://destination-earth.eu), the United States (https://esto.nasa.gov/earth-system-digital-twin/), and China (https://earthlab.iap.ac.cn/en/index.html#firstPage). The second section details their functions of information processing about ecosystems and societies, networked communication among private companies, public institutions, and citizens, and individual and collective agency in response to the climate crisis. Compared to past analog media systems (Hallin & Mancini, 2004) and digital communication system of the last several decades (Jensen & Helles, 2023), these planetary systems represent a radical step change in the social applications of digital computing. Building on comparative quantitative and qualitative analysis of governmental and corporate documents from the three world regions driving the development of IoT, the third section develops a typology of the imaginaries informing

the development of its constitutive technologies, institutions, and practices. The concluding section anticipates coming debates on the controversies of how to do the right thing for the planet and other species while simultaneously observing the recognized rights of personal privacy for one species—humans. For scholarship and policy alike, the question is, at once, empirical and existential: Which kinds and degrees of surveillance, with what checks and balances, will the present human cohort be prepared to accept in the coming pivotal decades to ensure the livelihood of human and other species centuries and millennia into the future?

PP 1100 Sustainable science communication: Theoretical foundations, ethical perspectives and practical implications

Pamela Nölleke-Przybylski[1], Sigrid Kannengießer[1], Julia Metag[1]

[1] University of Münster, Department of Communication, Münster, Germany

As it is accountable to society, science has a particular responsibility to communicate. The communication of scientific knowledge eventually constitutes a core element of public discourse, informing political and societal problem-solving processes (Druckmann et al. 2025). In a world characterised by multiple, intersecting crises, science may also be held responsible for contributing to their mitigation. In this context, sustainability (defined as social, ecological, and economic justice, (WCED 1987)) functions as a norm for reflecting on possible pathways towards crisis mitigation. Besides being a normative framework for research, the norm of sustainability also provokes reflections on the contribution of science communication to sustainable development.

Over recent years, communication research has extensively examined communication *for* sustainability—understood as communication aimed at supporting societal transformation towards sustainability—and has highlighted its intersections with science communication (Hoppe & Wolling 2017). However, a systematic conceptualisation of sustainability as a guiding norm for the practice and design, rather than merely as a topic of science communication, is still lacking. Our presentation addresses this gap proposing a concept of *sustainable science communication*, which we define as *processes of science communication that are designed in a sustainable way*. To explain this concept, we will present a matrix integrating examples of the potential and dilemmas of designing science communication sustainably.

This matrix of sustainable science communication provides examples of various forms of science communication formats and measures that are designed in a sustainable way. It is structured along different formats of science communication that differ notably in their degree of digital orientation—an aspect of particular relevance in sustainability debates: (1) online-digital formats, which take place entirely within digital environments; (2) offline-digital formats, in which digital tools support communication in physical settings; and (3) offline-non-digital formats, which rely exclusively on non-digital means and settings. Building on this, this matrix systematically maps the socio-ecological consequences and the associated potentials for the sustainable design of science communication. It differentiates science communication formats according to the three format types and across the three dimensions of sustainability—social, ecological and economic.

Presenting this matrix, we argue that the concept of sustainable science communication has the potential to enrich the field of science communication for several reasons: *First*, as a publicly funded domain, the communication of science can be understood as bearing a particular societal responsibility to act in the public interest and to organise its resources and mechanisms accordingly. *Second*, following years of intensive efforts to increase the quantity of science communication—driven by political actors, societal expectations and third-party funders—the field is now called upon to reflect more systematically on its quality. Sustainability offers a norm for quality assessment that is closely aligned with broader societal

discourses. *Third*, reflections from professional practice already indicate how closely communication for sustainability may be intertwined with sustainably designed communication.

PP 1101 The scientific-political discourse on nuclear energy in Norway and Australia

Johann Roppen[1]

[1] Volda University College, Faculty of Media and Journalism, Volda, Norway

In this paper the scientific-political discourse of nuclear power in Norway will be compared to the Australian media discourse as presented in Altenkamp and McManus study "Nuclear power in a de-carbonised future? A critical discourse analysis of nuclear energy debates and media framing in Australia" (Altenkamp & McManus, 2024) within the methodological framework of Critical Discourse Analysis (CDA).

An important insight from Altenkamp and McManus is how "climate change and energy security concerns" is keeping the issues on the agenda and reframing the whole energy discourse, but also how the discourse is a struggle of what is "good" science.

The Norwegian media being studied will correspond closely to the media selected by Altenkamp and McManus with 5 newspapers across the political spectrum being studied. In this paper only results from analysis of media content will be presented as this is the first step of a larger project.

Norway and Australia are both advanced, western economies and share some common features regarding energy: Both countries are big exporters of hydro-carbons, as Australia exports coal, while Norway exports petroleum-products. Thus both countries contribute to global warming, as other energy-hungry countries burn the coal, oil and gas.

Both Australia and Norway also have a very high level of renewable electric energy: Both have wind; Australia has sun, while Norway has hydro power.

When it comes to nuclear power the two countries are seemingly different. The current Australian government was elected on a programme to not introduce nuclear power in Australias energy-mix. In Norway the general sentiment towards nuclear power has shifted strongly in favour of nuclear power after 2020. In 2026 a governmental committee will give advice to the future of nuclear power in Norway.

The arguments for and against nuclear power have been heavily discussed internationally, but Norwegian media and the Norwegian public has mostly been disinterested in these matters, since nuclear power has not been considered a relevant option. Thus the opinion as well as most politicians seemingly were surprised and unprepared as the general opinion as well as local politicians loudly starting to promote nuclear power. Also supported by a small but vocal group of proponents of nuclear power, several with strong links to the oil- and gas industries.

The shift in the public opinion seems not to have changed substantially since 2023: The positive attitude towards nuclear power seems to be stable. But young people are more positive than older, men more positive than women and people on the right more positive than on the left. This is a general pattern also corresponding roughly to the findings in Australia and also in other countries.

- Altenkamp, I., & McManus, P. (2024). Nuclear power in a de-carbonised future? A critical discourse analysis of nuclear energy debates and media framing in Australia. *Australian Geographer*, 55(1), 23–43. https://doi.org/10.1080/00049182.2023.2291879

SCI14 Sustainability

PP 1102 Sustainable development in the communication of local government units with residents: Between technocracy and inclusivity

Anna Adamus-Matuszyńska[1]

[1] University of Economics in Katowice, of Market and Marketing Reserach, Katowice, Poland

Research Objective

The aim of this study is to analyse the communication strategies of local government units (LGUs) in the field of sustainable development (SD). The research focusses on the deconstruction of dominant narrative frames and the assessment of the level of inclusivity within the discourse, specifically regarding gender perspectives and marginalised social groups.

Theoretical assumptions

The first theoretical premise relates to communication on sustainable development, which is required to preserve an appropriate balance among three dimensions: Planet, Profit, and People (the Triple Bottom Line). If a local government focuses its communication exclusively on "profit" or solely on environmental actions such as "tree planting," while neglecting social dimensions (e.g., the exclusion of women, unequal access to public services), such communication must be regarded as theoretically inadequate and conceptually inconsistent with the Triple Bottom Line framework. The second assumption is grounded in Jürgen Habermas's theoretical framework, which postulates that communication between local government

and residents is not merely a unidirectional "transmission of information", but constitutes the formation of a public sphere. This public sphere is expected to be free from domination and characterized by inclusivity. When the language employed by local government actors is excessively complex or technocratic, or when it systematically marginalizes or renders women invisible (e.g., through the absence of feminist perspectives or gender-inclusive formulations), the administrative system can be said to "colonize the lifeworld," thereby blocking the conditions necessary for genuine dialogue and deliberation.

Methodology

The study adopts a multimodal approach, combining quantitative and qualitative content analysis with elements of Critical Discourse Analysis (CDA). The research sample covers the digital communication of 74 cities in the Silesian Voivodeship in 2025 and 2026. To evaluate the material, an original "Inclusive Index" was applied, operationalising variables such as the use of feminine job titles (femininitives), the representation of women in decision-making roles, cognitive accessibility (Plain Language) and digital accessibility (WCAG standards).

Problem Statement

This paper advances the argument that local governmental communication concerning sustainable development frequently undergoes a process of "technocratic closure," in which environmental and economic dimensions are prioritized over the social pillar. This communicative configuration generates a predominantly elitist discourse that marginalizes social groups possessing lower levels of cultural capital, while concurrently reproducing and reinforcing conventional gender roles within the public sphere.

Results and Conclusions

The analysis identifies "participatory gaps" in local communication. The findings indicate a necessity to redefine LGU communication strategies toward a participatory model that not only informs about the goals of the 2030 Agenda but actively engages diverse groups of residents in the transformation process of the region. The research tools developed herein can serve as a standard for civic monitoring (watchdogging) by non-governmental organisations and regulatory bodies.

SCI14 Sustainability

PP 1103 The aesthetic of excess: Unsustainable practices in influencer content

Lisa Curdes[1], Julia Sophie Spahn[1], Wolfgang Schweiger[1]

[1] University of Hohenheim, Department of Communication Science: Interactive Media and Online Communication, Stuttgart, Germany

Young people spend substantial time on social media and increasingly rely on it as their primary source of information. On platforms such as TikTok, Instagram, and YouTube, influencers interact with their followers daily by sharing their everyday lives, opinions, and recommendations. While greenfluencers promote sustainability and thus typically attract only small audiences, high-reach influencers, as commercially oriented actors whose business model relies on brand collaborations, are more likely to share content that aligns with the expectations of a broad, heterogeneous audience. Consequently, they may emphasize hedonistic lifestyles and avoid climate-related messages. Research indicates that frequent following of influencers is positively associated with materialism (Tuominen et al., 2023).

Although influencers' effects on their followers' attitudes and behavior have been studied, little is known about the environmental behavior they share with their audience when showing their everyday life. Thus, this study examines the individual environmental behavior of high-reach influencers in three domains: mobility, diet, and consumption. Since environmental attitudes and behavior correlate with gender (Brough et al., 2016), the study also aims to identify differences between male and female influencers.

A quantitative content analysis was conducted of all posts published by the 20 most popular German influencers, quoted by gender, on Instagram, TikTok, and YouTube from May to July 2025. Influencers were identified via a pre-survey of 16- to 29-year-olds (n = 500). Due to the large amount of content, daily Instagram stories were recorded on working days using a rotating schedule, covering approx. a third of all stories. The final dataset comprised n = 2,559 units (896 posts, 1,663 stories). Automated image classification and keyword search were performed to pre-filter the material, identifying relevant content in 45% (n = 1,154) of the data. These units were then manually coded by two coders.

Mobility behavior appears in 16% of the total sample and is dominated by cars (67% in mobility-related posts, multiple coding), while public transport is rare (4%). Among car-related posts, 58% were created by male influencers. Diet-related elements were identified in 18% of the collected material. Of all dietary units, 9% show meat consumption, with a slightly higher share among male influencers (61% of meat display). Environmentally harmful food packaging is frequent, with plastic-packaged foods in 45% of all dietary posts. Advertisements and giveaways are featured in 19% of all units, primarily for food (35% in advertisements), technical equipment (31%), beauty products (20%), and fashion (13%).

The results illustrate that influencers' portrayals of their daily lives include several relevant aspects of environmental behavior, predominantly unsustainable practices. In the presentation, detailed results, further findings concerning gender differences and implications regarding the impact on followers will be discussed.

PP 0093 Repositioning public service television in a post-migrant society

Yulia Yurtaeva-Martens[1], Susanne Eichner[2], Eylem Yanardagoglu[3]

[1] Freie Universitaet Berlin, Media and Communication Studies, Berlin, Germany
[2] Filmuniversity Babelsberg Konrad Wolf, Media Studies, Potsdam, Germany
[3] Macromedia Univercity, Media Management, Berlin, Germany

Television remains a central, though increasingly contested, infrastructure of democratic communication. In Germany, public service television is constitutionally mandated to contribute to democratic opinion formation, social cohesion, and cultural diversity by addressing all segments of society. Within this framework, integration is understood as enabling equal participation, visibility, and recognizability within the public sphere. This mandate has gained renewed relevance in a society shaped by sustained migration: around 30% of the population in Germany has a migration history, either through personal migration experience or parental migration (Mediendienst Integration, 2025). Migrant and post-migrant publics therefore constitute a structural component of contemporary television publics rather than marginal audience segments (Foroutan, 2019).

At the same time, television studies and audience research point to a growing discrepancy between this normative mandate and actual patterns of television use among migrant and post-migrant publics. While public service television continues to reach large parts of the majority population and long-established, German-speaking migrant audiences, it increasingly struggles to engage younger, recently immigrated, and transnationally oriented publics (Hasebrink, 2023). These publics often rely on diasporic and algorithmically curated media environments, contributing to fragmented and hybridised public spheres and parallel communicative spaces (PSM-AP, 2025).

Against this backdrop, the study examines how public service media in Germany re-articulate their democratic role as public service television within hybrid media environments shaped by sustained migration, platform capitalism, and increasingly hybrid communication ecologies (Couldry & Hepp, 2017). Conceptually, the study builds on television studies research that understands public service television as a democratic media institution embedded in platform-dominated ecosystems, whose legitimacy increasingly depends on its ability to connect linear broadcasting, on-demand services, and social media environments (Sehl, 2024; Doyle et al., 2025). The analysis is guided by the following research question: How do public service media in Germany reposition their democratic role within hybrid publics under conditions of sustained migration and platformisation?

Methodologically, the study adopts an institutional and analytical perspective and develops a systematic mapping of organisational and strategic responses pursued by German public service broadcasters. Drawing on policy documents, organisational reports, programme strategies, and existing empirical studies on migrants' media use and audience expectations, it examines which target-group-specific offerings, participatory formats, partnerships with migrant organisations, and cross-platform distribution strategies German PSM have developed, and how these strategies are oriented towards strengthening democratic values such as inclusion, participation, and recognition (SVR, 2023; Urbániková & Smejkal, 2025).

Looking ahead to future democratic media orders, the paper argues that PSM's role as a "democratic anchor institution" will depend on its capacity to (a) position itself within hybrid platform ecologies and (b) respond to the differentiated expectations of digital natives and migrant audiences across linear television, streaming services, and social media environments (Doyle et al., 2025; Sehl, 2024; SVR, 2023). As a democratic anchor institution, public service television can still provide a common frame of reference—but only if institutional structures and production logics are re-aligned with a public value orientation that prioritises epistemic quality and representational justice within hybrid television publics shaped by sustained migration.

TVS01 Representation, Visibility & Change

PP 0094 Mapping disability on the small screen: A qualitative content analysis into the representation of disability in Flemish fictional television programmes (2005–2025)

Mendel Missorten[1], Frederik Dhaenens[1]

[1] Ghent University, Department of Communication Sciences - CIMS, Ghent, Belgium

Within disability studies, it is often argued that disability holds a crucial role in creating minority groups. Biological differences resulted in gender hierarchies, eugenics led to discriminatory notions of race, and medical pathologisations of homosexual people facilitated centuries of oppression. As a counterreaction, gender, critical race, and queer studies emerged during the twentieth century. Yet, what combined these disciplines, a foundation of bodily difference, often remained invisible and underexplored (Goodley, 2017; Mogk, 2013; Snyder & Mitchell, 2006), which led to the continuation of discrimination based on disability. Only since the 1980s, disability movements started addressing these acts of disablism. Importantly, they replaced individual, medicalised discourses with a nuanced understanding of disability rooted in oppressive social processes (Priestly, 2003; Twardowski, 2022). This led to disability studies, which "theorizes and historicizes … disability in similarly complex ways to the way race, class, and gender have been theorized" (Davis, 2006, p. XVI).

However, within media and television studies, directing attention towards disability has been a slow process (Ellcessor & Kirkpatrick, 2019). In Flanders, Belgium, a small but meaningful body of research exists (see Goethals, 2017; Vertoont, 2019; Vertoont et al., 2022), but significant questions remain unanswered. How are different kinds of disability represented on television? How do socio-cultural discourses on disability, located within either the individual, social or cultural model of disability, translate into representational practices? How do images of disability evolve throughout time? Specifically, as stressed by Ellis and Goggin (2015), there is a need for longitudinal studies.

Considering that fictional programmes in Flemish primetime television feature twice as many roles for disabled characters as non-fictional programmes (Vertoont, 2019), this study aims to gain a deeper understanding of how disability has been represented in Flemish television fiction over the past twenty years. Therefore, we will conduct an explorative, qualitative content analysis focusing on the overall representation of disability on television in Flemish fiction programmes. First, we will compile a database of Flemish television fiction produced between 2005 and 2025 that features main or recurring characters with disabilities. We rely on secondary sources such as television guides, articles, internet databases, and previous research on Flemish television fiction (for example, Vanlee et al., 2018) rather than an analysis of the actual television programmes. Second, we will study these series using a conventional qualitative content analysis (Maene, 2023) to map how disability and disabled characters are portrayed. This analysis will partly be guided by former studies on disability representation (Cumberbatch & Negrine, 1992) but will also allow room for new interpretations that are unique to Flemish television fiction.

With this study, we aim to provide a longitudinal overview of how disability has been represented in Flemish television fiction. Because of the topic's novelty, we approach disability in the broadest possible meaning of the word as we hope to demonstrate which disabilities have been explored in Flemish fiction and how.

TVS01 Representation, Visibility & Change

PP 0095 The representation and oppression of disabled characters in the fantasy genre of television and streaming programs

Sabrina Pasztor[1], Zsuzsanna Lilla Szegedi[1]

[1] Corvinus University of Budapest, Communication and Media Sciences, Budapest, Hungary

Media content unquestionably influences society, as it can reinforce or deconstruct social views and perceptions, educate, or mediate representations of identity (Staiger, 2005) and make audiences confront their pre-existing biases or stereotypes of others (Donnelly, 2016). This study aims to examine an underexplored area of research: the representation and oppression (Cudd, 2006) of physically disabled characters in television and streaming shows in the genre of fantasy, described as a type of speculative fiction that incorporates magical elements (Timmerman, 1983; Oziewicz, 2017). Two research questions were addressed: RQ1: How are characters' interpersonal relationships, community involvement, personalities, and the frequency and forms of oppression they experience represented? How do the representations of these four themes influence each other? RQ2: What character arcs do disabled characters have, and what roles does their disability play in these stories that contribute to the fantasy genre?

The research examines character complexity and how heavily disability is connected to a character's representation building on and expanding the framework established by Black & Pretes (2007), and Hall's representation theory (2020). A textual analysis was conducted of 102 episodes across six globally popular or fancult fantasy genre shows, geared towards mature viewers (>18 years of age) and younger audiences (<18) in which 11 characters (protagonists, main, and minor characters) were analyzed. Furthermore, it examines the transformative and symbolic character arcs disabled characters are given using Veale's character arc theory (2014).

Findings reveal four aspects: 1. there is a considerable difference between character representation and oppression of characters in programs targeted toward younger audiences vs. mature viewers (>18), with greater levels of oppression in the latter; 2. characters were consistently represented as complex individuals not solely defined by- or reduced to their disabilities, with fully-developed personalities, close and intimate interpersonal relationships, and integration into their communities (using Black & Pretes' enhanced model for analysis). 3: characters had arcs that both centered or did not center around their disabilities, and their arcs were not confined to stories focused solely on their disabilities, and 4. The portrayal of magical healing in these character arcs did not follow typical ableist portrayals.

Overall, disabled characters were represented as complex, capable, developed individuals whose arcs were influenced by their disabilities but not severely limited by their disabled status. This contradicts the findings of many previous studies around disability (Hughes, 2009; Omiegbe & Ezehi (2023). The research in this paper also expands on the claim of fantasy allowing the rediscovery of awe and wonder, by showing fantasy's ability as a genre in facilitating discussion around sensitive real-world topics such as disability representation. Fantasy lets those creating it and interacting with it explore themes in the abstract and opens doors for discussion around the constructed representations of disability. In this way, it presents a unique contribution to the research landscape as it explores the influence of the fantasy genre and its traits on how disability is represented, and what possibilities it can present.

TVS01 Representation, Visibility & Change

PP 0096 Female creative leadership and fiction series in Spain after the arrival of transnational video-on-demand services (2017–2025)

Concepción Cascajosa Virino[1]

[1] Carlos III University of Madrid, Department of Communication, Getafe, Spain

This study aims to provide a quantitative analysis of creative leadership in Spanish serialized fiction between 2017 and 2025 from a gender perspective, with the objective of determining the extent to which gender inequality between women and men persists or has diminished during this period. The production of television fiction in Spain constitutes a particularly relevant field for addressing this issue, given the significant boom the sector has experienced in recent years as a result of the consolidation of video-on-demand (VoD) services. This transformation has been driven both by local platforms—such as RTVE Play, Atresplayer, and Movistar+—and by transnational streaming services, including Netflix, Prime Video, and Disney+, which have reshaped production models, commissioning practices, and creative hierarchies within the audiovisual industry.

The study focuses on women's creative leadership in serialized fiction following the expansion of VoD services, using an original database that includes 347 series premieres released by players with national reach between 2017 and 2025. Creative leadership is examined through key roles such as creators, showrunners, and head writers. The results are analyzed through several complementary axes, including overall gender gaps in creative leadership, women's participation rates in series creation, differences according to commissioning broadcasters and platforms, variations across narrative genres, and the degree of originality of the projects (original concepts versus adaptations). This multidimensional approach makes it possible to identify patterns of inclusion and exclusion that are not immediately visible in aggregate data. In addition, the professional trajectories of female creators with more than one credit are examined in order to incorporate a more qualitative perspective.

The conclusions assess the extent of progress toward gender equality in the Spanish series industry during the period analyzed and identify the institutional, industrial, and cultural factors that contribute to the persistence of current inequalities. The findings offer empirical evidence that can inform public policy, industry practices, and future research on gender and creative labor in contemporary audiovisual production.

TVS01 Representation, Visibility & Change

PP 0097 Serial drama as a 'common third'. Research-action approaches to gender-related issues, audiovisual media and young adults in EU shifting grounds

Marica Spalletta[1], Hansen Kim Toft[2], Re Valentina[3]

[1] Link Campus University, Department of Human Sciences, Roma, Italy
[2] Aalborg University, Department of Culture and Communication, Aalborg, Denmark
[3] University of Naples L'Orientale, Department of Literary- Linguistic- and Comparative Studies, Naples, Italy

In the contemporary platform society – characterized by the dominance of streaming platforms, algorithmic recommendation systems and audiences' fragmentation – serial dramas play a fundamental role in shaping imaginaries about relevant social issues, standing out as powerful discursive spaces where norms, identities, and differences are negotiated. For this reason, the European Union has long recognised them as strategic tools for raising awareness on relevant social issues such as diversity and inclusion, which are highly controversial in a European landscape characterised by deep cultural and political tensions. The pillar role played by serial dramas in tackling gender stereotypes and fostering a more inclusive society is also reinforced when European strategies address the so-called "young adults" which, as digital natives, are particularly receptive to the symbolic power of these cultural products. Finally, European strategies pay particular attention to the pedagogical dimension, enhancing serial dramas as key agents in informal education, as they complement or sometimes contradict institutional teachings.

Based on the premises, our talk aims to detect the interplay between serial dramas, gender-related issues and European young audiences by presenting the final results of the EU CERV project GEMINI-Gender Equality through Media Investigation and New training Insights, which involved 4 European countries (Denmark, Ireland, Italy and Romania) differently labelled by the Gender Equality Index.

Content analysis on selected case studies revealed significant differences concerning how gender-related issues are portrayed on-screen. While serial dramas contribute to construct social meanings and, in some cases, challenge dominant narratives by offering alternative representations of gender roles, sexual identities, and intersectional experiences, the influence of global platforms raises questions about cultural homogenization, algorithmic bias, and the commercial imperatives that often prioritize visibility over authenticity. Transnational focus groups and survey on high school students showed that the problematic role of serial dramas in raising awareness and engaging audiences in critical thinking: while high school students recognize the social relevance of gender-related issues, they are less personally interested in them; meanwhile, serial dramas stand out as powerful tools in reinforcing already existing ideas rather than changing them. Finally, in depth

interviews with high schools' teachers and trainers revealed that, in a very fragmented European educational landscape, teachers are aware of the added value of using serial dramas as educational tools, but they have to deal with the challenges posed by national legal frameworks, cultural resistance and technological constraints

Based on these research findings, the GEMINI project suggests an innovative approach for creating a safe and productive learning environment in which gender and media literacy can be addressed. By using serial drama as a 'common third', this approach, based on the GMN triangle – a model designed to guide analysis of a specific series by focusing on gender representation, media communication, and narrative comprehension – fosters both security and engagement, both enabling students to explore gender-related issues while simultaneously developing their media literacy and providing teachers with an innovative and effective tool suitable to be embedded within different teaching paths.

TVS02 Changing television: Genres and Forms

PP 0198 Bite-sized storytelling: Reaching young audiences through short format scripted series. A view from Flanders

Axelle Asmar[1], Raats Tim[1]

[1]*imec-SMIT-Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium*

In recent years, there has been increased attention to programming for young audiences, or teen television. Chiefly, Subscription Video-on-Demand (SVODs) such as Netflix have significantly changed the content landscape for young adults, exporting a genre historically tied to American television beyond the Anglo-Saxon world. Many other streamers have followed suit, developing titles specifically aimed at young audiences in an effort to diversify their content offerings and appeal to younger demographics. This strategic focus on teen television by global streamers places pressure on local television players in Europe. Furthermore, the industrial disruptions caused by SVODs highlight the specific challenges faced by local television players in the streaming age. First, the ability of SVODs to aggregate globally underserved audiences, such as young adults, allows streamers to invest in stories for niche audiences at levels and budgets difficult to sustain for broadcasters whose focus is on national audiences. Second, local television players also face structural pressures as viewing habits shift towards digital media consumption. Linear television viewing has declined steadily in recent years, particularly among young audiences, and broadcasters' shift to an online-first strategy has yet to compensate for these losses. Moreover, even where local broadcasters have developed digital or hybrid delivery models, their services compete within an expanded attention economy that includes SVODs as well as user-generated environments such as YouTube or gaming. Finally, particularly in smaller media markets, public and commercial funding is generally limited, which restricts experimentation and tends to favour investments in cost-intensive genres expected to generate the broadest possible appeal. As a result, production volume is generally lower than in larger markets, and volumes of specific niche content are considerably lower. Under these conditions, teen television is often treated as a niche category or displaced by formats designed for older demographics.

Nevertheless, recent research shows that local commissioning and production strategies for young audiences are changing. Particularly, short-format scripted series–hereafter short formats–emerge as a key way to engage young audiences and adapt to their changing viewing habits. Indeed, as younger viewers abandon linear television, broadcasters have recognised the need to adapt by offering more flexible and youth-oriented fiction. Moreover, short formats allow local broadcasters to leverage cultural and linguistic proximity while experimenting with new genres that can compete with global streamers' offerings. However, little is known about how broadcasters strategically manage short-format series within broader content catalogues, and how narrative structures, genres, and production values are adapted to ultra-short storytelling. Taking Flemish public and commercial broadcasters as a case study, this presentation first examines how these short formats are integrated into the content catalogues, commissioning, and branding strategies of Flemish television players; second, we explore which narrative and thematic structures emerge, and how global themes are adapted to local storytelling and mobile-first formats. Based on a mapping of domestic broadcasters' offerings and supplemented by an analysis of trade press and promotional material of these short formats, we identify broadcasters' changing production and distribution strategies for young audiences in the streaming age.

TVS02 Changing television: Genres and Forms

PP 0199 YouTube as a new "lawless city": Youth reception of the Spanish broadcast "La Casa de los Gemelos", a distortion of the classic "Big Brother" reality television format

Juan Francisco Gutierrez Lozano[1], Antonio Cuartero[1], Francisco Javier Ruiz del Olmo[2], Eduardo Ramos Rodriguez[1]

[1] University of Malaga, Department of Journalism- Communication Faculty Media Studies, Malaga, Spain
[2] University of Malaga, Department of Audiovisual Communication- Communication Faculty Media Studies, Malaga, Spain

In a context of audience fragmentation and the declining centrality of traditional television among younger audiences (Sundet & Lüders, 2023), an event broadcast exclusively on YouTube and Kick in 2025 came to dominate social discussion about audiovisual content in Spain. This event was *La Casa de los Gemelos*, a "revision" or "free adaptation" of the *Big*

Brother format, which coincided with the lowest audience figures in the history of the twentieth Spanish edition of *Gran Hermano*, aired on the free-to-air channel Telecinco (Mediaset).

La Casa de los Gemelos was created by Madrid-based brothers Carlos and Daniel Ramos, known under the brand Zona Gemelos, with a strong presence on platforms such as Kick, where they stream online gambling-related content (Grosemans et al., 2024). The format reproduced several conventions of reality television, but introduced a defining and potentially harmful element: continuous unfiltered broadcasting without editorial mediation. Consequently, participant interactions frequently involved insults, verbal aggression, hate speech, and explicit references to drug use, for example. Most participants were viral social media figures without recognized professional status beyond their role as influencers.

The first edition was cancelled after only nine hours due to the seriousness of the incidents among participants, which required police intervention. A second edition (from 7 to 31 December 2025) achieved daily audience peaks close to one million viewers. It became a daily trending topic on X in Spain. The live broadcast of the New Year's Eve countdown attracted 2.7 million unique viewers, and further editions are planned for 2026. In response, Spain's main private free-to-air television groups, Atresmedia and Mediaset, devoted critical coverage to the format, emphasizing the deterioration of content aimed at young audiences and the reputational risks for brands advertising within a programme characterized by low production quality.

The aim of this paper is to explain and define the characteristics of this emerging format, and to conduct an audience research examining the ethical perceptions of Spanish secondary school students (aged 14–18) and university students (aged 18–22) regarding *La Casa de los Gemelos*. Using six focus groups (approximately 48 participants), we will explore how young audiences evaluate the legitimacy of digital content that reproduces, intensifies distorts reality television formats conventions, as well as differences in perception according to age and educational level. The findings will contribute evidence on the risks associated with deregulated platform environments such as YouTube, Twitch, and Kick. The research is part of the national project *AV-ADJUVEN* (PID2022-138281NB-C22), funded by the Spanish Government and the ERDF/EU.

TVS02 Changing television: Genres and Forms

PP 0200 Slow Reality TV: Making and engaging with Swedish public service television The Great Moose Migration

Annette Hill[1]

[1] Jönköping University, Media and Communication, Jönköping, Sweden

This research focuses on transnational audiences for the slow TV phenomenon of *The Great Moose Migration* made by public service media SVT in Sweden. With over 9 million page impressions for the 2025 series, transnational audiences watched minute by minute for three weeks the forests, lakes and occasional moose on the move. This live event generates calm, green atmospherics, a slow burn reality that is affective, moving and strangely mesmerizing. The research draws on production interviews with the documentary filmmakers of the series and transnational audience interviews to understand first, the making of engagement for slow reality television with public service values, e.g. non commercial interests; and second, intensities of audience engagement with slow reality and its affective atmospherics. How and why do transnational audiences engage with slow reality about forestry, nature and the environment?

The talk situates this production and audience research in the context of shifting grounds for reality within public service television. Representations of the real and engagement with factual, reality and entertainment genres face multilevel challenges in media environments. According to John Corner (see Nash et al 2025), in recent work on documentary, reality and factuality can be understood in a post referential frame of reference. Post referentiality means that public engagement with witnesses and accounts of real events, or experts and explanations of scientific knowledge struggle to maintain referentiality in the real world. The unusual path of slow reality TV about natural environments is a striking example of how public service television responds to post referentiality. If the integrity of the real is unmoored from its mediated factual and trust based settings, why is this television series resonating with transnational audiences? And what role does slow reality play in shaping new pathways in referential integrity? This research addresses these challenging questions, exploring how professional producers and audiences understand values in slow atmospherics, referentiality, forestry and the environment for slow reality television.

TVS02 Changing television: Genres and Forms

PP 0201 Legitimizing streaming platforms in Turkey: Industry-reflexive series as strategic productions

Ayşegül Kesirli Unur[1]

[1] Istanbul Bilgi University, Department of Film and Television, Istanbul, Turkey

A new wave of Turkish content emerged shortly after the launch of local and global streaming platforms in Turkey in 2016 and challenged the globally successful formula of Turkish TV series that broadcast on mainstream television channels. Compared to the mainstream productions, the new generation of Turkish series has been featuring significantly shorter episodes and seasons (Vitrinel & Ildır, 2021) and experimenting with different genres, styles, and storytelling practices (Yörükoğlu & Akçalı, 2020). Beyond their narrative and stylistic qualities, these streaming series have also been perceived as distinct from their counterparts on mainstream television due to their relative freedom from state censorship. Through

these distinguishing features, these productions have been discursively positioned as an 'alternative' to the Turkish TV series on mainstream channels (Ildır & Çelik, 2021), targeting a more 'sophisticated' audience (Arslan &Tetik, 2021).

By conceptualizing the Turkish television industry as a Bourdieusian 'cultural field' (Lindell, 2024), this paper argues that such a discourse of distinction reflects an ongoing struggle for positions within the industry, in which streaming platforms seek to legitimize their status by building hierarchies based on artistic value, creative autonomy, and claims to higher professional standards. Within this context, industry-reflexive television series, which have emerged as a persistent genre on streaming platforms in Turkey, can be approached as strategic productions, through which streaming platforms seek to establish legitimacy within the field. Created by showrunners with professional backgrounds in mainstream Turkish television across different roles, these series use comedy to expose the 'flawed' practices in Turkish TV series production while simultaneously positioning streaming platforms as appropriate sites to reveal insider knowledge about the industry.

Based on this theoretical framework, the paper analyzes both the narrative discourses of industry-reflexive series across various streaming platforms, including *Me, Bartu* (HBO Max, 2018), *Ethos* (Netflix, 2020), *Between the World and Us* (Disney+, 2022), *Audition* (HBO Max, 2023), and *Background Actor* (Tabii, 2024) and the discourses articulated by showrunners in public interviews about their production processes. In this way, the paper intends to investigate the kinds of knowledge these series produce about the established industrial practices in the mainstream Turkish TV series production and argues how this insider knowledge contributes to the construction of streaming platforms' positions within the field of Turkish television industry.

TVS02 Changing television: Genres and Forms

PP 0202 International sports documentaries broadcast in Spain from a gender perspective (2018–2025): A return to the past

Anna Tous Rovirosa[1], Jorge Martínez Lucena[2], Leonor Balbuena[3], Elena Neira[4]

[1] Autonomous University of Barcelona (UAB), Sports Research Institute (IRE) / Journalism and Communication Sciences, Bellaterra, Spain
[2] University Abat Oliba CEU, Department of Communication, Barcelon, Spain
[3] Autonomous University of Barcelona, Publicity and Public Relations, Bellaterra- Barcelona, Spain
[4] Open University of Catalonia, Communication, Barcelona, Spain

The production of sports documentaries has experienced exponential growth in recent years (Sarkar & Jyotsna, 2023), far surpassing that of fictional series and films addressing similar themes. This quantitative increase justifies the need for a systematic analysis from a gender perspective, particularly within a context shaped by the supposed paradigm shift in sports-related audiovisual fiction identified in recent research (Tous-Rovirosa et al, 2023; 2026), as well as by the social impact of audiovisual narratives on audiences. Previous studies have warned of the persistence of a hegemonic representation of white, heterosexual masculinity, in which women, LGBTIQ+ identities, and BIPOC communities occupy marginal or exceptional positions (Oates, 2017; Darda & Davis, 2023).

The present study analyzes a corpus of 345 sports documentaries broadcast in Spain between 2018 and 2025, of both national and international origin. Based on an ad hoc analytical framework—developed from the authors' previous research—a set of variables was coded with the aim of examining gender representation across different OTT platforms and TV channels and its relationship with the gender of the director. Coding was conducted using Excel, drawing on the IMDb and FilmAffinity databases, as well as institutional sources, and the statistical analysis was carried out using the PSPP software.

The results show that sports documentaries represent, from a gender perspective, a return to traditional approaches and even a regression when compared to sports TV series. Protagonism is predominantly male, concentrated in male figures, whether individual (36.5%) or ensemble-based (39.4%). The predominant target audience is adult (87.5%), football constitutes the central sport (37.7%), and the main thematic focus revolves around values of self-improvement and resilience (47.8%), which suggests a relationship between resilience and eudamony (Baldwin & Bantle). Direction is overwhelmingly male (73.9%), and the main producing countries are Spain (43.8%) and the United States (29.3%).

Despite the enactment in Spain of the LGCA (Law 13/2022 of 7 July), aimed at fostering and promoting women in directorial positions, no observable effects of this legislation are detected in Spanish productions, which display problems similar to those found in international content.

The relationship between the gender of the director and protagonism reveals a strong gender homology: 79.4% of productions featuring male protagonists are directed by men, while individual female protagonism accounts for only 4.7% of works directed by men. Women directors represent just 7.2% of the total, and their works show a more balanced distribution of protagonism and account for 34.8% of individual female protagonisms and 57.1% of female ensembles.

Platform-based analysis indicates that Netflix (21,7%) and Movistar (22%) clearly reproduce male bias, whereas Prime Video, Disney+, and smaller platforms such as Filmin offer slightly greater female visibility. Platforms with a higher volume of titles are those that display the most hegemonically masculine bias.

It is concluded that sports documentaries promote a narrative of self-improvement and resilience centered on male representation, with a strong dominant pattern, which only varies in the case of minority platforms or in the scarce cases in which women occupy directorial roles, and it is related to the minimal representation of "other" minorities...

TVS04 Between Dependency and Hybridisation: European Broadcasters Navigating Platform Power

PN 27 The search for reach and revenue: Responses of commercial European broadcasters to streamers

Catalina Iordache[1]

[1] Vrije Universiteit Brussel, imec-SMIT, Brussel, Belgium

This paper examines how Europe's commercial television sector has responded to the disruptive rise of digitalisation and global streaming services. The convergence of ad-skipping technologies, delayed viewing, and the shift of advertising to digital platforms eroded the traditional pillars of linear broadcasting—audience concentration, scheduling control, and advertising revenue. Despite extensive scholarship on public service media, research on commercial broadcasting in Europe remains limited. Aside from comparative work such as the Private Television in Western Europe collection (Donders et al., 2013), few studies have systematically examined how commercial broadcasters are responding to changes in the media industries, across Europe. Theoretically, this study draws on three complementary frameworks: Napoli's (1998) model of strategic responses, as adapted by D'Arma et al. (2021); Evens and Donders' (2018) framework of platform power; and the concept of platformisation (Nieborg & Poell, 2018; Poell et al., 2019), increasingly used to examine strategic change in public service media (Iordache et al., 2024; Johnson et al., 2025). The analysis combines aggregated industry data, trade press coverage, and recent academic research to map how commercial broadcasters adapt to global competition and the wider digital transformation of the audiovisual sector. The paper discusses four interlinked strategies through which European commercial broadcasters have responded: (1) diversification of revenue streams, (2) developing online portals, (3) scale through concentration and collaboration, and (4) advocating for regulation. European commercial broadcasters have responded through a complex interplay of diversification, platformisation, and consolidation, each reflecting an effort to reconcile economic sustainability with continued cultural relevance. Diversification involved expanding income sources beyond linear advertising: developing advertising video-on-demand, subscription video-on-demand, and hybrid freemium models; investing in digital advertising technologies; and extending commercial activities into data services, content licensing, and brand partnerships. Platformisation—the process through which broadcasters adopt the technological and operational logics of global streaming—saw traditional channels reinvent themselves as multi-platform ecosystems, controlling user interfaces, data infrastructures, and on-demand catalogues. Consolidation, in turn, sought to restore scale and bargaining power in an environment where both audiences and advertisers diminished. Finally, they sought regulatory change to safeguard their position and impose comparable obligations on streamers, lobbying for measures to 'level the playing field' and forming alliances with public broadcasters to call for prominence and discoverability. These strategies have been as much defensive as innovative, driven by the need to survive in markets dominated by global platforms with deeper pockets and transnational reach. Many broadcasters embraced experimentation and short-term pragmatism, illustrating a fragmented landscape of approaches, shaped by both market pressures and regulatory interventions. Ultimately, Europe's commercial television sector stands at a crossroads between adaptation and dependency.

TVS04 Between Dependency and Hybridisation: European Broadcasters Navigating Platform Power

PN 28 The challenges to the external television production industry in small markets in the context of an online public service media trajectory

Hanne Bruun[1]

[1] Aarhus University, Centre for Media Industries and Production Studies, Aarhus, Denmark

Recent contributions to research on how public service media (PSM) in Europe are transforming to online PSM show that the competition for audiences with global video-on-demand services (VoD) in different national contexts challenge their content strategies and publishing practices (e.g. Iordache et al. 2024; Bruun et al. 2025; Donders 2021). This paper contributes to this body of research but from the perspective of the external television production industry in a small market such as Denmark. The focus is on the relationship between the external production industry and TV 2 Denmark as

the company is a publisher-broadcaster and the biggest commissioner of original Danish television programmes. TV 2 has profound structural power in the local production industry. In recent years, the external production industry itself has undergone a process of either merging with international production companies or merging into larger groups to counter this structural power (Bruun 2010; Doyle 2023; Doyle et al. 2021). However, the local companies must be sustainable despite this organisational strategy. The paper argues that TV 2's current content strategies entail a radical shift in commissioning compared to the multi-channel era of television, which intensifies the competition in the external production industry. Furthermore, it changes the creative playing field, as the risk-taking behaviour of the public service company is also changing (Bruun and Lassen forthcoming; Bruun forthcoming). The paper outlines the recent development in the national external production industry and includes a case study of two typical production companies: Blu Productions part of Fremantle and owned by RTL group, and Monday Media Group, a network company active in the Nordic Countries and The Netherlands. The paper builds on interviews with the professionals and document analysis, e.g., calls for programmes, content strategic documents, programmes commissioned and trade press. Based on these data, the paper investigates the impact of TV 2's content strategies, and whether the small market or other factors such as number of customers, language and public service policies can explain the patterns found on the Danish market. Furthermore, the development in commissioning strategies call for a new interpretation and implementation of core public service values and broadcasters' needs by the external production companies with an impact on their creative work and the kind of cultural production they provide.

TVS04 Between Dependency and Hybridisation: European Broadcasters Navigating Platform Power

PN 29 "This programme is now available to streamcast". When legacy media meet platforms: Italian TV broadcasters between resistance and hybridisation

Massimo Scaglioni[1], Mattia Galli[1]

[1] Università Cattolica del Sacro Cuore, CeRTA, Milano, Italy

Over the past decade, the emergence and proliferation of video-on-demand services and digital platforms has had a profound impact on the traditional television supply chain, transforming production and distribution practices as well as the industry's revenue streams (Lotz, 2022). Building on the concept of "streamcasting" (Scaglioni, 2025) – a synthesis of the features of traditional broadcasting, such as scheduled programming, and the new digital properties introduced by portals, such as on-demand viewing and the collection and management of first-party data (Johnson, 2019) – and recent empirical academic research (Ce.R.T.A., 2025), the paper analyses the "resistance and adaptation" strategies (D'Arma et al., 2021) adopted by legacy Italian broadcasters in the current platformised media economy, focusing in particular on public service media company Rai. The paper focuses on three interconnected issues within the current national media scenario: (1) the hybridisation of distribution patterns between linear and on-demand, particularly for valuable content such as scripted TV series, in a peculiar national context where linear viewing remains a crucial part of the audiovisual economy; (2) cross-platform extensions and touchpoints (on both proprietary web spaces and third-party platforms) to increase reach among core target audiences who have moved away from traditional broadcasting; (3) editorial rebranding of assets such as on-demand libraries and online properties, in order to align with market pressures. The strategies adopted by Rai in response to these issues all address an urgent yet unavoidable need: the adaptation of the public service mission that has guided the PSM's broadcasting operations for a century, in an arena that is evolving rapidly with the emergence of new digital competitors. From a methodological point of view, the paper takes a mixed-methods approach. This incorporates policy and industrial paper analysis (Iordache et al., 2024), as well as aggregated economic and audience figures for linear and digital properties over the last few years, qualitative case studies, and interviews with Rai executives. The ultimate goal is to develop a typology of the "streamcasting" strategies adopted by Rai, based on an interpretative framework that considers the recurrent tensions between the PSM's mission and the ever-changing, platformised economy and society. The paper makes two valuable contributions to the body of knowledge in television studies. Theoretically, its aim is to establish a connection between the tradition of television studies and the paradigm of platformisation. It demonstrates how linearity is not just an outdated legacy; rather, it can become a valuable cultural resource in a highly platformised media economy. Furthermore, it shows how broadcasting features can be effectively combined with the properties of VOD services. From an empirical point of view, it illustrates the specific strategies, routines, and experiments of an Italian legacy media company. It focuses on instances of "resistance" (defence of schedules and programming practices; brand safety and content diversity) and "adaptation" (increasing digital touchpoints to capture additional reach, and developing on-demand and digital-first libraries).

TVS04 Between Dependency and Hybridisation: European Broadcasters Navigating Platform Power

PN 30 The dilemma of YouTube-presence: Two Danish perspectives on legacy broadcasters' content distribution on third-party platforms

Julie Münter Lassen[1]

[1] Danish School of Media and Journalism, Danish School of Media and Journalism, Copenhagen, Denmark

This paper examines the difficult dependency on third-party platforms faced by public service media (PSM) organisations, when they choose to distribute their content on video sharing platforms and social media. The focus of the paper are

two Danish legacy broadcasters, DR and TV 2, both of which are currently strengthening their presence on third-party platforms. Each broadcaster has launched – or is about to launch – new five-year strategies, addressing challenges related to, among other issues, competition, appropriation of new technology, and changing user habits. While both organisations enjoy a high reach within the general population, they struggle, as most other legacy media, to reach and engage younger audiences. Their response is a strategic decision to prioritise a stronger presence on third-party platforms such as YouTube. As described by Johnson et al. (2025), distribution on third-party platforms requires balancing the imperative to reach younger audiences with substantial challenges of distributing content on platforms, which are subject to very different rules and norms. Among these challenges are lack of transparency in content visibility, limited access to data, challenged communication with the platforms, and for commercial broadcaster also compromising their business model from linear and/or VoD distribution (ibid., p. 20). Also, the risk of offering PSM content alongside harmful content raises ethical concerns. Methodologically, the paper draws on analyses of strategy and policy documents as well as interviews with key players from the two organisations. It asks what the broadcasters' rationale is for deciding on more third-party distribution and considers how the challenges and solutions differ (or are alike) between the two broadcasters operating within the same media system with similar public service ambitions but with different business models. The paper contributes to the study of the digital transformation of PSM by addressing widely known challenges within the context of strong public media in the Nordic countries. As Syvertsen et al. (2014) observe, PSM organisations in the Nordic countries have traditionally been well-funded and supported by the public and politically. The paper discusses how distribution via third-party platforms may risk undermining this support, thus questioning the PSM raison d'être in the public. Key words: public service media, digital distribution, Nordic media, platform dependency, corporate strategy.

TVS04 Between Dependency and Hybridisation: European Broadcasters Navigating Platform Power

PN 31 The cost of staying in the game: Fiction budgets and platform power in Italian legacy television

Nicola Crippa[1], Giovanni Ceccatelli[1]

[1] Università Cattolica del Sacro Cuore Milano, CeRTA, Milano, Italy

Over the past decade, the Italian television market has been reshaped by the entry of global streaming platforms, producing a multipolar environment in which legacy broadcasters and digital-native players coexist and compete (Scaglioni 2024). While platform impact has often been analysed through the lenses of circulation, visibility and algorithmic gatekeeping, or cultural diversity (cf. Curtin et al. 2014, Beschiera et al., 2017, Hesmondhalgh & Lotz 2020, Grece & Tran 2023, Idiz et al. 2025), less academic attention has been paid to how it operates upstream, reshaping the budgets of scripted production. This paper addresses this gap by examining production costs as a key site where platform-induced benchmarks intersect with legacy broadcasting strategies. Adopting a system-level perspective, the paper analyses the Italian scripted production landscape (cf. Buonanno 2012), focusing on Rai, Mediaset, and Sky as a historically rooted legacy ecosystem responding to the scale, risk profiles, and commissioning norms introduced by global streamers such as Netflix and Prime Video. Empirically, the analysis draws on an original dataset of over 600 Italian scripted titles – including series seasons, miniseries, and long-running serial formats – first released on linear television and OTT services from 2020 onwards. A distinctive feature of the Italian case is the availability of title-level production budgets, self-declared by producers and collected by the Italian Ministry of Culture. These data are combined with information on IP ownership and adaptation status, genres, formats, renewals, evidence from industry reports, and European circulation data from the Lumière VOD database (cf. Bengesser et al. 2024). Together, they enable a comparative analysis of total budgets, cost per minute, commissioning patterns, and subsequent circulation across linear and on-demand environments. After outlining the key characteristics and production trends of Italian broadcasters in a context of streamers' co-opetition, the paper identifies recurrent production and editorial regimes across the legacy system – high-end drama, mainstream generalist series, long-running low-cost formats, digital-first experiments, etc. By conceptualising production budgets as a sensitive seismograph of industrial change, we offer a case study of how public service media and commercial broadcasters negotiate value, risk, and reach in Italy's multipolar market, while outlining a methodological template that can be extended to other European systems.

TVS05 Audiovisual Streaming: Data, Audiences & Production

PP 0541 From data asymmetry to data lore: Effects of audience data on authorship and production relationships in the Finnish television industry

Anne Soronen[1], Laura Seppälä[1], Saara-Maija Kallio[1], Eliisa Vainikka[2]

[1] Tampere University, The Communication Sciences Unit, Tampere, Finland
[2] University of Vaasa, School of Marketing and Communication, Vaasa, Finland

Television and streaming industries are permeated by data and metrics. With the streaming platforms, the abundant and detailed audience data reshapes the power structures of the television industry. Creative workers' and production companies' dependence on data owned by streaming platforms has made these platforms significant gatekeepers in the industry (Ibid & Poell 2025). Viewer ratings and the knowledge of viewer segments have long guided the production and commissioning of television series, but with the collection of streaming data, television and streaming industries have considerably more detailed information to support decision-making about how, when and who consumes their content (Doyle 2018; Kelly 2019). Despite the growing amount of data, one trend in the industry has been the culture of data secrecy (Navar-Gill 2020; Rasmussen 2024).This shift related to the asymmetry of data availability can be seen as a continuation of the power imbalance between creatives and commissioners, but it also entails new manifestations of how creatives perceive the expectations placed on their productions by commissioners.

Our goal is to examine the relationship between data secrecy and "being data-driven" (see Navar-Gill 2020) and how they both affect understandings of authorship in the television production culture. We focus on what meanings both creatives and commissioners assign to the audience data and how they see the relevance of data in their creative decision-making. We also consider how the current industry lore is built around data access and data imaginary. Our research material consists of interviews collected in 2023 and 2024 with 32 television industry professionals working in Finland. 25 of them represented creatives (screenwriters, directors, producers, script supervisors) and seven represented professionals working as commissioners in the Finnish Broadcasting Company Yle, streaming services or television networks.

Our reflexive thematic analysis illustrates that audience data plays a key role in the development processes and commissioning decisions of television series, but creatives do not have clearly agreed access to data collected from their own productions. The data and its potential uses seem to both weaken and strengthen creatives' authorship. From the creatives' perspective, data secrecy and opacity of data interpretation cause confusion. In the absence of information, they are prone to guess the effects of data and its intended use: beliefs and imaginations of data produce specific data lore that is part of streaming lore (Burroughs 2019) and a continuation of the industry lore (Havens 2008). While industry lore consists of insider information, unspoken rules and experience-based knowledge about the prevailing operating cultures and viewer preferences, data lore prioritizes assumptions and speculation about the role of data in decision-making of television industry actors. However, access to audience data is assumed to provide useful ways to navigate a competitive and uncertain working environment, furthering the prevalence of data lore.

PP 0543 Scheduling Netflix: On the remediation of viewing routines in the streaming video on-demand era

Alessia Gebauer[1], Karin van Es[2]

[1] Erasmus University Rotterdam, Erasmus School of History Culture and Communication, Rotterdam, Netherlands
[2] Utrecht University, Media and Culture Studies, Utrecht, Netherlands

Television studies continue to understand broadcast television viewing as structured through schedules, genres, and channels that organise how audiences engage with content (Ellis, 1982; Ellis, 1990). Streaming platforms such as Netflix frequently position themselves as breaking from these logics through narratives of alt-genres and post-demographic taste communities, personalisation and on-demand viewing (Elkins, 2019; Frey, 2021). This study explores these narratives and argues that viewing behaviour, rather than being hyper-individualised, continues to be organised through schedule-like routines and conventions familiar from broadcast television. Netflix's recommendation system, rather than disrupting these conventions, acts as a broad framework within which these routines are practised.

Drawing on computational analysis of approximately 285,000 viewing events from 126 Dutch Netflix users, collected through data donations and linked with demographic survey data (Van Es & Nguyen, 2025), this study examines viewing behaviour and how it is organised across time and content type. We combine temporal analysis of viewing activity with network analysis of Netflix's catalogue and video-to-video recommendation system (Gomez-Uribe & Hunt, 2015). Beyond genre and mood labels, we structure the catalogue into algorithmically derived "metadata clusters": 22 modularity-based communities ($Q \approx 0.6$) built from video-to-video recommendations. These groupings reflect how Netflix operationalises video-to-video similarity, enabling a detailed comparison of viewing behaviour over time along genre and recommender-based classifications.

The paper has three main findings. First, Netflix viewing follows a repetitive weekly rhythm with distinct daily patterns, such as evening "prime-time"-like concentration and early-morning children's content viewing. What users watch is not best described by genre categories alone, but by the recommender-system-derived metadata clusters, which provide a clearer organising structure than genre tags when observing viewing behaviour.

Second, when we structured individual viewing behaviour into a weekly 'what-they-watched-when' schedule, a visual analysis identified four distinct viewing routines within the sample. A modularity analysis of viewing behaviour, examining which users watched which types of content throughout the week, showed that these groups of users were sufficiently distinct in their behaviour ($Q \approx 0.3$). Each of these behavioural groups showed significant demographic differences in age and gender. Group 1 was predominantly middleaged men ($N = 36$, Age $\mu \approx 47$, 80.6% M), Group 2 was predominantly middle-aged women ($N = 21$, Age $\mu \approx 42$, 76.2% F), Group 3 was predominantly younger adults with no significant gender difference ($N = 33$, Age $\mu \approx 36$), and Group 4 ($N = 9$, Age $\mu \approx 42$) appeared to be sporadic viewers that mostly watched only a single type of content.

Third, we show that following direct title-to-title recommendations is rare; instead, users follow broader paths between spaces of recommendation, within which they exercise their agency. While users rarely follow direct video-to-video recommendations (1.37%), their movement between titles aligns closely with the weighted directional relationships in the higher-level metadata clusters of the video-to-video recommender graph (63%). These findings suggest that Netflix, rather than prescribing what to watch next, organises content into spaces of recommendation within which users reproduce routine viewing patterns.

TVS05 Audiovisual Streaming: Data, Audiences & Production

PP 0544 Content prominence and its impact on circulation diversity and viewership on a PSM VOD service

Raul Lobanov[1]

[1] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

In response to the rise of on-demand consumption, most public service media (PSM) organisations have launched their own video-on-demand (VOD) services over the last decades. While the viewership of these services is on the rise, traditional linear TV viewership is declining. Such a shift in consumption of TV content may pose challenges for PSM in sustaining diverse patterns of consumption. At the same time, although prominence has become a central issue in platform regulation and policy debates, empirical research has typically focused either on VOD catalogue composition or on interface description, leaving the relationship between content prominence and viewership underexplored. This paper addresses this gap by analysing how content prominence affects viewership and how it structures circulation diversity on Estonian Public Broadcasting's (ERR) VOD service. Circulation diversity refers to the diversity that emerges as content moves from catalogue (available diversity) to interface visibility (exposure diversity) and finally to viewership (consumed diversity).

The study combines a longitudinal dataset comprising daily measurements over a full year (June 2024–May 2025) with interviews conducted with ERR's VOD editorial team. Quantitative data include catalogue composition, content prominence, viewership, and linear TV scheduling data, and content metadata. For each title, daily prominence, TV broadcast recency, and VOD premiere recency scores were computed, and viewership figures were collected. Circulation diversity was assessed by comparing the distribution of content types, origins, and production years across catalogue, exposure, and viewership levels. Regression analysis examined the explanatory power of prominence, broadcast recency, and premiere recency in predicting viewership.

The findings show that although ERR's VOD catalogue is diverse and well-balanced (with strong representation of cultural, factual, and domestic content), exposure and viewership patterns diverge substantially from this catalogue-level diversity. Acquired scripted series and feature films receive disproportionately high prominence, and their dominance is even more pronounced in viewership outcomes. Long-term availability emerges as an important enabling VOD affordance: although only 36% of available titles are watched on an average day, 99% receive viewership across the whole year. Yet regression analysis demonstrates that once content prominence and premiere recency are accounted for, duration of availability exerts only a weak negative effect, and broadcast recency loses its apparent positive influence. Overall, the visibility of content (prominence) and the novelty of content (premiere recency) explain most of the variance in viewership ($R^2 = 0.62$).

Interviews with ERR's editors contextualise these dynamics, revealing curational work as a balancing act between PSM value commitments, resource constraints, linear scheduling rhythms, and audience expectations shaped by global commercial

VOD services. Although editors aim to promote diversity, their decisions remain influenced by popularity, novelty, rights windows, and residual linear logics, producing tensions between PSM missions and commercial VOD logics.

The study contributes empirical evidence to ongoing debates on prominence, discoverability, and PSM platformisation. It demonstrates that content prominence is a central, but not exhaustive, driver of viewership, and shows how content diversity is progressively reshaped as it moves from availability to viewership. Evaluating PSM VOD services therefore requires analysing availability, exposure, and consumption jointly rather than in isolation.

TVS05 Audiovisual Streaming: Data, Audiences & Production

PP 0545 Beyond the streaming black box: Navigating data secrecy and access in media industries research

Sandra Becker[1], Daphne Idiz[2], Hanna Surma[1], Karin van Es[1]

[1] Utrecht University, Media and Culture Studies, Utrecht, Netherlands
[2] University of Toronto Scarborough, Department of Arts- Culture and Media, Toronto, Canada

Global streaming services have reshaped the media landscape introducing disruptive business and distribution models. Moreover, they have shifted to unprecedented data collection and management. Streaming giant Netflix, for example, has been identified as a "black box when it comes to data" (Idiz et al. 2021, 437) due to its "data secrecy" (Rasmussen 2024). This includes not only the data generated by users on their platforms, but a broader range of data related to their various practices. With increased production budgets and a shrinking number of commissions in the age of streaming, data access has become even more essential to producers, legacy players in the screen industry, and policymakers. Screen industry workers need performance insights for future contract negotiations (Navar-Gill 2020; Idiz and Poell 2024). Policy makers across Europe rely on production and investment data to assess the need and effectiveness of national investment obligations (Hagedoorn and Becker 2025). For media and communication scholars various forms of data access are essential to map and theorize these developments, and assist policy makers with empirical insights on the transformation of the screen industry.

In line with the conference theme "shifting grounds," this paper examines how researchers navigate the opacity of the streaming "black box" in the screen industries, marked by data secrecy and strategic selective disclosure (Van Es 2024). Building on critiques of the transparency ideal, we reconceptualize data access as an ongoing, relational process. Drawing on multi-sited and mixed-method research from previous studies, it maps the shift to this fragmented terrain of data access across research into *production*, *platforms*, and *policy*. By synthesizing these previously siloed approaches, we identify shared challenges, valuable sources, and innovative as well as tried-and-true methods for circumventing industry secrecy. It concludes by proposing a framework for streaming video research founded on collaboration, industry partnerships, and reciprocity, addressing the infrastructural shifts and ethical limits of open science in the streaming era.

TVS06 Entertainment Television: Practices & Politics

PP 0646 25 years later – How Big Brother changed the global television landscape

Lothar Mikos[1]

[1] Freie Universität Berlin, Institut for Media and Communication Studies, Berlin, Germany

When we think back to the year 2000, it turned out that not all computers crashed at the turn of the millennium, and that the national and global television landscape was still very different. In spring of 2000 a Dutch television format initially in Germany and then in 62 television markets worldwide shocked the public. The reality show format *Big Brother* by production company Endemol appeared not only on television screens, but also on other screens, permanently changing the television landscape.

Big Brother illustrates five developments in television that began in the Netherlands and Germany:

1. *Big Brother* can be seen as a blueprint for other reality TV formats, which have experienced a real boom and are now an integral part of television (and streaming) programming (Chalaby 2016 and 2023).
2. *Big Brother* and the boom of Reality TV formats, the global format trade experienced enormous growth rates (Havens 2006; Mikos 2020; Moran 2009).
3. This format trade sparked a new dynamic in the acquisition of IP and licensing rights, leading to numerous company takeovers (Esser 2016).
4. The example of Big Brother illustrates how media convergence between the traditional media industry, telecommunications and the tech industry work. The format made marketing, merchandising and multi-screen exploitation important (Sparviero etal. 2017).
5. The expansion of format trading was accompanied by fragmentation both on the supply side (number of television stations and channels, streaming services) and on the audience side (niche audiences, different preferences in different milieus), who live in a 'society of singularities' (Athique 2016; Reckwitz 2020).

Even though *Big Brother* was not predicted to have a long lifespan in 2000, the format still exists today. Looking back on the last 25 years of television development, it must be said that *Big Brother* was innovative in many ways, both in terms of format and the reality TV genre, as well as in terms of marketing and the structure of the value chain. *Big Brother* has changed the production and distribution of television formats as well as the advertising and marketing formats for programmes. In my paper, I will analyse these five developments in detail.

TVS06 Entertainment Television: Practices & Politics

PP 0647 Entertainment television as a site of memory politics: The case of the Intervision Song Contest 2025

Yulia Yurtaeva-Martens[1]

[1] Freie Universitaet Berlin, Media and Communication Studies, Berlin, Germany

In September 2025, Russia staged the Intervision Song Contest (ISC) in Moscow, presenting it as the revival of a supposedly forgotten television tradition and as a cultural counterweight to the Eurovision Song Contest, from which Russia has been excluded since 2022. This paper analyses ISC 2025 as a televisual memory project and argues that the contest functioned as a politically instrumentalised construction of cultural continuity through media spectacle. Building on the memory concepts developed by Assmann and Assmann (1994) and on approaches to media memory articulated by Erll (2011), the paper conceptualises the ISC as a medial act of remembrance through which a usable past was produced for contemporary political agendas.

Historically, the Intervision Song Contest never constituted a continuous or stable television format. Although various music festivals in socialist Eastern Europe during the 1960s and 1970s were retrospectively labelled "Intervision Song Contests" in Western discourse, only two competitions officially carried this title: the Prague-based contest launched in 1965 and the Sopot-based contest held between 1977 and 1980. Both were short-lived and ended amid political upheavals, notably the suppression of the Prague Spring in 1968 and the declaration of martial law in Poland in 1981 (Vuletic 2019; Yurtaeva-Martens 2025). Neither contest was hosted by the Soviet Union itself, situating ISC 2025 within a historically discontinuous tradition shaped by political rupture rather than continuity.

Empirically, the paper follows a three-part analytical approach conducted between January and November 2025. First, it analyses the framing of ISC 2025 by Russian state actors and state-aligned media, focusing on how the contest was positioned as a marker of historical and cultural continuity. Second, it examines international news coverage to trace how the event was interpreted and contextualised outside Russia, particularly in relation to geopolitical narratives. Third, it investigates non-state-curated online reactions by Russian audiences in order to assess how the official framing resonated in public reception.

While Russian state media consistently framed the ISC as a return to an internationalist cultural legacy, non-state-curated online reactions showed little engagement with the historical narrative of Intervision. Instead, public discussion focused on

issues such as the event's funding, comparisons with the Eurovision Song Contest, and critical assessments of the appropriateness of staging a lavish entertainment spectacle amid Russia's ongoing war against Ukraine. In this context, the contest was widely perceived as an attempt to project normality and cultural vitality under conditions of war and international isolation. International media coverage echoed this reading, predominantly interpreting the ISC as a geopolitically charged media event (see Morton 2025).

The study concludes that ISC 2025 highlights the limits of state-driven televisual memory construction. As a case study, it demonstrates how television formats can be mobilised within contemporary memory politics and how such efforts can remain ineffective when confronted with historical discontinuity, geopolitical realities, and audience reception. In doing so, the study contributes to television and memory studies by showing how contemporary entertainment formats operate as sites of state-led memory politics in politically charged contexts.

TVS06 Entertainment Television: Practices & Politics

PP 0648 Comfort Viewing in an Age of Crisis: TV series as security blankets for (young) audience

Stefania Antonioni[1]

[1] University of Urbino Carlo Bo, Department of Communication- Humanities and International Studies, Urbino, Italy

The rewatching of television series has become a widespread and meaningful consumption practice among young audiences in the contemporary streaming ecosystem, characterized by an unprecedented abundance of available content. This paper approaches rewatching through the lens of affect theory, situating it as a form of comfort viewing that responds to the affective conditions of media saturation and choice overload that shape audience experience, especially young one. Rather than understanding rewatching as a nostalgic impulse or a resistance to novelty, the study conceptualizes it as an affective strategy through which viewers actively manage emotional states, cognitive fatigue, and the pressures of constant cultural availability.

Drawing on affect theory and on the premises of Eva Illouz's *Explosive Modernity* (2024), the paper argues that rewatching operates as a stabilizing practice within an environment defined by acceleration, excess and discomfort. Familiar television series provide predictable narrative rhythms, known emotional trajectories, and established character relationships, allowing young viewers to engage with media in ways that reduce uncertainty, mitigate decision fatigue and are used as comfort experiences. In contrast to the affective demands of discovering new content—often accompanied by algorithmic pressure to keep up, optimize taste, and remain culturally informed—rewatching enables a slower, less demanding mode of engagement that prioritizes emotional reassurance over narrative surprise.

The paper situates the practice of rewatch as comfort viewing within the broader transformations of television as a technology and cultural form under conditions of streaming and algorithmic governance. While streaming platforms in some ways intensify anxiety through endless choice, optimization pressures, and accelerated consumption, they simultaneously facilitate rewatching through on-demand access, personalized recommendations, and interfaces that normalize repetition. This paradox highlights how contemporary television participates in both the production and the management of affective responses to crisis, positioning audiences not only as consumers as active agents navigating media abundance.

Moreover, the paper will show the first findings from exploratory qualitative research, based on preliminary interviews with young viewers. This initial empirical material will be used to identify recurring affective motivations, emotional vocabularies, and viewing routines associated with rewatching practices. Another aspect that will be examined is the sense of media-driven nostalgia, represented by TV shows from the past, now available again via streaming, which are often mentioned by interviewees.

TVS06 Entertainment Television: Practices & Politics

PP 0649 MEME(T)VISION New practices of circulation and commentary on television in the platform age The Eurovision Song Contest as a context for analysis

Anna Bisogno[1]

[1] Universitas Mercatorum, Scienze Umane e Sociali, Roma, Italy

Contemporary television is increasingly influenced by practices of circulation, transformation, and commentary that develop beyond the traditional contexts of broadcasting and streaming. In this scenario, social media assume a central role in the processes through which television content is remediated, re-signified, and reinserted into the space of public debate. This paper introduces the concept of memevision to describe these dynamics and to analyze the role of memes as a cultural modality through which television continues to produce meaning within a profoundly transformed media ecosystem.

The topic theoretically lies at the intersection of studies on media platformization (Van Dijck, Poell, Nieborg), studies on television and media events, with particular reference to research on the circulation of texts, paratexts, and media events (Dayan and Katz; Gray), and the literature on convergence and the participatory circulation of content (Jenkins). This framework is complemented by studies on memes as a communicative and cultural practice (Shifman; Milner), which allow us

to understand memes not only as textual objects but as situated social practices, grounded in processes of remixing, irony, and critical commentary.

Empirically, the paper examines the practices of meme production and circulation related to the Eurovision Song Contest 2025 on social media, with particular attention to X (formerly Twitter), analyzing the reworking of television content within a highly mediatized transnational event characterized by forms of real-time commentary. The analysis focuses on three main areas: memetic reactions to the performances and the show's most visually iconic moments, often constructed from expressions, gestures, or scenographic choices; memes relating to voting dynamics and the geopolitical dimensions of the event, including ironic or critical references to national alliances and political contexts; and the use of memes as a form of live commentary synchronized with the live broadcast, through official hashtags and practices of re-sharing and commentary, with particular attention to the processes of decontextualization and re-semanticization of the television text and the role of the platform's affordances in the visibility of content.

In this framework, memes function as devices for reworking the television event, multiplying its interpretive trajectories. The event thus emerges as an open text, continually rewritten through practices of commentary and reconfiguration that develop on social media.

This paper explores how these practices contribute to configuring the television event as an extended and distributed process, which unfolds beyond the temporality of live broadcast through practices of commentary, reworking, and rewriting. Starting from the observation of the practices of circulation and commentary related to the Eurovision Song Contest 2025, the paper offers a reflection on how contemporary television can be analyzed as a circulating object, whose meanings are progressively constructed and negotiated in the space of social media.

VIS01 Visual Journalism in (inter)national contexts

PP 0722 Everyday visual politics in Switzerland: A study of gendered representation in national and local media coverage

Giulia Isabella Guerra[1], Isabel Prinzing[1], Katharina Lobinger[1]

[1] Università della Svizzera Italiana, Institute of Digital Technologies for Communication ITDxC, Lugano, Switzerland

Images reproduced in news media decisively shape how politicians are perceived, evaluated, and remembered by citizens (Graber, 1990; Kepplinger, 2010; Schill, 2012). Visual cues subtly evoke emotional responses in viewers and contribute to shaping perceptions of politicians' attributes, including competence, trustworthiness, and leadership (Grabe & Bucy, 2009; Lobinger & Brantner, 2015; Coleman & Wu, 2015).

However, visual portrayals and representational techniques in news media may reproduce gendered stereotypes. Accordingly, previous research has shown that female politicians are not only less visible than their male counterparts (Nyffeler, 2001; Schwaiger et al., 2021) but are also portrayed differently, through distinct visual framing, emotional expressiveness, or social distance (Bauer, 2015; Archer et al., 1983; Schmerl, 2004; Holtz-Bacha & Koch, 2008; Everitt et al., 2016). This combined dynamic of underrepresentation and misrepresentation shapes public perceptions of political authority (Carpinella & Johnson, 2016; Rohrbach et al., 2020; Ruprecht & Zumbrunn, 2025; Verge & Pastor, 2018), potentially undermining the electoral success of female politicians (Bauer & Carpinella, 2018).

While research has documented significant gender differences in both the quantity and quality of political representation in Anglo-American and European Union contexts (Bauer, 2015; Boussalis et al., 2021; Karl & Cormack, 2023; Van der Pas & Aaldering, 2020; Verge & Pastor, 2018), systematic visual analyses of political representation in Switzerland remain limited. This gap is particularly noteworthy given Switzerland's unique political system, in which citizens participate in decision-making through initiatives of direct democracy (Rauchfleisch & Metag, 2016). As citizens rely on media coverage at both national and local levels to make informed political decisions, accurate and fair media representation is of central importance.

This project is among the first in Switzerland to examine how national and regional media outlets depict Swiss politicians and whether these visual practices reinforce or challenge gender-specific stereotypes. We present findings from a quantitative visual content analysis of images depicting Swiss politicians, published by leading national and regional online portals across the three main language regions between 2022 and 2025. We apply a multi-level coding scheme that captures formal, content-related, and person-centered visual features, including, for example, framing, perspective, social distance (Hall, 1966; Kress & van Leeuwen, 2006), and expressive cues. We further examine the ratio of head to body in image framing across genders (Archer et al., 1983), as a stronger emphasis on the face is often associated with perceived competence and positive evaluations, yet has been found to be less common in depictions of women (Holtz-Bacha & Koch, 2008; Schmerl, 2004). Our analysis systematically maps gendered visual patterns and their variation across contexts, situating them within Swiss political culture.

By focusing on everyday visual representations rather than exceptional moments, the study contributes to a deeper understanding of Switzerland's political visual culture and journalistic practices of depicting political figures. In doing so, the project aims to raise awareness within visual reporting practices and to support growing audience demands for more equitable and inclusive media depictions of political actors.

VIS01 Visual Journalism in (inter)national contexts

PP 0723 Russian visual journalism in exile: Seeking paths, connections and futures on shifting grounds

Liudmila Voronova[1]

[1] Södertörn University, Journalism, Huddinge, Sweden

With Russia's full-scale invasion of Ukraine in 2022, nearly all independent Russian media relocated abroad due to censorship, repression, and technological constraints inside the country (Yablokov and Gatov, 2025). Frequent platform bans inside Russia forced exiled outlets to rely on diverse social media channels, requiring journalists to constantly adapt to new formats and tools (Wiik and Johansson, 2025). Like other exiled media worldwide, they now operate under constraints, serving audiences at home, abroad, and across diasporic communities (Dodds et al., 2024). Today, approximately 62 Russian exile outlets operate globally (JX Fund, 2025). Their work often blurs the boundaries between journalism and activism (Wiik and Johansson, 2025). They also occupy a politically liminal position: often labeled "foreign agents" in Russia, and viewed as "citizens of the aggressor state" in host countries or by Ukrainian actors (Rodina and Dovbysh, 2025: 10).

Drawing on seven semi-structured interviews with visual professionals working for seven Russian exile outlets (five photo-editors, an art director, and a data visualization specialist), this paper examines how visual journalism in exile responds to both universal and context-specific challenges. It asks: How do visual professionals work with selection, production and distribution of visual content under conditions of exile?

Economic constraints typical for visual journalism globally (e.g., Gynnild et al., 2017) become more severe in exile, with some outlets unable to subscribe to international photo-agencies. As one photo-editor noted, "there simply isn't a budget,

for example, for a proper image." Among the more specific challenges, interviewees described the paradox of covering events in Ukraine: while the intensity of visual coverage is "unmatched", access to images is often limited. International "war fatigue," combined with difficulties collaborating with both Russian and Ukrainian photographers, means exiled photo-editors sometimes no longer "choose from good photos, but rather publish at least anything."

Questions of authorship and transparency also arise. Due to safety concerns, outlets frequently cannot publish the names of photographers or non-professional image contributors, creating ethical dilemmas around attribution. Meanwhile, heavy reliance on social media for audience reach shapes both formats and priorities. Even small outlets employ social media specialists who advise visual professionals on platform-appropriate content, with video becoming a central priority for outlets originally focused on text and still photography. As one editor explained: "If we were a normal media outlet in a normal situation, the role of our social networks would be to drive traffic to our website… Instead, we try to make our social networks function as independent media in their own right." Finally, echoing broader research on Russian exile journalism (Rodina and Dovbysh, 2025; Yablokov and Gatov, 2025), interviewees highlighted the absence of a professional visual community: unlike general journalism, "there doesn't seem to be a similar community specifically for those who… focus on visual content."

Despite these challenges, Russian exile visual professionals remain in profession and believe that "people still maintain interest in certain kinds of high-quality images, created by skilled professionals", as expressed by one of the photo-editors in exile.

VIS01 Visual Journalism in (inter)national contexts

PP 0724 From golden age to precarity: Press cartooning in post-1989 Poland's media landscape

Mateusz Kossakowski[1]

[1] University of Warmia and Mazury, Humanities, Olsztyn, Poland

Poland has a long and distinctive tradition of press cartooning, which for much of the twentieth century functioned as an integral part of journalistic commentary and public debate. Until the late 1980s, press cartoons occupied a stable and visible position within the Polish media system, with cartoonists enjoying high cultural recognition and relatively secure institutional support. The political and economic transformation after 1989 profoundly reshaped this landscape. While the abolition of censorship brought unprecedented artistic freedom, it coincided with the rapid commercialization, privatization, and later digitalization of the media sector, fundamentally altering the conditions of production and circulation of visual satire.

This paper examines the contemporary role of press cartoons and the professional situation of press cartoonists in Poland, focusing on the period after 1989. It is based on original qualitative research, including in-depth interviews with both well-established and younger Polish cartoonists, such as Andrzej Mleczko, Edward Lutczyn, and Jacek Frankowski. Their testimonies provide rare empirical insight into the lived experience of media transformation from the perspective of visual communicators who have traditionally operated at the intersection of art, journalism, and political commentary.

The analysis demonstrates that press cartooning in Poland has undergone a process of structural marginalization. The collapse of iconic satirical magazines and the gradual withdrawal of cartoons from mainstream newspapers have resulted in the disappearance of stable editorial positions and long-term contracts. Cartoonists have largely been pushed into freelance work, forced to diversify their income through illustration, graphic design, comics, or online activities. This shift has led to the growing precarization of the profession, characterized by economic instability, project-based employment, and limited visibility within contemporary news media.

At the same time, the paper highlights important changes in the communicative ecology of visual satire. As cartoons migrate to digital platforms and social media, their form increasingly overlaps with memes and other vernacular visual genres. While this transition offers new modes of circulation and audience engagement, it also contributes to authorial anonymity and the erosion of the cartoonist's recognizable public role. The study situates these developments within broader debates on creative labor, media transformation, and the declining institutional support for critical visual journalism.

By foregrounding the voices of cartoonists themselves, the paper argues that the precarization of press cartooning is not merely a professional issue but a symptom of wider changes in public communication. Despite their diminished institutional presence, press cartoons remain a powerful mode of visual commentary, capable of condensing complex political and social issues into accessible and emotionally resonant images. The paper concludes by reflecting on the implications of this transformation for the future of visual political communication and the democratic functions of satire in contemporary media systems.

PP 0725 Imagining internationalism: What photojournalists submit in "international photographer of the year" competitions

Kyser Lough[1]

[1] University of Georgia, Journalism, Athens, USA

This study examines the entrants, and their entries, to international photojournalist of the year categories in two annual major photojournalism competitions between 2022–2026. Broadly, it asks: who enters this category, and what do they choose to include to represent international interests?

Photojournalism varies across cultures, as does photojournalistic practice (Kim, 2025). There are numerous studies which examine how the world is represented in photojournalism, both from local photographers and from outsider photographers who travel in (see Gynnild et al., 2017; Mitra & Witherspoon, 2023). Photojournalism competitions recognize excellence in the field and serve as capital that shapes what is seen as valued in the industry (Solaroli, 2020). Studying these competitions can complement studies on published photojournalism, as it offers a different perspective from how the images are selected and valued. Much of the existing research on photojournalism competitions reveal useful insight based on the award-winning images (Greenwood & Smith, 2007), but this limits our knowledge to what the jury decides is worthy. By turning to the full population of entrants/entries instead, we can gain a different perspective of what photojournalists value, and think juries will value, in international visual coverage.

The first component of this study examines the entrants themselves, including demographic data such as age, gender, nationality and current country of residence. The second component examines the photos they submit in their portfolio entry, including topic and location.

Entry guidelines for two major photojournalism competitions open to photographers worldwide, Best of Photojournalism (BOP) and Pictures of the Year International (POY), permit the use of all entry information for research purposes, which makes this study possible (NPPA BoP, n.d.-a; POY, n.d.-a). Both competitions have portfolio-style categories relating to international photojournalism: BOP's "Photojournalist of the Year – International" and POY's "International Photographer of the Year" (BOP, n.d.-b; POY, n.d.-b)

An initial data request to both organizations resulted in a dataset containing 260 entries from 154 entrants in the 2022, 2023, 2024 and 2025 competitions, with an average of 44.2 photos per entry (BOP limits to 40 photos, POY limits to 50). The 2026 competition data will be added once available, and analysis will then be carried out.

VIS01 Visual Journalism in (inter)national contexts

PP 0726 Shifting grounds in photojournalism: From index to reconstruction in AI-generated documentary practices

Chiara Spaggiari[1], Laura Gemini[1], Stefano Brilli[1]

[1] University of Urbino Carlo Bo - Università di Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies - Dipartimento di Scienze della Comunicazione- Studi Umanistici e Internazionali DISCUI, Urbino, Italy

Debates on AI-generated imagery in journalism have largely focused on its role in disinformation and visual manipulation (Farid 2022; Thompson et al. 2019; Hausken 2024). While digital technologies have already challenged photography's traditional indexicality (Barthes 1980), photography continues to be culturally and professionally associated with documentation and testimony (Keith et al 2006; Carlson 2009). In fields such as photojournalism, this documentary value has historically

been safeguarded through professional norms, verification practices, and institutional protocols (Schwartz 2003; Thomson 2019). The emergence of photorealistic AI-generated images further complicates this landscape by combining a strong aesthetic realism with the absence of a material link to an external referent.

From a constructivist perspective, the documentary status of images depends not only on their technical properties but also on the professional discourses, codes, and practices that frame them as evidence (Becker 1995; Harper 2023). While AI-generated images are often criticized for their potential to mislead audiences, they have also been used in journalistic and para-journalistic contexts to visualize events that cannot be photographed for material, legal, or ethical reasons. Despite these emerging practices, little empirical research has examined how media professionals themselves assess the informational and documentary legitimacy of AI-generated images.

This study asks: **under which conditions do news media professionals consider AI-generated images a legitimate means of documenting events?**

To address this question, we conducted a qualitative study based on 15 semi-structured interviews carried out between June and December 2024 with Italian photo editors and photojournalists who hold decision-making power over documentary imagery. A snowball sampling strategy was adopted, starting from members of the National Iconographic Editors Group (GRIN). Participants were selected based on two criteria: (1) responsibility for producing or selecting documentary images in news media, and (2) direct experience with AI-generated imagery. The sample included 8 photo editors and 7 photojournalists working for leading Italian media outlets. Interviews focused on three thematic areas: the impact of AI-generated images in news media, their relationship with documentary photography, and transformations in the visual content and stock agency industry. The data were analyzed through qualitative content analysis.

The findings indicate that interviewees do not perceive AI-generated imagery as a radical rupture in photojournalism, but rather as part of a longer process shaped by economic pressures, changing labor conditions, and the historical use of non-photographic visual forms (such as illustrations or reconstructions). While AI-generated images are not categorically rejected for documentary purposes, their legitimacy depends on specific conditions. These include the visualization of unphotographable events or verified verbal testimonies, explicit labeling as reconstructions, restrained aesthetic choices, and transparent, verified captions. The absence of shared ethical standards, the circulation of images on social media, and the reliance on stock archives emerge as major sources of concern.

The study concludes that AI-generated images cannot be dismissed outright as non-documentary. However, their potential integration into visual journalism depends on the development of clear ethical frameworks and professional protocols that recognize AI imagery as a distinct medium rather than a seamless extension of photography.

VIS02 Visual Stereotypes, Imaginaries and Identities

PP 0815 Negotiating female identity through collage creation in South Africa: A discourse-theoretical analysis and decolonial perspective

Lenka Marxová[1]

[1] Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

The paper presents a discourse-theoretical analysis of how contemporary female artists in South Africa use collage to construct and negotiate female identity in decolonial contexts. Grounded in social constructionism and discourse theory (Laclau and Mouffe, 1985), the study is further informed by feminist postcolonial, decolonial, and intersectional perspectives (including Oyěwùmí, Lugones, Tamale, Mohanty, Spivak, hooks, and Crenshaw). Female identity is approached not as a fixed or universal category, but as a contingent articulation shaped by intersecting cultural, political, religious, and colonial power relations.

Collage artwork is conceptualised as a medium that enables fragmentation, juxtaposition, and re-signification, offering insight into how hegemonic and counter-hegemonic articulations of female identity interact and are continually renegotiated within artistic practice. The paper approaches collage as a discursive practice through which female artists articulate and negotiate meanings associated with female identity within specific geographic, cultural, and sociopolitical contexts. Particular attention is paid to the ways in which gender binaries are reproduced, questioned, or reconfigured through collage creation, especially in relation to the legacies of modernity and decolonial contexts.

Collage artworks are examined as analytically productive sites for tracing how visual and material configurations—including layering, juxtaposition, and symbolic associations—articulate competing discourses of female identity in local contexts. Rather than being treated as representative, these artistic practices are approached as sites through which female identity is actively negotiated and continuously reinterpreted through diverse expressive practices.

Challenging Eurocentric assumptions about gender, identity, and representation, the study is empirically grounded in discourse-theoretical analysis of selected collage artworks, semi-structured interviews, and participant observation conducted with contemporary female artists living in South Africa. The analysis demonstrates how the South African sociopolitical landscape—shaped by the intertwined legacies of colonialism, apartheid, indigenous epistemologies, decolonial perspectives and contemporary feminist struggles—produces specific discursive conditions in which competing discourses of femininity are articulated, sustaining female identity as a process that is never fully sutured into a coherent or unified identity.

VIS02 Visual Stereotypes, Imaginaries and Identities

PP 0816 Constructing countryside: Negotiating stereotypes of rural life in digital media

Joanna Najbor[1]

[1] SPWS University, Department of Journalism and Social Communication, Warsaw, Poland

The second decade of the 21st century has witnessed a turn towards rurality. Issues of provincial idyll, rural folklore and peasant origins are addressed not only by the media, but also by scholars in the social sciences attempting to redefine the paradigms of rurality, considering questions of identity, lifestyle and social mobility (Hoggard, 1990; Halfacree, 2006; Śpiewak, 2012). The countryside is increasingly a focus of media studies. Images disseminated in the media, perpetuating established myths and stereotypes, often contrast with the realities of the rapidly deagrarianized, multifunctional countryside. An influx of former city dwellers is creating new groups of residents and transforming social structures, provoking a shift from pre-existing mythologies and rural imaginaries in favour of alternative narratives. Rurality becomes a space of discourse, in which social media such as Instagram play an important part in (auto)representation and negotiating new roles of extra-urban areas and communities.

The research problem developed as part of a PhD dissertation involved identifying, categorising and analysing communication practices concerning the countryside and rurality in the digital sphere, with particular emphasis on social media. The study assumes that communication on social media results in transmitting established stereotypes into new media spaces, with a specific emphasis on the reproduction of the rural idyll myth. Accordingly, the research first identifies the most popular stereotypes and myths regarding the countryside in media and academic literature, and then traces their presence in the communication practices of private and institutional Instagram users. The study sought to capture diverse visual regimes of rural representation, as well as tensions between traditional narratives and portrayals of a countryside as a space of technological development and class aspirations.

The research is based on a corpus of 726 posts from 72 Polish-language Instagram accounts, analysed through qualitative content analysis with elements of netnography (Kozinets, 2020) and visual discourse analysis I (Rose, 2007). The accounts on rural themes selected during multi-stage research were divided into three communication perspectives, differentiated by broadcasting positions and assumed goals: individual (private users such as farmers or rural influencers), functional (oriented toward achieving specific goals, e.g. promotional or sales) and institutional (communication held by media outlets and public institutions).

Preliminary results indicate that “rural content” on Instagram has become a broad category: aestheticizing narratives from the cottagecore trend, fitting into stereotypes of slow life and living in harmony with nature, coexist with content that aspires to represent “authentic life” as well as commercial materials focused on promotion and sales, which draw on the myth of idyllic countryside for marketing and political purposes. An additional notable dimension is the grassroots relations of previously unheard groups, gaining new areas of digital visibility. One such group is young female farmers, who, in their communication, break stereotypes regarding women in the countryside. Although the study considers Poland, its results can serve as a basis for comparative analyses in the field of representations of the countryside in post-communist countries, as well as the mediatisation of rural areas in Western European countries whose societies did not experience post-war authoritarian regimes.

VIS02 Visual Stereotypes, Imaginaries and Identities

PP 0817 Ideological reversibility and visual homogenization in template-based visual communication

Jan Novotný[1]

[1] Charles University- Faculty of Social Sciences, Institute of Communication Studies and Journalism, Praha, Czech Republic

In today’s platform-based communication landscape, the same graphic design template can be used to announce a protest, promote a corporate diversity initiative, or circulate institutional messaging, all without altering its visual structure. This paper takes this situation seriously and asks: “How can the same graphic form convincingly carry incompatible ideological messages without visual contradiction?”

Tools such as Canva promise accessibility and quick production, offering pre-designed layouts intended for wide reuse across campaigns, organizations, and causes. This paper introduces the concept of *ideological reversibility* to describe a design condition in which a single visual template is structured to accommodate different or even opposing ideological messages without requiring structural or even aesthetic modification.

This study examines how Canva templates are designed to remain semantically open in advance. Drawing on a semiotic analysis of highly promoted Canva templates designed for activist messages, the study examines iconographic abstraction that enables ideological and discursive substitution within a stable visual form. These design-level findings are contextualized through a comparative reading of selected Instagram posts that reuse the same templates across different activist and organizational contexts, illustrating how ideological reversibility operates in practice.

The findings suggest that ideological reversibility is not merely an accidental byproduct of generic design but a recurrent design condition that aligns with the logics of template economies, where scalability and reusability are prioritized. Building on Laclau's concept of the empty signifier and Barthes' analysis of myth, the study argues that commonly used activist symbols, such as megaphones or raised hands, function as empty signifiers within template-based design, retaining a generalized association with "voice" or "participation" while remaining ideologically nonspecific. This allows the same template to host feminist solidarity messages, corporate rhetoric, or institutional public communication without visual semantic resistance.

By conceptualizing Canva templates as visual infrastructures rather than neutral tools, this paper further argues that ideological reversibility can contribute to a form of pre-emptive depoliticization in visual communication, where graphic form absorbs ideological conflict rather than articulating difference. At the same time, ideological reversibility may contribute to visual homogenization, thereby limiting the capacity of the visual mode to convey meaning effectively altogether as communication becomes increasingly standardized.

VIS02 Visual Stereotypes, Imaginaries and Identities

PP 0818 Visual representation of science & scientists' Dutch media and science communication

Danielle Arets[1], Michiel Bles[1]

[1] Fontys Applied Sciences, School of journalism/ research group Designing Journalism, Tilburg, Netherlands

'Portrayed behind a bookshelf, wearing a lab coat or experimenting with microscopes and pipets'; the visual representation of science and scientists seems to be rather unbalanced and not representative for the diversity of the Dutch research landscape and the scientist operating within it.

Images of science and scientist play an important role in the dissemination and communication of science to a wide audience (Davies & Horst, 2016; Cho et al., 2009). Visual images can effectively bridge the gap between complex scientific ideas and public understanding (Monoyioset al.2024; Butdisuwan et al. 2024). However, the use of images for science communication is not neutral (Delicado, Rowland, 2021). A study by Delicado and Rowland on the visual representation of science during the Covid-19 Pandemic indicates a disbalance in representation with excessive attention to people in white coats and goggles, laboratory benches or microscopes.

Various studies have indicated a disbalance between men & women in the representation of science in scientific magazines (Loverock & Hart, 2018) or in media, (Mitchell & McKinnon, 2019). Furthermore, there is an underrepresentation of scientists from culturally and linguistically diverse backgrounds (Mitchell & McKinnon, 2019).Despite the growing attention to diversity at Dutch Universities, the proportion of female researchers in the Netherlands is low, compared to other European countries (European Commission, 2019) and, according to the Global Media Monitoring Project (GMMP 2025), women experts are dramatically underrepresented in media.

In the Science (Un)seen project, researchers from Fontys University of Applied Sciences and the Dutch Centre of Expertise Science and Society (NEWS) are unravelling the representation of science and scientist in the Netherlands. By organisaing a focus group session with 25 experts of science communication we identified needs and concerns concerning the visual representation of science and scientist. The attendees mention a severe lack of cultural diversity and an overrepresentation of specific scientific disciplines.

In the second stage of the project, we are analysing a sample of 300 images (between 2020–2024) of online news platforms of Dutch media Outlets (100 images), Dutch Universities and Universities of Applied Science (100 images) and online Dutch science platforms (100 images) focusing on the diversity in research fields & disciplines, gender and cultural diversity and research methods..

The study will be completed in March; at this stage the preliminary insights can not be shared.

VIS02 Visual Stereotypes, Imaginaries and Identities

PP 0819 Visualising health: sexual and reproductive health communication on social media

Jenni Niemelä Nyrhinen[1], Josie Hamper[2], Jaana Davidjants[3], Katrin Tiidenberg[3]

[1] LAB University of Applied Sciences, Institute of Design and Fine Arts, Lahti, Finland
[2] University of Oxford, School of Geography and the Environment, Oxford, United Kingdom
[3] Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

Social media platforms have become everyday environments where individuals not only search for health-related information but also share personal experiences. At the same time, these platforms function as important communication channels for health professionals, influencers, and marketers promoting health products and services. While health communication on social media has attracted scholarly attention, research that foregrounds the visual dimension and centres women's perspectives remains limited. This paper addresses this gap by examining visual communication of sexual and reproductive health, with a particular focus on women's health, as it appears across mainstream social media platforms.

The study sets out to analyse *the explanatory and affective work that visuals perform in communicating sexual and reproductive health topics*. It draws on a dataset gathered in four European countries, namely Austria, Estonia, Finland, and the UK, between 2023 and 2025. The data consist of social media content by diverse creators, such as health professionals, health organisations, companies, as well as lifestyle and wellness influencers, whose messaging reinforces both evidence-based and alternative health approaches. These visual data were gathered through social media user autoethnographies and social media user and content creator interviews, focusing on users' interpretations and perceptions of online health content and creators' visual strategies and motivations. The autoethnographic descriptions and interview data provide contextual grounding for the visual analysis done in the study. This multi-source approach enables an exploration of the various perspectives that shape the visuality of contemporary sexual health discourses online.

Using qualitative visual analysis that takes into account the multimodality of the examined content, the study identifies recurring visual elements and cues in the image and video content (e.g., metaphoric visualisations of the sexual organs, cultural performances in specific situations, such as the reading of a pregnancy test result and medical props, such as the ultrasound machine) and examines how these contribute to making sexual and reproductive health issues in/visible, understandable and emotionally resonant. While health content on social media faces universal challenges related to platform governance and cultural taboos, different types of creators (health professionals, health organisations, holistic and alternative health creators, influencer-type creators, companies) use different multimodal strategies to navigate between attention-grabbing, persuasiveness, and making a particular argument. By exploring the framings of women's sexual and reproductive health in the context of social media creator and user perceptions, we highlight tensions between evidence-based health argumentation and ideological alignment. Furthermore, the findings demonstrate the potential of visual communication to support education and empowerment around women's health while also pointing to risks of misguidance and unnecessary medicalisation.

VIS03 Gendered Bodies in Visual Social Media

PP 0922 "Far-right daddies": Cross-platform vernacular and the practice of embarrassment

Shepuya Famwang[1]

[1] University of Southampton, Art and Media Technology, Winchester, United Kingdom

On social media, political deliberation is often enacted through culturally recognisable forms of humour, visuals and sound rather than through formal institutions, organisations or elite discourse. Social media enables various forms of vernacular creativity, such as humorous interpretations of political events, expecting and rewarding it, offering ways to playfully engage with politics (Hartley, 2013). These types of humorous interpretations are often satirical in nature, exposing historical reality to ridicule (Billig, 2005). This type of playful political deliberation is adapted to the norms, affordances, and genres of particular platforms, with each platform having its own unique combination of styles, grammars and logics (Gibbs et al., 2015; Keller, 2019). The platform's vernacular is also shaped by the mediated practices and communicative habits of users. Elite users, such as content creators, are on multiple platforms, producing content that is shareable across platforms. This study examines how social media content creators draw on platform vernacular, popular culture and humour to ridicule political actors on the political right and the far-right in England and America. The study uses multimodal thematic analysis to analyse videos from a content creator on Instagram and TikTok. The findings reveal that, through curated image selections, creative uses of sound and audio memes, and renders of visual filters and effects, the audiovisual aesthetics of both platforms are used to redefine platform vernacular as something that occurs across platforms rather than on a single one. The findings also reveal that images are used to delegitimise and ridicule political actors, positioning them as being unworthy of respect or reasoned engagement. The images also ridicule the political actors by embodying them and making them appear mechanical, excessive and incompetent. The findings highlight how social media remains the 'ground' where political life can be playfully corrected through ridicule and embarrassment and the use of cross-platform vernacular creating connections in the shifting grounds of platformised labour.

VIS03 Gendered Bodies in Visual Social Media

PP 0923 Do short videos mitigate gender bias in visual political representation? A face-ism analysis of six Swiss parties

Giulia Isabella Guerra[1], Katharina Lobinger[1]

[1] Università della Svizzera Italiana, Institute of Digital Technologies for Communication ITDxC, Lugano, Switzerland

Research has consistently documented gendered patterns in the visual depiction of political figures, with facial prominence representing a central dimension. The face-ism index measures the ratio between the length of the face and the total visible body in a photograph (Archer et al., 1983). Higher facial prominence has been associated with perceived competence and traits such as intelligence and assertiveness (Archer et al., 1983; Schwarz & Kurz, 1989). Across both media coverage and official political imagery, male politicians are more frequently depicted with facial emphasis, while female politicians are shown with greater bodily emphasis (Copeland, 1989; Holtz-Bacha & Koch, 2008; Peng, 2018; Kinnebrock & Knieper, 2014; Schmerl, 2004; Konrath & Schwarz, 2007), reinforcing stereotypical representations and limiting perceptions of competence. While this body of research has primarily focused on static images in traditional media, the increasing centrality of social media platforms as arenas for political visibility (Highfield, 2016; Van Aelst et al., 2017) calls for exploring whether facial prominence, a well-established analytical indicator of gendered representation, can be applied to shifting visual formats. In particular, the short video format popularized by visual platforms such as TikTok has introduced new compositional norms based on vertical framing (Ryan, 2018). These portrayal standards may challenge or reconfigure the gendered visual conventions historically observed in still images.

Focusing on short videos by six Swiss parties during the 2023 federal election year that were published on TikTok and Instagram, this study proposes a methodological adaptation of face-ism for video analysis. We thereby examine how the facial prominence of political figures varies across scenes and individual shots, addressing challenges posed by movement and temporal segmentation that were absent in the original method (Archer et al., 1983). To ensure accuracy, measurements combine manual coding with computational approaches using PySceneDetect and Amazon Rekognition (AWS) (Ulloah et al., 2024), enabling a robust assessment of facial prominence in video content.

Our results indicate that gender alone does not significantly predict facial prominence ($F(1, 251) = 0.609$, $p = 0.436$). In contrast, party affiliation exerts a strong effect ($F(5, 251) = 25.446$, $p < 0.001$, partial $\eta^2 = 0.336$). While the mean difference between women and men is smaller than historically documented, overall face-ism values are lower than those reported in classic studies that examined still images (Archer et al., 1983; Konrath & Schwarz, 2007; Schmerl et al., 2004). On the one hand, our preliminary findings suggest that vertical short videos may mitigate gender disparities through compositional norms that center the subject and foster visual intimacy (Ryan, 2018). On the other hand, the emphasis on bodily visibility and movement appears to reduce facial prominence overall, which raises the important question of how the video format shapes the evaluation of competence of political figures. By analyzing facial prominence across political short videos, this study contributes to ongoing debates on shifting visual norms in political communication and explores how evolving platform-specific practices perpetuate persistent gendered patterns or contribute to more balanced depictions of male and female politicians.

VIS03 Gendered Bodies in Visual Social Media

PP 0924 Choreographic rites: From Chantal Akerman's Toute une nuit (1982) to Ana Esteve Reig's Fancams (2022) and TikTok practices

Ariadna Moreno Pellejero[1]

[1] Universidad de Zaragoza, Historia del Arte, Zaragoza, Spain

TikTok dance practices can be understood as choreographic rites of everyday life in our mediated societies. By placing these practices in dialogue with Chantal Akerman's choreographic film *Toute une nuit* (1982), and Ana Esteve Reig's essayistic video installation *Fancams* (2022), based on platform dances, the paper traces a trajectory through these embodied practices across cinema, audiovisual art, and social media platforms. In both Akerman's and Ana Esteve Reig's work, choreography, body language and gestures, as well as repetition and temporal duration, play a fundamental role. A qualitative and comparative analysis of these works allows us to reflect on how the ritual of dance changes when we move from the intimate movements of lovers who meet and part on a summer night in Brussels in Akerman's film to the young people who meet in the Azca area of Madrid, who use dance as a social gesture, intended for posting on their social networks to be viewed by those on the other side of the screen.

This analysis also reflects on the ways in which these dances are shown, from the choreographic editing of Akerman's film, designed for an audience standing in front of a large horizontal screen, to the slow motion of Ana Esteve Reig's work, which focuses on the gestures used by young people in dance videos, intended to be viewed with a certain immediacy in a vertical format that facilitates scrolling on a Smartphone screen. At the same time, Ana Esteve Reig's audiovisual essay is conceived as a video art installation on two simultaneous screens that invites an immersive experience in these mediated dances, as well as prompting reflection on the new ways of presenting ourselves in front of the camera, where young people learn new

choreographies and create diverse communities, both in the physical and virtual worlds, with which to share, imitate and reiterate their gestures, generating a space for self-expression, while at the same time influenced by the culture of virality, data and 'likes', where the private becomes public. I will address these movements and changes with an interdisciplinary approach based on texts from Film and Media Studies (Couldry, 2004; Deuze, 2016; Guardiola, 2018; Russell, 1999; Vannini, 2023; Zafra, 2010, 2013), Anthropology (Certeau et al., 2007; Gennep, 1960; Turner, 1982), Spectatoriality and Gender Studies (Marks, 2000, 2024; Sobchack, 1992, 2004).

VIS04 AI, Automation, and Visual Communication

PP 1030 Dehumanised and fleshy: The grotesque bodies in AI slop

Louise Yung Nielsen[1]

[1] Roskilde University, Department of Communication and Arts, Roskilde, Denmark

'AI Slop' refers to low-quality content generated by AI systems and distributed across the internet, often for engagement, attention, and monetisation. The term captures a sense of degradation: Content that's technically coherent but aesthetically excessive, often vulgar, and demanding of attention. This article examines a particularly disturbing category of AI-generated imagery where bodily transformation and distortion become entertainment. AI-generated imagery participates in a broader cultural logic where bodies are seen as endlessly modifiable, improvable, and transformable. But where cosmetic image culture promises improvement, grotesque 'AI slop' displays a darker side of body culture: The body as a site of corruption and loss of control. Imagine a pile of heads, recognisable as human-like, detached from a body, but still 'alive', widely grinning with protruding teeth. Or the display of a large human body made of hamburgers running on a treadmill, oozing cheese on the treadmill.

While debates around AI-generated content often focus on questions of authenticity and labour displacement, I argue that visual studies' most urgent concern lies in how these images mobilise cultural reflections of dehumanisation and the grotesqueness of bodies, repackaging them as absurdist entertainment. Drawing on Bakhtin's grotesque body (, I examine how AI slop appropriates the aesthetics of bodily transgression, boundary violations, excessive materiality, bodies in transformation, while stripping away carnival's regenerative politics. Through Kristeva's (2024) concept of abjection, I analyse the visceral disgust these images produce: bodies that violate categories, disturbing boundaries between human and non-human, subject and object. Building on Linda Williams' (1991) notion of body genres, I demonstrate how AI slop operates through body horror's logic – spectacles of bodily violation that produce involuntary physical responses in viewers, collapsing the distance between image and embodied spectator. Finally, deploying Mbembe's (2019) framework of necropolitics, I reveal how these images enact a form of visual violence wherein certain bodies are made available for the grotesque, reduced to spectacles of partial death, degraded into meat, objects, or void. This imagery is symptomatic, not as intentional expressions of coherent ideas but rather cultural symptoms that reveal underlying anxieties, tensions, and contradictions. In this framework, these images are like dreams: they do not have authors with clear intentions, but they condense and displace cultural ideas in ways that reveal what's repressed.

The study employs a critical-aesthetic approach to AI slop on TikTok and Instagram, combining visual analysis with platform ethnography to understand how grotesque bodies circulate as popular entertainment. I select videos based on engagement metrics (views, likes, shares) to capture content that successfully generates platform visibility. Through systematic mapping, I categorise the types of AI slop I encounter. This corpus reveals patterns in which bodies become available for grotesque transformation and how platform algorithms amplify particular grotesque expressions. The original contribution of this paper lies in revealing how AI slop's grotesque aesthetics are not merely technological artefacts but showcase cultural and political fears about how bodies are made available for degradation and spectacle.

VIS04 AI, Automation, and Visual Communication

PP 1031 When photographs look fake and AI images feel real: How audiences perceive and assess AI-generated images in journalistic contexts

Peter Dahlen[1], Rebecca Bengtsson Lundin[2]

[1] Linnaeus University, Department of Media and Journalism, Kalmar, Sweden
[2] Södertörn University, The Department of Social Sciences, Huddinge, Sweden

The rapid diffusion of generative artificial intelligence (genAI) has introduced new visual forms into journalistic environments, challenging long-established assumptions about photographic realism, authenticity, and visual truth. Images have historically functioned as central evidentiary devices in news media, anchoring journalistic narratives to the perceived reality of events. As genAI imagery increasingly appears in news contexts, sometimes with limited transparency, questions arise about how audiences interpret such images, how they assess credibility, and how visual cultures of journalism are being reshaped (Hausken, 2024).

This paper examines how young adults perceive, interpret, and assess genAI images in journalistic contexts, with particular attention to the interplay between visual cues, material practices, and affective responses. Situated within media and visual culture studies, the paper approaches images as culturally embedded, technologically mediated, and affectively charged

objects that shape how audiences imagine and understand reality (Bengtsson Lundin, 2021; Nilsson, 2020). It explores how audiences navigate the blurred boundaries between photographic and genAI images, and how this navigation shapes their understanding of visual authenticity and trust in news media.

Empirically, the paper draws on a qualitative, two-session mixed-methods study combining eye-tracking data with in-depth, semi-structured interviews. In the first session, participants were asked to engage with online news articles in which original photographs had been replaced with genAI images, followed by a second session in which they assessed standalone images as either photographs or genAI visuals. Following each session, participants were interviewed about their experience. This methodological design allows for an analysis of both articulated interpretive strategies and embodied viewing practices, offering insight into how visual attention, intuition, and contextual framing interact in real time.

Preliminary findings suggest that participants rely on a combination of learned visual heuristics and affective "gut feelings" when assessing image authenticity. Attention is frequently directed towards faces, skin textures, hands, and backgrounds, areas perceived as prone to AI-related irregularities, yet confidence in these strategies is uneven among participants. Contextual elements such as accompanying news texts, captions, and the perceived credibility of news outlets play a significant role, sometimes reinforcing trust and at other times obscuring critical scrutiny. Notably, participants demonstrated lower accuracy and confidence when evaluating images outside a journalistic context, underscoring the importance of journalistic framing in visual interpretation.

The study contributes to ongoing discussions within visual cultures by highlighting how material practices of image production intersect with audience perception, emotion, and ethical reflection. It underscores the need to understand genAI imagery not only as a technological development, but as a cultural and perceptual phenomenon with implications for visual literacy, journalistic ethics, and the future norms of visual truth in news media.

VIS04 AI, Automation, and Visual Communication

PP 1032 Understanding the recipient: Comparison of GenAI-generated and human-created images in marketing communication

Agnieszka Nowak[1]

[1] University of Maria Curie-Skłodowska in Lublin, Doctoral School of Social Sciences, Lublin, Poland

Images are an inherent component of marketing communication. Generative AI allows for creating unprecedented amounts of visual content in previously unattainable short amount of time. As a consequence, the academic community begins to research user engagement for both GenAI-generated and human-created images. As of today, they came to varied conclusions: online ads which involve GenAi-generated images may outperform human-produced ads in terms of online response (Hartmann, Exner et al. 2024, Heitmann 2024) At the same time, researchers already discovered that reception of artistic images is more favourable (on semantic and emotional levels) when images are produced by humans (Hond, Curran 2019; Sun, Yang et al., 2022).

It is imperative to understand why recipients click on different ads and what was their response to marketing imagery specifically. This can be achieved by conducting research on the recipients' response to images, taking into account their evaluation of technical, semantic and emotional aspects of an image (Norman 2002).

The purpose of the study is to perform a focus group interview involving images related to the theme of 'Self-care' (this one being one of the fastest-growing industries around the world at the moment). Respondents at the age between 18 and 45 years old (the largest group that spends disposable income on self care) (McKinsey, 2024) come from varied backgrounds and education levels.

Research questions are as follows: Are recipients able to distinguish GenAI-generated images from human-created marketing images? If so, how do they recognise them? What is the recipients' response to both groups of images on the technical level (image quality and style), semantic level (connotations and meanings) and emotional level (emotions that are provoked)?

Anticipated outcomes for this study include finding a preference for human-created images on semantic and emotional levels, similarly to previous findings about recipients' response to artistic images. Similarities found in all GenAI-generated which occur due to the technological framework used to create them, as well as excessive symmetry and perfection found in the images, appears to create emotional distance in recipients. This should be significant for the creators of marketing communication who aim at having a real impact on their audience.

VIS04 AI, Automation, and Visual Communication

PP 1033 Searching for peace: An image-type analysis of Google Images results

Isabel Prinzing[1], Cornelia Brantner[2], Katharina Lobinger[1], Georgia Aitaki[2]

[1] Università della Svizzera italiana, Institute of Digital Technologies for Communication, Lugano, Switzerland
[2] Karlstad University, Department of Geography- Media and Communication, Karlstad, Sweden

Destruction, soldiers, suffering: conflict and war consistently dominate news coverage and social media feeds, reinforcing a visual culture of violence and spectacle. Such imagery circulates widely and shapes collective understandings of global instability. In contrast, visual representations of peace are either absent or confined to a narrow repertoire of generic motifs, divorced from political complexity or historical contexts. This visual asymmetry is not happening by accident: it reflects and reinforces broader epistemic hierarchies about what is deemed representable, newsworthy, or emotionally resonant and raises critical questions about whose futures are imagined and made visible (Fast et al., 2024). As digital infrastructures like Google Images increasingly act as default gateways to knowledge, their algorithmic curation of images plays a decisive role in structuring public meaning-making. This raises urgent questions about how peace is imagined, depoliticized, or rendered invisible within platform-driven visual economies. Foregrounding concerns about understanding media ecosystems, we examine the Google Images search engine as an actor that shapes how people access and connect with representations of peace and conflict. Their influence on collective imaginaries is therefore both significant and understudied.

To address this gap, our study explores how online visual repertoires of peace are constructed through an analysis of Google Images results for 20 peace-related keywords. For each keyword, 300 images were analyzed using an image-type analysis that integrates semi-automated clustering (ViT-B/16) with iterative rounds of open sorting and qualitative interpretation.

Our findings reveal three central patterns that provide interesting entry points for further analysis. First, most image types omit human presence entirely, thereby aligning with the concept of “negative peace”, in which the absence of humans symbolizes peace. Second, symbolic imagery, such as doves, handshakes, flags, and other historically entrenched icons, dominates the online repertoire. As a result, although widely circulated, such symbols offer limited conceptual depth and display striking aesthetic uniformity. Nevertheless, such generic images remain influential by capturing attention, reinforcing ideological frames, and enabling emotional engagement (Kennedy et al, 2025). Third, images featuring human actors display a clear gender bias: men are predominantly shown in positions of power (e.g., signing agreements or speaking at political events), while women more often appear as aid recipients or community caretakers. Even in peacekeeping imagery, where institutions such as the UN strive for gender-balanced representation, male soldiers are shown in groups in militarized settings, whereas female soldiers typically appear isolated in close-ups and engaged in community-oriented tasks.

By revealing how digital search infrastructures privilege reductive and biased visual representations and gender tropes, this research highlights the shifting grounds that shape public understandings of peace and conflict. In doing so, it informs broader debates about the role of (visual) communication scholarship in cultivating more nuanced, inclusive, and future-oriented representations of complex global challenges. The study also contributes to ongoing debates about the political implications of visual communication technologies. It reaffirms the role of media scholarship in interrogating the visual architecture of geopolitical discourse and alternative futures.

VIS05 Contested Public Visibilities

PP 1134 Regimes of visibility: Media infrastructures in the Age of hybrid warfare

Lars Lundgren[1]

[1] Södertörn University, Media and Communication Studies, Huddinge, Sweden

In war, Antoine Bousquet reminds us, "visibility equals death" (Bousquet 2018). Infrastructures, Susan Leigh Star famously noted, are "visible until breakdown" (Star 1999). Media infrastructures has been att the centre of the latest development in what has been called a hybrid war in the Baltic Sea region. This paper address how the role of media infrastructures in hybrid warfare can be understood through the lens of what I call regimes of visibility. In September 2022 the NordStream 2 pipeline was the target of sabotage, resulting in a massive gas leak and speculations over suspected perpetrators. This can be considered a first step of a developing hybrid war in the Baltic Sea region in wake of Russia's full scale invasion of Ukraine. These acts of sabotage intensified and widened in scope, and by 2024 media infrastructures such as undersea communication cables, but also navigational media such as radar, AIS (Automated Identification System) and GNSS (Global Navigation Satellite System) were targeted. To protect, as well as target, these infrastructures, a range of efforts to move them in and out of visibility were employed. The paper demonstrates, by means of analyzing data and visuals presented by so-called OSINT (OpenSource Intelligence) specialists, how hybrid warfare involves various acts of making the invisible visible, resulting in an oscillation between regimes of visibility.

The paper considers two interlinked acts of hybrid warfare. First, a series of cable breaks in the Gulf of Finland and east of the Swedish island Gotland has occurred since 2024. The cables and their routes are themselves the result of "negotiations of visibility" (Starosielski 2012), with their exact location hidden from direct view but still marked on cable maps of the area (i.e. submarincablemap.com). The cable breaks were investigated by Finnish and Swedish authorities, accusing false flag Russian tankers of purposefully dragging anchors across known cable routes. OSINT specialists has used open source AIS data in order to verify these accusations. The data demonstrated unusual behaviour of the ships, i.e. unmotivated deviations from course or slowing down (as a result of dragging the anchor across the seabed). Live and recorded AIS data is visualized by tools such as marinetraffic.com and OSINT specialists have further visualized these otherwise invisible acts of sabotage far out on the sea.

Second, AIS together with other navigational systems such as GNSS and radar have themselves been targets of hybrid warfare. Since late 2023 the so-called "Baltic Jammer" has interfered with the digital signals of these systems, seriously affecting the accuracy and disrupted air as well as marine traffic. Again, OSINT specialists have used open source data in order to localize and identify the "jammer", detecting the origins of the interfering signal but also visualizing the extent of the jamming operation.

Together, the acts of sabotaging media infrastructures and the forensic work invested in detecting and confirming them represents an oscillation between regimes of visibility, keeping infrastructures protected and vulnerable in the age if hybrid warfare.

VIS05 Contested Public Visibilities

PP 1135 From screens to streets: Physical situated data visualization as a tool for civic engagement and communication in public spaces

Magdaléna Bohuslavová[1]

[1] Masaryk University, Department of Information and Library Studies, Brno, Czech Republic

We live in a visually saturated information society (Webster, 2014; Kostelnick & Hasset, 2022) where our perception is increasingly shaped by data visualizations and infographics. However, these are typically confined to interaction with digital screens. (Coenen & Moere, 2021; Drucker & Gumpert, 2012) This paper investigates the informational and communicative potential of situated data visualizations embedded directly into the physical public space – examining how they influence public discussion (Claes & Vande Moere, 2013; Coenen & Moere, 2021), foster civic engagement (Camociny & Dominoni, 2022; Gill et al., 2023) and allow passers-by to reflect on complex phenomena.

The research is based on two distinct case studies conducted in Brno, Czechia. The first intervention (September 2024) took place on Vachova Street, which was transformed into a temporary pedestrian zone. Here, the author used analogue media (chalk crayons) to visualize survey data on urban life directly onto the pavement. The second case study (December 2024 – March 2025) involved a large-scale printed dashboard placed in a passageway near Kino Art, visualizing the cinema's annual data using the popular Spotify Wrapped format (Annabell & Rasmussen, 2024; Keenan, 2024).

Methodologically, both studies relied on a qualitative analysis of semi-structured in-depth interviews with passersby and observation. The research focused on how the public perceives, interacts with, and understands these complex data visualizations in a non-traditional form and environment.

The findings highlight that visual appeal (such as colours and simple graphics) often acts as the critical primary trigger for engagement. Respondents indicated that the aesthetics forced them to stop, and subsequently immerse themselves in

the data. In the case of the cinema intervention, elements reminiscent of popular digital formats (e.g., wrapped) made the data instantly recognisable and comparable, significantly facilitating comprehension and engagement. (Bohuslavová, 2025)

Furthermore, the analysis reveals that contextual embedding is crucial. Participants noted that the physical proximity to the subject matter transformed abstract statistics into relevant, personal narratives. The participants also emphasised a sense of self-identification and familiarity with either the format or the data as a key element of their interest in the intervention.

Finally, the research synthesises these findings into practical design implications. It argues that effective public data communication requires a balance of familiarity and unexpectedness in its elements – using recognisable formats in unexpected physical settings and forms. Based on the author's creative practice, the research also proposes a strategic communication workflow. It emphasises that the communication impact of a visualization in public space is determined in the preparatory phase by defining the purpose through essential questions, such as: *What is the purpose of this visualization and who is it targeted at? How is the perception of visual elements by passers-by influenced by thoughtful contextual placement?*

In conclusion, this research argues that situated data visualizations function as powerful communication tools. By combining engaging visual aesthetics and data-based elements with site-specific relevance, they successfully disrupt routine urban experiences and offer a new, accessible space for collective sense-making and reflection on complex data and phenomena that would otherwise remain hidden.

VIS05 Contested Public Visibilities

PP 1136 Attacking the canon to save the planet: Visual culture and climate activism in art museums and monuments

Cristina Perez-Ordoñez[1], Silvia Olmedo-Salar[2]

[1] Universidad de Málaga, Comunicación Audiovisual y Publicidad, Málaga, Spain
[2] Universidad de Málaga, Periodismo, Málaga, Spain

Since 2022, iconic art museums and monuments have become key sites for climate protests carried out by civil disobedience collectives. Through disruptive actions targeting canonical artworks—such as Leonardo da Vinci's Mona Lisa, Velázquez's Venus at her Mirror, Goya's Majas, Munch's The Scream and Botticelli's Primavera—as well as monuments including Stonehenge, the Brandenburg Gate and the Spanish Congress of Deputies, these groups have systematically broken into the international media agenda.

Primarily funded by the Climate Emergency Fund, activist collectives have developed a communication strategy centred on the production of highly impactful images aimed at denouncing governmental inaction in the face of the climate emergency. These interventions are not limited to provocation, but articulate a coherent visual storytelling which, beyond local differences, reveals shared references to art history and to previous activist movements such as the suffragettes or Femen. In this way, cultural heritage functions as a symbolic surface from which the meaning of the ecosocial crisis is contested.

This paper analyses the images resulting from these actions carried out between 2022 and 2025, to identify and describe the visual universe, recurring symbols, and aesthetic patterns that structure this phenomenon. Drawing on a corpus of images produced by groups such as Futuro Vegetal, Just Stop Oil, Ultima Generazione, Letzte Generation and Riposte Alimentaire, the study explores how these interventions configure an aesthetic of disruption based on the symbolic reappropriation of the artistic canon. These practices generate a visual storytelling that combines references to art history with earlier activist traditions—from the suffragettes to Femen—thereby producing a recognisable iconography circulating globally.

The findings reveal not only ideological, strategic and economic connections among these groups, but also strong aesthetic and narrative affinities. The repeated use of ritualised elements—such as red liquids (tomato soup or washable paint), specific bodily poses, the centrality of the female body and the performative staging of protest—points to the existence of a shared and carefully designed iconography. Far from isolated events, these practices constitute a transnational aesthetic that leverages the symbolic authority of the artistic canon to generate moral and emotional friction.

Finally, in contrast to their frequent media characterisation as acts of vandalism, this study argues that these actions should be understood as strategic visual devices aimed at activating public consciousness and reinscribing the art museum as a space of political antagonism. In this sense, climate protests targeting artistic heritage reveal a sophisticated understanding of contemporary visual culture and the regimes of visibility that structure public debate on the climate crisis.

PP 1137 Suffering in the eye of an algorithmic beholder: Auditing aesthetic bias in the visual representation of Holocaust victims on Google

Mykola Makhortykh[1], Tobias Rohrbach[2], Maryna Sydorova[1]

[1] University of Bern, Institute of Communication and Media Studies, Bern, Switzerland
[2] University of Fribourg, Department of Communication and Media Studies, Fribourg, Switzerland

Many studies (e.g., Kay et al., 2015; Otterbacher et al., 2017) indicate the risk of search engine algorithms reiterating or amplifying gender bias, particularly regarding the representation of vulnerable groups (e.g., women of colour and from

countries outside of the Global North; e.g., Noble, 2018; Urman & Makhortykh, 2024). However, despite the growing number of areas in which gender bias is discussed in the context of web search, for instance, politics (Pradel, 2021) or innovation (Makhortykh et al., 2021), its role in some societally relevant areas remains understudied. One of such areas is heritage, particularly heritage dealing with mass atrocities such as the Holocaust, which until now is often contested and frequently instrumentalized for the needs of today's politics.

To address these questions, we conduct an algorithm audit of how Google, one of the world's most commonly used search engines, visually represents victims of the Holocaust and whether such representation is prone to gender bias. We are interested in gender bias in image search, both due to the strong affective potential that visual images have, and much research on the topic so far has focused on image search. Specifically, we manually collected the top 50 image search results from 50 locations worldwide (with most of the locations in Europe, where the Holocaust took place). We used a VPN to simulate local IP addresses for all the locations and also translated the gender-neutral query - i.e., "Holocaust victims" - into the official languages of the country corresponding to each location.

After collecting the data, we used computer vision to automatically identify the number of human beings present on each image appearing in search results and their sex (we recognize that sex is a simplified proxy for a complex gender construct, but automated identification of different forms of gender remains a challenging task). For this aim, we used Amazon Rekognition API, as earlier studies (e.g., Ulloa et al., 2024) demonstrated that its performance for analysing human-related features (including the number of individuals and their age) is on par with human-made assessments. To confirm it, we conducted a sanity test using a small subset of images, which were analyzed by the authors and then compared to the outcomes of the Rekognition API.

For the analysis, we tested a set of hypotheses, which are informed by research on Holocaust heritage, particularly the memorialization of victims. The first hypothesis is that image search results will contain more images of women than of men due to Holocaust-related memorial practices in many European countries focusing on images of more vulnerable victims, such as women and children. The second hypothesis is that the number of images with humans will be higher for countries from which more Holocaust victims originated and where we find more Holocaust memorial sites. The third hypothesis is that the present-day gender equality score will influence the distribution of female and male victims depicted in image search results. To test these hypotheses, we employed correlation analysis and generalized linear mixed-effects models.

AEM01 Who Are We (Not)? Affective Potentials of Mediated Identity Work and Politics

PP 0655 "Woke" as an affective signifier in the Nordic public debates

Juha Herkman[1], Liv Sunnercrantz[2], Mattias Ekman[3], Morten Stinus Kristensen[2], Mona Heimonen[4]

[1] University of Helsinki, Faculty of Social Sciences / Media and Communication Studies, University of Helsinki, Finland
[2] University of Stavanger, Department of Media and Social Sciences, Stavanger, Norway
[3] Stockholm University, Department of Media Studies, Stockholm, Sweden
[4] University of Helsinki, Media and Communication Studies, Helsinki, Finland

The paper delivers a comparative analysis of how the signifier "woke" is imported from the US and circulated in the Nordic press. Inspired by Ernesto Laclau's theory on populism, "woke" is understood here as a floating signifier that various political groups use in their self-identifications and differentiations with other groups.

The paper is part of the research project Polarization, Affect, Identity: Nordic populism and the media landscape (Pol-Aid) funded by the Norwegian research council. The project has formerly conducted country specific case analyses of woke in Finland, Sweden, Norway and Denmark.

This study focuses on the original comparative content analysis of the woke discourses of leading daily and tabloid in four above-mentioned countries and explores when the debates over woke entered the mainstream public sphere, who have dominated these debates and what kind of meanings have been linked to woke. Through the analysis we compare the affective identifications and mobilizations woke as a signifier has been connected in different Nordic countries.

While the Nordic countries form in global comparison rather distinct country family on system and institutional level, their political cultures and histories differ significantly. Therefore, the comparison of the public debates over "woke" in these countries reveal remarkable differences in their populist mobilizations and identifications and in the connections of these affective processes to transnational narratives recycled especially by the Anglo-American far right and their "enemies". In this, our analysis also contributes to the increasingly discussed theory of affective polarization in liberal multi-party democracies.

Our preliminary analysis of the public use of "woke" indicates that the term has been discussed much more in Sweden than in three other countries and its use as an affective signifier in far-right's anti-woke campaigns has largely been adopted in all four countries. However, the use and framing of the term depends heavily on the status and success of the populist radical right actors in their party fields and varies according to contextual issues debated on the public spheres of the four studied countries.

PP 0656 Between trans joy and trans-antagonism: Affective contestations around Germany's self-determination act on TikTok

Annabella Backes[1], Ana Makhashvili[1], Margreth Lünenborg[2]

[1] Freie Universität Berlin, Collaborative Research Centre "Affective Societies", Berlin, Germany
[2] Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

In November 2024, Germany passed the Self-Determination Act (*Selbstbestimmungsgesetz*, SBGG), replacing the restrictive "Transsexuals Act" and enabling name and gender marker changes through self-declaration for trans, intersex, and non-binary people. Against the backdrop of shifting social and political grounds, the legislative process triggered intense and highly emotional debates across competing publics, revealing deep-seated tensions around gender and contested claims over vulnerability. Digital platforms, as "infrastructures of feeling" (Authors, 2026), play a central role in shaping the ways emotions are performed, claimed, and publicly felt. TikTok in particular produces specific temporalities, intensities, relationalities, and forms of (dis)embodiment, privileging its algorithmically curated "ForYouPage," memetic templates, and expressive bodies as central modes of communication (Kaye et al., 2022).

This paper examines the affective and discursive negotiation of the SBGG on TikTok, asking: (1) How are emotions embodied and performed through different affective registers, and how are these shaped by TikTok's affordances? (2) Which emotions gain visibility and relevance, and how are they (de)legitimized across communities? The analysis draws on a dataset of 1,509 publicly accessible videos collected via TikTok's Research API using the hashtags #Selbstbestimmungsgesetz and #SBGG, covering the period from the release of the draft bill in May 2023 to one year after the law's implementation in November 2025. We use a mixed-methods design that combines hashtag co-occurrence analysis to map broader affective and discursive themes, tensions, and alliances with qualitative multimodal analysis of a sample of 190 videos guided by the concept of "affective registers" (Töpper, 2020) to examine how emotions are embodied and performed across different communities.

Preliminary results indicate the emergence of three distinct *affective communities*. Trans creators and activists mobilize joy, relief, pride, and solidarity to claim visibility and create a sense of belonging, while using platform affordances to share educational content, political commentary, and guidance on bureaucratic procedures. Self-ascribed radical feminists foreground fear and anger, weaponizing narratives of protecting cis women and children, positioning them as vulnerable subjects under

threat. Although their discourse is at times explicitly transmisogynist, they also draw on feelings of empowerment, offering a conditional sense of belonging to "women" as a generalized category (e.g., #sisterhood, #womenempowerment), while hashtags such as #radfemsafespace signal the exclusion of trans identities. Far-right accounts amplify similar narratives, blending resentment with ridicule against trans people, and mobilizing a sense of insecurity and imminent threat, centering particularly on children and cis women.

By situating these affective dynamics within the broader theme of "shifting grounds," the paper demonstrates how affective registers contribute to emergent ruptures and alliances across and within feminist and anti-feminist movements. The analysis reveals how radical feminist and far-right actors capitalize on essentialized understandings of womanhood as inherently tied to vulnerability, imagined as permanently under threat and in need of protection (Bassi & LaFleur, 2022). It also shows how emotions can be channeled into distinct forms of solidarity and community building. Understanding these contestations offers crucial insights into how emotions on TikTok shape political discourse, experiences of belonging, and the trajectories of present and future gender politics.

AEM01 Who Are We (Not)? Affective Potentials of Mediated Identity Work and Politics

PP 0657 Domestic warmth in times of crisis: Defining the material-affective apparatus of the "tradwife" movement of Instagram

Lydia Garcia Vaquero[1]

[1] Aarhus University, Department of Media and Journalism Studies, Aarhus, Denmark

This proposal examines how affects are mobilized through domestic materials and digital affordances within the "tradwife" movement on Instagram to produce a stable, comforting alternative to a perceived contemporary disorder in relation to gender, economics, and culture. While existing scholarship on "tradwives" has focused on analyzing their antifeminist discourse and political underpinnings, the following piece turns attention to what I conceptualize as the material-affective apparatus of tradwives: an assemblage of materials, bodies, and digital technologies that intra-act to render domestic femininity desirable and reproducible. In the article currently awaiting publication, I draw from new materialist theory (Barad, 2013), affect theory (Ahmed, 2010), and Proctor's concept of "totemic nostalgia" (2017), to showcase how domestic artifacts in this context function as totemic mediators of nostalgic yearnings for an idealised past in which homemaking labor, childcare, and economic dependence bestow emotional fulfillment and social stability.

The paper includes a small-scale, in-depth qualitative visual and textual analysis of 14 reels pertaining to the trend "looking for a tradwife", a parody of an earlier viral song "looking for a man in finance" (Emba 2024), sampled around three affective clusters: love, nostalgia, and hate. Love was exhibited through gentle, caring gestures between objects and animals, children, husbands, and affectionate mentions to Christ. Seven users reflected on footnotes and hashtags the aspiration to meet like-minded individuals, with some even declaring the importance of belonging and sorority in the tradwife community. Another sentiment that abides in tradwife posts on Instagram is the longing for an idealized past. Users yearn for sensed stability, tranquility, and security that past times had. Nostalgia is enacted through artisanal practices like the patient fermentation of sourdough, the warmth of baking, vintage dresses, and old music, and an explicit preference for analogic domestic technologies like butter churners. These become carriers of feelings that structure the tradwife ethos in opposition to the hectic, unstable contemporary rhythm of urban lifestyle. This nostalgia is not merely aesthetic, as domestic objects help frame the tradwife ethos. However, the findings also revealed contradictions in the construction of the "happy housewife" ideal (Ahmed, 2010:52) uncovering hatred towards feminists. In doing so, tradwife media constructs affective boundaries: positioning feminism, urban life, and contemporary precarity as sources of misery, and domestic submission as a pathway to happiness and moral clarity. Some creators grudgefully differentiate themselves from feminists sharing unpleasant encounters with them, or through sarcastic jokes in the captions, showcasing how emotional media environments shape belonging, opposition, and future imaginaries. The sarcastic gestures towards the tin foil hats, and tallow, and the visceral presence of meat and the crudeness with which it is maneuvered are examples of how the otherwise tranquil, soft-feminine aesthetics of tradwives is unsettled.

In summary, the paper explores how affects operate through material agents in contemporary digital public spheres. Tradwife posts circulate idealised representations of domestic femininity that promise stability, belonging, and moral grounding amid social and economic uncertainty, demonstrating how neotraditional gender politics are enacted through materials, affects, and technologies.

AEM01 Who Are We (Not)? Affective Potentials of Mediated Identity Work and Politics

PP 0658 Inspired by superstars: Understanding celebrity role-modelling influence through affect

Maria Adamson[1]

[1] Queen Mary University of London, School of Business and Management, London, United Kingdom

Calls for more visible role models to inspire women and minorities into successful careers and leadership have dominated media discourse for over a decade. Various superstar CEOs and business celebrities in particular, such as Sheryl Sandberg, Oprah Winfrey, or Satya Nadella, are often portrayed by the media as positive role models. However, research has been

critical of the impact of such elite figures, arguing that they promote and reinforce neoliberal discourses of success and meritocracy and therefore, albeit visible, they have little potential for disrupting the status quo of power relations (Adamson, 2017; Adamson and Kelan, 2019; Bloom & Rhodes, 2018; Littler, 2007; Kansikas, 2021). However, some have argued that the current theorising has not sufficiently explored people's capacity to critically engage with elite role models (Adamson and Kelan, 2024), and we continue to lack tools to explain the appeal of celebrity role models, without dismissing such perceptions through false consciousness-type explanations. To address this, the paper explores how individuals get inspired by prominent celebrity role models (if at all) and how we can understand such engagement better.

Drawing on a diverse sample of 60 in-depth interviews and four focus groups with UK-based professionals from various industries and sectors, I examine how they view and relate to prominent celebrity figures and how they construe the meaning of inspiration in their encounters with such role models. I argue that neither the dominant psychological approaches that theorise role models as 'cognitive constructs', nor social-discursive approaches that see them critically as 'texts' and vehicles of certain ideologies, are sufficient to explain the appeal and influence of these role models, as neither captures the emotional element of the role modelling relationship.

To address this, I draw on the social theory of affect (Grossberg, 1992; Massoumi, 2010). I suggest that inspiration is best understood as an affective force produced in the role-modelling relationship and should be viewed as the key element of the role-modelling influence, as it energises and moves one towards change, in the right circumstances. My analysis shows that most interviewees, men more so than women, do not see role models as a 'holistic' construct, and can be inspired by one aspect relevant to them, while being critical of other traits of the same person. Visible role models, thus, could be personally inspiring (or not) and influential, regardless of their positive or negative public image. The paper extends the current theorising of elite and celebrity role modelling influence by foregrounding the emotive element in role modelling, and positioning inspiration as a central, yet overlooked, mechanism through which visible role models with heightened media presence exert influence. This reframing deepens our theoretical understanding of the role-modelling process and the implications for our approaches to communicating and assessing the role of visible public and media celebrity figures and their effect.

AEM01 Who Are We (Not)? Affective Potentials of Mediated Identity Work and Politics

PP 0659 "Make yourself comfortable": A multimethod approach to studying comfort content consumption on digital platforms

Anastasiia Osipova[1]

[1] University of Milan, Department of Social and Political Sciences, Milan, Italy

Digital platforms bring with them a whole set of comforts and discomforts (Beer, 2019). In recent years, users have grown more aware of how important it is to feel safe in digital spaces: since the pandemic, even if audience necessities still balance between the pole of curiosity and old habits (Fortunati & Vincent, 2009), there is an acute growth of preferences towards online interactions that promote well-being other than strong emotional responses (Kruegler & Osloer, 2019). Creators have also become more inclined to share their lives "unfiltered", including mental health struggles and everyday comforts (YouTube, 2023).

This fosters a supportive environment where people find solace in "shared vulnerabilities" (Kreling et al., 2022) and the realisation that others "might be going through the same as them" (Lupinacci, 2021, p. 10). These motivations triggered a surge in so-called "comfort content" consumption (VanArendonk, 2020; Zeitoune, 2022). The term "comfort content" is used to describe content people seek when in need of familiar and soothing: "*It can feel like the presence of a familiar friend without you having to put in the effort from your end*" (Markus, 2021). The popularity of comfort content is continuously growing as the realities of life are rapidly changing, with the increasing cognitive load and omnipresent news fatigue (Fitzpatrick, 2022).

Through a multimethod approach combining qualitative interviews with 20 participants and content analysis of short videos identified by them as "comforting", this research explores how comfort content is perceived, consumed, and integrated into everyday digital routines. Talking about comfort content, participants often address the words *"calm", "safety", "stability", "predictability",* and *"inspiration*", and consistently use spatial metaphors (*"shelter", "safe space", "comfort zone"*) when describing how comfort content functions during stress. Aligned with the existing literature, participants confirm seeking distinctive features: authenticity that signals genuine creator presence, predictability and familiarity reducing cognitive load (Kushlev et al., 2017), relatability and the feeling of "not being alone", nostalgic aesthetics (Jacobsen & Beer, 2021), and low-stakes narratives. Content analysis confirms these user perceptions, demonstrating how formal elements – soft lighting, minimal but appropriate editing, conversational tone, repetitive structures (Bidin & Lokman, 2018) – work together to create atmospheres of comfort and safety.

However, comfort content consumption reveals significant tensions. While users frame this practice as self-care, they also express anxiety about "overexposure" (describing how algorithmic systems can trap them in comfort content loops discouraging engagement with challenging information), concerns about how algorithms could affect young people's wellbeing,

and the possibility that comfort-seeking itself might increase anxiety when framed as "guilty pleasure" consumption (see Peters et al., 2017).

By situating comfort content within affective media practices, this research contributes to understanding how emotions dominate the digital landscape and how the desire for comfort shapes contemporary content consumption, which aligns with consumer forecasts describing "strategic joy" as a key motivation for consumer behaviours (WGSN, 2026). This research demonstrates that comfort content functions as a socio-technical phenomenon where individual emotional needs intersect with attention economy while raising questions about whether algorithmic systems can genuinely provide the refuge we seek online.

AEM02 A Curse or a Blessing? Evoking Emotion in Journalism and Politics

PP 0760 See Gaza through my eyes: Performing journalism as affective labor

Laura Cervi[1], Nuria Roca Trench[2]

[1] Universitat Autonoma de Barcelona, Journalism, Bellaterra- Barcelona, Spain
[2] Universitat Internacional de Catalunya, Department of Communication Sciences, Barcelona, Spain

In Gaza, the loss of senior journalists and the constraints imposed by the blockade have compelled young reporters to assume professional responsibilities under extreme conditions. With international media largely excluded, social media has become the primary avenue for documenting and communicating local realities.

Within this context, a form of **affective journalism** emerges, in which affect functions both as the lived experience of witnessing precarity and as a strategic resource employed to generate visibility, mobilize solidarity, and assert narrative authority. Drawing on scholarship on the emotional turn in journalism, this study conceptualizes affect as central to contemporary journalistic labor: it shapes what is reported, how stories are constructed, and how audiences are engaged.

To examine this, the study analyzes the Instagram practices of the most-followed young Gazan journalists—Plestia Alaqad, Bisan Owda, Motaz Azaiza, and Hind Khoudary—demonstrating how Instagram operates not merely as a channel for information but as a medium through which affect is rendered visible and relational, translating personal experiences of trauma into communicative strategies legible to distant audiences.

Methodologically, the study employs multimodal content analysis of Instagram posts, attending to visual, textual, and performative modes that convey affect while interacting with platform affordances. The analysis considers both the affect these journalists experience and the ways it is intentionally deployed to structure attention, foreground moral urgency, and facilitate audience engagement.

Findings indicate that affective labor is simultaneously constitutive and instrumental. It enables journalists to navigate the immediacy of lived crisis while functioning as a resource to amplify visibility, cultivate empathy, and foster transnational solidarity. Posts balance personal vulnerability with professional witnessing, illustrating how affect can be leveraged to communicate the gravity of events without undermining credibility or journalistic authority.

By centering young journalists operating under extreme conditions, this study contributes to understanding the emotional turn in journalism. It demonstrates how affect operates at the intersection of experience and strategy, highlighting that under conditions of extreme precarity, affect is not only what journalists feel but also a tool through which they sustain narratives, negotiate professional responsibilities, and mobilize public attention to contested realities.

AEM02 A Curse or a Blessing? Evoking Emotion in Journalism and Politics

PP 0761 Affects in war journalism – A case study of Finnish journalists reporting from Russo-Ukraine war

Suvi Mononen[1]

[1] Tampere University, Social Sciences, Tampere, Finland

Russo-Ukrainian war stroke a specifically emotional chord in the Finnish nation considering our national history of war with Russia in 1939–1940. Since the beginning of Russias' full scale invasion of Ukraine in 2022, exceptionally large group (approx. 100) of Finnish journalists have reported on site from Ukraine, providing the Finnish audience a firsthand look at a nation in crisis through the civilians stories. Finnish war reporting is characterized as having a strong human interest-focus, and news stories combine elements of crisis- and feature journalism (Raippalinna et al. 2025).

Based on extensive ethnographic interview data (n = 210 hours) collected from Finnish journalists, photographers and Ukrainian fixers (Raippalinna, Mononen & Ikonen 2024) this paper examines the role of affects in Finnish war journalism, and asks: How emotions are employed, negotiated and organized concerning journalistic process of war coverage?

Drawing from Johana Kotisovas' (2024; 2025) research on affective epistemology in war journalism, and Castro, Mendes & Coutinhos' (2025) proposal for analytical framework for investigating emotional practices in organizations (see also Voronov & Vince 2010; Beckett & Deuze 2016), the analysis employs the concepts of *affective hierarchies* and *emotional practices* into empirical investigation of journalistic practice and -culture of war reporting portrayed by the journalists, photographers and fixers.

The paper presents preliminary findings of Mononen's doctoral dissertation research in the field of Social Anthropology taking an interdisciplinary look on investigating journalistic culture by combining social anthropology and journalism studies. The dissertation expands from her previous academic research in the field of journalism studies on Finnish war journalisms' cultural proximity and emotion (Mononen 2024 in ECREA), and ethical decision making of Finnish photographers working in Ukraine 2014–2024 (Raippalinna, Mononen, Mykkänen & Uskali 2025) towards an understanding of journalism as an *affective institution* (see also Castro, Mendes & Coutinho 2025; Medeiros & Makhashvili 2022; Makhashvili, Medeiros & Lünenborg 2022) and the role of affects in the journalistic process of war reporting.

AEM02 A Curse or a Blessing? Evoking Emotion in Journalism and Politics

PP 0762 Resilience is not enough: Portuguese journalists' perspectives on organizational support for emotional health and well-being in the newsroom

Gabriela Ferreira[1], Dora Santos-Silva[1]

[1] ICNOVA, Media and Journalism, Lisboa, Portugal

Journalism is a high-pressure profession, frequently exposing its professionals to sensitive, traumatic, and high-stress environments (Deuze, 2022; Pantti & Wahl-Jorgensen, 2021). A substantial body of research has documented the psychological risks associated with newswork, including burnout, emotional exhaustion or secondary trauma (Feinstein, 2012; Maslach et al., 2001). However, comparatively less attention has been paid to journalists' own assessments of how news organizations can support their emotional well-being. Existing studies indicate that journalists rely primarily on their personal and informal coping resources rather than on the mental health initiatives formally provided by news organizations to manage work-related stress (Šimunjak & Menke, 2022; Huxford & Hopper, 2020).

This research aims to investigate the perspectives of Portuguese journalists on organizational strategies for emotional health, analyzing the gap between the professional demands and the support mechanisms provided by media organizations. Specifically, this study aims to look into these research questions: RQ1: Which mental health initiatives and support resources within media organizations do journalists have access to and value most, and which do they perceive as lacking? RQ2: How do journalists evaluate the effectiveness of mental health resources in their newsrooms?, and RQ3: How do journalists describe their relationship with mental health and well-being in the context of news organizations and peer interactions?

Adopting a quantitative research design, this study is based on a questionnaire applied to Portuguese journalists working across several media platforms, between January and July 2025. The analysis includes 359 valid answers to help understand how organizational practices, such as mental health resources, workload management, and emotional training, are perceived and implemented.

The findings show that 95% of respondents acknowledge that their work directly impacts their mental health and emotional well-being. The severity of this strain is evidenced by the fact that 32% of the sampled journalists have already required clinical leave due to psychological issues. Despite the prevalence of emotional risk, the data reveals lack of support within Portuguese newsrooms. Only 25% of journalists report that their companies offer any form of psychological support, and only 5% of newsrooms include a dedicated psychologist. Furthermore, the study identifies cultural barriers within leadership: 51% of participants find it difficult to discuss mental health with their superiors, and 52% do not feel that their health and safety are treated as organizational priorities. Proactive strategies, such as regular debriefing sessions (present

in only 18% of cases) and formal work-life balance policies (9%), remain the exception rather than the rule. Results also show a strong demand for organisational support, particularly psychotherapy, although journalists revealed distrust of employer-mediated help.

Keywords

Journalism, Well-being, Mental Health, Organizational Strategy, Burnout, Portuguese Media, Newsroom Culture.

AEM02 A Curse or a Blessing? Evoking Emotion in Journalism and Politics

PP 0763 Empathy across modalities – A comparative q sort study of text-image-relations in war photography

Patrick Nehls[1], Marion G. Müller[1]

[1] University of Trier, Media Studies, Trier, Germany

Empathy is a key concept for understanding how audiences react to media coverage of conflict and war (Müller & Christ, 2023). Although contested (Lobb, 2017), most scholars agree that empathy encompasses cognitive and affective dimensions and always involves both the self and others (Guthridge & Giummarra, 2021). Empathy does not necessarily require physical co-presence but can also be elicited under mediated conditions (Höijer, 2004): Studies have shown that empathic reactions can foster prosocial emotions toward those depicted, while also being the basis for traumatizing viewers (Kaplan, 2011). Images play a particularly important role here, as they address both cognitive and affective levels and significantly influence how wars and their consequences are seen and perceived. Compared to other modalities, visual stimuli tend to elicit stronger effects than text (Geise & Xu, 2024). Yet, images rarely appear without textual elements in media reports, which raises the question of how empathic effects in audiences unfold in combined image-text stimuli.

Against this background, two Q Sort studies (Watts & Stenner, 2012) were conducted on the Russian war of aggression in Ukraine, each with 25 participants. While the first study used 33 press photographs as statements, the second study used the same press photographs but included their accompanying textual captions. Both Q sorts were identical in set-up, using a forced-distribution approach. Results show how different modalities influence emotional responses and that empathy as an emotional reaction serves as a critical concept for analyzing text-image relations in visual communication studies, particularly in the context of war and conflict. Furthermore, the study demonstrates how participants' individual properties shape their assessment of images and texts (Paananen et al., 2024), providing insight into the interplay of visual and textual motifs and empathetic audience reactions.

AEM02 A Curse or a Blessing? Evoking Emotion in Journalism and Politics

PP 0764 The politics of race and emotions in reform UK's Facebook campaigning

Pratichi Chatterjee[1], Anna Nordstrom[2]

[1] Univeristy of Sheffield, School of Geography and Planning, Sheffield, United Kingdom
[2] Stockholm University, Department of Media Studies IMS, Stockholm, Sweden

Anti-immigrant rhetoric and policies have become increasingly central to British and European politics in recent years. Whilst often claiming not to be racist, hostility to migrants bears the hallmarks of racist dehumanisation. This paper examines how immigrants and immigration have been negatively racialised in Facebook content from the UK's increasingly popular Reform Party, in the month leading up to the 2024 general election. Drawing on theories that analyse race in relation to narratives of threat and deservingness, and theories of the role of emotions in politics, we analyse 223 Facebook posts published

between the 1st June and 4th July 2024. We demonstrate how Reform UK constructs immigrant men, particularly those arriving via small boats, as a threat to Britain — endangering public resources, national and public security, and cultural integrity.

The analysis highlights how reinforcing social divisions, by evoking emotions, is a central mechanism of racist discourse. Fear and anger are mobilised by conveying a message of imminent threat, using repetitive language, dehumanising numerical representations, pejorative tropes and visual imagery. Anger, fear and apprehension about immigration circulated in Reform's posts, were central in constructing a racial grievance. Racialising the threatening immigrants vis-à-vis the decent and generous native Britons in relation to each other enables a grievance that is not concerned with deprivation itself, but rather is a response to an unjust deprivation. The racialisations expressed in Reform's social media messaging were also repeated in one of the largest anti-migration protests seen in the UK in recent years, held in London, and led by far-right activist Tommy Robinson in September 2025.

The findings illuminate how contemporary racialisation operates through threat narratives that express a form of racial grievance, and provide discursive groundwork for anti-immigrant mobilisations. The study demonstrates the continued salience of race in UK politics despite its formal absence from public debate.

This begs the question- what is to be done in response?

AEM03 Does it Feel Right? Emotional Connection and Trust in Media

PP 1076 The comfort of normality: Affective sense-making in alternative media repertoires

Katharina Schöppl[1], Christian Schwarzenegger[2]

[1] University of Mannheim, Institute for Media and Communication Studies, Mannheim, Germany
[2] University of Bremen, Centre for Media- Communication and Information Research ZeMKI, Bremen, Germany

Although interest in alternative media users has grown in recent years (Brems, 2025; Schwarzenegger, 2021, 2022), research has focused primarily on why people abandon mainstream journalism and turn to alternative sources. We still know relatively little about the epistemic reassurance, sense of recognition, and emotional comfort that users may find when engaging with these "other media." This gap is particularly pressing in times of epistemic instability (Harambam, 2020) and the increasing role of alternative media (Newman, 2025). Alternative media, as affect generators (Lünenborg 2022), are particularly effective in activating emotions when guiding media choice and affective sense-making (Schöppl & Schwarzenegger, 2025).

This study approaches alternative media as *emotional comfort zones* that offer validation and resonance amid broader conditions of epistemic instability. Theoretically, we build on Mau et al.'s (2023) taxonomy of trigger points, which conceptualizes contemporary conflicts as crystallizing around moments where taken-for-granted orders of normality are perceived to be violated and societal consensus turns into dissensus. Trigger points emerge where expectations about rules, routines, and shared common sense are disrupted by issues such as gender politics, or climate policies. In these moments of perceived order loss and identity threat, emotions become central, as actors seek to defend, restore, or redefine what counts as "normal." We argue that alternative media provide affective infrastructures in which such breaches of normality can be interpreted, personalized, and emotionally processed, offering users spaces to reaffirm moral order, belonging, and epistemic orientation (Bartsch et al., 2024).

Empirically, the paper draws on a three-year qualitative longitudinal panel study (n = 33) on users of alternative media, combining interviews, media diaries, and media repertoire cards across three waves. The temporal design is essential for tracing how affective engagements, media repertoires, and identity narratives evolve in response to shifting trigger points.

Focusing on *normality* as a central yet underexplored narrative, our results demonstrate how alternative media provide the *comfort of normality*: they validate perceptions of norm violations, particularly at trigger points, and reassure users that it is others – often political, media, or cultural elites – who deviate from common sense, from what is „normal". However, negotiations remain fluid and ambivalent: users oscillate between feeling victimized, exceptional, and "simply normal," and these constellations shift across issues, platforms, and over time. While previous studies (Chouliaraki, 2024; Mayer & Parks, 2025; Roberts & Wahl-Jorgensen, 2020; Schwarzenegger, 2021, 2022) have emphasised narratives of *victimhood* and *exceptionality* as integral to alternative media, we find that the narrative of *normality* is equally important.

By foregrounding the affective search for *normality* within broader constellations of victimhood and exceptionality, this study contributes to the emotional turn (Wahl-Jorgensen, 2020) in communication research. In line with ECREA 2026's theme *Shifting Grounds*, it shows how users seek emotional stabilization at moments when consensus fractures, how affective media practices foster connections and imagined communities of „normal people and viewpoints" and how these comfort zones shape the futures users envision under conditions of epistemic instability.

AEM03 Does it Feel Right? Emotional Connection and Trust in Media

PP 1077 Anger predicts individual misinformation sharing but not aggregate dynamics: a multi-level analysis of Austrian Twitter 2019–2023

Jula Luehring[1], David Garcia[2], Apeksha Shetty[1], Annie Waldherr[1]

[1] University of Vienna, Communication Science, Vienna, Austria
[2] University of Konstanz, Political Science, Konstanz, Germany

Understanding how users interact with trustworthy and untrustworthy news online is crucial for combating misinformation. While research shows that high-arousal negative emotions predict misinformation sharing (Ecker et al., 2022), the temporal relationship between emotions and engagement with untrustworthy content remains underexplored. Moreover, existing research has examined either aggregate patterns or individual mechanisms, rarely both simultaneously, masking how mechanisms differ across levels of analysis (Leach & Bou Zeineddine, 2021). In this study, we examined how emotions predict news sharing at both collective and individual levels. We analyzed ~29,000 Austrian Twitter users and their tweets from January 2019 to March 2023, capturing both pre-pandemic and pandemic dynamics, and employed natural language processing to detect anger and fear expression and NewsGuard ratings to identify untrustworthy news sources.

Our findings reveal a divergence between levels: At the collective level, untrustworthy news sharing and emotional expression operate as largely independent processes, each responding primarily to external events rather than mutually reinforcing each other (Goldenberg et al., 2020). At the individual level, however, anger consistently predicts increased sharing of all news types, with particularly strong effects for untrustworthy content: Users with one standard deviation higher anger baseline show 142% greater odds of sharing untrustworthy news. Temporal dynamics of anger expression (including variability, instability, and inertia; Houben et al., 2015) all predict engagement with untrustworthy sources, while fear expression predicts decreased news sharing, with variability reducing odds of untrustworthy news sharing by 72%. Analyzing emotional states before and after sharing reveals that elevated anger precedes untrustworthy news sharing, but sharing does not reduce emotional expression, suggesting that misinformation engagement is not primarily motivated by emotion regulation.

These findings demonstrate that individual-level mechanisms can coexist with collective-level independence. The minority of users who share misinformation tend to be emotionally distinctive, but collective spikes are driven by events affecting all users. This multi-level perspective has implications: platform-level interventions should focus on rapid response during crisis periods, while individual-level interventions should address psychological needs (Douglas et al., 2017; Ecker et al., 2022) among the motivated minority of users sharing misinformation (Petersen et al., 2023).

AEM03 Does it Feel Right? Emotional Connection and Trust in Media

PP 1078 Beyond fact-checks: testing cognitive and affective interventions to neutralize misinformation's persuasive effects

Ivar Vermeulen[1], Ellen Droog[1], Dian Van Huijstee[1]

[1] Vrije Universiteit Amsterdam, Communication Science, Amsterdam, Netherlands

Introduction

The persuasive impact of misinformation can persist even after it has been factually corrected (e.g., Johnson & Seifert, 1994). This phenomenon, known as continued influence, shows that although people may update their factual beliefs, negative impressions formed by the initial misinformation often endure (Lewandowsky et al., 2012; Thorson, 2016). Standard fact-checks are crucial for correcting false beliefs but are frequently insufficient to fully neutralize these lingering persuasive effects (Van Huijstee et al., 2025). One explanation is that fact-checks primarily target belief accuracy, while broader attitudes inferred from misinformation remain unaddressed. This creates a need for interventions that directly target these inferred attitudes. The present paper reports two studies testing the efficacy of three such interventions:

one cognitive intervention requiring active engagement, and two affective interventions relying on passive associative learning. Specifically, we examine a counter-explanation task (Greitemeyer, 2019; Siebert & Siebert, 2023) and evaluative and classical conditioning (De Houwer et al., 2001; Olson & Fazio, 2001).

Method

Two experimental studies were conducted (N = 443 and N = 614). In both, participants were exposed to misinformation via a fabricated social media post alleging that a fictional individual had committed insurance fraud. Participants were then assigned to different conditions to test intervention effects. Study 1 examined a cognitive counter-explanation task, in which participants actively generated arguments supporting an opposing conclusion (e.g., reasons why the subject is a good person). Study 2 tested two affective audio-visual interventions: evaluative conditioning, which paired the subject with pleasant music, and classical conditioning, which repeatedly followed an image of the subject with images of highly attractive people. Across both studies, dependent variables included explicit attitudes measured with semantic differential scales, and implicit attitudes measured using the Affect Misattribution Procedure (Bar-Anan & Nosek, 2012).

Results

Exposure to the fabricated misinformation led to significantly more negative explicit and implicit attitudes toward the subject compared to a neutral control condition. Both studies also showed that a standard fact-check alone was insufficient to eliminate these effects: participants who received only a correction continued to hold more negative attitudes than those in the control group.

In Study 1, combining a factual correction with the counter-explanation task produced a marginally significant improvement in explicit attitudes compared to correction alone; no significant improvement was observed for implicit attitudes. Notably, implicit attitudes in this combined condition did return to the level of the neutral control group. In contrast, Study 2 found no evidence that either conditioning technique improved explicit or implicit attitudes beyond the effects of a standard fact-check.

Discussion

Overall, the findings indicate only modest additional benefits of the tested interventions over traditional fact-checking in reducing attitudinal effects of misinformation. Nonetheless, the approach of directly targeting inferred attitudes rather than focusing solely on veracity remains promising. To enhance external validity, the present studies used relatively low-intensive and low-immersive interventions—for example, by requiring only two counter-explanations or presenting brief, low-production-value videos. Future research should systematically vary message characteristics to more rigorously test the potential of this approach to counteract misinformation's persuasive effects.

AEM03 Does it Feel Right? Emotional Connection and Trust in Media

PP 1079 Trump gaza: The impact of Trump's neocolonialistic AI fantasy on geopolitics from a film-psychological perspective

Johann Pibert[1]

[1] University of Bonn, Media Studies, Berlin, Germany

The 33-second, AI-generated video of a Gaza fantasy Trump posted on February 26, 2025, on his own Truth Social network[1] reveals a neoimperialistic nature of the White House's new geopolitics.[2] The video that was initially created as political satire[3] shows, among other things, a monumental golden Trump statue, topless Trump and Netanyahu enjoying cocktails at a pool, and bearded Hamas fighters as belly dancers. It immediately went viral and gathered a vast number of comments on every social media platform where it appeared. However, positive comments on Trump's alternative reality for the Gaza region are getting lost in the sea of rejection. Even among Trump's supporters, there is a lack of willingness to accept such a neocolonialistic vision.[4] Accordingly, the viral video hit the headlines of major media worldwide. The journalistic assessments largely validate negative attitudes and affects toward Trump's speculative fiction presented in *Trump Gaza*.

The intensity of Trump's fantasy's rejection in social and professional media is reflected in the intensity of the video's aesthetics. This paper analyzes the audiovisual strategies in *Trump Gaza* from a film-psychological—i.e., transdisciplinary—perspective.[5] Thirty-four shots in 33 seconds indicate a highly rhythmic editing that can be conceived as a quantitative strategy of overwhelming. Moreover, a qualitative strategy of emotionalization can be assumed because recipients experience exaggerated (statue), grotesque (pool), and absurd (Hamas dancers) images eliciting a range of intense emotions like negative surprise, disgust, anger, sadness, or fear. It is mainly the emotion of fear found at the micro level of analysis that leads to the feeling of anxiety (meso level), an uncanny atmosphere (macro level), and, in many ways, distorted 'entertainment' (meta level). Correspondingly, distortion characterizes Trump's geopolitical strategies, paving the way for radicalization and facilitating fascist tendencies.

Besides its film-psychological endeavor, this paper presents the so-called Four-Level Theory of International Relations with Gaza's re-creation and the relocation of its population as exemplary political instruments on the micro level, neocolonialism as a political model or program on the meso level, neoimperialism as a political theory on the macro level, and neorealism as a political paradigm on the meta level. These four levels correspond to those used in the film-psychological analysis

of *Trump Gaza*, connecting historical–political and (film-)psychological considerations. Altogether, the significance of the culture war in media and politics becomes clear.

AEM04 Creepy, Scary, or Curious? Emotional Impact of Media Technologies and Content

PP 1176 Laughter and regulation: The affective politics of representing Northeastern-ness in Chinese media

Jamie Wang[1]

[1] UCL, Culture- Communication and Media, London, United Kingdom

This paper investigates how laughter operates as a politically mediated affect in contemporary representations of Chinese Northeastern-ness. Once known as the industrial heartland and celebrated as the "eldest son of the republic," China's Northeast region has been culturally marginalised and economically dispossessed in the post-reform era. Following the state-owned enterprise restructuring of the 1990s, the region underwent widespread deindustrialisation and mass layoffs, triggering media discourses of Northeast China's backwardness and social decay. This structural marginalisation provides the backdrop against which Northeastern bodies, dialects, and performance styles became recurrent sites of ridicule, pity, and amusement in various Chinese media.

Building on Bakhtin's (1984) concept of carnivalesque laughter and grotesque realism, and Giamario's (2022) theorisation of laughter as a political affect, this paper examines how laughter—particularly in Northeastern folk comedic forms such as televised *Errenzhuan*, *Xiaopin* (sketch comedy), and livestream performances—functions not merely as spontaneous joy but as an affective mode of ideological regulation. I focus especially on the female grotesque figures, often portrayed as brash, vulgar, rural, and excessive, whose perceived "lack of *suzhi* (personal quality)" marks them as objects of both laughter and contempt. Their ambivalent position—as simultaneously laughable and desirable—encapsulates broader tensions in the social negotiation of gender, class, and regional hierarchy.

I investigate how such grotesque bodies were celebrated throughout the 1990s on the most-watched Chinese TV programme *The Spring Festival Gala*—particularly through Northeastern comedian Zhao Benshan's iconic performances that mixed satire, sexual innuendo, and rustic wisdom to challenge social hierarchies—yet were later censored or forcibly sanitised under campaigns of *Zheng Nengliang* (positive energy) and cultural refinement under the rule of President Xi Jinping after 2014. I further explore how, in the digital era, these forms of laughter have been re-commodified: influencers like "Northeast Tiger Brother" deploy grotesque personas—featuring loud Northeastern dialects, flashy outfits, exaggerated and laughable postures—to generate algorithmic visibility and monetisable emotional reactions. In this way, laughter becomes embedded in platform capitalism and what Rofel (2007) terms "consumer fundamentalism," where affective excess and regional stigma are repackaged into consumable, profitable content.

By tracing how Northeastern-ness is gradually rendered grotesque, laughable, and affectively out-of-place, this paper examines how laughter participates in constructing regional and gendered boundaries and affective hierarchies in China.

The contribution of this paper lies in repositioning laughter as a mediated, historically contingent affective practice, shaped by ideological campaigns, regional marginalisation, and platform economies in the Chinese context. It foregrounds the need to theorise laughter as a key modality through which social and ideological power, affective citizenship, and national imaginaries are regulated and reproduced in post-socialist China.

AEM04 Creepy, Scary, or Curious? Emotional Impact of Media Technologies and Content

PP 1177 Empirically exploring the affect dynamics of dataveillance-induced chilling effects over time

Céline Odermatt[1], Kiran Kappeler[2], Noemi Festic[1], Michael Latzer[1]

[1] University of Zurich, Department of Communication and Media Research IKMZ, Zurich, Switzerland
[2] University of Copenhagen, Department of Communication, Copenhagen, Denmark

Dataveillance, i.e., the automatic and continuous collection and analysis of data traces, is a continuous feature of everyday digital life, evoking temporally dynamic affective and behavioral responses. Individuals' sense of dataveillance–the diffuse feeling of being monitored online–is gradually heightened through repeated encounters with triggers such as privacy notices and dataveillance-related news (Author, 2025). We conceptualize this sense of dataveillance as an affective state, i.e., an embodied and often unconscious feeling, rather than a purely cognitive perception. Situated within broader affective atmospheres of surveillance (Ellis et al., 2013), it can evolve over time as individuals habituate to recurring triggers, regulate their feelings, or reinterpret experiences. As the sense of dataveillance can linger and accumulate, it can ultimately inhibit legitimate digital communication behaviors such as searching for information, sharing opinions, and disclosing personal information. These so-called chilling effects can undermine individuals' autonomy and democratic rights (Penney, 2025; White & Zimbardo, 1975). Their temporally dynamic processes are crucial in understanding how chilling effects emerge, persist, and transform. Yet, research on the temporal dimensions of chilling effects remains scarce. This study draws on affect dynamics (Kuppens & Verduyn, 2017) and chilling effects research (Büchi et al., 2022) to investigate how chilling effects unfold over time in response to repeated exposure to triggers of a sense of dataveillance. We examine the affective dynamics of the sense of dataveillance and digital communication behaviors in terms of both temporal changes (trajectories, reactivity to triggers, variability) and temporal dependencies (inertia and mutual augmentation).

Using the data of a representative, longitudinal online field experiment in Switzerland, we ran mixed-effects models to assess temporal changes, and Bayesian multilevel SEMs to test temporal dependencies. At each wave of the experiment, participants were randomly assigned to either a treatment condition, in which dataveillance was made salient through triggers, or a control condition. After each exposure, participants reported their sense of dataveillance and their comfort with three digital communication behaviors: searching for information, sharing opinions, and disclosing personal information.

The results reveal that chilling effects unfold as subtle but consistent affective and behavioral dynamics: individuals developed a relatively stable sense of dataveillance while continuing to respond to recurring triggers with small, persistent effects. The sense of dataveillance first increased and then stabilized but was consistently heightened through exposure to triggers. Variability in the sense of dataveillance was mainly between individuals, whereas variability in communication behaviors was primarily within individuals, suggesting greater situational volatility. Comfort with digital communication was momentarily reduced by exposure to triggers. Both the sense of dataveillance and communication behaviors showed inertia but no mutual augmentation.

By integrating time and affect into chilling effects research, this study offers innovative insights into individual experiences and adaptations to dataveillance in everyday life. Rather than discrete acts of self-censorship, chilling effects unfold as a dual temporal and adaptive affective process: a gradual stabilization of the sense of dataveillance alongside persistent reactivity to triggers. Hence, self-inhibition can emerge from affective adaptations to environments characterized by pervasive dataveillance, even in ordinary, low-stakes online contexts.

PP 1178 From "yay" to "meh" and back again: Knowledge workers' emotional trajectories of communicative AI adoption

Minna Koivula[1], Liisa Mäkinen[2], Mia Leppälä[3], Salla-Maaria Laaksonen[2], Kaisa Lindholm[1]

[1] University of Jyväskylä, Department of Language and Communication Studies, Jyvaskyla, Finland
[2] University of Helsinki, Center for Consumer Society Research, Helsinki, Finland
[3] Tampere University, Faculty of Information and Business- Information and Knowledge Management, Tampere, Finland

The emergence of generative artificial intelligence (GenAI), understood as machine-learning models capable of producing human-like outputs in the form of text, visual, or audio responses to messages (Brynjolfsson et al., 2025), has intensified societal narratives regarding job loss due to automation (Lucia et al., 2025). In public discourse, generative AI is often seen as a threat to professional identity, impinging on what workers especially in creative industries see as the heart of their expertise: Their ability to create original content (Coddington, 2014). This is because, as Lewis et al. (2025) argue, generative AI, for all its limitations, has reached its potential to fit into the role of a creator/communicator, a role previously reserved to humans.

Consequently, in this study, we examine how knowledge workers emotionally adapt to the arrival of large language model based tools (e.g., ChatGPT, Microsoft Copilot) to the workplace. We draw from human-machine communication and the concept of communicative AI (commAI), defined as algorithmic tools communicating in natural language that are able to adapt to real-life conversational situations (Guzman & Lewis, 2020) to theorize communicative AI as an affective

identity threat. An identity threat is "any discursively constituted thought or feeling that challenges one of an individual or group's preferred identity narratives" (Brown & Coupland, 2015, p. 1318). Given that many knowledge work professions are essentially about text production, communicative AI's capacity to produce large amounts of (seemingly) credible text can be argued to pose a threat to workers' identities and, consequently, lead to a variety of emotional responses.

Empirically, we draw from 33 semi-structured interviews with Finnish knowledge workers from multiple fields (e.g., media, higher education, IT consulting). At the time of the interviews (May–December 2024), the early adopters among our interviewees had around two years of use experience with communicative AI. Conversely, those that had waited longer to start using the technology, reported tenures from three to six months. At this point, we have conducted a preliminary screening of the dataset. We will be engaging in a more systematic qualitative analysis using the phronetic iterative approach (Tracy et al., 2024) during the first half of 2026.

Our preliminary findings indicate that the interviewees' affective trajectories of commAI adoption can be roughly grouped into five types: (1) Going from suspicion to inspiration, (2) from initial excitement to eventual disillusionment, (3) starting out enthusiastic and remaining so, (4) starting out fearful, becoming disappointed, and (5) remaining in ambivalence. These trajectories are based on individual reactions, but they are also social in the sense that they are influenced by cultural norms, social structures, technologies and media texts related to communicative AI (see Ahmed, 2004). Moreover, the data also indicate that depending on how much of an identity threat an individual knowledge worker sees commAI to be shapes their emotional trajectory in the adoption process of the technology. Specifically, interviewees whose core tasks are most reminiscent of what a communicative AI is capable of doing (e.g., producing creative output, such as text) are most likely to perceive it as an identity threat.

AEM04 Creepy, Scary, or Curious? Emotional Impact of Media Technologies and Content

PP 1179 Creepy or Curious? Exploring people's affective experiences with digital voice assistants' self-activating

Helene Maria Teigen[1]

[1] Oslo Metropolitan University, Consumption Research Norway, Oslo, Norway

Digital voice assistants such as Google Assistant and Amazon Alexa are popular home devices. Their human-mimicking features allow users to interact with them as if they were another person. However, users report that the assistants sometimes act without user initiation, which previous research has shown to make them aware of the devices' associations with privacy issues. This paper further examines the moods and sensations people experience during these self-activations.

The paper builds on video-recorded qualitative interviews with people living with digital voice assistants, which included participant-led activities such as map drawing and a home tour to explore participants' experiences and sense-making. The conceptual framework takes its starting point in Sundén's theorisation of affect and technology through breaks, disconnections and delays. She suggests viewing these as "formative for how we can both sense and make sense of digital connectivity" (Sundén, 2018, p. 63). This paper draws on Sundén's perspective to view accidental interactions as breaks in connectivity. They are not a disconnection but can be viewed as a glitch or a faulty connection, which breaks with participants' expectations of how the connectivity should unfold. These breaks shed light on how people sense and make sense of the constant connectivity of the home through digital voice assistants. To further operationalise how the break can shape our sense and sensemaking of technological attachments, I draw from critical algorithm studies and Bucher's (2017) concept of algorithmic imaginaries. Bucher describes algorithmic imaginaries as "ways of thinking about what algorithms are, what they should be, how they function and what these imaginations in turn make possible" (2017, pp. 39–40). It is about the spaces where people and algorithms meet and what that meeting produces. Accidental interactions, as breaks in connectivity, are situations where silent aspects of the technology are made visible to people and generate affective expressions.

The analysis shows that accidental interactions highlight the ambivalence in affective experiences of living with connected devices, arguing that people's affective responses are tied to sensations of exposure and vulnerability to external influence, for instance from commercial companies. The study underscores the importance of home as a site for these interactions, arguing that accidental interactions temporarily destabilise the home from being experienced as closed, private and safe, to exposed, public and unsafe. However, the paper further argues that these bodily sensations and people's sense-making of them may serve as a starting point for raising awareness of privacy issues related to smart home devices.

AEM04 Creepy, Scary, or Curious? Emotional Impact of Media Technologies and Content

PP 1180 Disconnection, uncertainty and anxiety: Parents' feelings on interpretation of environmental and climate news

Tom Roberts[1], Maria-Nerina Boursinou[1], Nivedita Chatterjee[2], Ranjana Das[1], Emily Setty[1]

[1] University of Surrey, Sociology, Guildford, United Kingdom
[2] University of Surrey, Department of Sociology, Guildford, United Kingdom

This paper examines parents' engagement with climate and environmental news in England to highlight that their perception is shaped by their dual role of a caregiver and protectors for their children and as individuals. This longitudinal

study, based on 30 semi-structured interviews and WhatsApp diaries, finds that parents navigate intertwined feelings of disconnection, uncertainty and anxiety upon engaging with environmental coverage.

The current breadth of literature states that even though climate change has been recognised as an immediate matter of concern, environmental news coverage still grapples to engage and retain public attention (Luebke et al., 2025). Arguably, due to reasons like overuse of scientific jargon (Forgács, 2024), complex news framings (Nisbet, 2009) and also its overlapping existence with other news beats (Fahy, 2017). While audiences are left to interpret these complex intricacies on their own, they are also exposed to 'trending topics' of the environmental news that are shaped by algorithms, which could be spreading misinformation (Sultana et al., 2024). These stories are often episodic, politicised, sensationalised and are circulated by the news outlets following influencer-like strategies conforming to algorithmic pressures (Cotter, 2019). Limited but few studies (Spiteri, 2025) have pointed out that such news stories can evoke emotions of hopelessness, anxiety, banality, confusion and uncertainty. But parents as a group have not been studied enough. Parents' worries extend beyond the present and into the imagined futures, centred around their children's wellbeing (Das, 2024). Hence, they often take up dual responsibility of protecting their children from being the inheritors of environmental consequences (Cripps, 2017) while also bringing them up to become resilient adults capable of navigating future risk. However, little is known about parents' emotional responses to environmental coverage and how that shapes their parenting practices.

This paper addresses that gap by thematically analysing the interview and WhatsApp diary responses of parents based in England to reveal that interpretation of environmental news requires emotional and practical labour that evokes a combined feeling of disconnection, anxiety and uncertainty. These are not isolated emotional responses but intersecting ones. The analysis indicates that these emotional responses occurred due to being exposed to information overload and an anxiety-driven tone of news coverage. Parents reported a heightened disconnection, anxiety and uncertainty for environmental that lacked local relevance or clear guidance, often compounded by their limited scientific knowledge. Their response highlighted that their engagement occurred in two terrains, as an individual audience and as caregiver for their children. Hence, the study concludes by advocating for a more locally relevant, sustained and actionable reporting, which could encourage parents towards an informed engagement with climate and environmental issues.

AGC01 Navigating Platformization: Everyday Digital Practices, Aging Bodies, and Institutional Interfaces

PP 0504 "Without YouTube my day couldn't start": Exploring engagement with digital audio entertainment as an everyday practice that supports wellbeing for older adults

Emily Cousins[1]

[1] University of Southern Denmark, Department for Design- Media and Educational Science, Odense, Denmark

Digital audio entertainment, for example music streaming, podcasts and audiobooks, is increasingly ubiquitous in everyday life, and therefore has the potential to support hedonic wellbeing (happiness) and eudaimonic wellbeing (a sense of meaning) (Reinecke and Oliver, 2017). However, research focussed on the uses and impacts of audio media and digital listening has typically concentrated on the experiences of adolescents and young adults (Gagne, 2024; Tattersall Wallin, 2022; Calvo-Sotelo and D'Ancona, 2019; Wadley et al., 2019). While some work has investigated the perspectives of older adults (Poerio and Totterdell, 2020; Kim, Oh and Kim, 2021), their intersectional experiences remain largely underexplored. It is important that this gap is addressed, not only to generate insights into the complex and nuanced digital media lives of older adults (Hjorth et al., 2025; Fernández-Ardèvol, Sawchuk and Grenier, 2017), but also to ascertain the extent to which digital audio entertainment can be used to support wellbeing across the life course. Recognising older adults as active consumers of digital audio media contests reductive narratives of aging and helps to redress media discourses that overlook experiences of later life.

This presentation shares findings from an empirical study undertaken in Australia that used qualitative, arts-based elicitation methods (inspired by McGrane, Gerber and Hjorth, 2025) to examine how digital audio entertainment can influence the wellbeing of older adults in everyday life. There was a particular focus on exploring the experiences of older adults from culturally and linguistically diverse backgrounds because they are underrepresented in the current literature. Four workshops were facilitated, involving 28 participants who mapped their engagements with digital audio entertainment and discussed how these entanglements relate to personal wellbeing. Workshop participants took part in three activities: 1) a warm-up exercise with post it notes; 2) mapping a day-in-the-life of digital audio entertainment labelled with emotions and feelings; 3) writing a postcard that describes a perfect playlist.

Findings show that digital audio entertainment has the potential to support emotional, social, psychological and spiritual wellbeing in everyday life. Following data analysis, five themes were identified: everyday digital audio entertainment is important for wellbeing as a source of connection, participation and reminiscence; digital audio entertainment can create awareness by enabling listeners to learn about new topics and broaden personal perspectives; digital audio entertainment can provide company which is available at any time of day or night; digital audio can support spiritual practices by providing access to prayers, sermons or devotional music; digital audio entertainment has limitations as a wellbeing practice due to negative content or inaccessibility.

The study concludes that unique features of digital audio entertainment, such as on-demand access, mobility and personalisation, combined with diverse listening practices, can support the hedonic and eudaimonic wellbeing of older adults in everyday life. However, accessing digital audio can also pose challenges and prompt ambivalence. Consequently, non-digital entertainment routines and activities also remain popular, necessary and meaningful for older adults.

AGC01 Navigating Platformization: Everyday Digital Practices, Aging Bodies, and Institutional Interfaces

PP 0505 Retired women clocking in on Douyin: Mutual likes groups for senior women

Hanxiao Zhang[1]

[1] School of Information and Communication Studies, College of Social Sciences and Law, Dublin, Ireland

Douyin has become an important site of everyday media engagement for middle-aged and older users in China. This paper investigates the phenomenon of Douyin mutual-like groups among retired Chinese women aged 55 and above, focusing on how these groups organize daily media practices and reshape post-retirement life. Situated within the broader context of gendered aging and social invisibility, this study examines how participation in such groups enables both self-recognition and new forms of constraint.

Drawing on media practice theory (Couldry, 2004; 2012), this research conceptualizes engagement in mutual-like groups not simply as content consumption or self-expression, but as a set of routinized, socially organized media practices embedded in everyday life. Media practice theory shifts analytical attention from platform features or individual motivations to what users repeatedly do with media, how these practices structure time, social relations, and meaning-making, and how they are shaped by wider power relations.

Methodologically, the study employs online participant observation of 300 videos and interactions within two mutual-liking groups, combined with in-depth interviews with 6 group members. Online participant observation allows the researcher to capture media practices as they unfold in everyday contexts, rather than treating content as isolated texts. These groups

typically have the most of 1,000 participants and are led by a group owner who enforces rules regarding daily posting and mass liking. Other members are generally invited to join the group by the owner, and most are retired women. Members are required to complete two main tasks: uploading one video per day and indiscriminately liking others' videos regardless of content. These practices transform Douyin participation into a form of disciplined routine resembling "clocking in" for work after retirement.

The findings reveal that, unlike mutual-aid groups on platforms such as Instagram that often aim at brand collaboration or commercial growth, mutual-like groups among older women primarily cater to personal vanity and the desire for social recognition. Participants frequently use exaggerated beauty filters, youthful visual effects, and popular background music to lip-sync or dance, emphasizing youthful aesthetics and high like counts. These practices reflect a shift in self-perception that from long-term self-effacing roles centered on caregiving and domestic labor to a renewed focus on the self, visibility, and personal enjoyment. However, the study also find while initial participation offers a sense of purpose, social connection, and enhanced self-worth, the task-oriented nature of daily posting and liking gradually leads to fatigue, emotional exhaustion, and time pressure. Over time, their routinized and task-oriented nature gradually aligns with forms of unpaid platform labor. Some participants eventually withdraw from groups. Although their visibility metrics decline, they feel greater enjoyment in the creative process and increased attention to offline relationships and everyday pleasures.

By focus on older women's everyday media practices, this study contributes to the research on aging, gender, and platform cultures. It demonstrates how the socially organized media practices restructure everyday lives, identities, and sense of value of marginalized users in later life.

PP 0506 Inclusive cultural communication in ageing societies: Institutional strategies and older audiences in a comparative regional context

Tea Koneska-Vasilevska[1]

[1] Ss. Cyril and Methodius University in Skopje - Institute for Sociological Political and Juridical Research, Political-Juridical Department - Communications, Skopje, North Macedonia

In times of shifting communicative grounds marked by global demographic ageing, digital transformation, and changing patterns of cultural participation, communication practices toward older adults become an increasingly important field of institutional strategy and cultural policy. In this comparative study, we examine how national cultural institutions communicate with older audiences and how older adults perceive, access, and engage with cultural offerings in the Republic of North Macedonia, the Republic of Serbia, and the Republic of Bulgaria. Focusing on the capitals as key socio-cultural centres, we explore whether current communication strategies adequately respond to the communicative needs and practices of older audiences as audiences with longest accumulated communication and cultural participation trajectories.

Methodologically, we combine semi-structured interviews with representatives of 20 national cultural institutions and an online survey with 83 older respondents (62+) across the three countries, based on a convenience sample. This mixed-methods approach enables an analysis of both institutional communication strategies and the lived communicative practices of older audiences. We build on established theories and models in aging, communication, and culture to explore the intersection of age, media use, and cultural participation in a rapidly changing communication environment, emphasizing the relevance of older audiences not only as recipients, but also as potential contributors to participatory, co-educational, and co-creational communication approaches.

The findings indicate that the majority of national cultural institutions in all three countries lack systematic and strategically developed communication approaches specifically tailored to older audiences. Older adults are rarely addressed as distinct and active audiences, despite demographic trends and policy discourses emphasizing active ageing and lifelong cultural participation. At the same time, survey results reveal divided attitudes among older respondents. While a minority do not perceive the need for specialized communication, the majority express clear demand for more direct, personalized, and age-sensitive communication, as well as for cultural programs that acknowledge their interests, experiences, and accumulated cultural knowledge.

Regarding media use, television remains primary source of information for many respondents; however, a significant proportion report regular use of digital devices, the Internet, and social networks. This challenges institutional assumptions that older audiences are largely digitally illiterate or unreachable through digital channels. The mismatch between institutional perceptions and the actual communication and media practices of older adults, points to a communication gap that limits sustained engagement. The findings suggest the need for clearer and more differentiated communication strategies, as well as targeted educational initiatives that link older adults' existing communication and media habits with cultural content and institutional communication goals. Similarities between the three countries are more pronounced than their differences.

Although the relatively small sample size does not allow for broad generalizations, through the study we provide valuable comparative insights into shared regional patterns. We conceptualize communication with older adults as a matter of

institutional choice and strategic adaptation in ageing societies and provide a basis for creating institutional communication strategies and practices that recognize, support, and further develop older adults' active participation in socio-cultural life.

PP 0507 Reclaiming agency in shifting grounds: Femtech, menopause, and the platformization of aging bodies

Carla Ganito[1], Elizângela Noronha[2]

[1] Catholic University of Portugal, Communication, Lisboa, Portugal
[2] Catholic University of Portugal, Centro de Estudos de Comunicação e Cultura, Lisboa, Portugal

As global populations age and healthcare increasingly migrates to digital platforms, the intersection of femtech, aging, and digital citizenship has emerged as a critical site for human-computer interaction research and design innovation. This paper examines how neoliberal logics of self-optimization embedded within femtech technologies constrain and enable agency among older women, particularly focusing on menopause management technologies as a lens through which to explore broader questions of accessibility, literacy, and citizenship rights in the digital age.

Drawing on the conference theme of platformization and digital inequalities, this study analyzes how femtech applications frame menopause not as a natural life transition, but as a "complication" requiring technological intervention. We argue that these technologies create a "FEM-TRAP": the promise of agency via self-tracking paradoxically subjects older women to heightened data exploitation and the erosion of privacy. This dynamic is particularly acute for aging women facing intersectional pressures, including digital literacy gaps and socioeconomic vulnerabilities that make them susceptible to algorithmic discrimination and identity risks.

Methodologically, we present findings from a Critical Discourse Analysis (CDA) of the UI/UX, privacy policies, and marketing rhetoric of leading menopause-focused applications. We map how the "biopolitics of the self" are embedded in these interfaces, transforming intimate embodied experiences into extractable resources for profit. Theoretically, we challenge simplistic HCI definitions of agency as "user choice." Instead, drawing on Saba Mahmood's concept of situated agency, we examine how older women's actions are enabled and constrained within the technology's scripts.

This research contributes to HCI scholarship on aging, health technology, and digital equity by proposing an agency-centered framework that acknowledges how neoliberal structures constrain empowerment while identifying spaces for resistance and transformation. As digital health becomes increasingly essential to healthcare access, ensuring that aging women can reclaim agency as informed, protected, and empowered digital citizens—rather than surveilled consumer-subjects—represents both a design imperative and a matter of social justice. Only through feminist methodologies that center older women's voices, experiences, and collective power can we design technologies that genuinely support health across the lifespan rather than extracting profit from life transitions.

Ultimately, we propose an agency-centered framework that moves beyond the user as a surveilled consumer-subject, advocating for feminist design methodologies that support aging women as informed, empowered digital citizens capable of shaping inclusive media futures.

PP 0508 Older adults in an interface-first welfare state: Evaluating usability, comprehensibility, and security through vignette experiments

Dino Viscovi[1], Abalo Caldera Ernesto[2], Olsson Tobias[3], Mia-Marie Hammarlin[4]

[1] Linnæus University, Department of Social Studies, Växjö, Sweden
[2] Jönköping University, School of Education and Communication, Jönköping, Sweden
[3] Malmö University, Faculty of Education and Society, Malmö, Sweden
[4] Lund University, Department of Communication, Lund, Sweden

In Sweden, the government has implemented a strategy referred to as 'Digital First'. This policy stipulates that interactions between citizens and public authorities should primarily occur through digital platforms and channels, rather than through traditional means such as telephone, postal correspondence, or in-person visits.

The strategy is not unique to Sweden; consequently, an increasing number of researchers have begun to highlight what they refer to as the "digital welfare state" (van Toorn et al 2024), or the "interface-first welfare state" (Bennett & Meers 2025).

This transformation cannot be reduced to a mere technological shift. Based on what we know about digital divides (van Dijk, 2020) and citizens' varying degress of access, usage, and willingness to engage with digital media, it is reasonable to assume that equality in public service provision is at risk—a concern that has also been empirically demonstrated (cf. Olsson & Viscovi, 2023).

The present study, which forms part of the project *Digital by Default? Older Adult Citizens and Digital Welfare Interfaces*, employs vignette experiments to examine older individuals' (65+), with varying degrees of digital literacy, perception and evaluation of welfare interfaces.

To what degree do users regard the interfaces as enhancing or impeding communication? Are digital platforms viewed as safe? Do users demonstrate a preference for conventional channels, including telephone or physical appointments?

More specifically, attention is given to two platforms—1177.se (healthcare) and Pensionsmyndigheten.se (pensions and benefits)—as well as BankID (electronic identification), which constitutes a fundamental prerequisite for many welfare services in Sweden. Through the vignettes, channel preferences, usability, comprehensibility, and perceived security are tested.

The vignette experiments represent the final step out of four in a sequential exploratory mixed-methods approach (Cabrera, 2011; Cresswell & Plano Clark, 2017). Both the vignettes and the experimental design are informed by our previous sub studies including discourse analysis of welfare interfaces, ethnographic interviews with older adult users (and non-users) as well as reception analysis of specifically relevant welfare interfaces.

The paper adds to the scant empirical research about the consequences that the digitalization of welfare services has for older adults.

AGC02 Paths to Connection: Civic Engagement, Intergenerational Communication, AI and Caregiving

PP 0940 It's never too late to be green: Ageing and sustainable behaviour awareness

Simone Carlo[1], Sara Nanetti[2], Piermarco Aroldi[1]

[1] Università Cattolica del Sacro Cuore, Communication and Performing Arts, Milano, Italy
[2] Università Cattolica del Sacro Cuore, Sociology, Milano, Italy

The analysis of the 2030 Agenda goals and policies reveals that older segments of the population are considered to be at greater "risk" from the outcomes of unsustainability—social, economic, and environmental. For example, individuals belonging to the so-called "fourth age" are likely to be among the first victims of climate change: negative health effects resulting from extreme temperatures, the spread of new diseases, water scarcity, and reduced mobility in the event of emergencies caused by adverse weather events tend to be more severe. At the same time, individuals over the age of 65 have a considerable impact on sustainability processes. This is due, on the one hand, to their growing numerical significance—and thus the increasing societal impact of their actions—and, on the other hand, to behaviors and conditions typical of this age group (e.g. mobility predominantly oriented toward private car use), together with a particular perception of the future shaped by their life-course position, all of which can significantly influence sustainability outcomes.

Despite demographic aging affecting many nations, only recently has attention been paid to what older adults think about sustainability. The inclusion of older people in the sustainability agenda at multiple levels—public debate, academia, and policymaking—is therefore necessary to effectively address climate change.

In this presentation, we examine the relationship between environmental sustainability and population aging, focusing on older generations' perceptions of environmental sustainability and ethical consumption practices. The analysis draws on data from a questionnaire administered in 2025 to a representative sample of the Italian population aged 65–84 (N ≈ 6,000).

The questionnaire includes a validated set of items known as The SustainABLE-16 Questionnaire, designed to measure how older people conceptualize environmental sustainability. The results of this scale have been related to other sections of the questionnaire concerning socio-demographic characteristics, family configuration, housing conditions, social capital, health status, economic situation, intergenerational solidarity, and civic engagement. In particular, we analyze how different patterns of media consumption influence the adoption of ecologically sustainable behaviors.

The main findings show that the sustainability index increases with higher levels of cultural capital, greater access to technological resources, and regular information consumption, both through traditional media such as television and radio and through digital channels. With regard to economic conditions, a positive gradient is also observed; however, its impact appears less pronounced than that of behavioral factors. Economic resources thus emerge as enabling conditions rather than as exclusive determinants of older adults' pro-environmental actions.

Finally, drawing on the knowledge gained, the research aims to: (i) counteract forms of ageism and discrimination implicitly embedded in environmental sustainability policies by avoiding an emphasis on the presumed faults of older generations compared to younger ones—an approach that tends to frame environmental messages as accusatory and thus leads to their rejection; (ii) prevent the exclusion of older generations from initiatives aimed at raising awareness of ethical and sustainable consumption practices, as if they were "structurally" incapable of envisioning a role oriented toward the future.

AGC02 Paths to Connection: Civic Engagement, Intergenerational Communication, AI and Caregiving

PP 0941 Age-attuned and situated: Older peer tutors as digital caregivers

Laura Pajula[1], Viivi Korpela[1], Riitta Hänninen[1]

[1] University of Jyväskylä, Department of Social Sciences and Philosophy, Jyväskylä, Finland

Age-attuned and situated approaches to digital support are central to how older adults learn and appropriate new digital technologies. Within this field, peer tutors occupy a unique and underexplored position, offering guidance that blends technical assistance with non-formal practices of digital caregiving. Peer tutors help peers of a similar age to complete digital activities of daily living, thereby occupying a role that parallels caregiving by enabling everyday functioning in increasingly digitalized society. In this article, we ask: In what ways do older peer tutors perform digital caregiving when supporting others in learning digital skills? The dataset consists of 21 semi-structured interviews conducted in Central Finland in March 2022 with peer tutors aged between 63 and 84. Many interviewees had developed substantial digital expertise during their former working lives and now provided individualized, voluntary guidance to peers in community-based settings. Using inductive thematic analysis, the study identifies how peer tutors tailor their support to the learning rhythms, emotional states, and everyday life situations of older adults. Rather than emphasizing efficiency or mastery, tutors foreground patience, repetition, trust, and shared generational experience. The findings show that peer tutoring frequently extends beyond technical instruction to include emotional care work, reassurance, and confidence-building. Tutors actively create safe and non-judgmental learning environments in which older adults can engage with digital technologies without fear of failure or stigma. By reconceptualizing peer tutoring as a form of digital caregiving, this study highlights the relational, affective, and situated dimensions of digital support in later life. In doing so, it challenges dominant, skill-centered models of digital support that overlook care practices and social relations. The article argues that peer-led digital support constitutes an important yet underrecognized contribution to digital caregiving practices, inclusion, and well-being in later life, with implications for the design of age-inclusive digital support initiatives and policies.

AGC02 Paths to Connection: Civic Engagement, Intergenerational Communication, AI and Caregiving

PP 0942 Grandparenting in the age of digital platforms

Maja Nordtug[1], Bogumiła Mateja-Jaworska[2]

[1] University of Oslo, Department of Education, Oslo, Norway
[2] Adam Mickiewicz University, Faculty of Sociology, Poznań, Poland

Modern family lives are increasingly shaped by digital platforms (Sefton-Green et al., 2025). Through the process of platformization, digital platforms' "infrastructures, economic processes and governmental frameworks" (Poell et al., 2019: 1) penetrate family life and reorganizes family practices. In this paper, we examine how grandparents' roles are transformed with digital platforms, including how platforms' business and governance models enable and constrain grandparenting, and how grandparenting as a cultural practice is reorganised through these platforms.

Focusing on grandparenting is important for several reasons. First, in Europe's ageing societies, the role of grandparents is becoming increasingly significant; some scholars even describe the current period as a "golden age" of grandparenting (Miller and Garvey, 2022). This reflects not only the increasing longevity of relationships with grandchildren, but also the capacity of grandparenting to reconfigure other family relationships. Second, present-day grandparents grew up in media landscapes that differ significantly from those of their grandchildren (cf. Bolin, 2016). Moreover, research on older adults, digital platforms, and family life has largely focused on older people's adaptation to digital environments and the role of younger family members as *warm experts* (Taipale, 2019). By contrast, broader dynamics of multigenerational family life in the platform age remain underexplored: though existing research indicate that platform use can strengthen family bonds for the grandparent generation (Siibak & Tamme, 2013), a recent review found that only few studies addresses relationships between children and grandparents (Erstad et al., 2024).

Our analysis draws on interviews with children/youth, parents, and grandparents from 19 families in Norway (55 participants) and 11 families in Poland (33 participants), conducted between 2023 and 2025. We examine cross-cultural similarities and differences in digital grandparenting in Norway and Poland, as well as whether family members' understandings of grandparenting align with or conflict with platform logics. The study encompasses a range of platforms, such as communication, gaming, streaming, educational, and parental control platforms.

AGC02 Paths to Connection: Civic Engagement, Intergenerational Communication, AI and Caregiving

PP 0943 Shifting grounds of dementia care: Communication, culture, and relational well-being among UK South Asian informal carers

Abdul-Munim Bashir[1], Maria Touri[1], Elizabeta Mukaetova-Ladinska[2], Sarah Gong[3]

[1] University of Leicester, Media and Communication, Leicester, United Kingdom
[2] University of Leicester, Psychology, Leicester, United Kingdom
[3] University of Central London, Media and Communication, London, United Kingdom

Background

As European societies confront demographic ageing alongside increasing cultural diversity, dementia care is unfolding on shifting social and communicative grounds. For UK South Asian informal carers, well-being is not an individualised psychological state but a relational and culturally mediated process, shaped through everyday communication within families, communities, and care infrastructures. However, dominant dementia services and psychosocial interventions frequently rely on universalist assumptions that overlook how cultural norms, migration histories, and structural inequities shape carers' experiences, meanings, and help-seeking pathways. Responding to the ECC 2026 theme of "Shifting Grounds: Paths, Connections, and Futures", this paper examines how carers communicatively construct well-being and how Voluntary, Community, Faith and Social Enterprise (VCFSE) organisations operate as cultural intermediaries within dementia care ecologies.

Methods

The study adopts a qualitative, multi-site ethnographic design based in the West Midlands, a region characterised by long-established South Asian communities and diverse voluntary sector provision. Data collection involves 15–20 South Asian informal dementia carers and 15–20 VCFSE staff, using participant observation, in-depth semi-structured interviews, and photo-elicitation. Visual and narrative methods are employed to capture embodied, affective, and relational dimensions of care that are often difficult to articulate through conventional interview techniques alone. Analysis will combine reflexive thematic analysis with interpretive visual analysis to examine three interconnected domains: (1) culturally situated conceptualisations of carer well-being; (2) the dual role of cultural values, such as honour, duty, gendered expectations, and stigma, as both psychosocial resources and constraints; and (3) the communicative role of VCFSE organisations in mediating trust, access, and identity in relation to dementia support.

Anticipated analytical focus

While data collection will be completed by the time of conference presentation, preliminary field engagement suggests that carers' well-being is negotiated through ongoing communicative practices across household, community, and institutional settings. The analysis will explore how traditional caring norms are being reinterpreted across generations, how silence and disclosure around dementia are managed, and how VCFSE spaces function as sites of connection that may both mitigate stigma and reconfigure caring identities. Particular attention is given to how structural conditions like language barriers, institutional mistrust, and resource precarity, shape communicative pathways to support.

Contribution

The paper contributes to health communication scholarship by conceptualising dementia caring well-being as culturally and structurally embedded communicative work, rather than an individual outcome. It advances ECC 2026's focus on "paths" (how carers navigate support), "connections" (how community organisations bridge divides), and "futures" (how culturally responsive dementia care can be co-produced). The findings will inform equitable, community-led approaches to dementia support in increasingly multicultural societies.

AGC02 Paths to Connection: Civic Engagement, Intergenerational Communication, AI and Caregiving

PP 0944 Bridging the grey–digital divide: Older adults' transcultural engagement with artificial intelligence

Sandra Miranda[1], Ana Cristina Antunes[2], Alexandra Miguel[1]

[1] Escola Superior de Comunicação Social- IPL- LIACOM, Social Sciences, Lisbon, Portugal
[2] Escola Superior de Comunicação Social- IPL- LIACOM, Human Sciences, Lisbon, Portugal

Population ageing is one of the defining transformations of the twenty-first century. At the same time, rapid advances in artificial intelligence (AI) are reshaping communication practices, social interactions and everyday life. Yet these two major forces—demographic ageing and AI-driven technological change—often evolve on parallel tracks, leaving older adults insufficiently integrated into emerging AI-mediated environments. This distance not only reinforces digital inequalities but also limits opportunities for autonomy, participation and active ageing.

This qualitative and transcultural study explores how older adults engage with, perceive and relate to AI across different sociocultural contexts. Grounded in an interpretivist paradigm, the research draws on nine Focus Groups conducted in Portugal, Spain and the United States of America, involving participants aged 65–75, from diverse educational and socio-economic backgrounds and all active internet users. This design enables the identification of shared meanings as well as culturally embedded distinctions in how seniors approach, understand and negotiate AI in their everyday lives.

The analysis compares behaviours, expectations and relational orientations toward AI, identifying both convergences and culturally specific dynamics. Preliminary findings reveal ambivalent attitudes combining curiosity, utility-oriented pragmatism and concerns about control, privacy, surveillance and dehumanisation. While many participants recognise the functional benefits of AI-enabled tools in domains such as health, security and convenience, they also express uncertainty regarding opaque decision-making processes and the potential erosion of human contact. Across contexts, participants negotiate AI through experiential frames shaped by trust, familiarity and perceived personal relevance, often drawing on previous encounters with digital technologies to make sense of more complex intelligent systems.

By illuminating how ageing populations make meaning of and interact with AI, this study contributes to the ongoing debate on communication, ageing and digital inclusion. It offers evidence on how seniors can be more effectively engaged and empowered within increasingly intelligent communication ecosystems. More broadly, the findings highlight the need for inclusive approaches to AI design, media literacy and policy development that recognise older adults not only as users with specific vulnerabilities but also as active interpreters capable of shaping their own technological experiences.

This research was funded by IDICA-IPL and the Portuguese Foundation for Science and Technology.

CAS01 Mediated Visibility of Women's Sport

PP 0611 About media, fans, finances and abuse: The obstacles and prejudices hindering the rise of women's football in Czechia

Anna Hrbáčková[1], Alice Němcová Tejkalová[1], Ondřej Trunečka[1], Kateřina Turková[1]

[1] Charles University, Faculty of Social Sciences, Prague, Czech Republic

The popularity of women's football worldwide has been gradually increasing. For example, more than 623.000 spectators watched the EURO 2025 matches from the stands to set a new record. Just a couple of days before last Christmas, Bayern Munich announced that the women's team would play in their own stadium instead of the training centre. The emancipation of women's football continues, aiming to reach equality in many ways. Among others, the next World Cup (2027) will take place in Brazil at the same stadiums that hosted the men's tournament in 2014. Despite that, the progress of this sports discipline is hampered by various factors, e.g., lack of media coverage and visibility, fans' prejudices, equal pay gap, or hate speech and abuse targeting players and other female professionals in and around the sport (Downward & Muniz, 2025; Gubby & Martin, 2025; Tjønndal et al., 2024).

This study focuses on the particular situation in Czechia, a country in the heart of Europe with a long-term high popularity of football, where the aforementioned tendencies related to women's football are evident, but more modest, given the country's size and economic situation. Through a series of 12 qualitative, semi-structured interviews (Bryman, 2016) with women's football professionals (players, coaches, referees, or journalists), and subsequent thematic analysis, we aim to answer the main research question: What obstacles hinder the faster development of women's football in Czechia?

The main limitations of the development of women's football in Czechia lie both within and outside the sports field. The position of the sports discipline in the eyes of the media is not equal to that of men's football, which may be the reason for moderate acceptance by the part of fans and public. Additionally, this (in)visibility can also lead to a lack of financial resources and marketing opportunities in women's football. However, the further crucial factors affecting the visibility, image and (self-)presentation of the female professionals are the hate speech and abusive behaviour. This study therefore argues that the initiatives against gender-based violence can strengthen the position of women's football (not only) in Czechia and create better conditions for its development.

CAS01 Mediated Visibility of Women's Sport

PP 0612 Will winter sports begin to rival sexualised summer sports? How leading Austrian and German female and male athletes in winter sports present themselves on social media

Philip Sinner[1], Sascha Trültzsch-Wijnen[2]

[1] University of Bremen, Centre for Media- Communication and Information Research ZeMKI / Lab Datafication and Mediatization, Bremen, Germany
[2] University of Salzburg, Department of Communication Studies, Salzburg, Austria

Social media has fundamentally changed self-presentation (Trültzsch-Wijnen 2018). This leads to profound shifts in power between the actors in the sports/media nexus. Those with visibility in mediatized societies, which often applies to athletes, have high potential for discursive power including identity formation (Driessens 2013). Such power is not present automatically (Couldry 2004), but must be negotiated. This interplay of performance, visibility, identification potential and community building is often discussed under the term *celebrity culture* (Robertson-von Trotha 2013). Athletes can influence everyday cultures and represent their own values (Holmes & Redmond, 2006). In sports in particular, these opportunities are reinforced by international marketing strategies, collaborations and sponsorships, commercialisation of lifestyles and growing importance of eSports, with a central role for social media (Giulianotti & Numerato 2017). Female athletes in particular can benefit from self-empowerment, who are often portrayed in the media in a sexualised manner and detached from their professional status (Konjer et al. 2019; Daniels et al. 2021): "Yet, new media does offer women's sports the chance to control their own content" (Bruce, 2013).

At an early stage many athletes have become "sports-pop-stars" (Nieland & Horak 2024). However, many continue to align self-presentation with mass media strategies, focusing on staging their bodies and sexualised representations. In this light, the "Six-Step-Model of Spornofication" by Schaaf and Nieland (2012) recently had to be expanded with stage 7 to include direct marketing on platforms such as OnlyFans; while sexualisation of established sports corresponds to stage 2. Though,

these developments have almost exclusively affected athletes in summer sports (Xu 2025), while winter sports followed own rules (Sinner et al., 2019; Nieland, 2019). There the proportion of sexualised motifs in athletes' self-presentation declined steadily (Xie et al. 2024; Schibblock et al. 2022) and was barely detectable among leading winter athletes from Austria and Germany (Trültzsch-Wijnen & Weber 2019; XXX, 2023). But media worlds are changing. Against this backdrop, the proposed presentation focusses on the following RQs, related to gender aspects:

- Which social media platforms do leading Austrian and German winter athletes use?
- Which kind of photos/videos are presented?

The respective sample consists of Austrian and German medal winners of the Milano-Cortina 2026 Olympics, 60 athletes are expected. This makes results comparable to own previous studies in 2010, 2018 and 2022 and offers a longitudinal perspective. Profiles are determined by web-screening (Plum 2010) and examined using qualitative content-analysis (Welker et al. 2015) combined with qualitative photograph-analysis (Astheimer 2016). Preliminary data indicate fundamental changes to previous results. Athlete's media repertoires changed, as the number of social media has increased. In addition, qualitative changes in used channels and published contents are expected: In contrast to previous surveys, promising medal contenders are represented on OnlyFans: German Olympic gold medallist bobsledder (2018) Lisa Buckwitz performs there since 11/2024. And Georg Fleischhauer, a favourite in bobsleigh, became the first male German winter athlete to make his OnlyFans profile public in 12/2025. Since Instagram, TikTok and X in particular are used as advertising measures for paid OnlyFans-accounts, changes to content are likely on these platforms, too.

CAS01 Mediated Visibility of Women's Sport

PP 0613 Breaking the net: How Turkish women's volleyball builds power through YouTube networks

Dilek Melike Uluçay[1]

[1] Yaşar University, Public Relations and Advertising, İzmir, Turkey

Previous research has consistently shown that mainstream sports media is dominated by football and male-centered content, leaving female athletes structurally disadvantaged in both coverage frequency and content framing. Sports such as volleyball, often gender-typed as women's sports, have historically received limited visibility within traditional media environments. However, despite its marginalization in mainstream sports media compared to football, volleyball has gained substantial visibility and audience engagement in digital media spaces, particularly on YouTube. As YouTube has become one of the most influential platforms for sports content consumption, the public representation of volleyball is increasingly shaped through digital networks that compensate for the visibility constraints imposed by traditional media. Within this digital media environment, women's indoor volleyball holds a distinctive position. In Türkiye, women's volleyball experienced a remarkable increase in media visibility and public interest throughout 2023, a year marked by major international successes of the Turkish Women's National Team, including victories in the FIVB Volleyball Nations League and the CEV EuroVolley championship. Beyond these tournament achievements, 2023 also encompassed the domestic league season as well as periods of routine content production, allowing volleyball-related narratives to circulate continuously across clubs, federations, and sports media channels. This sustained visibility contributed to the consolidation of women's volleyball as a prominent component of the national sports agenda. Among digital platforms, YouTube plays a central role in circulating sports content and shaping audience engagement. This study aims to analyze the relational dynamics among volleyball-related YouTube channels using Social Network Analysis (SNA). Specifically, it investigates which channels influence one another, which reach the widest audiences, and which channels most effectively accelerate the diffusion of volleyball-related information and content within the network. The analysis covers the period between January 1 and December 31, 2023 and includes the official YouTube channels of the top four clubs in the Turkish Women's Volleyball League—VakıfBank, Eczacıbaşı, Fenerbahçe, and Galatasaray—as well as the official channel of the Turkish Volleyball Federation. In addition, sports media channels operating in Türkiye, including TRT Spor Yıldız, Socrates Dergi, 4Bir4Bir, and Maçkolik, are incorporated into the analysis. These media channels were selected based on quantitative visibility criteria, specifically channels with more than 200,000 subscribers. The sample includes sports media channels that are not exclusively volleyball-oriented but regularly produce volleyball-related content; only volleyball-related videos from these channels are included in the analysis. By focusing on highly visible and influential nodes, the study captures the primary actors through which volleyball-related information is produced, circulated, and amplified within the digital network. The study is theoretically grounded in three communication frameworks. The gatekeeping approach examines how information is filtered and controlled by dominant channels within the network. The two-step flow model identifies opinion-leading channels that exert influence over audiences, while the diffusion of innovations theory explains the speed and patterns of content dissemination across the network. This integrated framework enables analysis of digital influence and visibility. This research represents a rare case of a historically marginalized, gendered sport with substantial digital visibility and offers a methodological model applicable to other marginalized sports.

CAS01 Mediated Visibility of Women's Sport

PP 0614 Women coaches' communicative agency and its role in defining success within gendered sport environments

Veera Ehrlén[1,2]

[1] University of Jyväskylä, Faculty of Sport and Health Sciences, Jyväskylä, Finland
[2] University of Turku, School of History- Culture and Arts Studies, Pori, Finland

Communication and social interaction are integral to sports coaching, and the ability to foster care and trust through interaction is fundamentally linked to coaching success (Lara-Bercial & Mallett, 2016). Social interaction is context-dependent, meaning that coaching situations are constructed by the actors involved while simultaneously shaped by surrounding social expectations and norms (Ronglan, 2010). Women coaches are often expected to adopt athlete-centred approaches emphasising emotional support, dialogue, and relational trust, yet such practices remain undervalued in male-dominated environments (Porter et al., 2025; Schull & Kihl, 2019). Discrimination also extends to the structural level, as limited opportunities, poorer working conditions, and persistent questioning of competence have been experienced by women coaches across different sports and at all stages of their careers (LaVoi & Dutove, 2012; Norman & Rankin-Wright, 2018).

This study examines how women coaches' communicative agency within socially embedded sporting structures relates to success. Twenty-one semi-structured interviews were conducted with women coaches aged 20–59 at international competitive levels across 12 sports. An interactive elicitation tool was employed to capture coaches' definitions of success and self-assessment against these criteria. The study addressed the following research questions: (1) To what extent do female coaches view communication skills as predictive of success? (2) What aspects constitute successful interpersonal communication? (3) How do gendered dynamics influence these perceptions?

Preliminary findings indicate that intra- and interpersonal communication skills, athlete-centred approaches, and coaching ambition are prioritised as markers of success by women coaches. Communication is described as fostering respect and autonomy, reframing coaching as an educational and ethical activity rather than a purely competitive enterprise. However, such approaches are reported as marginalised within male-dominated networks, requiring continual justification. Structural barriers, including lack of networks, job insecurity, and gendered recruitment, are identified as compounding these challenges.

CAS01 Mediated Visibility of Women's Sport

PP 0615 From ads to 'organic' hype: Sports betting promotion in algorithmically curated feeds

Aaleks Kasemi[1], Bieke Zaman[1], Rozane De Cock[1]

[1] KU Leuven, Social Sciences - Communication Sciences, Leuven, Belgium

The societal role of sports is increasingly intertwined with the gambling industry. This phenomenon can be described as 'gamblification', where betting becomes a normalized component of the sports experience (Hing et al., 2023; Lopez-Gonzalez & Griffiths, 2018; Macey & Hamari, 2024). While previous research has focused on traditional media or Twitter, the visual and algorithmic nature of newer platforms like TikTok and Instagram remains under-explored, particularly regarding how they target young adults (Pitt et al., 2024; Rossi & Nairn, 2022). More specifically, research shows that young men are more likely to bet on sports (DiCicco-Bloom & Romer, 2012; Kape et al., 2023; O'Loughlin & Blaszczynski, 2018). This study addresses this gap by examining the form and content of sports gambling material exposed to male youth, highlighting how 'new communicators', such as influencers and meme accounts, disrupt established advertising structures.

To capture the algorithmically curated experience of young users, this study conducted a qualitative content analysis using six simulated user profiles on smartphones set to factory settings. All profiles were configured as 18-year-old males and

were systematically varied in their levels of 'internal' (platform-based) and 'external' (search-based) interest and interaction, in order to emulate different algorithmic feedback loops. Over a three-week period in November 2025, all sports gambling-related content surfaced to these profiles was collected and analyzed.

The findings show that sports betting content on TikTok and Instagram is dominated by 'organic' posts from influencers and fan accounts rather than overt corporate advertising, frequently blurring the boundary between entertainment and promotion. Here, 'organic' refers to content that is not presented as formal advertising (e.g., produced by influencers or fan accounts), yet can still operate as promotional messaging and may involve undisclosed commercial ties. A prominent strategy is the use of humor, particularly self-deprecating jokes about financial loss, which downplays the potential harms of gambling and frames betting as a socially acceptable, shared experience.

The content environment is also strongly gendered. It is heavily masculinized, portraying men as knowledgeable experts and risk-takers, while women are largely absent or positioned as passive spectators. In parallel, the study identifies deliberate alignment with youth culture through slang, trending audio, and meme formats. While both platforms share these features, they diverge in style: content on TikTok more often trivializes gambling through challenges and comedic framing, whereas content on Instagram emphasizes stylized 'highlight reels' and aesthetic edits that glamorize betting.

Taken together, these results suggest that contemporary sports communication operates within an algorithmic ecosystem that normalizes gambling for young audiences through peer-like influence and humorous framing. This raises challenges for media literacy and regulation, especially in relation to hidden advertising practices and the broader 'gamblification' of sports consumption among vulnerable groups.

PP 0935 Esports, politics, communication and Olympic sportswashing - the IOC's flirtation with Saudi Arabia

Thomas Horky[1]

[1] Macromedia University, Sports Communication, Hamburg, Germany

The introduction and premature termination of the Olympic Esports Games in Saudi Arabia illustrates a mix of politics, communication, and future developments for sports federations and the sport itself (Dubinsky, 2023). Compared to traditional sports, esports exhibits distinctive features: The development of computer games into a competitive sport has been shaped from the outset by digitalization, internationalization, a young audience, and specific marketing characteristics (Yuan, 2024). This sport offers an opportunity for the development of sports federations (Thieme & Wojciechowski, 2021). The research question arises: What factors led to the start of the Olympic Esports Games and to the termination of the relationship between the IOC and Saudi Arabia?

Olympic sports have been engaging with esports for several years now (Jenny et al., 2025). Saudi Arabia's commitment to sports, and esports in particular, is based on a state plan for investments in sports, which is financed by the State Investment Fund (PIF) (Saudi Arabia, 2025; Saudi Vision 2030). In July 2024, the IOC awarded the Olympic Esports Games to Saudi Arabia for twelve years. The start of the Games was postponed to 2027 (IOC 2024; 2025a) and then cancelled in 2025 (IOC, 2025b).

Sports federations, as meta-organizations, exist in special relationships and develop dynamics in terms of structure, personnel, and finances (Thieme, 2024). Understanding the IOC as a company, the 7-S model can be used to analyze these dynamics. This model identifies organizations as entities influenced by hard factors such as strategy, structures, and systems, as well as soft factors such as skills, staff, style/culture, and historical conditions like shared values/superordinate goals (Hayes, 2014; Waterman et al., 1980). This presentation will analyze the relationship between the IOC and Saudi Arabia based on these factors.

The investigation into the motives of the IOC for the planned partnership with the National Olympic and Paralympic Committee of Saudi Arabia focuses particularly on the potential aspects of sportswashing (Bergkvist & Skeiseid, 2024; Boykoff, 2022; Boykoff & Mascarenhas, 2016), so the communicative perspective of Saudi Arabia and sportswashing are addressed (Borno & Mokhtar, 2025; Chadwick & Widdop, 2022; 2023). Therefore, a second aspect of the research question is: What significance did the flirtation of the Olympic Esports Games in Saudi Arabia by the IOC have with regard to sportswashing?

Methodologically, four in-depth interviews with stakeholders and experts in this field were conducted before cancellation in 2025. Four further in-depth interviews are planned for 2026 to explore the significance of the 7-S-factors. The interviews were analyzed using software-assisted content analysis.

The results demonstrate a classification or assessment of possible sportswashing in Saudi Arabia through esports and the Olympic Games based on the facts and varies greatly depending on the perspective. Some significant characteristics and categories of advantages and disadvantages of this development can be identified. The categories mentioned can be subsumed as Economy, Partnerships, Politics, Social structures, Image and Values (Ettinger, 2023; Grix & Brannagan, 2024; Kaspar, 2022; Skey, 2022). In summary, the perspectives are crucial for a designation or assessment as Olympic gamewashing.

CAS02 (New) Players in Digital Sports Media Landscapes

PP 0936 Between authenticity and spectacle. Red Bull and the visual transformation of winter sport

Thomas Neumann[1], Jörg-Uwe Nieland[1], Philip Sinner[2], Tina Perisutti[1]

[1] University Klagenfurt, Department of Media and Communications, Klagenfurt am Wörthersee, Austria
[2] University of Bremen, ZeMKI- Centre for Media- Communication and Information Research, Bremen, Germany

This paper is part of an ongoing project examining visual sports culture through selected sports films and series about ski and motorsport athletes. The project adopts a media- and cultural-sociological perspective and investigates how sport and national identity are represented in fictional and documentary formats. On the one hand, the theoretical framework combines approaches from Cultural Studies and film sociology (Winter 1992; Niederer & Winter 2008; Geimer, Heinze & Winter 2021), which conceptualize films as expressions of societal values, conflicts, and collective imaginaries. On the other hand, perspectives of sport communication research are used to address processes of mediatization, globalization, and commercialization (Author 2019a; Frandsen 2020). Methodologically, the analysis combines qualitative content analysis with visual discourse analysis.

Building on this framework, the paper examines Red Bull's engagement in media sports in Austria, focusing on the phenomenon described as the "Red Bullization" of sport (Author et. al. 2025). This concept refers to the ways in which Red Bull reshapes sport through extensive sponsorship, media production, and marketing strategies, transforming athletic performance into spectacle, commodifying risk, and producing globalized visual narratives that extend beyond traditional competition and sports reporting. Red Bull thus emerges as a central cultural producer within contemporary visual sports culture (Author 2019b).

To structure the field, this presentation builds upon the following selected case studies, which offer insights in different aspects of Red Bull's multitude media approaches. Gerald Salmina's *Streif – One Hell of a Ride* portrays the legendary Hahnenkamm downhill race in Kitzbühel. Following five athletes over several months of preparation and competition, the film foregrounds extreme athletic performance and its dangers, framed by retrospective sequences with prominent figures. The documentary exemplifies how brand-driven production and documentary storytelling contribute to the Red Bullization of winter sport by aestheticizing both the racecourse and the alpine landscape while creating immersive and emotionally charged viewing experiences.

A second focus lies on Red Bull's winter extreme sports videos, which negotiate the tension between authenticity, understood as scene credibility, and commercialization through sponsorship. From a film-sociological perspective, these productions can be interpreted through the concept of the cinema of attractions (Gunning 1990), emphasizing spectacle, speed, and immersive imagery to engage audiences while reinforcing brand visibility and transforming local sporting practices into transnational entertainment.

Another important site of Red Bull's visual sports production is the series *Winter Heroes* on Red Bull TV, which presents episodic portraits of predominantly Austrian ski stars. By focusing on personal biographies, training routines, and individual narratives, the series extends athletes' visibility beyond competition and fosters emotional connections between viewers and athletes. In doing so, *Winter Heroes* contributes to the broader Red Bullization of winter sport by integrating personal storytelling, national references, and globalized media aesthetics.

The analysis is further informed by Barthes' (1977) concepts of mythos and Bourdieu's (1993) notion of cultural capital. Overall, our work contributes to debates on commercialization, mediatization, and visual culture in sport by showing how Red Bullization produces narratives, images, and emotional experiences that reshape the presentation and perception of sport in the digital age.

CAS02 (New) Players in Digital Sports Media Landscapes

PP 0937 Serving Gen Z: A qualitative exploration of how quality demands and financial pressures redefine local sports journalists' professional identity

Emilia Hofmann[1], Moritz Hammann[1], Andrea Kloss[1]

[1] Macromedia University of Applied Sciences, Culture- Media- Psychology, Leipzig, Germany

Journalism reflects and shapes societal developments while responding sensitively to technological, economic, and cultural change (Kramp & Loosen, 2018). These dynamics are particularly visible in local journalism, where resource scarcity, shifting media consumption, and platform dominance weaken regional reporting and threaten democratic participation (Neff & Pickard, 2023; Heiselberg & Hopmann, 2024). Economic constraints coincide with a structural redefinition of professional identity: the pressure to reconcile journalistic quality with financial viability transforms newsroom routines and challenges traditional notions of "good journalism" (Schmidt et al., 2022).

Local sports serve as an exemplary lens for this transformation. As a social space fostering integration and identification, local sports reporting mediates between media, clubs, and audiences (Schaffrath, 2021). Yet it is highly exposed to economic pressures: newsrooms must produce more content with fewer resources while developing digital formats for younger

audiences to maintain relevance (Jonscher, 2024; Newman et al., 2025). For journalists in training, these tensions raise fundamental questions about how professional identity and quality are negotiated under changing conditions.

Grounded in journalistic roles (Hanitzsch & Vos, 2016), this study conceptualizes journalistic practice as an interplay between normative ideals- such as objectivity and social responsibility- and their situational enactment. Current research indicates increasing flexibility in role perceptions, shaped by audience logics, platform constraints, and technological innovation (Riedl & Hanitzsch, 2025). In local contexts, journalists simultaneously act as community members, information brokers, and economically dependent actors- a multi-layered role that generates conflicts but also new opportunities for proximity and participation (Nagel & Broersma, 2024). Quality discourses further complicate this picture: traditional criteria like relevance and diversity are under strain, while process-oriented dimensions such as transparency and dialogic engagement gain importance in algorithmically mediated environments (Wilczek et al., 2024).

The study employs a qualitative, exploratory design to capture meaning-making processes among local journalists. We conducted eight semi-structured interviews across diverse organizational settings, selected along contrast dimensions: carrier/financing (public-service, private, non-profit), status (newsroom, freelance/digital), and distribution channel (print, online, audio/podcast, social/video). These were complemented by 15 Generation Z audience interviews. Using qualitative content analysis (Mayring, 2015), the research contrasts professional and audience perspectives to illuminate shifts in role conceptions, quality standards, and strategies for addressing younger publics.

Findings indicate a persistent normative core (informing, contextualizing, local relevance) that is increasingly reorganized through resource scarcity and metric-driven routines; quality is negotiated as a situational trade-off between journalistic standards and measurable reach, retention, and conversion. Strategies to address younger publics focus on platform-native formats, personalization, and interaction, while limited time, skills, and institutional resources set clear boundaries for innovation.

By focusing on local sports within the broader news ecosystem, this study contributes to debates on the future of local public spheres and journalistic professionalism under conditions of economic pressure and digital acceleration.

CAS02 (New) Players in Digital Sports Media Landscapes

PP 0938 Soft 'power play' at the 2026 FIFA World Cup: Towards a theoretical framework for understanding sport, politics, and mediatized audiences

Cecilia Arregui Olivera[1], Vitaly Kazakov[1], Kirsten Frandsen[1]

[1] Aarhus University, Media and Journalism Studies, Aarhus, Denmark

Sports mega-events (SMEs) have continuously grown in significance as cultural, economic, political and media phenomena since the early twentieth century. While governing bodies often promote these events as 'apolitical' platforms fostering global unity (Meeuwsen & Kreft 2023), a framing frequently echoed in media coverage, SMEs are regularly connected to national conflicts, identity politics, and (geo)political rivalries (Wolfe 2025). In this context, this paper introduces a theoretical framework that examines the intersection of sports, politics, and media, using preliminary insights from fieldwork surrounding audience experiences of the 2026 FIFA World Cup as a case study.

The 2026 FIFA World Cup is co-hosted by the United States, Mexico, and Canada. The bid, *United as One* (2018), articulated visions of harmony and peace through football and sought to counter Donald Trump's divisive discourse (Beissel & Andrews 2021). However, the event has also become a tool for the US President's geopolitical 'power plays' and authoritarian populism, while Canada and Mexico contend with threats to sovereignty and economic challenges from their dominant co-host. This paper explores how (geo)political instability and tension around the World Cup shape media audience experiences in Canada and Mexico, the two smaller players in the bid which have distinct political, media, and sports systems. The paper asks: (1) How do media frame collective identities and national discourses amid political conflicts in SMEs? (2) How do audience perceptions of media, politicization, and identity formation vary based on historical, political, and media-specific contexts?

Theoretically, the paper integrates interdisciplinary insights from sports diplomacy (Grix & Brannagan 2024), emotion-driven politics (Hansen 2022), mediatization (Frandsen 2020), and media systems theory (Hepp & Couldry 2010), to analyse mediatized political tensions in SMEs. Preliminary findings from a qualitative research design combining media framing analysis and fieldwork—including focus groups with 3 natural groups in each country, in-depth interviews, and data donation—with Canadian and Mexican media audiences during the FIFA World Cup in June-July 2026 will aid in testing and illustrating the framework to be developed for the conference presentation.

CAS02 (New) Players in Digital Sports Media Landscapes

PP 0939 Athletes' assessment of institutional support structures in response to (potential) online hate

Chiara Gethmann[1], Yasemen Lappas[1], Daniel Nölleke[1]

[1] German Sport University, Institute of Communication and Media Research, Cologne, Germany

In digital media environments, athletes—just as other social stakeholders—increasingly face online hate (Kearns et al., 2023). This potentially harms their mental health and may even lead to their withdrawal from public arenas (McCarthy, 2022). While grounds are shifting since media visibility becomes more and more risky in increasingly hostile digital media environments, organized support structures may have the potential to positively influence athletes' experiences. However, for other professional groups, such as journalists, it has been noted that those affected by digital violence are usually left to cope on their own (Holton et al., 2023).

Sports organizations appear to have recognized the problem and are addressing it with various measures—from workshops (e.g., DFL, 2024) to legal action (e.g., FIFA, 2023) and AI-based filters (DOSB, 2024). However, current research criticizes these approaches as reactive and insufficient, especially with regard to gender-specific risks (Hayday et al., 2024; Williams et al., 2025). In that connection, the extent to which those measures are appreciated and perceived as helpful by the athletes affected, and whether they would like to see measures that go beyond this, is not yet known.

This raises the following questions:

RQ1: How do athletes rate the existing support against online hate offered by organized sports?
RQ1a: What potential do they particularly attribute to AI measures?
RQ2: What support measures would athletes like to see from organized sports?

To answer these questions, guided interviews were conducted with 29 German elite athletes (18 of whom were female) from various sports (summer and winter sports; individual and team sports) (survey period 11/24–07/25). The interviews lasted an average of 43 minutes, were transcribed automatically, and analyzed using qualitative content analysis in MAXQDA.

Results show that athletes were largely unaware of institutional support (RQ1). Only a minority of interviewees has made use of support services offered by sports organizations. However, they particularly referred to preventive formats that they perceived as valuable to prevent harm particularly from young athletes (RQ2). Strikingly, interviewees did not know about the potential and use of AI measures in order to combat online hate (RQ1a). While they acknowledged potential to AI filters, athletes voiced concerns regarding accuracy and freedom of expression. They highlighted that criticism must remain possible in the future, and censorship must not be allowed.

Overall, the interviews clearly indicate that athletes see themselves as primarily responsible for dealing with online hate. Organized support is welcomed, but is hardly known or accessible. AI is discussed as a possible relief, but its acceptance depends on maintaining an open culture of debate.

EMS01 Moving Images - Moved Audiences: Visual Witnessing During War and Conflict

PP 0265 Moving images, moved audiences? A focus group study into audience interpretations of distant suffering in The Impossible (2012)

Valerie Vanhove[1], Stijn Joye[1], David Ongenaert[2]

[1] Ghent University, Department of Communication Sciences, Ghent, Belgium
[2] Charles University, The Institute of Communication Studies and Journalism, Prague, Czech Republic

In December 2004, the Indian Ocean tsunami struck the coasts of several Asian countries. It resulted in one of the largest natural disasters ever, leading to massive media attention, aid, and solidarity (Moeller, 2006). Most studies have examined how Western audiences witness disasters indirectly through factual media formats such as news, documentaries and social media (Huiberts, 2019; Kyriakidou, 2015). By focusing on *The Impossible* (2012), which tells the story of a British family during the 2004 tsunami, this paper examines the largely unexplored audience responses to and interpretations of mediated distant suffering in fiction films. The latter form important signifiers of social phenomena, including distant suffering, and provide viewers with an emotional experience, as they 'mimic human consciousness' and amplify emotions (Plantinga, 2009: 48). Fiction films create an imagined, experiential overlap through which global audiences not only witness but partially share the suffering of the distant Other, potentially fostering deep emotional involvement (Scott, 2014). Five focus groups (N = 22) in Flanders, the northern Dutch-speaking part of Belgium, were organized to explore audiences' emotional involvement and responses to the human suffering as depicted in the disaster film *The Impossible*. The study explored whether and how fictionalized narratives of real disasters can incite audience emotions and engagement towards distant suffering.

Our findings show that our participants developed empathy for the characters in *The Impossible* by 'domesticating' the fictionalized suffering or relating the story to their own lives. This process rendered the characters' suffering more understandable and emotionally engaging. The Western characters made the suffering more accessible and emotionally impactful for some participants. However, this closeness rarely translated into concrete action. Participants first needed to process their own emotions and were not encouraged to reflect critically on their privileged position. When participants approached the film more rationally and developed sympathy, they maintained 'proper distance' (Silverstone, 2007), enabling reflection on their own position and that of the suffering Other. This is probably the film's greatest strength: its ability to build a connection between the Self and the Other based on common interest, understanding, and reflection.

Some participants' emotional distancing from the film's characters stemmed from factors such as the characters' privileged social class, which they found unrelatable (Kyriakidou, 2015). Geographical and temporal distance further limited engagement: an event that occurred far away or long ago was easily dismissed (Linklater, 2007). Personal taste, viewing habits and awareness of the film medium's affordances also shaped the viewing experience (Vaage, 2023). Participants often evaluated the film through its acting or cinematography. Some criticized the dramatization, while others found that the claim of being based on true events actually increased authenticity and emotional impact. The Eurocentric framing was mostly acknowledged only when raised by the moderator, prompting a reconsideration of their viewing experience. Some criticized the marginalization of the local population, while others defended the focus on the family's personal struggle. In general, underlying themes of socio-cultural polarisation or geopolitical power imbalances fuelling the stereotypical representations of Self and Other remained largely absent.

EMS01 Moving Images - Moved Audiences: Visual Witnessing During War and Conflict

PP 0266 Mass destruction through mass distraction: How TikTok videos by Israeli soldiers aestheticize war into entertainment during war in Gaza after October 7, 2023

Carolin Melz[1]

[1] The American University of Paris, Global Communications, Saint-Martin-en-Bière, France

This paper presents a visual and semiotic analysis of TikTok videos produced by male and female Israeli Defense Forces (IDF) soldiers in the aftermath of the October 7, 2023, attack. Drawing on a curated corpus of five short-form videos, the study incorporates screenshots of key scenes to illustrate recurring visual patterns and aesthetic strategies. Particular attention is given to gestures, framing, sound, captions, and performative elements through which violence, military presence, and civilian space are reconfigured for entertainment. The analysis demonstrates how the conflict is repeatedly rendered lighthearted, aestheticized, and ironic—stripped of emotional, political, and moral gravity, and detached from the lived realities of Palestinian suffering.

While the entanglement of militarism and entertainment is not new, TikTok intensifies this logic through its algorithmic structure, trend-driven aesthetics, and emphasis on humor, immediacy, and virality. In doing so, the platform facilitates a platform-specific military–entertainment complex in which ethical boundaries are increasingly blurred and violence becomes visually consumable. The playful performance of soldiers in uniform, combined with comedic timing and stylized imagery, produces an ethically troubling spectacle that normalizes asymmetrical power relations and reframes domination

as humor. These representations raise critical ethical questions not only about the actions depicted, but also about mediated witnessing, responsibility, and complicity within digitally circulated scenes of distant suffering.

Unlike existing scholarship that focuses primarily on political messaging, propaganda, or informational content related to the war in Gaza, this study examines the intersection of social media aesthetics, humor, and ethical desensitization within contemporary digital war culture. The analyzed videos have not previously been examined in such visual and semiotic detail, particularly as content produced by Israeli soldiers themselves—figures who function simultaneously as performers, video makers, and active participants in the conflict. By filming, editing, captioning, and circulating their own performances, the soldiers collapse the distinction between actor and author, embedding military power directly within the visual and affective economy of platform culture. This dual positioning complicates conventional distinctions between documentation, performance, and moral accountability.

The findings support a clear ethical interpretation of these videos. They can be read as performative assertions of military power in which irony and spectacle function to reinforce dominance while minimizing ethical scrutiny. Destroyed homes and abandoned shops in Gaza operate as a mise-en-scène, transforming civilian spaces into theatrical stages designed for TikTok circulation. The systematic absence of victims from the frame facilitates the erasure of suffering and the suspension of empathy, rendering destruction aesthetic, abstract, and consequence-free. At the same time, the videos' circulation to distant audiences reshapes practices of witnessing, further distancing viewers emotionally and weakening affective and moral engagement with mediated suffering. Through humor, repetition, and visual stylization, violence is normalized both within the filmed scene and in spectatorship itself. The videos thus reveal how digital platforms enable mediated suffering performed, framed, and consumed in ways that detach viewers emotionally while reinforcing dominance, creating a digital space where cruelty becomes spectacle.

PP 0267 Representing atrocity: Interpreting Ukraine war photojournalism through visual grammar

Giacomo Di Benedetto[1], Marco Bruno[1], Gaia Peruzzi[1]

[1] Sapienza University of Rome, Communication and Social Research, Rome, Italy

This article examines the representational strategies adopted by professional photojournalists documenting the war in Ukraine following Russia's full-scale invasion in February 2022, with particular attention to how images of violence and suffering construct humanitarian visuality and mediate distant suffering. Drawing on a qualitative thematic, interpretative, and comparative analysis of 88 photographs produced by 10 internationally recognized photojournalists, the study investigates how atrocity photography negotiates ethical witnessing, documentary testimony, and empathetic engagement within contemporary war reporting. Grounded in visual sociology and scholarship on humanitarian and war visuality, the research addresses longstanding critiques of sensationalism, voyeurism, and the spectacularization of pain, asking whether Ukraine war photojournalism reproduces or challenges dominant Euro-American representational traditions.

The analysis identifies six recurring thematic clusters – death, desolation, destruction, blood, rescue, and escape – through which embodied vulnerability and the magnitude of violence are visually articulated. Across these themes, three interconnected interpretative patterns emerge: the centrality of the victim, a strong documentary and historical intent, and a pronounced humanitarian and empathetic potential. Rather than aestheticizing violence or reducing subjects to passive icons of suffering, the photographs largely foreground victims' lived experiences, individuality, and dignity, positioning the body as both evidence of atrocity and a site of moral and political appeal. The images function simultaneously as testimonies of war crimes and as visual calls for justice, recognition, and humanitarian action.

A comparative technical analysis further reveals how compositional and photographic choices – such as proximity, imperfect framing, blurred focus, and sequential shooting – reinforce the testimonial character of the images. These elements signal the photographers' participatory presence and ethical engagement in the field, privileging immediacy and accuracy over aesthetic refinement. The resulting visual narratives resist spectacularization while sustaining the emotional and evidentiary force necessary for public witnessing.

Overall, the findings indicate a shift toward a more dignified and de-victimizing approach to atrocity photography in the context of the Ukraine war. By emphasizing ethical responsibility, documentary rigor, and humanitarian commitment, contemporary war photojournalism appears to reconfigure the visual politics of suffering. The study contributes empirically and theoretically to debates on humanitarian visuality, peace-oriented journalism, and the role of images in promoting justice, historical memory, and social responsibility in times of armed conflict.

EMS01 Moving Images - Moved Audiences: Visual Witnessing During War and Conflict

PP 0268 Visual (mis)information: Strategic doubt and contestation of war images

Mette Mortensen[1]

[1] University of Copenhagen, Communication, Copenhagen, Denmark

Images from warzones are habitually accused of being misinformation. Sometimes, this stems from genuine concern or suspicion. At other times, such accusations arise from the deliberate attempts to discredit images that reveal perceived inconvenient or harmful realities. They function as an *iconoclastic strategy* to delegitimize images that have the potential to go viral, mobilize public opinion, and influence policymaking by documenting war crimes and humanitarian disasters while simultaneously appealing to emotions.

Much attention over the past decade has been devoted in public debate and scholarly literature to misinformation, disinformation, fake news, and the broader crisis of trust (e.g. Bennett and Livingston, 2020; Farkas and Schou, 2020; Altay and Acerbi, 2024). By contrast, research on their visual manifestations remains comparatively scarce. This oversight is likely due to the predominantly text-based orientation of research fields dealing with misinformation. What literature on misinformation tends to overlook is that much communication today is visual, especially on social media, which serves as a major breeding ground for its spread and amplification.

This paper examines how visual evidence is contested in international news media's coverage of the first year of the Gaza War (2023–2024), focusing on images of child victims. Such images have historically held monumental impact on public opinion (e.g. Seu, 2015; Al-Ghazzi, 2019; Adler-Nissen, Andersen and Hansen, 2020; Mollerup and Mortensen, 2020). However, the Gaza War introduced a markedly different scenario: visual (mis)information battles escalated to the point where images of child victims were routinely suspected of being fake, staged, or AI-generated. This not only hindered their circulation but also complicated the public's ability to distinguish between genuine instances of misinformation and strategic accusations designed to neutralize the power of visual evidence.

Drawing on a mixed-methods approach combining quantitative mapping and qualitative textual analysis, the paper develops a typology of visual misinformation. It is based on a data set of news items in a global range of English-language news outlets accessed through Proquest (n = 116). The analysis identifies four types, ordered along a continuum from minimal to maximal manipulation: *associated* (images merely suspected of being misinformation); *imagined* (non-existent images cited as evidence); *recontextualized* (images from earlier conflicts presented as current); and *AI* (deepfakes and other AI-generated images). While existing research has primarily focused on recontextualized and deepfaked imagery, the findings show that the subtler forms—associated and imagined—are more prevalent and play a crucial role in sustaining uncertainty and mistrust.

Across the typology, three broader dynamics emerge. First, uncertainty surrounding visual evidence is frequently framed through classical catch-all phrases such as the "fog of war" (Clausewitz) and "truth is the first casualty of war" (Aeschylus), which obscure rather than clarify the specific mechanisms of visual misinformation. Second, emotions are central: images often "feel true" regardless of their factual status. Third, elites play a pivotal role in amplifying visual misinformation, while journalistic metacoverage may inadvertently erode trust in images more broadly. The paper concludes by arguing for a more fine-grained vocabulary to understand how images are contested and instrumentalized in contemporary warfare.

PP 0269 AI witnessing: Humanitarian communication in the age of Artificial Intelligence

Maria Kyriakidou na[1], Kari Andén-Papadopoulos[2], Anne Kaun[1]

[1] Södertörn University, Department of Media and Communications, Huddinge, Sweden
[2] Stockholm University, Media and Communication Studies, Stockholm, Sweden

Artificially generated images and videos are challenging traditional understandings of how we document and witness global crises. Although it has long been acknowledged that photographs can be purposefully framed and used to elicit emotional responses, their indexical power to represent and, thus, provide evidence about global events and crises has been central in suspending disbelief and eliciting trust in the truthfulness of the events represented. What is new, however, in the context of generative AI (genAI), is the photorealistic nature of synthetic visuals created by image-generators such as DALL-E, Midjourney or Stable Diffusion. This fictional photorealism introduces new ways of witnessing crises that raise with renewed urgency questions of authenticity and trust in humanitarian communication, in a context where genAI and synthetic media are implicated in broader anxieties about disinformation and manipulation.

This paper presents a theoretical contribution to these debates by introducing the concept of 'AI witnessing'. It does so by building on the concept of media witnessing (Frosh & Pinchevski, 2009), which describes the distinct modality of practices involved in the mediation of human suffering and vulnerability. We suggest 'AI witnessing' an analytical lens that can help us explore the tensions and transformations brought about in the field of humanitarian communication through the use of genAI to represent and document crises. We argue that, by renegotiating the role of presence and authenticity in the representation of suffering subjects, AI witnessing is built on three inter-related tensions. First, it can safeguard the

dignity and safety of victims, on one hand, but also renders their predicament vulnerable to further manipulation and political propaganda, on the other hand. Second, AI witnessing throws into relief the relationship between trust – both in the institutional credibility of humanitarian imagery and the reality of the suffering depicted – and empathy with suffering victims. Finally, AI witnessing poses questions about the authority to authenticate, interpret and regulate AI-generated imagery, as well as the norms, values and power dynamics that such authority maintains or challenges. Ultimately, we argue that AI-generated images challenge conventional understandings of media witnessing by blurring the line between reality and fabrication, demanding a new conceptualisation for humanitarian communication in the digital age and introducing new urgent questions on the mediation of humanitarian crises and suffering.

EMS02 Witnessing at a Distance: Practices, Ethics, and Politics of Mediated Suffering

PP 0377 Distant reporting and the distant suffering of Sudan: A new style of conflict journalism?

Chris Paterson[1], Kennedy Osuri[1], Muganzi Isharaza[2]

[1] University of Leeds, School of Media and Communication, Leeds, United Kingdom
[2] World Vision, Policy, Leeds, United Kingdom

The mediation of distant suffering (Chouliaraki) has long depended on a tripartite negotiation for information access between international non-governmental organisations (INGOs), states, and the news media. In the context of large-scale suffering from civil war in Sudan being rendered nearly invisible globally (Gregory), the authors set out to empirically investigate how current configurations of that relationship are impacting the international story told of Sudan. Through a survey and limited set of interviews with the key actors from the global journalism and humanitarian aid sectors, this paper examines story sourcing practices as deployed in recent coverage of events in Sudan. The development from instigation to publication of recent stories of the civil war are presented as case studies. Sudan's civil war is unprecedented in modern conflict journalism, since access for international journalists to conflict areas is mostly impossible and even INGOs have limited access to conflict and affected populations. This has resulted in a considerable dependence by international journalists on flow of story information from INGO workers. Close collaboration between media and INGOs in covering humanitarian crisis in East Africa is not new (e.g., Franks). However, initial indications in this research suggest new journalism models are emerging in which INGOs' stature and access (though limited) give them unprecedented storytelling and framing agency in ways that blur the boundaries between journalism and INGO communication. Recent scholarship has critiqued East African journalism for over-dependence on foreign news organisations in the coverage of regional stories (Wahutu) and being co-opted into racialised, Western news representation of the continent (Douglas). Within that context, examination of how those foreign stories are constructed takes on added importance. The authors draw from a unique extent of first-hand knowledge and links to relevant actors: Isharaza is a policy advisor with World Vision and author of a major study of INGO communications. Osuri is an experienced East African correspondent for international media, and board chair of the African Foreign Press Association.

EMS02 Witnessing at a Distance: Practices, Ethics, and Politics of Mediated Suffering

PP 0378 Synthetic witnessing from a distance: The sense-making practices of OSI(NT) activists during the Russian full-scale invasion

Johanna Hiebl[1]

[1] European University Viadrina, European New School of Digital Studies, Frankfurt Oder, Germany

Since the beginning of the russian full-scale invasion against Ukraine, this war has been extensively documented and analysed by the civilian population, both in Ukraine, but also transnationally. These practices, while being often described as "crowd witnessing" (Andén-Papadopoulos, 2013),"citizen witnessing" (Allan, 2013) or "data witnessing" (Gray, 2019) unites investigative volunteers and lay people together to distribute the "labor of witnessing" (Matviyenko & Larin, 2025) across platforms and networks. As civilians continue to participate in monitoring, collecting and verifying efforts to secure digital evidence, the distinction between civilians and combatants blurs (Ford, 2024). However, existing theories of witnessing assume either physical co-presence or mediated embodied interaction, leaving an insufficient conceptual vocabulary to explain how engagement and accountability operate in data-driven Open Source Investigation/Intelligence (in the following OSI(NT)) practices, despite being geographically distant from the frontline in Ukraine.

The following paper addresses this gap by investigating throug ethnographic inquiry how through the engagement of individual actors of OSI(NT) groups authoritative expertise emerges (cf. Charlton et al., 2024; Cochrane 2022). Therefore, I mobilise Knorr Cetina´s concept of the "synthetic situation" (2009) to reconceptualise OSI(NT) practices during russia´s war against Ukraine as a form of "synthetic witnessing" that is not dependent on physical co-presence and embodied interaction. Knorr

Cetina defines "synthetic situations" as "an environment augmented (and temporalized) by fully or partially scoped components—in which we find ourselves in one another's and the scopic components' response presence, without needing to be in one another's physical presence" (2009, p.69). Building on this, I am applying these features onto OSI(NT) practices to describe them as a form of non-embodied response to the russian full-scale invasion. These data practices entail, first, a shift from physical to "response presence"; second, focussing on scopic engagement mediated through the screen as primary interlocutor instead of human-centred interaction; and third, a shifted focus from narrow, localised perspective towards global information assemblages (Knorr Cetina, 2009, pp. 69ff).

Despite a lack of synchronicity in virtual arrangements, investigative actors can be held "accountable for responding without incoming attention or interaction request" (Knorr Cetina, 2009, 74). Yet, in line with Kotišová and van der Velden's (2023) concept of "affective epistemology", emotional engagement with data produced during the war can function as situated knowledge that further motivates for investigative work.

I further argue that "synthetic witnessing" stimulates new forms of expertise within OSI(NT) practice, even the absence of formalised guidelines and standards (beyond frameworks such as the Berkeley Protocol). While these investigative practices reflect democratic opportunities for participation in intelligence production (Van Puyvelde & Tabárez Rienzi, 2025), ethical ambiguities come up (cf. Dyer & Ivens, 2020), including risks of secondary trauma (Koenig & Lampros, 2023).

EMS02 Witnessing at a Distance: Practices, Ethics, and Politics of Mediated Suffering

PP 0379 Mediating suffering with care: Reimagining journalism ethics through peace journalism and minority representation

Naya Kalfeli[1], Christina Angeli[1]

[1] Aristotle University of Thessaloniki, School of Journalism and Mass Communications, Thessaloniki, Greece

In the early decades of the twenty-first century, journalism faces profound ethical challenges that test its foundational principles and social purpose (Ward, 2019). From threats to editorial independence and press freedom to the pressures of verification, disinformation, growing polarization and the commercial exploitation of attention through algorithmic systems, the question of what constitutes ethical journalism has become increasingly urgent. These challenges are further intensified by polarized debates over identity and social justice, often articulated through "anti-woke" discourses that politicize diversity, equality and inclusion, framing ethical and human-rights concerns as ideological bias rather than as democratic values.

While professional journalism continues to rely on normative principles such as accuracy and commitment to truth, these values alone appear insufficient to address the moral complexity of contemporary communication environments, particularly in the representation of minorities, where suffering is mediated through frames that may reproduce stigma and symbolic violence. In response, scholars (Aslam, 2019; Christians, 2019; Ward, 2019, 2021) increasingly call for ethical frameworks that are more human-centered, context-sensitive and attentive to vulnerability, reflecting a broader shift in media ethics from rule-based approaches toward care-oriented perspectives that foreground empathy, responsibility and moral awareness.

Building on this ethical turn, this paper argues that peace journalism, originally developed as an alternative to war and conflict reporting (Galtung, 1998, 2006), can be reconceptualized as a broader ethical framework for minority representation. It introduces the Peace Model for Ethical and Inclusive Journalism, a framework that operationalizes ethical responsibility through concrete dimensions of representation, including voice, sourcing, framing, problem definition, and language. The model distinguishes between two contrasting ethical orientations: a framework of polarization and stigma, characterized by elite-dominated sourcing, threat and victim frames, depersonalization and stigmatizing language; and a framework of peace and inclusion, which emphasizes pluralism, contextualization, human-centered storytelling and attention to structural inequalities. These orientations reflect competing moral understandings of journalism's responsibility toward those whose suffering is mediated.

Greece offers an instructive case, as its media system has been shaped by prolonged economic crisis, political polarization and intense public debates over migration and LGBTQI+ rights. Empirically, the paper synthesizes findings from quantitative content analyses of 2,345 news articles from Greek national media outlets across different periods, complemented by 14 semi-structured interviews with journalists working in print, broadcast and digital media. The analyses reveal persistent patterns of symbolic harm, including marginalized minority voices and dominant conflict-driven narratives, while the interviews illuminate journalists' ethical awareness, professional constraints, and critical engagement with empathy, bias and responsibility in everyday practice.

By integrating empirical evidence with normative ethical theory, the paper positions peace journalism as a harm-aware ethical framework that bridges virtue ethics, deontological responsibility, consequentialist harm reduction and the ethics of care. Central to this framework is moral imagination, the capacity to anticipate the social consequences of representation and to envision alternative narratives that affirm dignity rather than reproduce suffering. The paper thus contributes to debates on the ethics of mediated suffering by reframing minority representation as an ethical encounter and offering an adaptable framework for care-oriented, inclusive journalism in polarized media environments.

EMS02 Witnessing at a Distance: Practices, Ethics, and Politics of Mediated Suffering

PP 0380 Normalizing asymmetry of suffering in Czech television discussions of Gaza

Jan Motal[1], Lucie Čejková[1], Vojtěch Dvořák[1], Matěj Richtr[1]

[1] Masaryk University, Department for Media Studies and Journalism- Faculty of Social Studies, Brno, Czech Republic

This paper examines how Czech public service television mediates distant suffering by constructing Palestinian identity and (non-)grievability in its flagship discussion programme *Události, komentáře* during the Israel–Gaza war. In available scholarship, less attention has been paid to how the suffering of Palestinians is shaped in semi-peripheral media systems whose geopolitical orientation and historical memory are strongly aligned with "core" Western narratives. Employing Immanuel Wallerstein's world-system theoretical framework as well as emplying the conceptual framework of Critical Discourse Analysis tradition, we ask (1) How is Palestinian suffering discursively represented and made intelligible to Czech audiences? (2) How do journalistic performances of impartiality structure relationships between spectators and sufferers? (3) What ethical consequences follow from the civilisation framework that divides actors into a "civilised" moral community and a barbaric outside? In our analysis, we put special emphasis on how suffering and victimhood represent the structures of power, transposed into the Czech public sphere in its postransformational history and its dependence on Western allies.

Methodologically, the study combines Norman Fairclough's three-dimensional Critical Discourse Analysis (text, discursive practice, socio-cultural context) with a world system sensibility that treats the semi-peripheral position of Czechia as a structural condition of discursive circulation and legitimacy. The empirical corpus comprises 111 programme segments broadcast between 7 October 2023 and 10 December 2024, including studio debates, political interviews, and moderator-framed report packages.

The analysis identifies a recurring hierarchy of voice and affect. Israeli suffering is more frequently individualised, narrated through recognisable political and civic subject positions, and rendered emotionally accessible, whereas Palestinian suffering is commonly massified (as "losses," "numbers," "population density"), displaced into logistical/technocratic registers, and routinely recontextualised through securitisation. Moderators' questions and quotations often collapse "Palestinians" into "Hamas/terrorism," psychologise Palestinian violence as moral pathology, and position humanitarian testimony as potentially partial, thus constricting the space in which Palestinian civilianhood and political subjectivity can be recognised. Grammatical and rhetorical patterns further normalise asymmetry: Israeli measures are frequently described via passive or necessity-inflected formulations, while Palestinian violence is attributed in active and agentive terms. Finally, civilisational discourse ("the civilised world must defend itself") stabilises a moral boundary that invites spectators to identify with order, rationality, and Western alliance politics, while rendering Palestinian claims to statehood and self-determination peripheral and ambiguous.

The paper contributes to the working group agenda by showing how mediated suffering is not only represented, but governed by objectivity rituals and civilisational binaries that unevenly distribute empathy, responsibility and complicity. It argues for integrating semi-peripheral dependency and transnational discursive hierarchies into theorising ethical witnessing and post-national solidarities.

EMS02 Witnessing at a Distance: Practices, Ethics, and Politics of Mediated Suffering

PP 0381 Technologies of hope: Investigative labour in Russia's war on Ukraine

Johana Kotisova[1], Lonneke van der Velden[1], Olga Burlyuk[1]

[1] University of Amsterdam, Media Studies, Amsterdam, Netherlands

In this paper, we conceptualize hope labour in wartime investigative work, thus providing an excursion into the technologies of work of media professionals on the data frontlines of Russia's war on Ukraine while extending the concept of hope labour beyond its economic focus and pointing to its moral dimension. Drawing from the extant understanding of hope labour, the labour of witnessing, and technologies of hope, we seek to contribute to a more granular understanding of *how* hope is performed in wartime investigation work, and *what* the professionals engaged in wartime (digital) investigations hope for. In particular, our analysis addresses the following research questions:

RQ1: What are the objects of wartime hope labour and associated motivations?
RQ2: What are the technologies of hope labour involved in wartime investigations?
RQ1a: What practices, sources, and technologies do the wartime investigations engage?
RQ2b: What forms of collaborations does hope labour produce?

Empirically, the study builds on ethnographic fieldwork – semi-structured interviews with 12 media professionals, (digital) investigators, and experts in media advocacy organizations, all of them investigating and narrating diverse aspects of the Russian War on Ukraine, and participant observations at media conferences and seminars in Ukraine and beyond. We study people who observe, document, analyze and archive the war – and specifically, potential or yet-to-be-defined war crimes – for various national and international media, social, political, security and legal institutions and organizations. In their daily work, they accumulate, process, and organize big quantities of data produced either by digital technologies, or through

direct on-the-ground work. We suggest that the community of professionals involved in wartime investigations hopes for accountability and justice, contributing to collective memory and policy change. We argue that the ultimate object of hope is the hope itself; the reproduction of hopefulness. We also show how the technologies of hope combine established investigation practices with new (digital) tools and approaches, and how they rely on collaboration and collective action. Analyzing this extremely morally laden case of media labour, the paper thus broadens the current economically reductionist and individualistic way of conceptualizing hope labour in media studies.

MAI01 Media and Intimacy: Practices, Relations, and Transformations

PP 0650 Everyday meme sharing as digital intimacy: How private exchanges shape identity and closeness among young adults

Claus Toft-Nielsen[1], Tina Thode Hougaard[1], Lasse Balleby[1]

[1] Aarhus University, School of Communication and Culture, Aarhus C., Denmark

This paper investigates how everyday meme-sharing practices among young adults function as a form of digital intimacy and identity negotiation. While memes have been widely examined as cultural and political artifacts, their role in private, interpersonal communication remains underexplored. Drawing on media practice theory and narrative approaches to identity, this study conceptualizes memes as 'small stories' and affective artefacts that sustain emotional closeness in digitally mediated relationships (Bamberg & Georgakopoulou, 2008; Bamberg, 2016).

The research addresses two questions: (1) How do young adults integrate memes into their everyday media practices? (2) In what ways does meme-sharing foster intimacy and shape identity in private digital exchanges? To answer these questions, we conducted two qualitative focus group interviews with 14 Danish undergraduate students (early 20s) who actively engage with memes. The interviews, designed as informal group conversations, were complemented by brief questionnaires mapping participants' meme-related habits. Data were coded using grounded theory techniques to identify recurring themes and patterns (Charmaz, 2000).

Findings reveal that meme-sharing is a habitual yet meaningful practice embedded in daily routines. Participants primarily engage in private circulation rather than remixing, positioning memes as personalised communicative tokens and 'phatic' gestures that sustain co-presence (Malinowski, 1923; Sadowski, 2016). These exchanges serve multiple functions: maintaining emotional closeness, initiating low-stakes contact, and negotiating identity through shared cultural references. The affective and relational work of memes is evident in their framing as 'little gifts' that strengthen bonds and enable subtle facework (Goffman, 1955). Meme-sharing also supports ambient awareness and distributed intimacy across time and space (Lupton, 2017; McGlotten, 2013). This resonates with Berlant's account of intimacy as narrations of shared life and attachment, and with Rambukkana's articulation of digital intimacies operating across scales (Berlant, 1998, 2000; Rambukkana, 2024).

Conceptually, we situate these practices within media practice theory (Reckwitz, 2002; Couldry, 2004) and the distinction between dispersed and integrative practices (Schatzki, 1996; Warde, 2004), showing how private meme exchanges function as micro-participation oriented toward peers and family (Carpentier, 2011) and as affinity-building within everyday infrastructures (Knobel & Lankshear, 2007; Paasonen et al., 2023). We further draw on work on mediation and intimate infrastructures, living in media (Deuze, 2012) and the intensification of relations with non-human entities (Kember & Zylinska, 2015), to illuminate how platform affordances scaffold low-friction intimate contact. From meme studies, we mobilize concepts of prism, intertextuality, and templatability (Shifman, 2013; Wiggins, 2019; Rintel, 2013) and the kairotic timing of circulation (Ross & Rivers, 2017), explaining why particular memes resonate in specific relational moments.

In dialogue with the ECC 2026 theme "Shifting Grounds: Paths, Connections, and Futures," the paper shows how mundane, private exchanges reconfigure intimacy as a site of transformation, encounter, and possibility. We argue that everyday meme-sharing exemplifies shifting intimate infrastructures that connect private experience with broader cultural, technological, and governance dynamics of datafication and platformisation (Paasonen et al., 2023; Deuze, 2012). Ultimately, the study demonstrates how seemingly trivial communicative acts operate as narrative devices and embedded cultural practices that shape identity and sustain closeness in contemporary mediated life.

MAI01 Media and Intimacy: Practices, Relations, and Transformations

PP 0651 Intimacy as a professional mode in narrative journalism

Anelize Teodora Sălan[1]

[1] Faculty of Journalism and Communications Studies- University of Bucharest, Journalism, Bucharest, Romania

In recent years, journalism has increasingly moved away from ideals of emotional distance and detached objectivity toward forms of storytelling that bring journalists closer to the lives, emotions, and experiences they describe. This shift is often framed in terms of transparency, authenticity, or emotional openness, yet the concept of intimacy has received limited theoretical attention and is frequently associated with personal confession or autobiographical exposure. This paper proposes to rethink intimacy not as a private disclosure or a deviation from professional norms, but as an emerging professional mode within narrative journalism.

Following previous theoretical work on emotional journalism, narrative forms, and changing norms of journalistic authority, the paper explores how intimacy is produced through stylistic and relational practices rather than through self-revelation alone. Narrative voice, focalization, scene construction, and attention to emotional detail function as techniques that generate a sense of closeness between journalists, their subjects, and audiences. In this sense, intimacy functions less as a personal revelation and more as a mediated form of emotional closeness, shaped by intention and professional conventions.

Questions about intimacy as a journalistic practice arise at a moment when trust in traditional media has weakened and expectations of transparency and emotional presence have intensified. In this context, intimacy becomes a way of re-configuring the relationship between journalism and its public, offering what can be understood as a symbolic space of recognition and care. Rather than weakening professional credibility, intimate forms of storytelling can support emerging forms of authority shaped through relational engagement and emotional connection.

The paper combines a theoretical discussion with a stylistic analysis of award-winning narrative journalism, focusing on texts that received the reporting first prize within the Superscrieri, the national journalism competition in Romania, over the past fifteen years. Using narratological variables such as voice, focalization, scene construction, and characterization, the analysis explores how intimacy is constructed through narrative form rather than through explicit self-disclosure. This approach allows the paper to examine intimacy as a patterned and recognizable professional practice, shaped by stylistic choices and evaluative criteria, while keeping in view ongoing concerns about emotion, trust, and relational proximity in contemporary journalistic practice.

MAI01 Media and Intimacy: Practices, Relations, and Transformations

PP 0652 Human-Machine narration. How Generative AI transforms everyday storytelling

Ann-Katrine Schmidt Nielsen[1]

[1] Aarhus University, Department of Scandinavian Studies and Experience Economy, Aarhus C, Denmark

This paper investigates how the ways we make sense of and with stories are transformed with "communicative AI".[i] With the rise of large language models (LLMs) and GenAI, the personal, momentary, and open-ended stories of the everyday are increasingly being told to and with chatbots rather than intimate human others.[ii] As part of an emergent shift from primarily functional to intimate uses of the new technologies, people turn to GenAI platforms to, e.g., recount the small incidents of the day, test out social dilemmas and personal values, vent about family conflicts, engage in existential conversations, foster companionship, and create personalized fantasies.[iii] To understand this cultural shift in everyday storytelling and communication, the paper asks:

1) How and why do users engage with GenAI when telling everyday stories, and what relations, benefits, and challenges do they experience?
2) What are the social and cultural implications of telling stories with and to GenAI?

Drawing on text samples, interviews with, and media diaries from 10 adult regular users of GenAI for storytelling purposes, the paper combines insights from the Human-Machine Communication-paradigm and the stories "in/as practice"-paradigm to coin and develop the framework of Human-Machine Narration (HMN). HMN is understood as the entangled storytelling practices emerging between the prompt of a human and the response of a machine designed to communicate, and the analysis shows how HMN affords narrative meaning making and identity construction through the poisoning of selves, the personalization of communication, and the attribution of intent to GenAI systems. The paper argues that in the intimate everyday usage of GenAI a new form of technological self-reflexivity emerges where the question 'who am I?' becomes inseparable from considerations of 'what is GenAI?' and, even more so, 'what is GenAI *to me*?'. By embracing an emic perspective, the paper contributes with new knowledge on how media users engage with GenAI outside functional domains. This is important in a context where the everyday existential, therapeutic, social, and supportive uses of GenAI is still "poorly understood" and empirical qualitative work scarce.[iv]

MAI01 Media and Intimacy: Practices, Relations, and Transformations

PP 0653 Queering the sext: Bodies, desire, and digital intimacy among Italian emerging adults

Rachele Reschiglian[1]

[1] University of Padova, Department of Philosophy- Sociology- Education and Applied Psychology FISPPA, Padova PD, Italy

Sexting has become an ordinary yet contested practice within digital intimacies, where technologies mediate desire, embodiment, and relationality. Building on digital intimacy scholarship (Berlant, 1998; Attwood et al., 2017; Paasonen, 2018), this contribution approaches sexting as part of the infrastructural conditions through which intimate relations are produced, negotiated, and felt in everyday life. While existing research has predominantly framed sexting through risk, regulation, and heteronormative assumptions, queer and positive perspectives on this practice remain marginal.

This paper explores how self-identified queer Italian emerging adults construct their digital sexuality and (dis)embodiment through sexting practices.

Empirically, the study draws on qualitative material produced with 64 Italian self-identified queer participants (aged 18–35). Data were co-produced through focus groups, creative zine-making workshops, and in-depth interviews with body-mapping techniques, designed to capture the multimodal, affective, and embodied dimensions of sexting as a media practice.

Analytically, it focuses on two questions: (1) how sexting is queered as a media practice, (2) how bodies are mediated and experienced in sexting as playful, carnal, and (dis)embodied matter. Rather than treating queerness as a fixed identity category, the paper conceptualises it as a situated and strategic mode of meaning-making, enacted through everyday interactions with multimodal digital affective exchanges.

The analysis reveals sexting as a polyvalent practice operating across three interconnected registers: as a site of struggle between sexual agency and structural constraint; as a creative and sensual practice of meaning-making; and as a space that simultaneously challenges and reproduces normative expectations. Grounded in Paasonen's (2011, 2018) theorisations of carnal resonance and sexual playfulness, it demonstrates how sexting generates playful affective intensities through entanglements of bodies, technologies, and desire.

Participants mobilise sexting as a space for navigating intimacy, vulnerability, and playful exploration. Sexting serves for fantasy formulation, gender experimentation, and sexual development, while serving as a channel for testing compatibility and deepening relations. Moreover, it emerges as both a self-reflexive and relational practice, queering conventional assumptions about digital sexuality as other-directed. Through visual and textual construction of bodies (metaphorical or synecdochal), participants exceed offline material corporeal constraints in their sextual experience.

This research also illuminates how gender socialisation and queer scripts constrain sextual possibilities. Whilst sexting offers spaces for reimagining gender performances, it simultaneously reproduces some normative patterns. The findings reveal how digital sexual practices generate hybrid configurations articulating cognitive, corporeal, and technological dimensions, not as simple digitisation of pre-existing sexual practices, but as the emergence of new forms of embodied sexual subjectivity.

This study contributes to digital intimacy scholarship by centring non-normative experiences, demonstrating how queer digital sexual practices operate. By employing creative methodologies within a Research Brave Space paradigm, the research captures complex, embodied experiences often overlooked by conventional approaches. The findings challenge binary framings positioning sexting as either inherently empowering or necessarily problematic, revealing the simultaneous presence of agency and constraint, pleasure and risk, creativity and normativity within the same practice. It ultimately argues that sexting functions as technology of the self and body extending far beyond erotic exchange to encompass questions of identity formation, power negotiation, and social belonging within digital cultures.

MLC01 Contemporary Approaches to Media Literacies and Digital Competencies

PP 0084 Digital and AI competences of young people: A Systematic Literature Review (2020–25) from the lens of Media Literacy

Sandra Borges Tavares[1], Patricia Dias[1]

[1] Universidade Católica Portuguesa, Centro de Estudos de Comunicação e Cultura CECC, Lisbon, Portugal

The rapid diffusion of datafied platforms and more recently generative artificial intelligence (GenAI) has drawn further attention to how young people develop competences to access, evaluate, create, and participate in digital and media environments. While digital competencies and media literacy have been widely researched, the period between 2020 and 2025 marks an intensification of scholarly and policy interest in AI and adjacent constructs (e.g. algorithmic, data, and synthetic media literacies). This paper seeks to present a systematic literature review focusing on this period, aiming to map out how research conceptualises and measures young people's digital and AI-related competences and what trends are emerging, from the point of view of Media Literacy Studies. Additionally, the study aims to discuss the practical and ethical implications foregrounded for media literacy education.

Following PRISMA-guided procedures, the review synthesises peer-reviewed studies focusing on children and adolescents, published in English between January 2020 and December 2025. The analysis codes (1) competence frameworks and definitions; (2) methodological approaches and instruments; (3) competence domains emphasised (information evaluation, creation, safety, civic engagement); and (4) reported outcomes and contextual factors (school, family, platform use, socio-economic conditions).

In the preliminary analysis of the results, three trends stand out. First, research progressively shifts from broad digital skills towards more specific competence clusters, particularly information evaluation, datafication awareness, platform/algorithmic understanding, and the use of prompts to interact with AI. Second, post-2022 studies increasingly treat GenAI as a media literacy challenge, prioritising young people's practices around synthetic media, deepfakes, and credibility assessment, while documenting uneven understandings and opportunities. Third, despite the growth of AI literacy discourse, empirical work still relies heavily on self-report measures and short instruments, with comparatively fewer validated assessments of AI-related understanding or critical agency.

The review also identifies ethical concerns that are increasingly central: privacy and data exploitation, biases and discrimination, the epistemic disruption associated with AI-generated content, and risks emerging from young people's encounters with AI-mediated persuasion and relational systems. Practically, our findings support the urgency of integrating critical AI literacy into media literacy curricula (beyond "how to use tools"), strengthening teacher training, and prioritising equity-sensitive interventions that address access and knowledge gaps.

MLC01 Contemporary Approaches to Media Literacies and Digital Competencies

PP 0085 A critical analysis of the new European Digital Competence Framework DigComp 3.0. Has AI literacy been successfully integrated?

Leo Van Audenhove[1], Lotte Vermeire[1], Wendy Van den Broeck[1], Andy Demeulenaere[2], Carola Strobl[3], Walter Claassen[4]

[1] Vrije Universiteit Brussel, Studies on Media- Innovation and Technology, Brussels, Belgium
[2] imec, Knowledge Centre for Digital and Media Literacy, Brussel, Belgium
[3] University of Antwerp, Departement Toegepaste Taalkunde- Vertaal- en Tolkwetenschap, Antwerpen, Belgium
[4] University of the Western Cape, CoLAB, Cape Town, South Africa

At the end of 2025 the Joint Research Centre of the European Commission published a new version of the Digital Competence Framework (Cosgrove & Cachia, 2025). The DigComp framework is one of the most widely used digital competence frameworks both in Europe and beyond. The new Version 3.0 updates the framework in '(…) response to digital technological developments, trends and practices, and to support several EU policy initiatives on digital skills' (Cosgrove & Cachia, 2022). More specifically Version 3.0 '(…) includes a new section outlining learning outcomes which provides a more granular view of digital competence that allows easy and consistent interpretation and application of the framework, as well as the systematic and transversal integration of AI competence across the framework'.

The integration of AI and more specifically GenAI competences seems to be the main motivation for the update from the former 2022 Version 2.2. This seems to reflect the growing recognition of AI literacy as transversal, and embedded across other digital competence domains, rather than a specialized ability. The purpose of this paper is to analyse the integration of AI literacy in DigComp 3.0. The paper we present is an updated version of a widely read and cited article we wrote analyzing DigComp 2.2 in 2022. In line with that article we will analyze the new DigComp 3.0 framework based on an extensive content analysis of the 523 *Learning Outcomes* of the framework.

First, we will map the learning outcomes against the Flemish Data Literacy Competence Model (own work, 2025). In our former analysis of DigComp 2.2 we came to the conclusion that DigComp 2.2 is not neutral, as codes are not distributed evenly among the different DCLM competences. Furthermore, DigComp 2.2 puts a strong emphasis on understanding AI and data and less on being able to use AI and data actively. In a world in which GenAI has been taken up by more than one

third of the European Population (Eurostat, 2025) it will be interesting to see whether DigComp 3.0 now focuses more on competences required for actively using GenAI.

Second, we will carry out a thematic content analysis working towards themes that emerge out of DigComp 3.0. In our analysis of DigComp 2.2, we observed that the framework focused strongly on security and privacy. Yet, aspects of environmental impact and citizenship were also mentioned. Again, it will be interesting to see whether new themes emerge out of DigComp 3.0.

Note: We are currently conducting the content analysis ensuring this paper will be ready by the conference.

MLC01 Contemporary Approaches to Media Literacies and Digital Competencies

PP 0086 Approaches to measuring media literacy: Lessons from crisis development

Petra Foretová[1]

[1] Palacky University, Department of Media and Cultural studies and Journalism, Olomouc, Czech Republic

This contribution primarily reflects on experiences with conducting contract research for the Council for Radio and Television Broadcasting (RRTV) of the Czech Republic and focuses on the "paradox of complexity" faced by researchers in their efforts to measure media literacy comprehensively and scientifically validly under time constraints and the requirement to include the domain of media literacy as a whole and measure its levels across the entire population. Special attention is paid to the tension between theoretical comprehensiveness and empirical feasibility, which significantly shapes the design of large-scale assessment instruments. In developing the test, the authors drew on Renee Hobbs' five-competency model, which provides a comprehensive way to measure media literacy in its entirety. However, during the operationalization of the construct, fundamental limitations of this approach became apparent, particularly in the area of measuring productive skills and actions (Act), where an insurmountable barrier arises between declared knowledge and procedural actions. A way out of this methodological predicament is offered by the transfer of selected procedures from the field of language testing and language diagnostics, especially for the area of "Analysis and Evaluation" of media messages. The paper uses specific examples to show that this approach makes it possible to transform vague concepts associated with descriptions of media literacy such as "media understanding" into hierarchical, measurable, and standardized skill levels. In conclusion, the paper formulates a set of recommendations for the future development of media literacy tests. We argue for abandoning attempts at "comprehensive" tests in favor of tests focused on specific areas of media literacy, which would use established methods of linguistic and, by extension, psychometric diagnostics, and attempts to prove that this approach can overcome the paradox whereby the complexity of the theoretical model makes it impossible to measure it reliably and accurately in practice within large-scale assessment contexts.

MLC01 Contemporary Approaches to Media Literacies and Digital Competencies

PP 0087 Overreliance on generative AI? Digital inequalities in risk awareness and coping strategies

Franz-Ferdinand Rothe[1]

[1] Vrije Universiteit Brussel, Imec-SMIT, Ixelles, Belgium

As generative AI (GenAI) tools such as ChatGPT are being rapidly adopted across society, they are entering not only professional and educational contexts, but likewise everyday practices, from information seeking to decision-making and creative activities. While techno-optimistic accounts celebrate this uptake for its promise of efficiency, productivity, and accessibility, a growing body of critical research points to potentially problematic implications of this widespread and routine use of GenAI technologies.

Recent studies have, for example, raised concerns about overreliance on GenAI tools, suggesting that frequent delegation of cognitive tasks to AI systems may foster cognitive offloading and longer-term cognitive debt, potentially undermining users' critical thinking and learning capacities. Learning from earlier research on the interplay between reliance on technological assistance and cognitive skills, we can assume that such consequences of GenAI use are not universal, but contingent on users' critical skills. Whether GenAI use leads to problematic overreliance depends on how users perceive and navigate potential risks, and on the coping strategies they develop.

Research on digital inequalities has consistently shown that factors such as education, age, and socioeconomic status shape users' digital skills, critical literacy, and capacity to anticipate and manage technological risks. This raises the question whether similar inequalities emerge in the context of GenAI use. This paper therefore studies, which groups may be at greater risk of experiencing negative outcomes of overreliance on GenAI tools, due to structural differences in risk awareness and coping skills.

Drawing on survey data from more than 400 participants, this paper examines (1) how users perceive the cognitive risks associated with GenAI tools, (2) the extent to which they report engaging in coping strategies aimed at mitigating overreliance, and (3) how these perceptions and practices vary across different socio-economic backgrounds.

By empirically studying critical AI literacy through a digital inequality lens, this study contributes to a more differentiated understanding of who is better equipped to critically and reflectively engage with generative AI, and who may be more vulnerable to its potentially negative effects related to cognitive debt and deskilling. In doing so, the paper advances research on human–AI interaction by showing possible outcome inequalities in GenAI use due to inequalities in risk awareness and coping skills.

MLC01 Contemporary Approaches to Media Literacies and Digital Competencies

PP 0088 Media literacy approaches to the platformisation of generative AI

Kim Toft Hansen[1]

[1] Aalborg University, Department of Culture and Communication, Aalborg, Denmark

In this paper, I introduce a theory-led account of generative AI (GAI) by situating it within the platform society (van Dijck et al 2018; Nielsen & Ganter 2022; Feher 2025) and advancing media literacy approaches that address the pedagogical challenges emerging from platformised AI technologies. Drawing on research on digital platforms, digital pedagogy, and playful learning, I conceptualise GAI as shaping designed interactions and structuring interfaces for human-technology engagement. I argue that GAI occupies a dual role in education: as an object of descriptive analysis focused on user interface design and affordance structures, and as a basis for prescriptive educational recommendations for interaction with GAI platforms.

Framed through media literacy, this approach connects critical understandings of chatbot interfaces, algorithmic bias, and uncritical use to the everyday practices through which students and teachers encounter GAI in educational settings. In upper secondary schools, an under-researched domain in relation to GAI, such encounters are formative for the development of critical digital competencies necessary in contemporary societies.

The theoretical foundation of this paper builds on the collaborative GAIYA research project (2026–30), which develops an original approach by integrating technological mediation theory (Verbeek 2015; Greer et al 2024; de Boer et al 2018), platform societies, media affordances (Ronzhyn et al 2022; van Leeuwen 2005), digital pedagogy and digital learning design (Pratschke 2024), as well as playful learning and AI play (Whitton 2022; Kangas & Heljakka 2024). Technological mediation theory clarifies how GAI platforms mediate knowledge perception in teaching and learning, while platform society perspectives illuminate the infrastructural position of GAI within intermedial environments. Media affordances direct attention to the concrete configurations of interfaces and tools that enable and constrain educational practices.

Digital pedagogy and learning design connect these affordances to purposeful learning experiences, and playful learning and AI play emphasise curiosity and creativity as integral to meaningful engagement. Anchored in media literacy, I argue that understanding these dynamics is essential to fostering critical engagement with GAI and for designing learning environments that promote reflective and informed use of chatbot technologies.

For GAIYA, media literacy approaches become actionable for the design of interactive learning, guiding prescriptive recommendations for how to engage with GAI platforms in ways that harness their educational potential and mitigate challenges for young students. The aim is a coherent conceptual basis for analysing and redesigning educational approaches to GAI, strengthening a critically informed utilisation of new teaching and learning technologies.

GAIYA (Generative AI in Education for Young Adults) is a Nordic-Baltic research project examining how generative AI, particularly chatbot platforms, transforms upper secondary education. Grounded in media and AI literacy, it analyses classroom practices and policy frameworks to develop strategies for responsible, future-oriented GAI integration. Funded by NordForsk under the "Nordic-Baltic initiative on responsible use of Artificial Intelligence" (project no. 231681), GAIYA promotes collaborative research for critically informed and innovative educational approaches.

MLC02 Developing Media Literacies in Schools

PP 0300 What draws teachers and educators to practice media literacy education? Lessons from a public policy evaluation in French-speaking Belgium

Elsa Sarlet[1], Pierre Fastrez[1], Jerry Jacques[1], Louise-Amélie Cougnon[2]

[1] Université catholique de Louvain, Center for Research in Communication, Louvain-la-Neuve, Belgium
[2] Université catholique de Louvain, Media Innovation and Intelligibility Lab, Louvain-la-Neuve, Belgium

Media literacy education (MLE) is still being institutionalized at international, national, and regional levels, and its translation into public policy remains partial. Training and professional development are key levers for advancing MLE, yet they often rely on individual motivation rather than institutional mechanisms. The effective adoption of MLE instruments by teachers and educators is therefore critical for policy success, making it essential to understand their perceptions and motivations

to engage with these tools. Yet, research assessing the adoption and effectiveness of MLE policy instruments from the perspectives of teachers and educators remains scarce.

This presentation reports on the first phase of a two-year evaluation of the MLE policy implemented by the French-speaking Community of Belgium (FCB). The evaluation focuses on instruments supported by the FCB to promote MLE, including three regional initiatives addressing journalism, news media, and cinema education in compulsory education; four funding programs enabling teachers and educators to develop pilot MLE projects; professional training opportunities in MLE; and the annual Media Literacy Week organized by the Higher Council for Media Education (CSEM).

The project pursues three objectives: (1) to document motivational and contextual factors influencing education professionals' decisions to use—or not to use—FCB-supported MLE instruments; (2) to analyze the MLE practices of professionals who have adopted these instruments and their assessments of their pedagogical effects; and (3) to produce a needs-based mapping of MLE in French-speaking Belgium, identifying met and unmet needs to enhance the impact and relevance of current initiatives.

The evaluation is structured in two phases. The first, exploratory phase (09/2025–08/2026), combines focus groups with teachers and educators who have not used the assessed instruments ("non-users") but have shown interest in MLE, and semi-structured interviews with those who have. The second phase (09/2026–08/2027) will deploy a quantitative online survey to generalize and validate the findings of the exploratory phase among broader samples of teachers and educators.

This presentation will report on findings from interviews with recent users of the assessed MLE instruments (N ~ 30, currently underway), encompassing diverse socio-demographic and professional profiles from compulsory education, youth work, adult education, and cultural sectors. We will present the results of a thematic analysis of the interview data. Key outcomes of this analysis include (1) a mapping of participants' conceptions of MLE and how these inform their practice; (2) a typology of motivational and contextual factors that facilitate or hinder adoption, along with related needs; and (3) an assessment of how the assessed MLE instruments align with or transform existing practices and their perceived impact on beneficiaries' media literacy.

Finally, the presentation will discuss the methodological transferability and potential replicability of the project's approach, and its value for international comparison. For researchers, it offers a template for comparable studies in other contexts; for policymakers, it provides a means to generate evidence-based insights to inform and improve MLE policy design.

MLC02 Developing Media Literacies in Schools

PP 0301 Teachers' knowledge and understandings of media literacy: Insights from knowledge-assessment data collected in a professional development training programme in Latvia

Klinta Locmele[1]

[1] University of Latvia, Department of Communication and Information, Riga, Latvia

As media literacy is increasingly framed as a transversal competence rather than a standalone subject, teachers across diverse disciplinary backgrounds are expected to integrate media literacy into their pedagogical practice. This raises an important question for media literacy research and education: how do teachers understand media literacy, its core competencies, and the risks and challenges children and young people face in the information environment.

This paper presents an exploratory analysis of anonymised knowledge-assessment data collected in the context of teachers' professional development in media literacy.

The data derive from a certification test completed in Latvia between October and December 2025 by approximately 350 teachers who participated in a 12-academic-hour media literacy training programme implemented as part of a publicly funded teachers' professional development initiative. The training programme was designed and delivered by the author of the paper. Completion of the test was a formal requirement for receiving a course certificate. Importantly, the data were not originally collected for research purposes but as part of educational assessment and quality assurance. The analysis is therefore retrospective and based exclusively on aggregated, anonymised results.

The test functioned as a structured knowledge check rather than a self-report survey and focused on thematic areas addressed during the course: conceptual definitions of media literacy; commonly cited core media literacy competencies; children's and young people's media use and associated risks; emerging media consumption trends; the pedagogical role of teachers in fostering critical engagement with media; and distinctions between related concepts such as media literacy and informational resilience. Participants represented six training groups and a wide range of professional backgrounds, including social and civic education, language education, natural sciences, arts, and non-formal education contexts.

While the empirical material originates from Latvia, the analytical focus is not on national policy evaluation. In the Latvian education system, media literacy is not taught as a separate subject but is embedded across several of the nationally defined transversal competencies, such as critical thinking and problem-solving, civic participation, and digital skills. This structural positioning makes the case particularly relevant for international discussions on cross-curricular media literacy education.

Methodologically, the paper treats assessment results as indicators of prevailing conceptual framings and recurring areas of uncertainty rather than as measures of individual competence or representative national trends. The analysis identifies patterns in correct and incorrect responses, highlighting which dimensions of media literacy tend to be well established in teachers' understanding and which are more likely to be narrowed, conflated, or framed primarily through technical or protective lenses.

For the ECREA audience, this contribution demonstrates how routinely collected assessment data from professional development contexts can be ethically and productively repurposed for reflective analysis. The findings offer transferable insights into common conceptual tensions in media literacy education and provide implications for the design of teacher training programmes in contexts where media literacy is distributed across disciplines.

MLC02 Developing Media Literacies in Schools

PP 0302 Developing media literacy in teacher education: A comparative perspective from France and Germany

Jasmin Buddensiek[1], Sabine Bosler[2]

[1] University of Greifswald, Department of Political Science and Communication Studies, Greifswald, Germany
[2] Université d'Haute-Alsace, Centre de recherches sur les économies- les sociétés- les arts et les techniques CRESAT, Mulhouse, France

Alongside deep mediatisation (Hepp, 2018), fostering media literacy among young people has become a key educational challenge. In order to effectively support pupils in their media socialisation, teachers must acquire media teaching skills from an early stage (Nickel et al., 2023). In both Germany and France, public policies recognise the development of media literacy as part of the professionalisation of teachers in higher education (KMK, 2017; Corroy, 2022).

Despite their geographical proximity, the two countries have different educational governance structures and approaches to teacher professionalisation. In Germany, the federal states (Länder) are responsible for school curricula, although the Standing Conference of Ministers of Education (KMK) defines common guidelines, such as those relating to media competence. These guidelines are then implemented differently across the federal states (Bosler, 2024), but there are some loopholes (Schniefer-Rohs, 2012). In France, media and information literacy (MIL) is gradually being integrated into school curricula as a cross-curricular subject, primarily the responsibility of teacher-librarians, who have the same status as other teachers (Corroy, 2022).

This research examines the professionalisation of future teachers regarding media literacy in France and Germany, as well as the values and attitudes conveyed and the observable differences and similarities. First, a qualitative content analysis of policy documents was conducted to identify the knowledge that teachers should possess regarding media education (Bardin, 1977; Mayring, 2022). Secondly, 20 semi-structured interviews were conducted with experts involved in higher education teacher training in both countries. These interviews provided insights into current practices and were analysed using qualitative content analysis.

The results reveal a discrepancy between the imperative nature of official German texts, which stipulate that teachers must acquire media competencies, and the reality that such courses are not consistently mandatory. The development of teachers' media-educational attitude was identified as a key component within actual practices. Although official texts mention values, most respondents feel uncomfortable with the term. In France, those responsible for training teacher-librarians support making MIL compulsory. However, they highlight tensions between institutional requirements and the reality of schools, where MIL remains largely invisible. In terms of values, media education in France has a strong civic dimension. French respondents refer to pupils as future 'citizens', whereas German respondents focus on individuals independently of the state. In both cases, media education inspired by popular education predominates, with active methods favoured over traditional pedagogy. The interviewees advise students to move away from a 'protectionist' approach and start from pupils' media practices. There is common ground internationally in terms of understanding pupils' media practices and the associated educational approaches.

Adopting a comparative approach (Esser, 2019) allows to take a step back from national frameworks and identify new avenues for reflection and action in the field of media literacy. Situating these findings within broader debates on professionalisation enables valuable contributions to be made to discussions on future pathways for developing media competencies in teacher education.

MLC02 Developing Media Literacies in Schools

PP 0303 Evaluating a media education teaching sequence aimed at developing advertising literacy competencies among 11–12-year-old pupils

Fanny Fiore[1,2], Pierre Fastrez[1]

[1] Université catholique de Louvain, Center for Research in Communication, Louvain-la-Neuve, Belgium
[2] Université de Montpellier, Faculty of Education, Montpellier, France

By the end of primary school, pre-adolescents spend several hours a day on YouTube (Smahel et al., 2020). Among the content they consume are videos that blend entertainment with commercial communication through product placements—a strategy defined as the deliberate and planned delivery of persuasive intent in a discreet manner, in exchange for

monetary or other valuable compensation for the communicator (Guo et al., 2019, cited in Lemoine & Regnier, 2021, p. 1). This practice introduces brands into non-commercial contexts while ensuring that audiences, particularly young viewers, do not perceive the underlying advertising intent (Rozendaal et al., 2016; Feijoo et al., 2024). This is especially true when their emotional attachment to YouTubers—many of whom frequently feature product placements in their videos (El Mouldi et al., 2020)—overrides their critical judgment (Feijoo et al., 2024).

In a context where the aims and content of schooling are constantly reconfigured in response to societal changes, these emerging social practices highlight the need for the school system to address digital advertising discourse that may influence pre-adolescents' behavior. The goal is to help them develop advertising literacy competencies—a specific form of literacy involving the identification, understanding, and critical analysis of digital commercial messages (Rozendaal et al., 2016)—which remains largely neglected in formal education. This presentation is part of a doctoral research project that seeks to design and test the content and modalities of teaching advertising literacy competencies to 11–12-year-old pupils through a media education sequence co-developed with participating teachers.

Our presentation focuses on the first iteration of the evaluation of this sequence, using a quasi-experimental design with non-equivalent groups: a test group of five final-year primary classes that received the sequence, and a control group of two classes at the same grade level, drawn from five French-speaking Belgian primary schools. We will present the methodology and findings from pre- and post-tests conducted around the sequence. These tests, based on the same instrument, aimed to document pupils' pre-existing advertising literacy competencies and inform the sequence design (pre-test), and subsequently assess their progress and the sequence's effectiveness (post-test). The instrument included questions about pre-adolescents' social media practices and a practical task designed to document their advertising literacy competencies when confronted with several product placements.

We conclude by discussing the significance of this research. Beyond its scientific contribution to understanding the drivers of a new form of digital media literacy, our study is meant to provide teachers with pedagogical resources to support their pupils in developing their online media practices in an informed and critical manner. More broadly, it intends to guide public policy on media education in a context where this domain is increasingly prioritized in the French-speaking Community of Belgium.

MLC02 Developing Media Literacies in Schools

PP 0304 Film education in Portuguese schools: A mapping of the seventh art's integration in public education

Marisa Mourão[1], Isabel Macedo[2]

[1] University of Trás-os-Montes and Alto Douro, Centre for Research in Applied Communication- Culture- and New Technologies CICANT, Vila Real, Portugal
[2] University of Minho, Communication and Society Research Centre, Braga, Portugal

In an era marked by intense polarisation, growing radicalisation, and the resurgence of extremist positions, film education is a particularly relevant field. Since the early days of the seventh art, film has been recognised as a medium with strong educational potential, yet also as one capable of shaping and reinforcing specific representations and attitudes (Reia-Baptista, 2008). Film education goes beyond fostering critical consumption of film: it involves cultivating an understanding of the moving image as a tool for reading the world, endowed with aesthetic, social, and pedagogical potential (Liz, 2022). Recent research has shown that pedagogical approaches centred on the analysis and production of films foster critical and intercultural competences, enabling pupils to question cultural representations and stimulating reflexive capacities (Glotov, 2023; Glotov & Kotilainen, 2021). Thus, at a time when academic and policy concerns have increasingly centred on the digital—often overlooking other media forms that remain part of children's everyday media repertoires (Pereira et al., 2024)—, this communication examines the place of cinema within schools through the Portuguese case. It considers how the seventh art can contribute to a culturally relevant education and to foster critical and active citizenship within contemporary educational contexts. We seek to identify and characterise film-related practices in Portuguese public education. To this end, we conducted an analysis of the educational projects of 425 school clusters and non-clustered schools across mainland Portugal (52.53% of all public-school units), complemented by interviews with the management and/or other leaders of 15 school clusters. The educational projects were obtained through the school websites, and when unavailable, they were requested directly from school leadership. The selection of interviewees followed a quota sampling strategy, encompassing the various regions of mainland Portugal. Both the educational projects and the interviews were subjected to content analysis using MAXQDA software (version 24, without AI Assist). The analysis employed categories developed a posteriori, validated, and applied by the authors of the study. The findings show that cinema is present in Portuguese public schools through a wide range of initiatives and projects. References were identified in the educational projects of 21.88% of the public-school units analysed, and its use in curricular and extracurricular activities was mentioned in interviews with nine clusters. These data point to a significant yet modest role for cinema in Portuguese public education, despite the country's long-standing tradition of film education (Pinto et al., 2011). In cases where cinema is present, its integration into school occurs within subject-based classroom practices, but especially through projects and initiatives often developed in collaboration with external partners. The findings highlight the crucial role of such collaborations, most notably the National Cinema Plan, in promoting the integration of the seventh art in schools. The approaches to cinema

reflect the existence of film education in its multiple dimensions (Clarembeaux, 2010; Fantin, 2006; Liz, 2022): film viewing, critical analysis, and production. However, the data indicate that the latter dimension, film production, is less frequently represented.

MLC03 Mapping and Evaluating Media Literacies

PP 0426 Warning or Guiding? Comparing the effect of positive versus negative boosting interventions and the role of repetition for the effects of misinformation

Svenja Schäfer[1], Sanne Tamboer[1], Nicolas Mattis[2], Sanne Kruikemeier[1], Rens Vliegenthart[1], Claes de Vreese[2]

[1] Wageningen University and Research, Strategic Communication Research Group, Wageningen, Netherlands
[2] University of Amsterdam, Amsterdam School of Communication, Netherlands

The spread of misinformation poses a growing threat to democratic societies and is widely considered one of the most pressing global risks of the coming years (Ecker et al., 2022). Although the actual share of misinformation in people's daily information diets is relatively small, public concern about false information is high, coinciding with declining trust in media, political institutions, and democracy (Droog et al., 2025; Van Erkel et al., 2024). As a result, substantial efforts have been devoted to designing interventions that strengthen citizens' resilience against misinformation.

Among these interventions, media literacy and pre-emptive strategies such as boosting have shown promise. Boosting aims to equip individuals with the skills and knowledge needed to detect misleading information and evaluate sources more effectively (Ziemer & Rothmund, 2024). While such interventions are generally effective in improving misinformation detection, growing evidence suggests they may also have unintended consequences (Droog et al., 2025). In particular, alarmist interventions that emphasize the dangers and pervasiveness of misinformation may increase fear, cynicism, and skepticism, potentially leading individuals to distrust reliable news as well (Acerbi et al., 2022). This tension has sparked recent debates on whether misinformation interventions should focus less on warning and more on fostering informed trust, emotional resilience, and acceptance of credible information.

This work-in-progress study contributes to this debate by systematically comparing the effects of different framings of boosting interventions. Specifically, we examine whether a trust-building intervention focused on recognizing reliable news can reduce susceptibility to misinformation without undermining broader news attitudes, compared to a more alarmist intervention that emphasizes misinformation threats. In addition, we investigate whether repeated exposure to such interventions strengthens or alters their effects over time.

Using a two-wave between-subjects experiment ($N \approx 1{,}500$), we apply a 3×2 factorial design that varies 1) intervention type (alarmist boosting vs. trust-building boosting vs. no intervention) and 2) repetition (single exposure vs. repeated exposure after one month). After the exposure to the intervention, participants evaluate news articles, complete measures of news literacy application, and report on broader media-related attitudes, including fear of misinformation, media trust, cynicism, and skepticism. The stimuli consist of graphically designed literacy interventions that were pretested and differ systematically in content focus (detecting misinformation vs. identifying reliable news), language tone (threatening vs. calm), and visual design (alarming vs. calming colors). Data collection is completed for Wave 1 and currently ongoing for Wave 2. The study has received ethical approval and was pre-registered. By comparing warning-based and guiding approaches to boosting, and by examining the role of repetition, this study aims to inform the design of misinformation interventions that not only improve detection of false information but also support informed trust and emotional resilience in contemporary information environments.

MLC03 Mapping and Evaluating Media Literacies

PP 0427 Mapping the landscape of intervention programmes to mitigate mis- and disinformation: Findings from a scoping review

Tania Azadi[1], Leen d'Haenens[1], Ans De Nolf[1], Cristina Ponte[2], Estrella Luna[2], Łukasz Tomczyk[3], Verónica Donoso[1], Marisa Torres da Silva[2], Susana Batista[2], Magdalena Żegleń[4]

[1] KU Leuven, Media Culture and Policy Lab, Leuven, Belgium
[2] NOVA University of Lisbon, Interdisciplinary Centre of Social Sciences, Lisbon, Portugal
[3] Jagiellonian University, Institute of Pedagogy, Kraków, Poland
[4] University of Physical Culture in Kraków, Department of Anthropology, Kraków, Poland

This scoping review synthesises 132 studies of interventions targeting misinformation/disinformation and AI literacy. It maps intervention designs, delivery, implementation conditions, outputs, outcomes, effectiveness, and challenges, and compares AI literacy with broader digital and media literacy approaches. We searched multiple bibliographic databases for English-language publications (2021–2025) using terms covering mis- and disinformation, digital or AI contexts, literacy/skills, and intervention programmes. From 4,036 records, 132 studies met eligibility criteria after de-duplication and staged screening. Data were charted with a logic-model-informed codebook and summarised descriptively. Evidence is concentrated in high-income Western settings, especially the United States and Western Europe, and interventions are commonly delivered online or in formal education. Evaluations are dominated by randomised and quasi-experimental designs measuring short-term outcomes; longitudinal, qualitative, and implementation-focused studies are less common. Participants

were most often students and adults recruited online; fewer studies addressed children, older adults, professionals, or structurally disadvantaged groups. About one-third referenced "vulnerable" populations, but vulnerability was often unspecified, limiting equity-sensitive conclusions. Interventions cluster into two partially overlapping categories. Digital/media/misinformation literacy interventions emphasise content-level evaluation (assessing claims, sources, and evidence), critical thinking, and resistance to misleading information. AI literacy interventions emphasise system-level understanding of algorithms and data-driven decision-making and foreground ethical and societal implications (e.g., bias, fairness, transparency, accountability). Most interventions required moderate resources, relying on educators or researchers, widely available digital tools, and teaching-oriented materials; few required advanced technical expertise or fully functional AI systems. Delivery commonly combined instruction with active learning (guided analysis, scenario-based activities, discussion, reflection). Programmes were usually facilitator-led and group-based, though many were self-directed online modules. Intensity was generally low to moderate (often one session or a small number of sessions) and longer, curriculum-integrated programmes were less common. Theoretical grounding was unevenly reported: digital literacy studies more often referenced media and information literacy frameworks, critical thinking, or inoculation theory, while AI literacy studies more often drew on socio-technical and ethics-oriented perspectives. Reported outputs mainly described participant reach and educational materials, typically in small to medium samples, with limited evidence on longer-term uptake. Outcomes were usually assessed shortly after delivery. Self-reports were common for attitudes and perceived competence, while knowledge and evaluative skills were more often assessed directly. Across both intervention types, the most consistent improvements were in knowledge acquisition and critical evaluation skills. AI literacy interventions were mixed in effects on trust and attitudes, often reflecting increased critical scepticism rather than acceptance. Implementation was facilitated by easy-to-use technologies, clear guidance, hands-on learning, and alignment with existing teaching models. Challenges included limited time, conceptual complexity (especially around AI), weak theory–design links, and ambitious goals relative to short-term measurement. In some misinformation interventions, increased caution about misinformation coincided with reduced confidence in accurate, trustworthy news. Overall, the field shows encouraging short-term effectiveness but limited insight into durability, transfer, scalability, and real-world impact. Future research should diversify populations and contexts, strengthen theory, use longitudinal and mixed-methods designs, and report implementation conditions and longer-term outcomes more consistently in future policy and practice.

MLC03 Mapping and Evaluating Media Literacies

PP 0428 Assessing media and information literacies in Serbia through an integrated index that measures the interplay between competences and environmental factors

Marijana Matović[1], Ana Milojević[1], Aleksandar Tomašević[2], Snežana Milin Perković[3]

[1] Faculty of Political Science- University of Belgrade, Journalism and Communication Department, Belgrade, Serbia
[2] Institute of Physics- University of Belgrade, Scientific Computing Laboratory, Belgrade, Serbia
[3] Radio Television of Serbia, Research Center, Belgrade, Serbia

In the era of deepfakes, propaganda and disinformation campaigns, populistic rhetoric, the spread of hate speech and conspiracy theories, media and information literacy (MIL), in its broadest sense, remains central for developing resilience on both individual and social levels. Despite vibrant research field, educational and policy activities around MIL, there is conceptual plurality, operationalization diversity, more theoretical than empirical considerations, and relatively few studies encompassing broad population and age groups, as recent systematic literature review confirms (Schofield et al., 2023). Therefore, in this research we aim to design an index of MIL, measure MIL in Serbia, and set grounds for future cross-country comparisons.

We have opted for MIL concept, treating it as an umbrella term - integrating media, information, digital, civic and other literacies that are gaining traction in recent years (i.e., Tully et al., 2022; Valle et al., 2025). However, in defining MIL, we align with few scholars (Tully et al., 2022) and frameworks (EAVI) that consider influence of context—how environmental characteristics (social, institutional, legal, technical structures) shape individual competencies and practices. Following EAVI framework we have designed the MIL index consisting of six dimensions (value 1–100), including measurements of individual competences and environmental factors. First, we identified relevant sources of data for Serbia from reliable regular international and national surveys, databases and indexes, and then designed and conducted a survey on a national representative sample (n = 800) using CATI method. After confirming the reliability of the scales (Cronbach's alpha ≥ 0.60) and creating three sub-indexes using factor analysis, survey results are combined with normalized and standardized data from external international (e.g., OECD PISA, Freedom House, Eurostat, Media Pluralism Monitor, UN E-Participation Index, IMF AI Preparedness Index, Global AI Index) and national sources (e.g., Statistical Office of the Republic of Serbia, GEMIUS Audience, Share Foundation Cybersecurity Monitoring). Integration of this complementary data results in the calculation of MIL index scores (1–100) for the following dimensions: 1) Connectivity and use; 2) Critical evaluation; 3) Democratic participation; 4) Media pluralism and freedom; 5) Social trust, privacy protection and cybersecurity; 6) AI readiness. After determining dimensions weight, through the two rounds of Delphi consensus expert group method (30 expert participants), Serbia scored 43.11 on the MIL index for 2025.

The final score indicates that MIL in Serbia is below mid-range, while dimensional scores provide deeper insights for researchers, policymakers and educators. The dimensions reveal underdeveloped individual capabilities compared to solid

digital infrastructure, a gap that can be explained by constraining factors in the dimensions with lower scores—media freedom and pluralism, quality of education, AI readiness. The index composition is adaptable to other countries and changes in the digital ecosystem. While the overall score enables mapping and comparison of MIL levels across countries, dimensional scores carry explanatory power.

MLC03 Mapping and Evaluating Media Literacies

PP 0429 What media literacy leaves out: A framework for evaluating Sustainability integration

Hetvi Chheda[1], Sergio Sparviero[1]

[1] University of Salzburg, Institute of Communication Studies, Salzburg, Austria

Media literacy education is widely positioned as a core democratic competence, enabling learners to navigate misinformation, participate in digital publics, and communicate responsibly. Yet sustainability—understood in the Brundtland/UN sense as an integrated agenda linking environmental limits with equity and human development—remains marginal in many mainstream media literacy curricula. Where environmental topics appear, they are often treated as discrete units rather than as cross-cutting concerns that shape how media systems, knowledge, power, and participation are understood. Responding to this gap, this paper examines how media literacy programmes conceptualise and operationalise sustainability, with specific attention to ecological worldviews, climate framing, media materiality, and justice-oriented social dimensions. We introduce the Integrated Sustainability Media Literacy Framework (ISMLF), a six-category evaluative rubric designed for systematic comparison and critical reflection across programmes. ISMLF synthesises four complementary foundations: eco-media literacy's focus on media's environmental impacts, representational politics, and material footprints (López, 2022; Maxwell and Miller, 2012); pluriversal epistemologies that contest universalising knowledge hierarchies and foreground relationality (Shiva, 1993); systems thinking and ecological literacy for analysing complexity, interdependence, and leverage points (Capra and Luisi, 2014); and UN sustainability frameworks, including the Sustainable Development Goals. The framework is applied interpretively through transparent criteria and a three-point scoring scale. Importantly, scoring across all categories uses an explicit social sustainability lens, attending to equity and inclusion, labour and livelihood conditions, and distributional impacts. Empirically, ISMLF is applied to a mixed-methods dataset comprising a content analysis of 90 lesson plans from 10 publicly accessible media literacy programmes, complemented by seven expert interviews with educators and researchers. Findings reveal a consistent imbalance: curricula frequently excel in fostering civic participation and critical inquiry, while ecological worldviews and sustained engagement with climate issues are comparatively underdeveloped and often compartmentalised. Most strikingly, the material and social costs of media infrastructures—energy use, extraction, labour conditions, and e-waste—receive limited and uneven attention, despite their centrality to sustainability. Interview data further suggests that perceived neutrality norms, organisational mandates, and resource constraints shape curricular decisions and can discourage explicit engagement with contested sustainability politics and justice implications. For the "Media Literacies and Communication Competencies" TWG, the paper offers (1) a transferable rubric for evaluating how programmes embed sustainability-relevant media competencies and (2) comparative evidence of recurring curricular blind spots, with implications for programme design, teacher education, and future research on media literacies under ecological crisis.

MLC03 Mapping and Evaluating Media Literacies

PP 0430 Towards a multi-dimensional framework of AI literacy in higher education

Charmaine Voigt[1]

[1] University of Rostock, Institute for Media Research, Rostock, Germany

The rapid integration of generative artificial intelligence (GenAI) into higher education has re-ignited debates around the digital divide (Assefa 2025; Beckman et al. 2025) and media and information literacy. Across higher education institutions, GenAI is predominantly framed as a threat to academic integrity, prompting institutional responses that range from cautious instructional integration to restrictive, AI-proof assessment strategies. While often grounded in ethical concerns, these approaches also reflect a broader moral panic that risks obscuring the diverse and uneven ways students actually engage with GenAI tools. Current institutional and scholarly responses insufficiently capture the diversity of students' AI use. Focusing on homogeneous or purely instrumental student use, the discourse overlooks how inequalities in access, skills, confidence, and institutional support shape GenAI practices. Revisiting the digital divide in the context of GenAI

therefore calls for a more contextualized understanding of AI literacy in higher education, one that can be meaningfully adapted to diverse learning environments.

"Can it help calibrate learning to address the great differences between students across many dimensions? […] To do so will require new pedagogical approaches and changed classroom ecologies" (Kalantzis & Cope 2025: 26). Following the authors' demand and building on Kong et al. (2024), the paper proposes a multi-dimensional theoretical framework of AI literacy that situates AI engagement at the intersection of individual, institutional, and socio-political dimensions. Rather than treating AI literacy as a standalone technical competence, the framework conceptualizes it as embedded within psychological dispositions, organizational conditions, and broader cultural narratives.

At the individual level, AI literacy is shaped by personal values such as autonomy and psychological predispositions such as self-efficacy, and risk perception. These characteristics help explain why some students avoid GenAI tools due to fear of misconduct accusations or in favor of independent problem-solving. To operationalize this dimension, the framework adopts Jaakkola's (2025) distinction between personal stage, backstage, and frontstage AI use, capturing exploratory, supportive, and visible/performative forms of engagement across academic workflows.

The institutional dimension highlights how AI literacy is co-constructed through policy clarity (d'Haensens et al. 2025), teacher preparedness, and organizational culture. Educators' readiness to integrate AI meaningfully influences students' opportunities to develop reflective and ethical AI practices. Clear institutional guidelines on disclosure, plagiarism, grading, and tool use reduce uncertainty and foster equitable learning environments.

Finally, the socio-political dimension situates AI literacy within national, cultural, and economic contexts. Media discourses, political orientations toward AI industries, and dominant risk narratives shape how GenAI is perceived by students and educators. Importantly, the framework stresses the need to differentiate among GenAI tools, recognizing that varying functionalities demand distinct competencies.

Together, these three dimensions provide a comprehensive theoretical lens for understanding AI literacy as a contextual, relational, and socially embedded construct. The interplay of individual dispositions, institutional structures, and socio-political narratives offers a threefold application for literacy research, practical development, and policy. Besides a visualization of the framework, the presentation will explore its use in those areas of higher education.

MLC04 Perspectives on AI Literacy in Educational Contexts

PP 0532 Plagiarism, ethics, and creativity. Media and information literacy in young students' AI use

Estrella Luna Muñoz[1], Yonty Friesem[2], Anna Kozlowska-Barrios[3]

[1] NOVA University of Lisbon, NOVA Institute of Communication, Lisbon, Portugal
[2] Columbia College Chicago, School of Communication and Culture, Chicago, USA
[3] The University of Illinois Chicago, University Library, Chicago, USA

The use of Generative Artificial Intelligence (AI) by students worldwide has increased significantly. Eighty-six percent of students already use AI in their studies (DEC, 2024); however, students simultaneously demonstrate a limited understanding of how AI systems function (Azadi, T. et al., 2025). Alternatively, some university professors have begun integrating AI into classroom instruction as a tool for developing students' skills and competencies, including in Visual Art Education (Dehouche, N., & Dehouche, K., 2023); in a professional writing course (Bedington et al., 2024); and screen media education (Bender, S., & Marshall, 2023).

It is crucial to equip students with the values, knowledge, and skills necessary for the effective use of and active co-creation with AI technologies (UNESCO, 2024). Nevertheless, significant challenges remain regarding the design of learning activities for young students that foster media and information literacy, particularly given ongoing concerns related to plagiarism and ethical use of AI tools.

The primary objective of this educational intervention is to introduce students to the ethical use of generative AI and to examine students' understanding of AI when it is used in educational contexts. Multiple pedagogical approaches were implemented to support students' understanding of the ethical implications of AI use (Annapureddy et al., 2025), to foster creativity through collaboration with AI for idea generation and refinement, and to promote critical thinking skills for evaluating AI-generated content (OECD, 2025).

This paper presents three case studies conducted in 2024, including one in Portugal and two in the United States. The intervention involved three distinct groups of young students aged 17–25 (N = 63): Honors College students at a public university in the United States, journalism students at a private college in the United States, and communication/digital services students from a vocational school in Portugal. The intervention consisted of face-to-face sessions involving collaborative activities between the researcher and students, including AI image generation, search instruction, information analysis, reflective discussions, and teamwork focused on issues of plagiarism, ethics, and creative production using AI tools (e.g., Gemini, You.com, DeepAI, Claude, Jasper, Crayon, DALL·E 3, Canva, and Picsart).

A qualitative analysis was conducted using a codebook-guided approach based on the Essential Competencies of Digital and Media Literacy (Hobbs, 2010) and the AI literacy framework proposed by the OECD (2025). The analytical framework included the following dimensions: (1) access and fact-checking; (2) analyze and evaluate using critical thinking; (3) create,

compose, co-creation, generation, and creativity; (4) reflect, social responsibility, and ethical principles; and (5) act, sharing, problem-solving, and participation.

The results show that data verification, critical thinking, and analysis are clearly recognized by students as the essential skills for the use of artificial intelligence tools. However, the findings also reveal a significant gap in students' awareness and understanding of ethical issues and plagiarism related to their use of artificial intelligence. We conclude that educators at different grade levels should guide students in the responsible use of AI by encouraging reflective dialogue and structured questioning in collaborative settings. Such practices can support students' understanding of ethics, plagiarism, and meaningful co-creation with AI technologies.

MLC04 Perspectives on AI Literacy in Educational Contexts

PP 0533 Feeling, reflecting, resisting: Towards an affective–personal media literacy framework in the age of platforms

Borbála Timár[1]

[1] Moholy-Nagy University of Art and Design Budapest, Doctoral School, Budapest- II., Hungary

The pervasive influence of digital media in contemporary society has led to a complex interplay between digital engagement and emotional well-being. While these platforms facilitate connection and self-expression, they also introduce various stressors that can negatively impact mental health, especially among young people. With the spread of new technologies, the development of media literacy is more important than ever before. While traditionally media literacy has emphasized access, analysis, evaluation, and production (Livingstone, 2004), growing research on digital well-being highlights that emotional experiences—such as stress, overload, guilt, anxiety, and ambivalence—are constitutive elements of everyday media use rather than secondary effects (Büchi, 2021; Vanden Abeele et al., 2024). These affective experiences are closely intertwined with platform architectures designed to maximize engagement and continuous connectivity, raising critical questions about agency, responsibility, and power (Kellner & Share, 2005; Beattie & Daubs, 2020), by understanding the technology and the functioning of platforms (Lewis, 2021; Aguaded, Civila, and Vizcaíno-Verdú 2022).

This paper presents a comprehensive framework of affective–personal media literacy that integrates affective, critical, and agentic dimensions into contemporary media literacy theory. By reflecting on the emotional ambivalences of digital connectivity (Mick & Fournier, 1998; Vanden Abeele, 2021), connecting media literacy and digital wellbeing as media platforms expand and increasingly affect people's mental health and overall well-being (Rasi et al., 2019; Büchi, 2021, Feerrar, 2022.), relying on previous concepts of affective-individual aspects of media literacy (Schorb and Theunert 2000; Niesto, 2009; Potter, 2015; Lewis, 2021), this framework conceptualizes media literacy as a process through which individuals reflect not only on media content and structures, but also on how mediated environment shape their emotions and wellbeing.

The proposed model systematically articulates four interrelated components: skills such as emotional awareness, self-regulation, reflection, and critical thinking, knowledge domains (eg. platform mechanisms, emotional and psychological effects of media use), attitudes such as agency and care for well-being), and strategies. In this context, practices and critical forms of digital disconnection (Gui et al., 2017; Syvertsen, 2020; Good & Ciccone, 2025)—are positioned as active and generative components of media literacy rather than as deficits or failures of participation.

Far from reducing digital stress to individual self-control, the framework highlights the interplay between affective experiences and platform power. By fusing platform critique with affective reflexivity, *affective–personal media literacy* offers a robust theoretical base for educational interventions that cultivate agency, emotional resilience, and sustainable digital engagement.

MLC04 Perspectives on AI Literacy in Educational Contexts

PP 0534 Intergenerational learning without reciprocity? On the limits of algorithm literacy development within families

Hallvard Moe[1], Emilija Gagrcin[1], Marianne Borchgrevink-Brækhus[1], Carolin Schefner[1]

[1] University of Bergen, Information Science and Media Studies, Bergen, Norway

Algorithms have become key elements shaping users' public connection [1], in turn underscoring the need for algorithm literacy (AL) as a central component of critical media understanding. Yet public knowledge about algorithmic systems remains limited and speculative, primarily derived from personal experiences rather than explicit understanding of how algorithmic curation works [2,3]. These knowledge gaps are particularly pronounced across generations, with older adults generally showing lower levels of digital adoption and algorithm literacy than younger users [4]. Since most adults are beyond the reach of formal education, research points to informal learning environments as crucial for literacy development [5]. Families are often described as trust-based contexts for intergenerational learning, where knowledge and skills are conveyed between generations [6,7]. Accordingly, families may support AL through reciprocal exchange: younger family members contributing technical familiarity with platforms, and older members contributing critical perspectives grounded in life experience. To explore this, we asked: *How does intergenerational learning about algorithmic media unfold within families?*

We use semi-structured interviews and family technology maps to examine who provides and receives what kind of help with digital media. Interviews start with individuals identifying family members most relevant to their use of algorithmic media, who are then interviewed separately. The current sample includes a dozen families living in a large Norwegian city (data collection still ongoing).

We find that families play a central role in enabling older adults' *access* to algorithmic media, but that this role is largely instrumental, not pedagogical. A clear distinction emerges between high-stakes services such as digital ID-services and online banking, where family members are careful to ensure that systems function correctly (often acting as proxy users [8]), and social media platforms, which are treated as low-stakes entertainment. In the latter case, intergenerational support most often involves installing apps and setting up accounts. The choice of apps usually reflects preferences of younger family members acting as "warm experts" [6] since the motivation is mostly to stay connected by being on the same platform. Once an app is installed, older adults are typically left to "learn by doing," with warm experts stepping in when something goes wrong. Thus, a repair logic dominates these exchanges**.**

While families are theorized as sites of reciprocal learning, our findings point to an asymmetric, unidirectional dynamic. Younger family members underestimate older relatives' interest in deeper understanding, thus prioritizing efficiency and problem-solving over explanation. Older adults, in turn, ask narrowly framed, instrumental questions and accept partial understanding. In this sense, caregiving crowds out pedagogy.

We discuss implications for research on algorithm literacy, intergenerational learning, and informal media education.

MLC04 Perspectives on AI Literacy in Educational Contexts

PP 0535 Student engagement with generative AI and critical thinking in higher education: Exploring competence, attitudes, and public-interest perspectives

Andrea Kloss[1], Magdalena Taube[2]

[1] Macromedia University of Applied Sciences, Culture- Media- Psychology, Leipzig, Germany
[2] Macromedia University of Applied Sciences, Culture- Media- Psychology, Berlin, Germany

The widespread adoption of generative artificial intelligence (AI) is transforming contemporary knowledge cultures, reshaping how knowledge is produced, mediated, and appropriated (Cooper et al., 2024; Granata, 2025; Levin & Minyar-Beloruchev, 2024). While technical innovation in generative AI has received growing research attention, its socio-political implications- particularly in educational contexts- remain insufficiently explored (Rong et al, 2025; Sahin & Noroozi, 2025). This project investigates how students engage with AI tools and how public-interest-oriented models of AI may foster democratic and human-centered knowledge practices beyond dominant Big Tech infrastructures (Verdegem, 2024).

Within this framework, the present study focuses on higher education as a critical site of knowledge formation. AI tools such as chatbots and generative systems have become integral to students' academic routines, supporting tasks from research and summarization to ideation and drafting. These practices raise fundamental questions: Does AI strengthen critical thinking by creating new opportunities for reflection and comparison, or does it risk eroding analytical skills through cognitive offloading? How do competence, attitudes, and usage patterns shape this dynamic?

Using a mixed-methods design, we examine the interplay between AI competence, critical thinking, attitudes toward AI, and usage frequency among German and International students. The quantitative strand (N = 70) measures critical thinking (Payan-Carreira et al., 2022), AI competence (based on Rubach & Lazarides, 2019), and attitudes toward AI (Schepman & Rodway, 2020) - capturing both opportunity-oriented and risk-oriented dimensions - alongside usage contexts. Analyses include reliability checks, descriptive statistics, correlations, and exploratory regressions to test hypotheses on competence-attitude-thinking relationships. The qualitative strand comprises 39 semi-structured interviews, analyzed via qualitative content analysis, to uncover subjective interpretations of critical thinking, perceived benefits and risks, and strategies for navigating information overload and algorithmic mediation.

Findings contribute to two debates: (1) the role of generative AI in shaping epistemic practices, and (2) practical implications for designing educational frameworks that promote responsible, human-centered AI use. Ultimately, this research situates student engagement with AI within broader socio-political concerns about participation, autonomy, and the future of knowledge production.

MLC04 Perspectives on AI Literacy in Educational Contexts

PP 0536 Shifting pedagogies: Integrating immersive media and generative AI in media studies education

Adam Kuttner[1]

[1] Corvinus University of Budapest, Institute of Marketing and Communication Sciences, Budapest, Hungary

The increasing prominence of generative artificial intelligence is fundamentally reshaping the framework of communication and media studies education. Alongside the growing ease with which textual and visual content can be produced, forms of learning requiring experiential, reflective, and interpretative engagement are gaining significance. Within this transforming educational environment, immersive media may play a key role by foregrounding experiential presence.

The examination of immersive technologies within the field of communication and media education becomes justified by the technological transformation of educational environments. Due to the decreasing costs and increasing accessibility of VR headsets, AI-supported smart glasses, and 360-degree cameras, these tools can now be realistically integrated into higher education practice—not merely on an experimental basis, but also at the level of educational organization. In parallel, the emergence and rapid development of generative AI–based software has significantly lowered the technical knowledge threshold required for the production of immersive content, further strengthening the educational applicability of such technologies.

The present study introduces a two-phase educational research project, the first phase of which was conducted during the first semester of the 2025/26 academic year, involving 53 third-year undergraduate students in communication and media studies at Corvinus University of Budapest, within the framework of the course *Press Photography, Documentary and Campaign Filmmaking*. A dedicated VR session was integrated into the course, during which participants used virtual reality headsets to view a program consisting of short 360-degree documentary films and an animated work. The presented VR content addressed social, cultural, historical, and environmental themes. Following the experience, students completed a structured questionnaire.

The questionnaire examined interrelated dimensions of the reception of VR documentary films, focusing on mediated communicative functioning, message interpretation, narrative guidance, and issues of authenticity and representation. From a media literacy perspective, the findings suggest that the educational significance of 360-degree films and VR-based content lies less in instrumental information transfer and more in the interpretative and reflective engagement with mediation and representation, enabling critical interpretation of mediated reality and of the communicative functioning of documentary film as a form.

The second phase of the research will be implemented during the second semester of the 2025/26 academic year. In this phase, students will design and realize their own immersive projects, building on the reception experiences acquired in the previous semester, using 360-degree cameras and generative artificial intelligence–based tools. At this stage, the course focuses on introducing the fundamental principles of virtual reality technologies, as well as their creative and communicative applications within the context of contemporary visual storytelling. Through individual and group projects, participants gain practical experience with experimental methods of creating immersive media content, while the research examines how reception experiences can be interpreted and transformed into creative and educational practices, as well as into content adaptable for science communication purposes.

CEE02 Media in the CEE Between Autocratic Attacks and Democratic Resistance

PP 0387 State captured fact-checking taking advantage of regulatory gaps in the EU platform regulation

Kata Horváth[1], Gábor Polyák[2], Bálint Barki[2]

[1] Universidade Católica Portuguesa, Faculty of Human Sciences, Lisbon, Portugal
[2] Eötvös Loránd University, Media and Communication Department, Budapest, Hungary

State-captured fact-checking organizations, which self-identify as fact-checkers while functioning as extensions of political power, pose an underexplored threat to democratic discourse in captured media environments. Fact-checking has become widespread and institutionalized in Western media systems over the past decade (Graves & Cherubini, 2016; Stencel et al., 2022), but it has been evident from the beginning that the work of fact-checkers has been characterized by different practices, approaches, and methodologies in different countries and newsrooms (Graves, 2018; Humprecht, 2020). However, in polarized media systems, fact-checking can be used not only to improve social debate but also as a political weapon, thereby further increasing polarization and reducing trust in the media. The distortion and weaponization of fact-checking have coexisted with its wider spread (Liu & Zhou, 2022; Montaña-Niño et al., 2024; Fang, 2022).

This research examines the phenomenon of state-captured fact-checking in Hungary, focusing on two platforms - Tényellenőr.hu and Faktum Projekt - that self-identify as fact-checking sites while functioning as extensions of the Fidesz government's communication apparatus. In media environments where political actors have instrumentalized the media system for their own purposes, fact-checking itself becomes a site of contestation and manipulation. The distortion of fact-checking practices represents a particularly malicious form of media capture, as these outlets exploit the legitimacy and methodological authority of legitimate fact-checking to spread partisan narratives. To analyze state-captured fact-checking practices, we employed a systematic content analysis of 90 articles published on Faktum Projekt (N = 78) and Tényellenőr.hu (N = 12) during July- September 2025. Our analysis reveals weaponized fact-checking patterns, including selective issue targeting, delegitimization of opposition sources, and institutional capture via GONGO structures.

Through operational and content analysis of the two Hungarian platforms, combined with an examination of the European Media Freedom Act and the Code of Conduct on Disinformation, this research develops a typology for identifying weaponized fact-checking while evaluating the effectiveness of existing EU regulatory frameworks in protecting media pluralism and democratic discourse from such instrumentalization. Our research aimed to assess the extent to which EU regulations, such as EMFA, cover fact-checking activities and, beyond that, whether they can serve as a solution to curb the activities of weaponized fact-checking sites. Unfortunately, the Hungarian example is not unique in Europe, therefore we believe that this phenomenon requires further academic attention.

CEE02 Media in the CEE Between Autocratic Attacks and Democratic Resistance

PP 0388 Narratives of the past on YouTube: Automated content analysis of May 8 commemorations in Poland, Ukraine, and the Russian-speaking infospheres (2022–2025)

Olena Shypotilova[1], Dominika Kasprowicz[1]

[1] Institute of Journalism- Media and Social Communication- Jagiellonian University, Department of Mediatization Studies, Kraków, Poland

The memory of the end of World War II in Europe continues to function as a powerful symbolic resource in contemporary political communication and identity construction (Etkind 2013; Hoskins 2009). This paper examines platformized political commentary on YouTube as a key component of the contemporary media infosphere in Poland, Ukraine, and among the Russian-speaking opposition in exile. Focusing on representations of May 8 between 2022 and 2025, the study explores how this date is narrated, interpreted, and mobilized across divergent political and cultural contexts during Russia's full-scale war against Ukraine.

May 8 marks the end of the war in Europe and commemorates its victims; however, across Eastern Europe it has acquired historically contingent, contested, and often antagonistic meanings (Rutten, Fedor & Zvereva 2013; Stevens 2020). These divergences have intensified in the context of the ongoing war, where historical memory operates simultaneously as an instrument of state-sponsored historical policy and as a strategic resource in Russian information warfare (Makhortykh

2017; Kulyk 2023). Competing narratives of victory, sacrifice, liberation, and occupation are mobilized to secure political legitimation, enable collective mobilization, and sustain symbolic confrontation.

While previous research in memory and media studies has primarily focused on state narratives, official commemorations, and legacy media, digital platforms now constitute hybrid communicative spaces that combine journalism, political commentary, algorithmic visibility, and participatory user practices (van Dijck, Poell & de Waal 2018). From the perspective of mediatization theory, memory in platform environments is not merely representational but also performative, affective, and interactive (Hoskins 2009). Despite extensive scholarship on memory politics in Eastern Europe, comparatively little is known about how social media platforms – particularly YouTube – shape and transform the memory of May 8 across different national and transnational media infospheres (Makhortykh 2017).

The study draws on framing theory to examine how the historical event of May 8 is structured through specific semantic, moral, and emotional frameworks (Entman 2004). Particular attention is paid to temporal orientations (past–present–future linkages), moral evaluations (sacrifice, responsibility, liberation, occupation), and affective modes of remembering. Methodologically, the paper employs automated content analysis of YouTube data, integrating the analysis of audiovisual narratives with metrics of user interaction. Two analytical dimensions are examined: (1) representations – how May 8 is narrated in video content, including dominant frames and emotional registers; and (2) interactions – how users engage with these narratives through comments, reactions, and patterns of platform engagement (Bakke, Rickard, O'Loughlin & Toal 2024).

The study addresses key research questions concerning whether Polish YouTube articulates a predominantly traumatic and reflexive mode of remembrance of May 8, whether Ukrainian platformized narratives foreground anti-war interpretations and European-oriented future imaginaries, and whether Russian-speaking opposition channels engage in the critical deconstruction of the Soviet victory cult through irony and counter-memory strategies (Etkind 2013; Kulyk 2023). Building on a comparative, platform-sensitive framework, the analysis further explores how these differing narrative orientations correspond to distinctive patterns of user interaction, engagement, and affective response on YouTube, thereby advancing understanding of the platform as a contested arena of transnational memory production.

CEE02 Media in the CEE Between Autocratic Attacks and Democratic Resistance

PP 0389 Collective memory and identity politics in the Visegrad Group: A multimodal digital humanities approach (1989–2015)

Anatolii Iashchenko[1]

[1] Sapienza University of Rome, SARAS, Rome, Italy

The political trajectory of the Visegrad Group (V4) between 1989 and 2015 was characterized by the extensive instrumentalization of collective memory. While scholarship grounded in memory studies (e.g., Assmann) has analyzed these narratives, it predominantly focuses on textual semantics, often underestimating the paralinguistic dimensions of political communication. This paper addresses this limitation by proposing a multimodal framework that correlates the distant reading of parliamentary transcripts with the signal processing of speech data.

Utilizing the ParlaMint corpus as a structural index, the study implements a two-tiered analysis of parliamentary debates in Poland, Hungary, Czechia, and Slovakia. First, we apply Latent Dirichlet Allocation (LDA) to the textual corpus to map the semantic evolution of discourse regarding transitional justice and historical trauma. This identifies the lexical clusters that constitute the explicit narrative of memory politics.

Second, the research extends the analysis to the acoustic domain. We process archival audio recordings corresponding to key legislative sessions to extract prosodic features, specifically fundamental frequency (F0) variability, jitter, and intensity dynamics. These acoustic markers serve as proxies for affective arousal, allowing for a quantitative assessment of delivery style independent of linguistic content.

Furthermore, the comparative scope of the V4 analysis highlights a critical divergence in post-socialist trajectories. While the semantic content of parliamentary debates in the early 2000s largely converged around the normative language of European integration, the spectral data indicates a latent "affective resistance" distinct to specific national contexts. In the cases of Hungary and Poland, the acoustic footprint of debates concerning national sovereignty began to exhibit high-arousal markers years before the formal consolidation of illiberal policies. This suggests that the erosion of democratic consensus was not a sudden rupture but a gradual accumulation of "affective rigidity." By tracking these sonic anomalies, the model identifies specific "patient zero" events: parliamentary sessions where the normative consensus was first breached not by logical argumentation, but by the prosodic intensity of the delivery.

The study reveals a measurable divergence between the semantic neutrality of official legislative texts and the acoustic intensity of their performance. The data indicates that the intensification of identity-based discourse is frequently preceded by statistically significant shifts in vocal prosody, suggesting that political polarization is enacted through "sonic performativity" as much as through ideological text. This paper argues that integrating spectral analysis into historical research offers a more rigorous epistemological basis for understanding the mechanics of political communication, moving beyond logocentric hermeneutics toward a multimodal analysis of historical sources.

CEE02 Media in the CEE Between Autocratic Attacks and Democratic Resistance

PP 0390 Constructions of democracy in the Czech citizen parliament: Articulations and struggles

Vaia Doudaki[1], Nico Carpentier[1], Miloš Hroch[1]

[1] Charles University, Institute of Communication Studies and Journalism, Prague 1, Czech Republic

Citizen parliaments or citizen assemblies are democratic tools that offer opportunities to citizens to engage in processes of increased democratic participation regarding issues of broad societal relevance (Monnot et al., 2025; OECD, 2023; Vrydagh and Welp, 2023). The citizen parliaments (CPs) facilitate democratic dialogue by carefully organising deliberations on particular societal issues, and supporting citizens to formulate resolutions that propose specific societal and policy action to address these issues to the benefit of society.

In the Czech Republic, there is no long tradition in the organisation of citizen parliaments or assemblies. The organisation of the Czech Citizen Parliament on Media and Democracy –the first in the country focussing on media and democracy–that took place during March–May 2025, provided an opportunity to Czech citizens to be part of such a democratic endeavour. Through their participation in the parliament, 20 participants shared their views, deliberated with other citizens and worked together to develop proposed solutions on how the Czech media can (be supported to) strengthen democracy in the country.

This paper presents the main findings of the analysis of the material collected from the parliament's activities and output, during its 3-month operation, addressing the following research question: How is democracy constructed through the core elements of participation and representation, in the participatory process and the outputs of the citizen parliament?

The materials collected and analysed for the purposes of this project included ethnographic fieldnote reports produced during the CP operations; CP session minutes and selected recordings; surveys and interviews addressing the parliamentarians' experiences; the proposed and accepted resolutions produced by the parliamentarians, together with the parliamentarians' dissenting and confirmatory opinions on the accepted resolutions.

The collected material was analysed following an abductive strategy (Matthews & Ross, 2010; Reichertz, 2019), maintaining an open approach to interacting with the data and coding, being still guided by key theoretical-sensitising concepts, instructed by the literature on democratic theory and civic engagement, and on democracy, media and participation (Carpentier and Wimmer, 2025; Carpentier 2016; Held, 1996).

As the analysis showed, the democratic process, as it took place within the operations of the Czech citizen parliament, was constructed through (opportunities for) enhanced and pluralist participation and representation, as deliberative, consensual and outcome-oriented, and as adhering to direct, participatory and substantive modes of democracy. The citizen parliament itself functioned as a space of enhanced participation of the involved actors, facilitating the conditions towards the equalisation of power relations. When it comes to democracy's core dimension of representation, it is considered vital, for the parliamentarians, but is important for them that it is supported by pluralism, tolerance and inclusivity. Participation is constructed as the cornerstone of a healthy democracy, when it involves the broad realm of the political and is not reduced to the field of institutionalised and formal politics.

The Czech citizen parliament highlighted the importance but also complexity of participatory processes in civic life, addressing democracy and its struggles around participation and representation as processes and products of respectful dialogue, deliberation but also compromise.

CEE02 Media in the CEE Between Autocratic Attacks and Democratic Resistance

PP 0391 Shadow infrastructures of care and resistance: Communicative aspects of activism in Wartime Russia

Ekaterina Kalinina[1]

[1] Stockholm University, Institute for Media Studies, Stockholm, Sweden

This study investigates the evolving forms of civic activism in Russia in response to the full-scale invasion of Ukraine, focusing on the communicative and logistical infrastructures that enable these practices. Drawing on several dozens of qualitative interviews conducted between 2023 and 2024 with self-identified activists and volunteers operating in major Russian cities, the research traces how politically sensitive humanitarian efforts, including assistance to Ukrainian refugees, emerged in an increasingly repressive environment.

Post-2022 Russia presents a paradox: while digital infrastructures for e-commerce and lifestyle content remain robust, the state has aggressively criminalised political expression online, blocked global platforms, and ramped up surveillance of communications. As physical public spaces for dissent have become unavailable and open protest criminalised, the internet remains one of the few remaining arenas for coordination, albeit under constant risk. In this context, humanitarian relief,

although framed by participants as “apolitical” (Bronnikova 2025) frequently operates as silent dissent (Meyer Olimpieva 2025), leveraging informal networks, encrypted messaging platforms, and peer-to-peer aid structures.

Methodologically, this study uses thematic analysis of face-to-face interviews with urban activists who at the beginning of the full-scale invasion were involved in refugee relief either in Russia or while they temporarily left the country. The interviews reveal the importance of communicative ecologies, i.e. blending traditional technologies like landlines and face-to-face networks with tools such as Telegram, Notion, and OVD-Info bot. The paper also shows how domestic spaces (e.g., kitchens, apartments) become key sites of logistical coordination, while activists with previous communication and management skills become the main nodes in the activist communication ecologies, no matter what type of activism or profession they were involved prior to the war. These findings reflect the hybrid nature of civic action in authoritarian contexts, where physical and digital infrastructures are precariously intertwined and rapidly adapted in response to shifting conditions. The paper also highlights the transborder dimensions of war-time activism: Ukrainian refugees were moved from occupied zones to Europe via Russia, relying on detailed, often informal knowledge of border regimes. Meanwhile, displaced Russians reconstructed activist networks abroad through diasporic ties, relying heavily on trust, affect, and improvisation, forming what we call shadow infrastructures of care, held together not by hierarchy, but by emotional investment and interpersonal credibility.

By focusing on the intersection of repression, infrastructural fragility, and everyday resistance, this paper contributes to broader conversations about civil society under authoritarianism, and the transformation of activist practices in the digital age. It challenges the assumption that repression extinguishes activism in Russia, showing instead how civic engagement mutates under pressure taking on new forms to survive in the times of crisis.

WON01 Representation, Female Journalists in the Newsroom and in Confict Settings

PP 0616 The daily struggle of female journalists in the news media

Veronika Végh[1]

[1] Eötvös Loránd University, Department of Media and Communication, Budapest, Hungary

In 2021 the share of women was 86% in journalism and information related university studies in Europe.[1] By that time women comprised almost 62% of bachelor's-degree, more than 65% of master's-degree, and more than 58% of doctoral-degree candidates in journalism and mass communication studies in the United States, according to the report of the Women's Media Center.[2] Despite these numbers, the report of the 7th Global Media Monitoring Project (GMMP) – published in 2025 – mentions that four out of ten stories in traditional news media are reported by women globally, with only 41% of journalists named in news articles, seen or heard in multimedia clips are women.[3] In Hungary this number was even lower in 2022: women authored only 25% of articles published on the the most popular and cited news platforms (Shevchuk, 2022).

During my research, I conducted semi-structured interviews with female journalists working in the news media. My interviews focused primarily on two research questions. The first was does the gender of the journalist still matter in the news media? And the second was whether journalism has remained a male-dominated profession, requiring masculine qualities and characteristics to pursue.

One of the major findings of my research is that journalism is no longer necessarily considered a masculine, much more gender neutral profession, but my interviewees confirmed that masculine traits are necessary to pursue it. According to the interviews, hard news mainly covered by men, and experts also prefer to talk with male journalists, so glass walls still exist. They also confirmed that the glass ceiling exists too, with many feeling that they have reached the peak of their careers despite having the ability to attain higher positions.

The interviewed journalists confirmed my further previous assumptions: there are fewer women compared to men in the media sector, particularly in newsrooms that set the agenda and deal with news media; journalism as a profession is considered masculine according to social norms, and even female journalists must adopt masculine traits in order to succeed, thereby jeopardizing their femininity and womanhood; based on female journalists' individual information about the media industry, this masculine atmosphere directly rejects traditional female roles and feminine appearances; there are many forms of discrimination, but the most common ones come from within the editorial office, from sources an interviewees in everyday work, and from reader feedbacks.

To conclude, based on international literature and my research, female journalists struggle daily for recognition and acceptance.

WON01 Representation, Female Journalists in the Newsroom and in Confict Settings

PP 0617 Seeing the invisible: How news media frame unpaid care work in Germany, Austria and German-speaking Switzerland (2020–2024)

Elisabeth Ulrike Wagner-Olfermann[1]

[1] TU Ilmenau, Institut for Media and Communication Science, Ilmenau, Germany

Unpaid work affects everyone. Over the life course, individuals either benefit from unpaid labour or perform it themselves, for children, relatives or through voluntary engagement. Domestic, care and volunteer work accounts for an estimated one third of the social product of advanced industrialised nations. In Austria, the monetary value of unpaid work in 2022 was calculated at EUR 195 billion (44% of GDP). Despite its central economic contribution, much of this work remains invisible and undervalued.

Unpaid labour is predominantly performed by women. A 2022 EIGE survey of 60,000 respondents found that "56% of mothers with children under twelve spend at least five hours per day on childcare, compared to 26% of fathers". COVID-19 widened this gap: in Germany, women's unpaid informal care increased by 1.1 billion hours between 2020 and 2021 – roughly 700,000 part-time jobs. These patterns reinforce structural disadvantages, including lower employment levels, earnings, pensions and reduced access to leadership.

Demographic ageing is likely to heighten pressure on unpaid care. Responsibilities increasingly converge in the same life stages. Simultaneously, labour-market actors in Germany are responding to skilled-labour shortages by calling for higher weekly working hours for all genders – intensifying tensions between paid and unpaid work.

Despite temporary attention during the pandemic, sustainable solutions are lacking. Research on unpaid care remains fragmented due to overlapping concepts (Gender Care Gap, Pay Gap, Pension Gap) and disciplinary dispersion. Communication scholarship has expanded analyses of gendered visibility, yet few studies examine how unpaid labour itself is represented in news.

This study fills this gap by analysing how unpaid work is represented in news coverage in Austria, Germany and German-speaking Switzerland, and how the pandemic shaped these representations. It examines which forms of unpaid labour receive attention, which actors dominate and whether episodic or thematic framing prevails.

We analyse six quality newspapers (two per country) between 2020 and 2024. To ensure reproducibility, the study focuses on print coverage and employs a full sample identified through a comprehensive LexisNexis search. The dataset contains 491 articles, evenly distributed across countries; intercoder reliability reached 0.81 (Gwet's AC1).

Preliminary findings reveal predominantly event-driven reporting (68%), with strong opinion-section emphasis (40%). Unpaid work is the primary topic in only 36% of articles; more often it appears as an illustrative or causal factor within broader discussions on gender inequality. Coverage concentrates on childcare and household tasks, while elder care or volunteering appear less frequently, resulting in a partial depiction of unpaid labour. Women are overwhelmingly portrayed as primary actors (92%), supported by statistical evidence (54%), while personal narratives remain limited (23%). Articles and passages with a primary focus on unpaid work display thematic framing centred on structural causes and solutions; while consequences include personal ones such as stress and systemic ones such as labour-market impacts. Finally, the discourse appears largely "by and with women": 70% of authors and 60% of quoted actors are female.

The study is ongoing and will include a cross-national comparison. A supplementary online sample for Germany (≈170 articles) will analyse digital outlets and compare agenda dynamics.

WON01 Representation, Female Journalists in the Newsroom and in Confict Settings

PP 0618 Spotlight and shadows: Women's agency and representation in wartime media

Olena Zinenko[1], Olga Syniugina[2], Katerina Larina[3,4]

[1] Ruhr University Bochum, IFHV, Bochum, Ukraine
[2] NGO KRF Public Alternative, Women Networking for Peacbuilding, Kharkiv, Ukraine
[3] Charles University, Faculty of Arts, Prague, Czech Republic
[4] NGO Smarta, n/a, Lviv, Ukraine

Women's needs in media discourse are predominantly framed through negative or crisis-driven narratives- violence, loss, and humanitarian catastrophe- which reinforces objectification and limits the integration of women's experiences into policymaking and public dialogue. The discourse of needs rarely evolves into a discourse of agency, leaving women as objects rather than active subjects. War exacerbates structural inequalities: hyper-stereotyped portrayals of women combine with limited access to decision-making and public expertise.

This study adopts an interdisciplinary approach, integrating peace and conflict studies, media studies, feminist theory, pragmatics, and social anthropology. Peacebuilding frameworks (J. Galtung, 1969; J. P. Lederach, 1997) emphasize communication as a tool to mitigate violence and foster sustainable peace, while mediatization and audience studies (S. Hjarvard, 2008; A. Hepp, 2013; N. Couldry, 2003) show how media logic shapes social processes. Feminist media theory (J. Butler, 1990, 2004; D. Haraway, 1985, 1991; J. Radloff, 2017; A. S. Dobson, 2015) analyzes gendered representation, embodiment, and agency. Given their Western origins, these frameworks require adaptation to Ukraine's wartime context, accounting for trauma, power asymmetries, postcolonial legacies, and conflict-driven media realities.

War and media are interdependent situations: media both reflect and shape wartime contexts, influencing which voices are heard and how social roles are constructed. Using F. Krotz's mediatization framework (F. Krotz, 2007, 2014), this study examines how media structures transform social practices and women's visibility, showing that even highly active participation can coexist with systemic inequalities. Hyper-stereotypization amplifies this paradox: women are visible and articulate, yet their agency is constrained by the very media that presents them.

The repertoire of women's voices was examined through CAT-UA monitoring of social media, using a dataset of approximately 1 million posts collected via Youscan since 24 February 2022. A thematic sample of 159,000 posts was analyzed with partial content and multimodal discursive analysis. Focus groups with women remaining in Ukraine, internally displaced women, and those who fled abroad further clarified communicative dynamics and silences.

Analysis shows that women - from victims and volunteers to leaders and activists - are key carriers of humanitarian and peace-oriented narratives, articulating recovery, care, solidarity, and social cohesion. Yet institutional media often reproduce hierarchical communication models, limiting women's participation in meaning-making. Visibility is frequently reduced to victims, caretakers, symbols of resilience, or moral pillars, reinforcing power asymmetries and the perception of women's "natural" secondary status.

These findings highlight the urgent need for alternative media models that transform visibility into agency. Democratization of media, regulation of digital platforms and AI, and support for women's solidarity networks can counter hyper-stereotypization, fostering inclusive, ethical, and participatory discourse capable of advancing peace even under wartime conditions.

WON01 Representation, Female Journalists in the Newsroom and in Confict Settings

PP 0619 Doxxing as activism: Gendered practices of visual digital vigilantism

Patricia Prieto[1], Suay Melisa Özkula[2]

[1] Lancaster University, Sociology, Lancaster, United Kingdom
[2] Paris Lodron Universität Salzburg, Center for ICT&S, Salzburg, Austria

Visual forms of online misogyny have been subject to much debate in recent years. We have previously defined these as the ways in which social media platforms afford, limit, or shape particular gendered power relations through the visualities and visual cultures they produce and/or facilitate (anonymised, in press; anonymised, 2024). This article first reviews cases of gendered digital vigilantism discussed in legacy and independent media coverage towards identifying repertoires of gendered vigilantism and creating a conceptual framework of these practices. The framework illustrates the different ways in which digilantism preys on and exploits women's, queer, and non-binary individuals' digital data under the banner of producing "social good". This means that digilantism assumes a role of social justice and collective defence of public good, even where privacy rights are breached. Individuals who may have broken the "moral codes" of a given group (but not laws) consequently face digital public persecution and hate. As part of the framework, we pay particular attention to the use of visual data as ways of identifying, shaming, and controlling women, queer, and non-binary persons. We then provide in-depth insights into a particular case of visual digilantism. This case draws a connection between digitally mediated harassment and activist rhetorics by looking at a case study of a sexual harassment accusation by a digital vigilante group, which was interpreted in different ways by the involved and/or observing parties (the target, the accusers, bystanders, and the platforms) as either harassment/doxxing or activism. This event is an example of the culture of everyday surveillance (Lyon, 2018) and constitutes a case of digital vigilantism or 'vigitilantism' (Reichl, 2019) with, due to its hateful rhetorics, ambiguous interpretations as either (a) a form of activism or sousveillance, or (b) the wider spectrum of harassment, bullying, and doxxing, that carry potential for significant consequences of the involved individuals' everyday life and may be misinterpreted by content moderators and content creators alike. The article highlights above all the visual cues and aesthetics that were used in this case towards outlining the rhetoric and affective impact of implicit visual narratives. The article ends by highlighting feminist practices of care and support to counteract digital vigilantism that have been developed by activist groups working on the ground in the area of online sexual violence.

POS01 Poster session

P01 ARS Cognitive limits of attention and comprehension in high-speed advertising

Melissa Gurdián Franceschi[1], Miguel Ángel Martín-Pascual[2], Celia Andreu-Sánchez[1]

[1] Universitat Autònoma de Barcelona, Comunicación Audiovisual y Publicidad, Barcelona, Spain
[2] Instituto Radio Televisión Española, Research and Innovation, Barcelona, Spain

The pervasive practice of speed-watching, driven by information overload and digital immediacy, has redefined audiovisual consumption among young audiences. While this strategy prioritizes time efficiency, questions remain about the real impact that such compression has on the cognitive processing of persuasive communication.

In this context, the present ongoing research--part of the second year of doctoral studies in Audiovisual Communication at the Universitat Autònoma de Barcelona (UAB) of the first author and conducted in collaboration with the Spanish Public Television (RTVE) Institute-- poses the following central question: How do attentional processing, comprehension, and emotional perception vary when advertisements are viewed at normal speed (1×) versus accelerated speed (2×)?

Through a mixed-method experimental design, participants (N = 172) aged between 18 and 63 years were randomly assigned to one of two conditions: half were exposed to advertising stimuli at 1× speed, and the other half at 2× speed. Six video advertisements were selected, each lasting 15–30 seconds, with limited on-screen text and clearly visible branding. For each video, two versions were prepared: the original normal-speed version (1×) and an accelerated version (2×). The videos were sourced from YouTube in 1080p HD resolution and presented in a randomized order. The methodology integrates biometric data collection via eye-tracking technology to obtain objective metrics of attention through eye behavior, complemented by self-report questionnaires that assess information retention, affective response, including valence and arousal, and comprehension and credibility.

Data collection and preliminary processing are complete; full statistical analysis is ongoing and will be presented at the conference. This work aims to provide empirical evidence within an emerging line of research by examining how the acceleration of stimuli modulates cognitive resources and whether the potential increase in attentional demand associated with the 2× format compromises communicative effectiveness. Beyond its theoretical contribution, this research seeks to inform evidence-based decision-making in advertising production and broadcasting by clarifying the cognitive and communicative effects of accelerated content formats.

P02 CYM Peer-to-peer exploratory workshop as an empowering method in participatory youth research

Kansu Ekin Tanca[1]

[1] University of Vienna, Department of Education- Media Education Unit, Vienna, Austria

The poster proposal is part of my PhD project titled: “Human rights-based approach to critical media literacy: Youth perspectives on human rights in the digital environment.” For the poster session, I am focusing on one of the sub-research questions, which is well-suited for the session as it is exploratory in design and would benefit greatly from collegial feedback and discussion: “How do youth in Europe experience human rights (issues) in the digital environment?”

To address this research question, I designed a peer-to-peer exploratory workshop and engaged with youth from a European Youth Network.

The workshop has already been conducted in October 2025, with participation of 15 youth aged between 18–24, after piloting different components of the workshop with three different youth groups (each n = 12–15) and finalising it based on structured interviews conducted with youth (n = 3). The workshop uses peer education approach, following the art-based inquiry (Greenwood, 2012) and designed as low-threshold to stimulate a dialogue oriented learning environment. During the workshop, youth engaged in activities that allowed them to reflect on their experiences on the digital environment in relation to the human rights (issues). The method strongly values youth perspectives and their narrated/visualised expressions as valid empirical data (Rodriguez & Brown, 2009). By doing so, a focus has been given on experiences of (non-) participation vis-à-vis human rights and how youth reflect on the barriers and violations to human rights as well as opportunities emerging from exercise of rights in the digital environment. The workshop design as well as the analysis has been informed by three theories a) Critical media literacy (CML) theory by Kellner and Share (2019); b) Ideal requirements for public sphere framework by Dahlberg (2001), which derives from Jürgen Habermas’ theory (1962; 2023); and b) digital citizenship framework by Choi (2016).

The outputs/materials created during workshop (e.g posters, note cards drafted in activities and mapping exercise) as well as researcher’s field notes are considered as “data.” The data gathered from the workshop has currently been analysed using thematic analysis (Braun & Clarke, 2022). Interested participants from the workshop are involved in research and formed “youth expert group”.

P03 CYM Influencer marketing and Gen Z perceptions of Chinese e-commerce controversies: Shein and Temu in Spain

Lanruo Mao[1]

[1] Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain

Despite ongoing controversies related to labour conditions, environmental sustainability and ethical practices, Chinese fast-fashion e-commerce platforms such as Shein and Temu continue to achieve high sales in European markets. This paradox is particularly evident among Generation Z consumers, who are often described as environmentally and ethically conscious, yet remain highly engaged with these brands. This study explores how influencer marketing on social media contributes to this contradiction in the Spanish context.

Focusing on Gen Z users aged 16–31, the research examines the psychological and communicative mechanisms through which influencers mediate perceptions of brand controversy and consumption practices. The study addresses three research questions: (1) how do Shein and Temu understand and manage controversy through influencer collaborations; (2) what types of influencer content dominate brand-related communication on TikTok; and (3) how do Gen Z consumers negotiate personal values with their actual purchasing behaviours.

The project adopts a qualitative multi-method approach. First, a semi-structured in-depth interview with internal staff who has worked with Shein and Temu has been conducted and is currently being analyzed using thematic analysis. Second, a content analysis of fashion-related TikTok videos posted during the 2025 Black Friday period and tagging the official Spanish brand accounts is underway, using a coding framework informed by Taylor's Six-Segment Strategy Wheel and narrative persuasion theory. I now have a draft codebook and have downloaded almost all of the videos. Finally, focus groups with Spanish Gen Z participants will examine value orientations, awareness of brand controversies and the perceived influence of influencers on shopping decisions.

The findings of this study are expected to contribute academically to a deeper understanding of parasocial interactions between followers and influencers by incorporating a practice-oriented perspective grounded in industry professionals' insights. Unlike much previous research, which has primarily relied on hypothetical scenarios or imagined interactions, this study draws on real-world marketing practices and professional experiences. From a practical perspective, the results also offer insights into the actual market positioning of these brands and clarify how their often-described "addictive" marketing strategies are translated into sustained commercial success.

P04 CYM The digital privacy gap: How adolescents and their parents understand online privacy boundaries

Barbora Lisztwan Honusová[1], Lenka Dedkova[1], Vojtěch Mýlek[1]

[1] Masaryk University- Faculty of Social Studies, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Online activities are a routine part of adolescents' increasingly autonomous social lives but also a source of concerns for parents. This raises questions about which online experiences adolescents consider private versus those they are willing to share with parents. Social-cognitive domain theory (Smetana et al., 2009) provides a framework for understanding why adolescents consider certain activities personal, prudential, moral or multifaceted. In this theory, online activities were framed as multifaceted, thus viewed as a single domain. More recent works, however, argue that research should distinguish between different online social activities rather than consider online behaviour as homogenous (Van Zalk & Van Zalk, 2020). Nevertheless, empirical knowledge of how online privacy is perceived within families remains limited. Online interactions may blur the boundaries between adolescents' personal domain and parental authority. The same online activities may be perceived by adolescents as private and by parents as safety or prudential concerns, creating new sources of conflict. This study addresses this gap by investigating how early adolescents and their parents understand the privacy of various online social activities. It aims to explore the boundary between adolescents' right to privacy and parents' right to know, deepening our understanding of the social digital media use domains that adolescents and their parents perceive as private or routine, as well as those that may give rise to disagreements or conflicts. In this study, we collected data from 1,562 parent-child dyads, adolescents aged 11–14 (M = 12.51, SD = 1.13, 51.4 % boys) in May 2025. Both parents and children were asked two open-ended questions to describe the online content and online conversations they consider private, as well as those they believe parents should know about, including what it involves and why they draw these boundaries. We are analyzing their 5,304 answers using Structural Tabular Thematic Analysis (ST-TA; Robinson, 2022). We are currently beginning the first stage of ST-TA, involving deep immersion in the data. The study contributes to a more nuanced understanding of family privacy negotiation, enriching the Social-cognitive domain theory in the context of digital media and offering insights for both theory and parental mediation practice.

P05 CDE Ethical imperatives and structural dynamics in AI and disinformation regulation: Insights from Austrian Civil Society

Marina Lindmeyr[1], Christina Krakovsky[1]

[1] Austrian Academy of Sciences / University of Klagenfurt, CMC – Institute for Comparative Media and Communication Studies, Vienna, Austria

Austria's hybrid media environment (Chadwick, 2017) faces mounting pressures that erode journalistic autonomy and democratic deliberation (Vinatzer et al., 2024). Distinguishing from mis- and disinformation remains difficult (Farid, 2022), intensified by AI-driven amplification of deceptive content (Bontridder & Poullet, 2021). Regulatory frameworks struggle to keep pace (European Commission, 2025), threatening deliberative discourse (Riedl, 2024).

Building on dialogic communication ethics, this study conceptualises communication as a relational and moral process grounded in dialogue (Anderson et al., 1994; Johannesen et al., 2008). Concepts of the attention economy (Davenport & Beck, 2001; Webster, 2014; Klinger & Svensson, 2016) guide the analysis of power shifts, representation gaps and governance in public discourse, leading to the research questions:

How does Austrian civil society assess the ethical imperative of regulating AI and countering mis- and disinformation within the EU governance framework?

What role do socio-economic asymmetries and political dependencies play in shaping the implementation of regulatory frameworks for AI and the governance of mis- and disinformation?

Method

This study employs a qualitative design based on 13 focus groups conducted to date, involving 80 participants, most within a Horizon Europe project. Additional groups will follow to strengthen depth and robustness. Discussions addressed contentious issues such as AI, misinformation, scientific scepticism, elections and diversity in a multi-actor setting that included

underrepresented groups and institutional representatives. Data were analysed thematically (Braun & Clarke, 2006) using MAXQDA to examine social meaning and media representation, highlighting the interplay between individual experiences and structural conditions.

Results

Preliminary results indicate a consensus on coordinated regulatory responses that go beyond technical fixes to include societal and ethical considerations. Elite-driven AI discourses, weak enforcement and algorithmic opacity were identified as amplifying systemic risks, reinforcing calls to safeguard accountability and democratic resilience. Participants warned that increasing polarisation displaces evidence-based reasoning with emotionalised narratives, fostering communicative restraint on controversial issues and limiting fact-based dialogue. The absence of legal enforcement creates a regulatory gap, compounded by AI's influence on public perception. Civil society emphasised polarised narratives oscillating between extremes and called for coordinated efforts, including fact-checking mechanisms, to counter misinformation within shared EU digital policy frameworks.

P06 CDE The communicative construction of competing futures and contemporary practices of mobilisation

Sandra Kero[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

Media change and long-term societal transformations can be analyzed not only retrospectively but also with a focus on potential futures and their shaping. In times of multiple crises, questions about the future become central to individual and collective orientation, providing frameworks to process uncertainty and define societal goals (Cantó-Milà & Seebach, 2024). These negotiations also reveal present action possibilities – either to promote desired futures or counteract negative developments. Such "anticipated futures" influence perception, evaluation, and decision-making even before they materialize (Anderson, 2010). Future-oriented practices serve as effective mobilization tools for various groups, grounded in shared ideas, common norms and mechanisms of governance (Kashima et al., 2025). At the same time, differentiated and often competing ideas emerge about what constitutes a crisis and how it should be addressed (Mau et al., 2024).

This dissertation, currently in its early stages, examines competing visions following a potential collapse of the current social order, as well as strategies to avert, accelerate, or prepare for it and analyzes how different actors – from alternative communities to state institutions – use the future to create orientation, capacity for action, and community. Three empirical cases from Germany will be analyzed: a) the Bundeswehr as a state actor, b) the Reichsbürger milieu as anti-state actors, and c) the prepping milieu as largely non-political, individualistic actors. Using a qualitative content analysis of their online communication, the study will investigate which futures are interpreted by whom, how they relate to the present, and which communicative resources and public arenas are available to each group. Central research questions include: How is the future socially constructed and related to present action? How are futures communicated, legitimized as knowledge, and translated into action-guiding orientations? How do collective visions foster belonging, community, and identity, and what role does (online) communication play in their dissemination and stabilization?

The dissertation contributes to the understanding of contemporary processes of social fragmentation during times of multiple crises by comparatively examining the future as a communicative space for social and political negotiation and mobilization.

POS01 Poster session

P07 CDE Look Who's Talking! In/visibilities of impacted communities in news reporting on AI

Rahel Winter[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

News reporting brings light to topics, perspectives, and current events on both a local and global scale, aiding in the formation of public opinion and empowering readers to be informed citizens. Multiple factors impact which voices and stories are made in/visible in news media, including journalists' individual decisions (Haarkötter & Kalmuk, 2023), journalistic norms (O'Neill & Harcup, 2019; Trilling et al., 2017), media ownership (Archer & Clinton, 2018; Chomsky, 2006) and the outlet's ideological and political leanings (Firmstone, 2024).

Larger cultural and societal processes such as marginalization further impact who is made in/visible and, in turn, is forced to make additional efforts to make their voices heard (Strand, 2018). Communities disadvantaged by these processes are especially impacted by AI risks that reproduce and amplify pre-existing inequalities, including environmental harms (Bender et al., 2021; Li et al., 2025), gender-based violence (Ji, 2025) and socioeconomic disparity (Sahebi & Formosa, 2024). With the rise of widely used generative AI technologies and their increased infrastructural and resource demands, impacted communities worldwide have taken to engaging in various forms of resistance. This includes the establishment of dedicated non-profit institutes and organizations- for example, the Distributed AI Research Institute and PauseAI (DAIR Institute, 2025; PauseAI, 2025)- and the grassroots coordination of protests and lobby work opposing the building of energy-intensive data centers (Levy, 2026).

Voices amplified in news reporting on AI shape expectations, understandings and awareness of its risks and benefits (Dihal, 2024). The visibility of these impacted communities and their demands in news reporting thus provides an important counterweight to techno-optimist and solutionist narratives emphasized by tech CEOs and investors profiting off the widespread implementation of AI technologies (Danaher, 2021; Johnston, 2020).

This cumulative dissertation asks: Which communities are made in/visible in English- and German-language news reporting on artificial intelligence? It utilizes a mixed-methods approach using multiple semi-automated large-scale content analyses of news articles on AI from Austria, Germany, the United Kingdom and the United States, alongside supplementary text data from social media and communities impacted by AI technologies.

The dissertation is currently in the state of registration.

POS01 Poster session

P08 CDE Woman's emancipation in the Independent Social Democratic Party of Germany (USPD) and within the party press, 1917–1923

Hilke Hammer[1]

[1] Universität Leipzig, Institut für Kommunikations- und Medienwissenschaft, Leipzig, Germany

When the Independent Social Democratic Party of Germany (German: Unabhängige Sozialdemokratische Partei Deutschlands, USPD) was founded in 1917 as a split from the Social Democratic Party of Germany (SPD), female members hoped that they would now be taken more seriously. Leading politician Luise Zietz, for instance, hoped "that women's demands are now viewed differently than in the old party" (Zietz, 1917, 32). This hope was widely shared: in March 1919, female members accounted for approximately 25% of the total membership (Krause, 2025, 29). What is more, Clara Zetkin, the leading figure of the proletarian women's movement, also joined the USPD, which resulted in her dismissal as editor of the SPD-owned periodical *Die Gleichheit*, which was the movement's most important organ. The party split was played out extensively in the press (and as a battle for control of various publications), as it was considered crucial to the success of the labor movement in the 19th and early 20th centuries.

The PhD project examines the negotiation of the so-called "Frauenfrage" (women's issue) in the USPD's media policy. It focuses on opportunities for women to participate in the party press and the presence of women's political issues. Particular attention is paid to the quantitatively marginal women's press. Theory and practice of women's agitation and organization in the USPD are examined to shed light on the party's women's press between marginalization and self-empowerment. It examines the tensions between goals of women's emancipation and anti-feminist tendencies in the party and discusses these as a societal issue, going beyond the historical example.

The main research question is: How was the "Frauenfrage" reflected in the media policy and media practice of the USPD? Following sub-questions are: How were the functions and necessities of a (partial) separation of women in the party and its press discussed? What impact did this have on the content of various press organs? Who wrote in women's press organs and where did women write?

The project uses the method of historical source analysis. Sources used for the study include party conference minutes, programmatic writings, archive holdings such as personal estates, and USPD press publications.

POS01 Poster session

P09 CLP ComAI Provider's Governance of User-Chatbot Relationships

Kim Lisa Ermler[1]

[1] University of Bremen, Center for Media- Communication and Information Research ZeMKI, Bremen, Germany

Providers of digital services have historically acted as central points of control and regulation over the use of their products. This includes rules on the content hosted on the service which is commonly referred to as 'content moderation' (Gillespie, 2018). Research on content moderation generally spans three categories: (1) which rules providers set in their corporate

policies, such as Terms of Service (e.g. Einwiller & Kim, 2020), (2) how they implement these rules (e.g. De Keulenaar et al., 2023) and (3) how the enactment is perceived by users (e.g. Bucher, 2017).

While there is a considerable body of research with regards to social media platforms, little is known about how providers of Artificial Intelligence (AI) related products exercise content moderation, specifically those that offer Communicative Artificial Intelligence (ComAI), such as chatbots (Hepp et al., 2023). Initial research suggests that, although ComAI providers' content moderation themes appear similar to those of social media platforms (e.g. misinformation, harassment), new topics are emerging, especially due to the nature of direct interactions between users and chatbots (Gillespie, 2018; Klyman, 2025).

Thus, in my PhD thesis, I want to address the following research questions:

(1) Which rules do ComAI providers set to moderate the content they host, especially with regard to the nature of direct interactions between users and chatbots?
(2) How are these rules enacted?
(3) How is the enactment perceived by users?

My thesis comprises four interconnected studies. In all studies, I will focus on four ComAI providers, namely Anthropic, OpenAI, Google and Meta AI. The first study will provide an overview of the key themes of content moderation in the corporate policies of ComAI providers, while the second study will be an in-depth analysis of how they conceptualize user-chatbot-interactions. Studies three and four will examine content moderation in practice. The third study will examine how content moderation guidelines manifest in user-chatbot-interactions, and the fourth study will explore users' perceptions of providers' content moderation practices.

I am currently in the process of conducting the first study. By September 2026, I plan to have finished this study and started work on study two.

P10 DMM News from the Portuguese diaspora: Understanding diasporic news websites in France, Luxembourg and the United Kingdom

Joana Ferreira[1]

[1] NOVA University of Lisbon, School of Social Sciences and Humanities NOVA FCSH, Lisbon, Portugal

Diasporic media produced by Portuguese immigrants have been studied in regards to its characteristics and functions, revealing their role in promoting cultural identity, ties between the community, a bond with the country of origin, as well as the integration of the community in the country of destination (Ferreira, 2014; Ferreira, 2016; Rosales & Ferreira, 2010; Moura, 2010; Pena-Rodríguez & Lima, 2020).

Nevertheless, while Portuguese diaspora media - particularly printed newspapers, radio, and television - have been researched, little is known about the adaptation of these media to the digital environment, specifically in terms of the production and consumption of news websites created by and/or for the Portuguese immigrant communities.

This PhD project addresses this research gap by examining three news websites serving Portuguese immigrant communities in three destination countries of both historic and contemporary relevance for Portuguese migration: As Notícias (United Kingdom), LusoJornal (France) and Contacto (Luxembourg).

Using a mixed-methods approach that combines content analysis, ethnographic observation, interviews and surveys, the study will examine: the role of Portuguese diasporic news websites in the political, identity and cultural representation of Portuguese immigrants; levels of journalistic professionalization; production processes and thematic agendas in the websites' contents; the relevance of these websites for the community from the perspectives of both news professionals and

readers; readers' profiles and motivations for accessing these platforms; and the funding strategies and business models adopted by these news organizations. This study is currently in progress, with data collection set to begin in early 2026.

The findings aim to further knowledge about Portuguese diaspora journalism in the digital context and to provide a foundation for future research on news websites produced by and/or for Portuguese communities across different destination countries.

P11 DMM "This affects me, this hurts me!" News reception and social participation of Persons with migration background in Germany

Nieki Samar[1]

[1] University of Bremen, ZeMKI, Bremen, Germany

The growing phenomenon of news avoidance is receiving increasing attention. Some news avoiders feel that news does not directly affect them (Palmer & Toff, 2020). This raises the question of how news reception is influenced when news discusses one's own identity and therewith future. Focusing on people with a Migration background it is striking that media coverage of migrants is predominantly linked to crimes or conflicts—disproportionate to their actual prevalence (Gemi et al., 2013)—and is accompanied by negative media reactions (Bonfadelli, 2019; Toff et al., 2023).

Since media clichés in particular influence the recipient's news selection (Arendt, 2023), research debates the relation between the negative generalization of migrants in the media with negative effects on their socialization and sense of national belonging in Germany. The aim of the dissertation project is therefore to understand news reception and avoidance among people with a migration background as well as to their news consumption behavior regarding migration-related reporting in Germany.

There were 4 basic requirements for participants to achieve a sample group outwardly associated with a similar life and religious context: (1) a migration background, (2) a non-European country of origin, (3) with predominantly Muslim population, and (4) sufficient German language skills. Due to the declining relevance of inner European nationalities (Thränhardt, 2008), research explicitly focuses on non-European, as Muslim perceived backgrounds (Hafez & Schmidt, 2015) and participants were from the ten most frequent Muslim countries of origin in Germany (Statistisches Bundesamt, 2024).

Interviewees were recruited through associations and non-institutional groups, private contacts, requests in public spaces and online. Data was collected through 22 qualitative, semi-structured interviews. These interviews covered topics such as news consumption habits, topic-(dis)interest, social participation and (national) affiliation(s), media perception, and migration-related news.

The evaluation of the interviews is still *work in progress*. However, first results show this not only allows insights into the subjective worlds of meaning of a steadily growing population group in Germany, but has implications for the news processing practices of journalists and offers a prognosis for social cohesion and feelings of belonging. Therefore this study thus contributes to a rather unexplored intersection between migration and communication studies.

P12 DCC Shifting paths: How the sequencing of product decisions communicates institutional direction in early stage media platforms

Sesi Morgan[1]

[1] University of Nicosia, Media &- Communications, Nicosia, Cyprus

Early stage media platforms operate under conditions of uncertainty in which institutional identity, legitimacy and future direction are not yet stabilised. Existing research in platform studies has examined design choices, governance mechanisms, and business models as organisational features shaping digital platforms. However, less attention has been paid to how the temporal sequencing of decisions shapes how platforms are interpreted as evolving institutions. This poster asks, how does the order in which product, governance, and communication decisions are introduced influence interpretations of what a platform is and what it is becoming?

The poster presents work in progress from an analytic autoethnographic case study of Oriire, an early stage, mission-driven digital archive of African mythology and folklore. The study forms part of a broader doctoral project currently in its first-wave analytic phase. Methodologically, it draws on constructivist grounded theory principles and examines longitudinal documentation of product changes, governance interventions, and public-facing communications. Materials include interface redesigns, editorial standardisation, membership systems, privacy and consent flows, and crisis communications during infrastructural strain. The analysis examines the founder's reflective documentation alongside observable platform changes to trace how sequencing decisions shaped the platform's emerging institutional identity.

Preliminary findings suggest sequencing matters interpretively, not only substantively. Decisions introduced early in a platform's lifecycle appear to carry disproportionate weight in shaping how subsequent actions are understood. For example, early implementation of GDPR-style consent mechanisms communicated procedural seriousness and institutional aspiration prior to formalisation of editorial or monetisation structures. By contrast, governance and monetisation decisions introduced after growth were interpreted through established expectations, narrowing plausible future paths. Across these moments, sequencing appears to operate as implicit communication signaling priorities, values and imagined futures.

Aligned with the conference theme, the poster conceptualises early stage platforms as operating at moments of path dependency, where each decision contributes to expanding or constraining possible institutional futures. Rather than proposing a settled framework, the poster advances temporal sequencing as a sensitising concept for analysing how institutional meaning and legitimacy emerge over time. The analysis invites comparative research across niche and mission driven platforms to examine how sequencing practices shape trust, resilience, and organisational trajectories.

POS01 Poster session

P13 FIS Women documentary filmmakers' ethical reasoning: "No film is important enough to hurt someone"

Veronika Kováč[1]

[1] Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

This qualitative research focuses on documentary filmmaking ethics with special emphasis on women directors. How do they decide when facing a moral dilemma? Who comes first – the film or the participants? While prior research suggests that documentary filmmakers give their films a more prominent place (Sanders, 2012), our data indicate that among women documentary directors, the answer is more complicated. The findings have so far shown that making a good film is crucial for them, but not at the expense of harming people or damaging relationships.

The poster will present the results of the study as the first outcome of the ongoing qualitative research based on the grounded theory approach. Using in-depth interviews and grounded theory analysis, the study examines the ethical dilemmas Slovak and Czech women documentary filmmakers, focusing on feminist issues (N = 12), face, the solutions they employ, and the values they prioritise within five key relationships stemmed from previous research and theory (Sanders, 2010; Aufderheide, 2012): with protagonists, the industry, the crew, the audience, and their own film. Particular attention is paid to how they narrate power asymmetries, responsibility, and vulnerability.

The analysis indicates that their moral reasoning differs from the dominant understanding of documentary ethics shaped by a Western, white, male perspective in film theory (Pryluck, 1976; Nichols, 1991), which remains a normative imperative for examining ethics in documentary film even today, as our recent scoping review – on research within documentary filmmaking ethics – showed. The respondents' reasoning and values resonate more strongly with the ethics of care, as developed by Carol Gilligan (1993).

At the same time, the position of women filmmakers within the Czech and Slovak documentary film industry is more unstable, requiring them to repeatedly defend both the relevance of female-centred topics and their own ability to tell these stories in the way they find important. By foregrounding women's voices, the study seeks to reframe documentary ethics beyond its masculinized foundations, connect debates on the ethics of care with discussions of authorship and power in non-fiction cinema, and open a more inclusive debate on ethics and gender in documentary film.

P14 GSC From Digital Intimacy to Digital Violence: Revenge Pornography and Mental Health in LGBTIQ+ People

Lucia Farkašová[1]

[1] Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Revenge pornography, the nonconsensual distribution and sharing of sexually intimate content to third parties via digital technologies, has emerged as a prevalent form of online sexual violence. Psychological impacts of revenge porn include negative effects on short- and long-term mental health, and are comparable to rape and sexual harassment.

While research has documented these consequences in heterosexual women, LGBTIQ+ individuals remain understudied, despite facing elevated risks and unique vulnerabilities related to minority stress, marginalisation, and barriers to help-seeking. Unlike heterosexuals, LGBTIQ+ people are also at risk of having their gender identity or sexual orientation revealed without their permission, carrying significant stress and risks for their safety and well-being.

In this research, I combine the lens of digital closet (i.e., the controlled management of queer identity disclosure online) and minority stress to create a theoretical framework for understanding experiences of LGBTIQ+ individuals who had their intimate content non-consensually circulated.

Drawing on semi-structured interviews (planned for spring 2026) with at least 10 LGBTIQ+ individuals who have experienced revenge pornography, I ask: How does the dissemination of revenge pornography affect the mental health of LGBTIQ+ people? The data will be analysed using thematic analysis, which will explore how disclosure of intimate content may carry devastating implications within queer communities due to compounded vulnerabilities.

The study has several practical and research-oriented implications. First, it highlights how current legal and societal debate on revenge pornography does not consider the harm faced by LGBTIQ+ people and should be adjusted to better recognise these different impacts. Second, by focusing on queer voices, this study responds to the dearth of research on LGBTIQ+ experiences with revenge pornography and thus contributes to expanding the understanding of experiences of sexual minorities online. Third, by combining the digital closet and minority stress framework, the study will offer a novel approach for understanding the intersection of digital sexual violence and LGBTIQ+ identities that illustrate how revenge pornography can function as a forced outing that compounds pre-existing minority stressors. Findings will offer practical implications for therapeutic practice, nonprofit organisations, and educational institutions supporting LGBTIQ+ individuals affected by this form of sexual violence.

POS01 Poster session

P15 HCO Suicide reporting by UK news producers on Instagram, TikTok and Facebook: A multi-modal, cross-platform content analysis

Jason Maurer[1]

[1] University of Copenhagen, Media Section- Department of Communication, Copenhagen, Denmark

Researchers have long found that how news producers report about suicide deaths can impact population suicide rates: sensationalizing or simplifying suicide can lead to higher suicide rates within a population (Werther effect), whereas stories of recovery and hope are associated with lower-than-expected rates (Papageno effect) (Domaradzki, 2021; Niederkrotenthaler et al., 2010). Little research has been conducted on suicide reporting on social media, where news content is increasingly being adapted and consumed (Newman et al., 2024). Accordingly, this study examines how articles reporting on suicide deaths by large news producers in the United Kingdom are adapted for Instagram, TikTok, and Facebook. I further examine to what extent adapted news content conforms to existing suicide reporting guidelines, and whether user engagement differs according to adherence to these guidelines. Looking at how suicide reporting differs across social media platforms will yield both platform-specific insights regarding reporting of suicide content and build on earlier investigations of social media user engagement with suicide news (e.g., Sumner et al., 2020). All articles with a primary focus on a suicide death created by public (BBC.com), broadsheet (*The Guardian*), and tabloid (*Daily Mail*) news producers from 1 January 2024 to 1 January 2026 will be sampled. Whether and how these articles have been adapted to Instagram, TikTok, and Facebook, each of has its own affordances and audiences (Bucher & Helmond, 2017), will be examined using content analysis. The analysis codebook will be developed using insights from past research (Hase et al., 2023; Hendrickx & Vázquez-Herrero, 2024) and suicide reporting guidelines (World Health Organization, 2023). In addition to comparing content across platforms, I will examine how user engagement differs across platforms and according to level of adherence to suicide reporting guidelines. Data collection and analysis will be conducted in winter and spring of 2026, with the aim of submitting for publication by autumn 2026. The results of this study can provide a basis for adaptation and more nuanced application of suicide reporting guidelines for social media.

P16 JOS The new normal? Precarization of Czech media

Martin Honc[1]

[1] Charles University, Department of Media Studies – Institute of Communication Studies and Journalism, Prague, Czech Republic

Over the past 15 years, numerous qualitative studies (Gollmitzer, 2014; Örnebring, 2018; Marín-Sanchiz et al., 2023) have demonstrated that journalism has become increasingly precarious, leaving journalists exposed to structural insecurity that may influence their career paths as well as the future of journalism as a profession. Despite this, little quantitative evidence exists, meaning that the sociodemographic characteristics of precarious journalists and the extent to which they face uncertain working conditions remain insufficiently understood. Such conditions include unstable or insufficient income, fixed-term contracts, inadequate social protection, and the absence of employee insurance.

This paper therefore aims to systematically examine precariousness in Czech journalism at three levels—economic, legislative, and institutional—drawing on existing theories of precarity in media work (Rick, 2024). The theoretical framework is grounded in Standing's (2011) concept of the precariat as a class defined by labour-market insecurity, as well as in research by Deuze (2007) and Gollmitzer (2014), who have examined the long-term deterioration of journalistic working conditions.

To explore sociodemographic characteristics associated with precariousness, a quantitative survey will be employed. The planned research sample consists of approximately 300–400 journalists working in Czech news and current-affairs media who are directly involved in content production. The questionnaire focuses on economic insecurity (income from journalistic work), legislative insecurity (employment type), and institutional insecurity (social support). This design follows the methodological approach of established comparative studies of journalistic populations (Hanitzsch et al., 2011). To identify relationships and predictors of precarity, bivariate and multivariate analytical techniques will be used, including correlation analysis, logistic regression and exploratory cluster analysis (Disman, 2011).

Although many qualitative studies have mapped journalists' subjective experiences of precarity, only one quantitative study to date (Rick, 2024) has examined the phenomenon using objective indicators. By combining sociodemographic, economic, and institutional variables, this study is expected to provide the first systematic typology of precarious journalists in the Czech context and to identify which structural factors most strongly predict precarious working conditions. The findings are intended to contribute to broader debates on labour inequalities in journalism and to provide an empirically grounded basis for future policy and organisational measures aimed at improving the sustainability of journalistic work.

POS01 Poster session

P17 JOS Forgotten and overlooked: Longstanding and emerging challenges in bridging Computational Framing Analysis with its pre-digital roots

Ofer Shinar[1]

[1] Karlstad University, Media and Communication, Karlstad, Sweden

Framing is among the most established and widely employed concepts in media and communication research. Yet since its inception, it has also been marked by conceptual heterogeneity, stemming from interdisciplinary and diverse theoretical origins (Tewksbury & Scheufele, 2019). The shift from legacy to digital media environments, together with the rise of automated and computational approaches to framing analysis, has only amplified this heterogeneity (Otmakhova et al., 2024). This epistemological shift has reshaped and intensified longstanding concerns about framing's coherence, particularly as methodological innovation appears to be advancing faster than framing's conceptualization.

This study addresses framing as a research tradition situated on shifting epistemological ground. It conducts a dual systematic review in parallel: first, of recent empirical studies that employ computational tools to detect and measure media frames at scale; and second, of theoretical and systematic reviews that reflect on framing's conceptual development across its pre-digital and computational phases. By reading these literatures together rather than in isolation, the review asks not only how framing is currently being measured, but also what kind of theoretical concept framing is becoming under conditions of automation.

The analysis identifies five overarching challenges that currently distance computational framing research from its theoretical and pre-digital roots. Three are inherited but insufficiently resolved "forgotten" challenges: the Fragmentation Challenge, the Gradient Concepts Challenge, and the Abstractness Challenge. These originate in pre-digital framing debates and persist—often implicitly—within computational applications. Two additional challenges are "overlooked" and emerge

more directly from the computational turn itself: the Contextual Embeddedness Challenge, concerning the sidelining of audience, culture, and meaning-making, and the Ideological Flattening Challenge, by which framing increasingly risks being reduced to the detection of polarized or oppositional positions.

Together, these challenges suggest that automated framing analysis is not merely expanding existing paths but actively reconfiguring them. If left unaddressed, this trajectory risks narrowing framing's explanatory scope to detectable textual patterns at precisely the moment when communication research must cope with increasing complexity and ostensible ideology. The work concludes by outlining possible directions for reconnecting computational innovation with framing's theoretical commitments, arguing for preserving framing's relevance while adapting responsibly to shifting methodological ground.

POS01 Poster session

P18 JOS Building tomorrow's AI skills in journalism: An investigation into teaching prerequisites and practices at German universities

Sina Thäsler-Kordonouri[1], Vera Katzenberger[2]

[1] LMU University of Munich, Department of Media and Communication, Munich, Germany
[2] University of Leipzig, Department for Communication and Media Studies, Leipzig, Germany

AI has become increasingly embedded in journalism as news organizations institutionalize AI-driven systems within editorial processes and workflows (Borchardt et al., 2025). This development heightens the importance of journalists' AI literacy as a professional competence to ensure responsible, ethical, and autonomous journalism (Helberger et al., 2022). While prior research has emphasized AI literacy among media professionals, less is known about how journalism education and institutional contexts shape the AI literacy of aspiring journalists.

This study examines journalism instructors' perspectives on AI literacy in higher education. Conceptually, it builds on Ng et al.'s (2021) multidimensional framework of AI literacy, encompassing knowing and understanding AI, using and applying AI, evaluating and creating AI-based outputs, and reflecting on AI ethics. The study addresses three research questions: (1) how journalism instructors assess their own AI literacy, (2) how they integrate different dimensions of AI literacy into journalism education, and (3) which individual and institutional factors facilitate or constrain AI-related teaching.

Methodologically, the study draws on semi-structured interviews with 19 journalism educators from 18 bachelor's and master's programs in journalism in Germany. Interview data were analyzed using qualitative content analysis.

Preliminary findings show broad agreement that AI is a relevant topic in journalism education. AI is framed as a cross-cutting or "meta-topic" rather than a standalone subject. However, instructors report significant constraints, including limited self-assessed AI expertise, the rapid pace of technological change, and structural challenges within universities, such as scarce resources and inflexible curricula. These are challenges that echo earlier observations on barriers to AI literacy development (Dodds et al., 2025). Where AI is addressed in teaching, emphasis is placed primarily on ethical reflection and critical evaluation, while hands-on application is often delegated to practice-oriented modules or external experts. Instructors see their role not in teaching operational AI skills, but in fostering critical, ethically informed reflection on AI in journalism. This approach aligns with understandings of AI literacy as a reflective and normative competence (Ng et al., 2022). By foregrounding educators' perspectives, this study contributes empirical insights into an underexplored dimension of journalism education and provides a foundation for future curriculum and faculty development.

P19 JOS Between traditional and political role performance? The manifestation of journalistic role performances in alternative and traditional news media

Antonia Wurm[1], Ines Engelmann[1]

[1] Friedrich-Schiller-University, Institut für Kommunikationswissenschaft, Jena, Germany

Alternative news media have become increasingly visible actors in digital public spheres. While prior research has focused on misinformation (Mourão & Robertson, 2019) or professional self-understandings (Figenschou & Ihlebaek, 2025), less is known about the broader range of journalistic role performances in alternative news media content and how these performances relate to political motivations. As journalistic roles structure how news contributes to public discourse, focusing only on misinformation or self-perception provides an incomplete understanding of how alternative news media intervene in political communication. We address this gap by systematically examining forms of journalistic role performance in alternative news media and comparing them to those of traditional news outlets.

Theoretically, the study builds on Mellado's (2020) role performance framework, which conceptualizes journalistic roles as observable patterns in news content, known as interventionist, watchdog, loyal-facilitator, service and civic role performances. To address the often blurred boundaries between journalism and political communication in alternative news media, this framework is combined with the Social Identity Model of Collective Action (van Zomeren, 2016), allowing us to capture how political motivations such as collective identity, emotion, morality, and perceived efficacy become embedded in journalistic role performances.

Empirically, the study is based on a manual quantitative content analysis of 1,800 news articles published between September 2024 and August 2025. The sample includes six German alternative news media outlets (Tichys Einblick, Epoch Times, Junge Freiheit, (NIUS, Reitschuster, Achse des Guten). Additionally, three traditional outlets are benchmark media (Frankfurter Allgemeine Zeitung, Süddeutsche Zeitung, and tagesschau.de). Each article is coded for six journalistic roles according to Mellado (2020) and for the political motivations embedded in the content (van Zomeren, 2016). Using cluster analysis, the study examines how political motivations and journalistic role performances coalesce into distinct patterns (similarly, Staender et al., 2024).

At the time of submission, the coding scheme is refined, and the coding process is currently being prepared. The findings are expected to clarify how different forms of peripheral positioning translate into distinct configurations of journalistic role performance and political motivation across alternative and traditional news media.

P20 JOS Information overload: Journalists' perceptions and coping strategies

Tereza Bartůšková[1]

[1] Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Journalists process information at work and continue to consume it beyond working hours. This dual exposure makes them potential targets of information overload. This phenomenon refers to a subjective feeling of being overwhelmed when information demands (e.g., high information quantity or low information quality) exceed one's processing capacity, which can negatively affect performance and well-being.

Based on existing literature, research focusing specifically on journalists remains limited. Addressing this gap is important given journalists' key role in maintaining democracy. If affected by information overload, journalists' ability to fulfill this societal role could be compromised. Responding to calls for a more holistic understanding of the phenomenon, this study examines how journalists perceive information overload in their work (RQ1) and nonwork context (RQ2). Additionally, it

explores the coping strategies journalists employ to manage it (RQ3). The key contribution of this study is an empirically grounded model of information overload from a journalistic perspective, adapted from a context-neutral model by Graf and Antoni (2023).

The study adopts a qualitative case study design. The sample consists of 11 news agency editors from Czechia, selected through maximum variation sampling. Selection criteria included gender, years of experience in the news agency, news section, and position (managing or publishing editor). Data were collected through two-week non-participant observation in the newsroom and semi-structured interviews and analyzed using reflective thematic analysis.

By linking work and nonwork contexts, the adapted model conceptualizes information overload as primarily work-based, with consequences extending to editors' personal lives through a spillover effect. The findings highlight that despite high information exposure at work, editors do not perceive information overload as a significant strain on their performance and well-being. Instead, they perceive it as a situational burden, moderated by influencing factors (e.g., experience, shift work, technical equipment) and coping strategies (e.g., filtering, prioritizing, withdrawing). Furthermore, editors do not perceive information overload originating in a nonwork context, but they can still be affected by its consequences, such as reduced attention or tiredness, that spill over from work. These findings provide context-specific insights into information overload and identify effective strategies journalists can use to mitigate or prevent it.

P21 JOS When the use of AI fails: Evidence from a survey experiment on public perception of trust and legitimacy in news media

Emilie Midtsæter Strønen[1]

[1] University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

AI is increasingly deployed across society, including in news media, and AI errors have already appeared in national newspapers (e.g., Greger, 2025; Thobo-Carlsen, 2025). A growing overarching concern is that AI is increasingly implemented in news media, and there is a fear that this could damage audience trust (Toff & Simon, 2025). While there is much literature on AI in the news media (e.g., Cools & De Vreese, 2025; Leuppert et al., 2025; Morosoli et al., 2025), we lack knowledge about the implications of AI errors and their consequences on public perception.

This study presents evidence from a preregistered (https://osf.io/4e725/overview?view_only=0a372d28e77d49f6ba8bcac03a4258a5) survey experiment (N = 2030). I examine how public perceptions of trust and acceptance vary when AI errors occur with a 2 (authorship: human vs. AI) x 2 (outcome: no error vs. error) x 2 (actor: news media vs. public administration (PA)) factorial design. News media and PA are compared as they find themselves in similar situations; both perform important public tasks, depend on trust and legitimacy, and increasingly use AI. Trust is measured as trust in actor in given situation, and legitimacy as acceptance of actor publishing the article or report.

In line with the preregistered hypotheses, I find that AI-written articles reduce trust and acceptance, indicating an AI-penalty. Errors in articles reduce trust and acceptance. Importantly, this error-penalty is significantly much stronger than the AI-penalty. AI-written articles containing errors result in loss of trust and acceptance compared to human-written articles with errors. To assess whether these results are unique for the news sector, I compare them to PA. Similar patterns are observed for both sectors. However, the AI-penalty on trust and the error-penalty on trust and acceptance are significantly stronger for PA than for news media. The AI-penalty when errors are present is also stronger for PA for acceptance. While AI and error penalties are not exclusive to news media, the differences in effect size suggest there is something context-dependent about the public perception of trust and legitimacy in news media.

This paper is a work in progress; I received data in December 2025 and have recently conducted the analysis.

P22 JOS The future of journalism from the stakeholders' perspective: An early-stage PhD project

Martin Veselý[1]

[1] Faculty of Social Studies- Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

It has become popular to describe the state of contemporary journalism as one of a "crisis" (Brüggemann et al., 2016; Neuberger, 2025), with some of its perceived causes ranging from the collapse of the advertising-based business model (European Commission et al., 2024) over the rise of news avoidance and news fatigue among audiences (Newman et al., 2025) to political pressures on the freedom of the press worldwide. Yet, there is little knowledge about how the representatives of news organisations themselves interpret the current state of journalism and how these interpretations shape their strategic decisions. Further, journalists and media executives tend to rely on their imaginations of the audience (Litt, 2012; Nelson, 2021) when adopting innovation in reporting and making strategic decisions, but we do not have sufficient information about the audiences' interpretation of the crisis either, as well as what changes to journalism they deem acceptable or desirable.

The PhD project, currently in its first year and in the phase of a literature review, aims to investigate the perspectives of stakeholders within Czech journalism, understood as media executives, journalists, and members of the public, on: (1) how they interpret the current state of Czech journalism and the causes for this perceived state; (2) what they believe and wish journalism should be like in the future; and (3) how they envision the transition from the current state of affairs to the desired future one. Further, a systematic literature review will investigate theoretical assumptions among relevant "X-journalisms" (Loosen et al., 2022) which claim to offer a remedy to journalism's ails. Semi-structured qualitative interviewing is to be used for the study of media practitioners, while either focus groups or a standardised survey will be used to investigate the audiences' perspective.

The Czech case provides an insightful environment for studying the problem, as the local public debate lacks relevant think-tanks or similar organisations providing stakeholders with suggestions regarding the future of journalism. This stands in contrast to the countries of Western Europe and the US where research on novel approaches to reporting has mostly concentrated so far.

P23 MIP Join the rhythm: entertainment-based selling as cultural production through cross-gendered endorsement and rhythmic slogan-based performance in live-streaming e-commerce

Zhuo Zhang[1], Janina Schaumann[1], Benjamin Österle[2], Jörg Henseler[1]

[1] University of Twente, Department of Design- Production & Management, Enschede, Netherlands
[2] Heilbronn University of Applied Sciences, Faculty of Management and Sales, Heilbronn, Germany

Live-streaming e-commerce has become a key growth engine within media industries (Hao & Chen, 2025). In this competitive environment, capturing audience attention has driven the emergence of entertainment-based selling practices (Abidin,

2016). This study investigates how entertainment-based selling is shaped by China's cultural context, and how gendered embodiment and rhythmic performance are enacted in live-streaming e-commerce.

Drawing on a qualitative case study of livestream selling performances on Chinese TikTok (Douyin), this study examines a culturally distinctive selling format characterized by cross-gendered endorsement—male streamers selling female-oriented products such as high-heeled shoes (Mo & Yang, 2026)—and rhythmic, slogan-based performance. Building on scholarship that conceptualises slogans in political communication as performative and rhythmic communicative acts rather than purely propositional statements (Das, 2022; Lee, 2015), the study extends this perspective to live-streaming e-commerce, where rhythmic, slogen-based performance operates as part of entertainment-based selling practices. Using a multimodal analysis (Norris, 2004), it explores how selling is enacted through the coordination of speech, bodily movement, and rhythmic synchronization rather than through detailed product explanation .

The analysis is guided by a two-part theoretical framework. First, this study identifies a mode of cross-gender endorsement (Mo & Yang, 2026) in which male streamers do not adopt feminised appearances, but instead present their bodies as neutral testing devices for female-oriented products (Labrecque, 2014). This performance shifts attention away from gendered self-display and towards product quality (Abidin, 2016). The selected case centres on an emergent selling format in which male streamers try on high-heeled shoes and perform synchronised rhythmic movements to test quality. Across such performances, synchronised movement functions as visual proof of product reliability and as an attention-management strategy foregrounding entertainment (Connell, 2005). Second, the streamers employ rhythmic, slogan-based performance combined with synchronised bodily movement, drawing on the aesthetic legacies of socialist mass culture in China, where slogans, synchronised bodies, and repetitive movement function as familiar forms of collective expression (McNeill, 1997; McGrath, 2008).

This study seeks to understand cross-gendered endorsement and rhythmic, slogan-based performance as an entertainment-based selling strategy in live-streaming e-commerce in China. Theoretically, it contributes to media studies by broadening understandings of live-streaming e-commerce.

P24 POL Scrolling from the margins: The social media and perceived political visibility of youth living in peripheral areas

Dana Bučková[1], Martina Paulenová[1], Alena Kluknavská[1]

[1] Masaryk University, Media Studies and Journalism, Brno, Czech Republic

Social networking sites (SNS) shape how youth engage with politics, yet existing research largely treats young people as a homogeneous demographic, neglecting geographic disparities and the symbolic dimension of political recognition. What has not been particularly studied is how young people in peripheries experience SNS as a space where political visibility, particularly feeling seen or overlooked, is mediated. Ignoring this "double vulnerability" of age and spatial marginalization can exacerbate their feelings of being "forgotten" or "left behind" which can contribute to disengagement, radicalization, or support for populist parties or populist ideas. Drawing on recognition theory and relational approaches to peripherality, we conceptualize perceptions of political visibility as a form of symbolic recognition, shaped by encounters with SNS content that either facilitates or hinders peripheral experiences.

We aim to fill the gap by focusing on how youth in peripheral regions make sense of their political visibility through everyday encounters with SNS, focusing on forms of political information exposure to social media content and visuals such as

memes and reels. Key questions include: How does exposure to political and visual content on social media shape young people's perceptions of political visibility in peripheral areas? We will conduct 20–25 semi-structured interviews with youth aged 18–25 residing in geographically peripheral areas, using visual prompts and guided SNS walkthroughs to capture their interpretations of content.

We anticipate that SNS content reflecting peripheral experiences can enhance perceptions of political visibility and mitigate feelings of being left behind, whereas content disconnected from these experiences may reinforce invisibility and alienation. In particular, when people find content on SNS that is consistent with their peripheral experiences, i.e., content with which they can identify, SNS can serve as a kind of "center" that can help them overcome feelings of marginalization.

This study contributes to research on youth political engagement by conceptualizing perceived political visibility as a key mechanism linking SNS use to engagement of youth in peripheral regions. It advances the study of peripherality as a relational experience shaped by digital media and highlights social media as a site where symbolic recognition and political inclusion are negotiated.

P25 POL From reactive to proactive moderation: AI tools for political discourse on social media

Patrick Frey[1]

[1] University of Bremen, Centre for Media- Communication and Information Research ZeMKI, Bremen, Germany

Although social media serves as a central arena for political discourse, debates are frequently disrupted by phenomena such as incivility (Duncan et al., 2024). Given the vast volume of online discussions, automated and semi-automated (human-in-the-loop) moderation has become an increasingly relevant and promising tool for enabling constructive political discourse at scale (Argyle et al., 2023). However, reactive moderation, the predominant practice in online moderation, functions as "post-hoc damage control" (Schluger et al., 2022, p. 4) and exposes individuals to harmful content before removal. In contrast, proactive approaches that seek to predict the future occurrence of harmful content can intervene before conversations derail (e.g., into toxic language), enabling timely, scalable, and cost-effective moderation that better protects users and moderators (Altarawneh et al., 2024; Schluger et al., 2022).

Even though generative artificial intelligence (AI) opens new possibilities for making automated proactive approaches feasible (Nonaka & Yoshida, 2025), these tools remain under-researched (Chakraborty, 2025). Furthermore, they entail a wide range of risks and ethical challenges (Schluger et al., 2022), including model biases in conversation forecasting that may particularly harm marginalized groups (Chang, 2024). However, these considerations have played a minor role in the research field, occurring more as risk assessments, rather than in the form of ethical frameworks that could inform future, admittedly high-risk, real-world implementations (Chang, 2024). Against this backdrop, my dissertation advances the field by moving beyond reactive intervention towards ethically sound conversation forecasting and proactive strategies. This approach aims to mitigate conversation derailment, thereby supporting constructive online debates, and addressing the following research questions:

RQ1: *How can AI-based (semi-)automated interventions be designed to predict and prevent conversation derailment while adhering to ethical standards and mitigating potential biases?*

RQ2: *How do users perceive and react to proactive interventions?*

To explore these questions, this planned dissertation will follow a four-phase, mixed-methods design: (1) identification of research gaps and promising approaches through a systematic review; (2) comparison of (AI-based) forecasting approaches to identify best practices; (3) controlled experiments with "human-in-the-loop" monitoring testing promising (semi-)automated proactive interventions (e.g., de-escalation prompts by AI-bots); and (4) evaluation of user perceptions and attitudes via follow-up surveys and semi-structured interviews.

POS01 Poster session

P26 POL Trending tradition: Conservative identity construction in online spaces

Karolína Ježková[1]

[1] Charles University- Faculty of Social Sciences, Insitute of Sociological Studies, Prague, Czech Republic

TikTok's short-form, algorithmically curated environment is a shifting ground where young users forge collective identities through sound, meme formats, and aesthetic repetition. This poster presents how conservative identities form and function within digital spaces – aiming to identify visual motifs and communicative strategies that underpin the construction of conservative identity in digital contexts. Building on my doctoral project proposal, the poster thematizes how smaller discursive arenas shape group identities and collective imaginaries, and how these arenas exert influence on the broader public sphere. By framing these phenomena as meaning-making processes, the project advances scholarship on how conservative identities emerge in digital media and situates these dynamics within public sphere theory.

The study focuses on in-group dynamics within conservative TikTok publics by establishing ten diverse experimental research profiles and combining qualitative content analysis with thirty in-depth interviews. The project integrates users, platform affordances, and publics into a coherent analytic framework to reconstruct the emergence of conservative identity and the power relations that shape it. Three types of empirical data – longitudinal digital observation of influencers and users on TikTok, qualitative content analysis of selected trends, and semi-structured interviews with influencers and users – enable the development of conceptual groupings focusing on communication, language, interactions, environment, meanings and narratives. Further analysis of posts, patterns of online behaviour, and interactions among users will examine how information is framed and how participants assign meaning to themselves and to the broader public sphere.

The proposed research is highly socially relevant as radical and extremist movements are gaining popularity and emerging in new digital spaces and communicating in new ways. Contextualization these developments contributes to a more nuanced and empirically grounded understanding of how algorithmically mediated platforms reconfigure everyday communication, identity formation, and the distribution of symbolic power in contemporary publics. The poster visualizes an initial mapping of conservative TikTok groupings, highlights methodological approaches to researching volatile, platform-mediated publics, and presents concrete examples of trend-based framing alongside preliminary typologies of conservative visual culture.

P28 SCI Communicating climate in the digital platform society: Visual practices, new communicators and the rise of GenAI in science communication

Paul Pressmann[1]

[1] University Bremen, Centre for Media- Communication and Information Research ZeMKI, Bremen, Germany

Climate change is a paradigmatic case of post-normal science, characterised by high uncertainty, political contestation, and urgent societal relevance. At the same time, science communication has undergone a profound transformation through the rise of digital platforms, short-form video, and generative artificial intelligence (GenAI). This cumulative doctoral project examines how climate-related science communication is reshaped within contemporary platform environments, with a particular focus on multimodal visual practices, changing communicator roles, and emerging AI-driven forms of content production. The dissertation mainly addresses three interrelated research questions: (1) which visual-narrative formats and communicative strategies dominate in climate science communication on multimodal platforms such as TikTok, Instagram, and YouTube; (2) how traditional communicators (e.g. scientists, journalists, institutions) differ from "non-traditional" actors (e.g. influencers, activists, citizen communicators) in style, reach, and perceived authority; and (3) how GenAI is integrated into climate communication and how audiences evaluate AI-generated content in terms of credibility and authenticity. The project is theoretically grounded in mediatization theory, platform studies, visual epistemology, and post-normal science. Methodologically, it follows a mixed-methods approach across four interconnected empirical studies, combining large-scale computational content analysis of short-form videos with multimodal qualitative analysis, comparative engagement metrics, and exploratory reception analyses. Empirical materials include platform data from TikTok, Instagram, and YouTube, as well as AI-generated visual climate content. The dissertation aims to contribute (1) an empirically grounded typology of platform-based climate communication formats, (2) a systematic comparison of authority and trust dynamics between traditional and non-traditional communicators, and (3) an assessment of the epistemic and communicative implications of GenAI for science communication. The project is currently in a semi-advanced empirical stage, with data collection and analyses underway in advanced progress for several individual papers. The poster presents interim findings, methodological decisions, and conceptual challenges for discussion and feedback.

P29 SCI Climate change communication on Instagram: An experimental study on the effects of threat and collective efficacy

Benjamin Elias Bäßler[1], Eva Maria Tellmann[1], Lea Kamp[1], Sofia Chouaf[1], Ellen Wältring[1], Petya Toneva[1], Sofie Beisemann[1], Felix Reer[1]

[1] University of Münster, Department of Communication, Münster, Germany

Climate activism on social media emphasizes the threat of climate change and elicits diverse reactions, ranging from pro-environmental behavior to defensive rejection. According to fear-appeal research, threat-focused climate activism should promote pro-environmental behavior when messages enhance perceived climate protection efficacy, whereas low perceived efficacy fosters maladaptive strategies such as delegitimizing the message (Witte, 1992). We posit that perceived collective efficacy is central in this process, as effective climate change mitigation depends on coordinated collective action (Jugert et al., 2016).

To examine how the design of climate change social media activism messages affects recipients' perceptions and behavioral intentions, we conducted a 2x2 laboratory experiment using a two-slide, text-based fictitious Instagram post as stimulus. The first slide manipulated climate change threat (high vs. low), and the second slide manipulated perceived collective climate protection efficacy (high vs. low). A total of 111 participants aged 18–63 years were randomly assigned to one of four conditions. Following stimulus exposure, participants completed established scales assessing cognitive processing of the message (defensive avoidance, message derogation, perceived manipulation), and online and offline pro-environmental behavioral intentions. Further, general climate skepticism was considered as a covariate.

Results suggest that the manipulation of high vs. low perceived threat worked well, while the manipulation of perceived efficacy was less successful, which should be kept in mind when interpreting the results. We conducted ANCOVAs to examine how the two experimental factors and the covariate were related to the outcome variables. In all analyses, we found that general climate skepticism was the most important predictor of behavioral intentions and cognitive processing of the message, which puts the influence of one-time exposure to social media climate change activism into perspective. Accordingly, we did not find significant effects of threat and efficacy manipulations on most of the dependent variables as well as no significant interaction effects. However, interestingly, we found that participants in the high threat condition found the message more manipulative than in the low threat condition. Thus, one could conclude that climate change messages should not be formulated in a too threatening manner to avoid creating a sense of being manipulated.

P30 SCI Understanding the implementation of sustainability measures from a dairy farmer's perspective

Romy Joziasse[1], Shreya Dubey[1], Monique Chambon[2], Marijn Meijers[1], Frenk van Harreveld[2], Edith Smit[1]

[1] Amsterdam School of Communication Research- University of Amsterdam, Persuasive Communication, Amsterdam, Netherlands
[2] University of Amsterdam, Social Psychology, Amsterdam, Netherlands

Farmers are facing increasingly complex decisions in sustainability transitions in agriculture, shaped by policies, economic viability (Farstad et al., 2022), and public debate. In the Netherlands, dairy farmers encounter emission reduction policies that require significant changes to business operations and on-farm practices. Despite policymakers' efforts, prior research suggests a discrepancy between policy intentions and the feasibility of implementation by farmers (de Lauwere et al., 2014). For example, constantly changing laws and regulations can lead to uncertainty and unnecessary delays in achieving actual emission reduction (Backus, 2024). Addressing this discrepancy requires understanding what determinants shape dairy farmers' decisions regarding the implementation of sustainability measures.

Understanding the decision-making underlying sustainability transitions requires more than a focus on individual behavior. Adopting a broader systems perspective can provide insight into the communicative and contextual factors that affect dairy farmers' decision-making. This explorative study therefore investigates the behavioral dynamics that shape decision-making in Dutch dairy farms, using a behavioral systems analysis.

The current study combines insights from approximately 30 semi-structured interviews with Dutch dairy farmers and related stakeholders, such as policymakers and interest representatives (fieldwork January-March 2026), with the results from a qualitative social media scan. The social media discourse on dairy farm policy and proposed sustainability transitions is also considered, as earlier research on the Dutch agro-food sector has shown that social media can influence public opinion and policy (Stevens et al., 2018). A behavioral systems map will display the key factors, possible feedback loops, and decision points that follow from the analyses.

The behavioural systems map will provide an integrated and context-sensitive overview of key determinants of decision-making (Lunetto et al., 2022). Additionally, the findings from this study will identify potential opportunities to better align emission reduction policies with dairy farmers' lived realities and their communicative environments. Overall, this study emphasises the value of systemic, behavioural, and communication-focused approaches for understanding pressing sustainability transitions.
